LEGISLATION

A nurse who works with physically disabled clients may have a caseload of clients of all ages, while another nurse, such as a school nurse, may see clients in a specific age group. Nurses need to be knowledgeable about the legislation that relates to populations for whom they provide nursing care. **Box 31-4** summarizes categories of historically significant federal legislation designed to benefit those who are disabled, and **Box 31-5** summarizes key disability rights legislation.

The U.S. Department of Justice (USDOJ, 2012) provides *A Guide to Disability Rights Law*. This publication provides an overview of federal civil rights laws designed to ensure equal opportunity for people with disabilities. This guide is an excellent reference about legislation and disability rights information. The document is available in multiple formats including large print, Braille, and audio.

Rehabilitation services were originally developed through legislation for veterans of World War I. In time, others who were physically disabled were regarded less as sources of embarrassment to their families and more as citizens who should participate as fully as possible in all aspects of society. This change in attitude was reflected in changing laws affecting the disabled.

The Rehabilitation Act of 1973 was the first legislation designed specifically to eliminate discrimination against the disabled. This act required all federal agencies and programs receiving federal funds to hire disabled workers. The Rehabilitation Act was an important piece of legislation that defined disability clearly and increased opportunities for some disabled Americans. However, additional legislation was needed to provide more inclusive protection for individuals with disabilities and to extend the benefits of the Rehabilitation Act to encompass more than federal programs. The ADA of 1990 was designed to decrease discrimination and increase opportunities for all disabled Americans by providing more comprehensive protection for them (Allarie, 2005; Lair and Kale, 2005).

The ADA was signed into law July 26, 1990. The act makes it illegal for state and local governments, private employers, employment agencies, labor organizations, and labor-management committees to discriminate against the disabled in employment, public accommodations, transportation, state and local government operations, and telecommunications (ADA, 1990). Cutting across the specific policy provisions of the ADA are four global goals that clarify the intent of the legislation. For persons with a disability, the ADA is designed to promote (1) equality of opportunity, (2) full participation in society and social integration, (3) independent living, and (4) economic self-sufficiency (ADA, 1990). “The ADA provides comprehensive civil rights protection for qualified individuals with disabilities” (Walk et al, 1993, p. 92). The ADA addresses four areas as shown in **Box 31-6**.

According to the ADA (1990), a qualified employee or applicant with a disability is a person who, with or without reasonable accommodation, can perform the essential functions of the job in question. Reasonable accommodations may include but are not limited to the following:

- Making existing facilities that are used by employees readily accessible to and usable by persons with disabilities
- Job restructuring, modifying work schedules, reassignment to a vacant position
- Acquiring or modifying equipment or devices; adjusting or modifying examinations, training materials, or policies; and providing qualified readers or interpreters

Employers may not ask qualified job applicants questions about the existence, nature, or severity of a disability. Qualified applicants may be asked about their ability to perform job functions. A job offer may be made conditional based on the results of a medical examination, but only if that examination is required for all applicants for the same job. In addition, the examination must be job related and consistent with the employer’s business needs. Individuals who use illegal drugs or who are intoxicated at work are not covered under the ADA. Tests for illegal drugs are not subject to the ADA’s

BOX 31-6 Components of the Americans with Disabilities Act

Title 1 (Employment): Employers, including religious organizations that employ 15 or more employees, cannot exclude individuals with disabilities from being hired solely on the basis of disability with or without accommodations, unless they can prove that provision of such accommodations may cause undue burden on the business.

Title 2 (Access to state and local governments, and public transportation): All state and local government agencies, programs, services, and activities must be accessible to individuals with disabilities. In addition all public transportation systems, including city buses and public rail transit systems must be accessible, unless they can prove that provision of such accommodations will cause an undue burden. In such cases, an alternative paratransit system must be made available to individuals with disabilities who are unable to use the regular transportation system.

Title 3 (Public Accommodations): All business and nonprofit organizations that offer public accommodations, private entities that offer services, privately operated transportation and commercial facilities, must not exclude, separate, or discriminate against individuals with disabilities who are trying to access their programs and services otherwise available to the public. They must remove any architectural barriers that prevent individuals with disabilities from using their facilities.

Title 4 (Telecommunications Relay Services): Covers access to communication and media for people with hearing and speech disabilities. It requires common carriers (telephone companies) to establish interstate and intrastate telecommunications relay services (TRS) 24 hours a day, 7 days a week. It also requires closed captioning of federally funded public service announcements.

Gallaudet University national Deaf Education Center: *Americans with disabilities act*, 2014: author. Available at <http://clerccenter.gallaudet.edu>. Accessed April 11, 2014.

restrictions on examinations. Employers may hold illegal drug users and alcoholics to the same performance standards as other employees.

Service animals are defined and protected under the ADA. Service animals are working animals that are individually trained to perform tasks for persons with disabilities. These tasks may include guiding someone who is blind, alerting persons who are deaf, pulling wheelchairs, and other special tasks. Under the ADA, businesses and other organizations who serve the public, including restaurants, hotels, taxis, stores, medical offices and hospitals, theaters, and parks, are required to allow service animals to accompany a disabled person into all areas open to the general public.

The Fair Housing Act of 1988 prohibits housing discrimination based on race, color, religion, sex, disability, familial status, and national origin. This includes private as well as public housing. The Act also requires new multifamily housing with four or more units to be accessible for persons with disabilities.

The Civil Rights of Institutionalized Persons Act of 1980 authorizes the attorney general to investigate conditions of confinement in state and local institutions such as prisons, detention centers, jails, nursing homes, and institutions for persons with psychiatric or developmental disabilities. Civil lawsuits

may be initiated on the behalf of the person if harmful or neglectful conditions are found (Guiding Light Foundation (GLF), 2010).

According to the Department of Justice, the Voting Accessibility for the Elderly and the Handicapped Act of 1984 requires polling places across the United States to be accessible for persons with disabilities during federal elections. In addition, states are responsible for ensuring available registration and voting aids for disabled and elderly voters, including telecommunication devices for the deaf (GLF, 2010).

The National Voter Registration Act of 1993, also known as the Motor Voter Act, makes it easier for all Americans to vote. Because of the low registration turnout of minorities and persons with disabilities, this act requires all offices of state-funded programs to provide program applicants with voter registration forms, to assist them in completing the forms, and to transmit the forms to the appropriate office (GLF, 2010).

The Air Carrier Access Act of 1986 prohibits discrimination by airlines. Persons with disabilities do not have to give advance notice before they fly. Moreover, unless there is a safety concern, they cannot be discriminated against with regard to seat assignment (GLF, 2010).

IDEA of 1975 is federal legislation that guarantees all children with disabilities ages 3 through 21 years the right to a free and appropriate public school education that will meet their individual needs. This law protects the rights of parents, guardians, and surrogate parents to fully participate in educational decisions. Special education including physical education is defined in this law, and special instruction is to be provided at no cost to parents. Special education was created to meet the special needs of children with disabilities.

According to IDEA, children with disabilities are those who have one or a combination of the following conditions and therefore would benefit from special education: autism, blindness, deafness, hearing impairment, mental retardation, multiple disabilities, orthopedic impairment, serious emotional disturbance, specific learning disabilities, traumatic brain injury, visual impairment, and other health impairments (U.S. Department of Education (USDE), 2010).

Basic Rights Under IDEA

Free and appropriate public education (FAPE)—The child's education must be designed to meet the child's special needs.

Appropriate evaluation/assessment—Each child with a disability must receive a complete educational assessment before being placed in a special education program.

Individualized education plan (IEP)—This plan must be focused and modified on a set of goals and objectives to meet the child's individual needs.

Education in the least restrictive environment (LRE)—Children with disabilities should be educated as much as possible with their peers who do not have disabilities.

Parent and student participation in decision making—Parent and student participation and communication are encouraged. Parents are members of the IEP team and are included in evaluation, eligibility, and placement.

Early intervention services for children and their families—Funds are allocated to infants who have disabling conditions and/or developmental delays. An individualized family service plan (IFSP) is developed that details the early intervention services to enhance the child's development and strengthen the family ([National Dissemination Center for Children with Disabilities, 2012](#)).

The No Child Left Behind Act of 2001 expands parental roles in their child's education. This law reauthorized the Elementary and Secondary Education Act of 1965, the principal federal law governing elementary and secondary education. According to the USDE, it is built on four concepts: accountability, doing what works according to the scientific research, expanding parental options, and expanding local control and flexibility. This bill does the following:

- Supports learning in the early years, hopefully preventing learning disabilities
- Provides more information for parents about their child's programs
- Alerts parents to important information about their child's performance
- Gives more resources to schools
- Gives children and parents a lifeline
- Improves teaching and learning by providing better information to teachers
- Ensures that teacher quality is a high priority
- Allows more flexibility

The Individuals with Disabilities Education Improvement Act of 2004 is the nation's special education law and serves 6.8 million children and youth with disabilities ([USDE, 2010](#)).

The Developmental Disabilities Act and Bill of Rights Act of 2000 requires the Administration of Developmental Disabilities (ADD) under the USDHHS to ensure that people with developmental disabilities and their families receive the services and support they need. The disabled and their families must also be given the opportunity to participate in the planning and implementation of these services. The ADD is a federal agency within the USDHHS and is responsible for implementation and administration of The Developmental Disabilities Act and Bill of Rights Act of 2000 and the disability provisions of the Help Americans Vote Act. There are eight areas of emphasis for ADD: employment, education, child care, health, housing, transportation, recreation, and quality assurance. The ADD meets these requirements through four programs:

1. *State Councils on Developmental Disabilities (SCDD)*: Each state has a council whose function is to increase the independence, productivity, inclusion, and community integration of persons with developmental disabilities.
2. *Protection and Advocacy Agencies (PeAs)*: Every state has a system to empower, protect, and advocate on the behalf of persons with developmental disabilities. The system investigates incidents of abuse, neglect, or discrimination based on disability.
3. *University Centers for Excellence in Developmental Disabilities—Education, Research, and Services (UCEDD)*:

This program provides support to a national network of university centers to carry out interdisciplinary training, services, technical assistance, and information dissemination activities. Its purpose is to increase independence, productivity, and integration into communities.

4. *Projects of National Significance*: The purpose of this program is to focus on emerging issues, provide technical assistance, conduct research regarding disability issues, and develop state and federal policy (www.acf.hhs.gov). In addition, most states and many large cities and counties have their own laws prohibiting discrimination on the basis of disability. Such laws offer greater protection to employees by extending coverage to smaller employers, by using more expansive definitions of disability than those used under the ADA, and by expanding the duty of employers to assist employees with disabilities to move to new positions for which they are qualified. [Box 31-7](#) lists federal agencies with developmental disability activities.

BOX 31-7 Federal Agencies with Developmental Disability Activities

- Administration on Developmental Disabilities (ADD)
- Center for Medicaid and Medicare Services—Medicaid and the State Children's Health Insurance Program can help children and adults obtain health care coverage
- DisabilityInfo.gov—provides information about disability resources in the federal government
- Maternal and Child Health Bureau (MCHB)—promotes the health of mothers and children; provides newborn hearing screening, information on child health and safety and information on genetics
- Medline plus Health Information, National Library of Medicine—online resource for information
- National Council on Disability (NCD)—ensures that persons with disabilities have the same opportunities as others; promotes policies and programs that assist people with disabilities
- National Institutes of Health (NIH)—conducts and funds research on developmental disabilities
- National Institute on Disability and Rehabilitation Research (NIDRR)—promotes the participation of persons with disabilities in their communities
- Office of Disability Employment—focus is to increase job opportunities for people with disabilities; this office is within the U.S. Department of Labor
- Office of Special Education Programs (OSEP)—improves the lives of children and youth with disabilities from birth to adulthood through education and support services; this office is within the U.S. Department of Education
- Office on Disability—oversees the implementation of federal disability policies and programs; fosters interactions between the U.S. Department of Health and Human Services, other federal and state agencies, and private-sector groups
- Rehabilitative Services Administration (RSA)—helps persons with disabilities get jobs and live more independently; RSA is part of the U.S. Department of Education

PRACTICE APPLICATION

A referral was made to a public health department from a nearby regional level III neonatal intensive care unit (NICU) regarding discharge plans for a developmentally delayed infant. The infant, Joel, was born at 27 weeks gestation and had remained in intensive care for 7 months. His hospital course was complicated by respiratory distress syndrome, bronchopulmonary dysplasia, and intraventricular hemorrhage. At the time of discharge, Joel was receiving neither supplemental oxygen nor medications and was taking all of his feedings orally. There were strong indications of spastic diplegia and he was diagnosed as having severe retinopathy of prematurity with the expectation of eventual blindness.

Family financial resources were extremely limited. Although Medicaid coverage was available for subsequent needs, the family owed more than \$100,000 to the hospital. Joel's grandmother agreed to care for him while his 17-year-old mother Mary finished high school. Joel's father, who is also 17 years old and unemployed, had not been active with Mary and her mother in the hospital discharge-planning program. His involvement with Mary and Joel was expected to be minimal. The hospital was seeking a home evaluation before discharge.

What would you consider to be the first step in completing the home evaluation?

Answers can be found on the Evolve site.

KEY POINTS

- Nurses have many opportunities to influence the care of individuals with disabilities through health promotion activities. Health education is important for parents who might be at high risk for having a disabled child, for children at risk for accidents and injuries, and for adults with chronic illnesses who might prevent disability through careful health practices.
- Many of the *Healthy People 2020* objectives apply to physically compromised individuals, their families, and communities.
- Physically compromised individuals need to participate in health promotion to prevent the onset of a new health disruption, to strengthen their well-functioning aspects, and to prevent further deterioration of their health.
- Nursing interventions for physically compromised clients require attention to their health as well as to the environment in which they live.
- Nurses influence policy decisions that affect the health and well-being of compromised individuals.
- Nurses must know both federal and state laws pertaining to disabilities to most effectively assist clients and their families.

CLINICAL DECISION-MAKING ACTIVITIES

1. Divide the class or the clinical group into two teams and debate the following: Children with developmental disabilities should or should not be mainstreamed into classrooms with nondisabled children.
2. During a home visit first to an adult and then to a child who have a chronic illness that leaves them physically compromised, answer the following questions:
 - A. Could this disability have been prevented? If so, what steps could a nurse have taken to provide health promotion activities that would have prevented the occurrence of the disabling condition?
 - B. What role, if any, does the environment play in the onset of this compromising health condition?
 - C. What preventive activities are currently needed to ensure the highest possible quality of life for this person?
3. For the next week, look at each building you enter and consider the following:
 - A. What accommodations have been made to allow physically compromised people to enter this building?
 - B. What accommodations should still be made?
 - C. Who should pay for these architectural accommodations?
4. Spend one day following your usual schedule using either crutches or a wheelchair, so that you can understand better what it means to be physically compromised and have special needs.
5. Using a telephone book, community resource directory, or the web pages for your town, identify all agencies whose scope of work is devoted to assisting special needs individuals and their families.

Promoting and Protecting the Health of Vulnerable Populations

The chapters in this section of the text describe the myriad ways in which the social determinants of health affect people. There is a growing body of information that tells us that one of the most powerful ways to improve the health of the community is to consider and hopefully improve the social determinants of health. [The World Health Organization \(2012\)](#) defines social determinants of health as “conditions in which people are born, grow, live, work, and age, including the health system” and which are “shaped by the distribution of money, power, and resources at global, national and local levels” (para 1). Social determinants of health include social, political, and economic factors, and include living environments and conditions, geographic location, and social class. Populations that lack adequate socioeconomic and psychosocial resources have a greater exposure to violence, alcohol, tobacco and other drugs, mental health issues, and poverty. Migrant workers are often included in a population that is high risk for health disruptions due to their work and transitory lifestyle. Homeless persons and pregnant teens are also high-risk populations due to the circumstances that they face. Solutions to the many problems described in the chapters in this part of the text require an integrated behavioral, social, and health care approach. This approach must begin with a commitment to primary health care. Primary health care involves a partnership between public health and primary care to address the problems of society as well as of individuals and families. The chapters in Part 6 discuss some of the most common problems seen in communities. There is hope that health care reform will positively intervene in the social determinants that affect the groups described in this part of the text.

Vulnerability and Vulnerable Populations: An Overview

Jeanette Lancaster, PhD, RN, FAAN*

Dr. Lancaster is Professor and Dean Emerita of Nursing at the University of Virginia. She has edited this book with Dr. Marcia Stanhope through its previous eight editions.

OBJECTIVES

After reading this chapter, the student should be able to do the following:

1. Describe population groups who might be considered vulnerable.
2. Identify the ways in which these populations often have health disparities compared with the general population.
3. Analyze trends that have influenced both the development of vulnerability among certain population groups and social attitudes toward vulnerability.
4. Analyze the effects of public policies on vulnerable populations and on reducing health disparities experienced by these populations.
5. Examine the multiple individual and social factors that contribute to vulnerability.
6. Evaluate strategies that nurses can use to improve the health status, and eliminate health disparities, of vulnerable populations including governmental, community, and private programs.

Assessment Issues

Planning and Implementing Care for Vulnerable Populations

This chapter discusses the concept of *vulnerability* and the nursing roles for meeting the health needs of vulnerable population groups. Selected population groups that are at greater risk than others of poor health outcomes are described briefly in this chapter and in depth in other chapters in this book. The relationship between health disparities, health equity, and vulnerability is described. Public policies that have influenced vulnerable groups and the effects of these policies are explored. The nature of vulnerability is analyzed and factors that predispose people to vulnerability, outcomes of vulnerability, and the cycle of vulnerability are described. Two of the overarching goals of *Healthy People 2020* are to achieve equity, eliminate disparities, and improve the health of all groups; and to create social and physical environments that promote good health for all (U.S. Department of Health and Human Services [USDHHS], 2010). Nursing interventions to break the cycle of vulnerability and to eliminate health disparities are possible at the individual, family, group, community, and population levels, and examples of interventions are discussed. This chapter also describes how nurses use the nursing process with vulnerable population groups and presents case examples to illustrate nursing actions.

VULNERABILITY: DEFINITION, RISK FACTORS, AND HEALTH DISPARITIES

Vulnerability is defined as susceptibility to actual or potential stressors that may lead to an adverse effect. Vulnerable populations are typically considered to be those that are at greater risk for poor health status and that have poor access to health care. As discussed in Chapter 12, **risk** is an epidemiologic term indicating that some people have a higher probability of illness than others. In the epidemiologic triangle, the agent, host, and environment interact to produce illness or poor health. The natural history of disease model explains how certain aspects of physiology and the environment, including personal habits, social environment, and physical environment, make it more likely that a person will develop particular health problems (Friis, 2010). For example, a smoker is at risk for developing lung cancer because cellular changes occur with smoking. However, not everyone who is at risk develops health problems. Some individuals are more likely than others to develop the health problems for which they are at risk. These people are more vulnerable than other people.

The web of causation model helps to explain what happens in these situations. A **vulnerable population group** is a subgroup

of the population that is more likely to develop health problems as a result of exposure to risk and to have worse outcomes from these health problems than the rest of the population. That is, the interaction among many variables creates a more powerful combination of factors that predispose the persons in that group to illness. Vulnerable populations often experience multiple **cumulative risks**, and they are particularly sensitive to the effects of those risks. Risks come from environmental hazards (e.g., lead exposure from lead-based paint from peeling walls or paint used in toy manufacturing, melamine added to milk supplies), social hazards (e.g., crime, violence), personal behavior (e.g., diet, exercise habits, smoking), or biological or genetic makeup (e.g., congenital addiction, compromised immune status). Members of vulnerable populations often have multiple illnesses, with each affecting the other. Some members of vulnerable populations do not succumb to the health risks that impinge on them. It is important to learn what factors help these people to resist, or have **resilience** to, the effects of vulnerability. Vulnerability is a global concern, with different populations being more vulnerable in different countries. Several vulnerable population groups are discussed in Chapters 33 through 38 and in Chapters 11, 13, 14, and 31.

Examples of vulnerable populations of concern to nurses are persons who are poor and homeless, persons with special needs, pregnant teens, migrant workers and immigrants, individuals with mental health problems, people who abuse addictive substances, persons who have been incarcerated, persons who have or who are at risk for communicable and infectious diseases including persons who are HIV positive or have hepatitis B virus (HBV) or sexually transmitted diseases (STDs). Genetics also plays a role in vulnerability and influences a person's resilience to socioeconomic adverse conditions (Braveman and Gottlieb, 2014).

Benatar (2013) cites potentially avoidable factors that are often ignored by what he calls privileged societies and that could be alleviated by appropriate approaches. These are as follows: a bad start in life, such as in utero factors including material deprivation, abuse, substance abuse, or poor care; physical and emotional deprivation during childhood and adolescence; inadequate education and lack of exposure to social and environmental factors needed to promote adolescent development; inadequate access to the basic living conditions for a healthy life; lack of training for work that will allow the person to develop independently; and a lack of a sense of belonging and as a valued citizen (Benatar, 2013, p. 43).

Vulnerable populations are more likely than the general population to suffer from health disparities. **Health disparities** refer to the wide variations in health services and health status among certain population groups. For more than two decades, *Healthy People* has had an overarching goal that focused on intervening in disparities. The goal in *Healthy People 2000* was to reduce health disparities, and the goal moved to remove health disparities in *Healthy People 2010*. *Healthy People 2020* has expanded the goal to aim to achieve health equity, eliminate disparities, and improve the health of all groups. *Healthy People 2020* describes health equity as attaining the highest possible level of health for all people and includes eliminating health disparities (USDHHS, 2010). Thirty-eight topic areas in *Healthy People 2020* emphasize access, chronic health problems, injury and violence prevention, environmental health, food safety, education and community-based programs, health communication, health information technologies, immunization and infectious diseases, and public health infrastructure, among others. These topic areas are discussed in chapters throughout the text.

HEALTHY PEOPLE 2020

Objectives for Vulnerable Populations

Following are examples of objectives that nurses who work with vulnerable populations might want to note:

- AHS-1: Increase the proportion of persons with health insurance.
- AHS-6: Reduce the proportion of individuals who are unable to obtain or delay obtaining necessary medical care, dental care, or prescription medicines.
- HIV-4: Reduce the number of new HIV cases among adolescents and adults.
- EMC-2.5: Increase the proportion of parents with children under the age of 3 years whose doctors or other health care professionals talk with them about positive parenting practices.

AHS, Access to Health Services; EMC, Early and Middle Childhood. From U.S. Department of Health and Human Services (USDHHS): *Healthy People 2020*. Washington, DC, 2010, USDHHS. Retrieved February 2015 from <http://www.healthypeople.gov/>.

As discussed in other chapters, *Healthy People 2020* is an implementation guide for all federal and most state health initiatives. It is especially relevant to a discussion of vulnerable populations because these underserved and disadvantaged populations have fewer resources for promoting health and treating illness than does the average person in the United States. For example, a family or individual below the federal poverty line is considered **disadvantaged** in terms of access to economic resources. These groups are thought to be vulnerable because of the combination of risk factors, health status, and lack of resources needed to access health care and reduce risk factors.

Areas that show health disparities across population groups include infant mortality, mortality among children under 5 years of age, and age-adjusted mortality rates. In 2010, the mortality rate for black infants was 2.2 times the rate for white infants, with black infant deaths being 11.6 per 1000 live births in contrast to 5.19 infant deaths per 1000 live births for white infants (Murphy et al, 2013). Life expectancy at birth for white

males and females in 2010 was 76.4 and 81.1 years of age, respectively, and for black males and females, 71.4 and 77.7 years, respectively; the life expectancy for Hispanic males was 78.8 years, and Hispanic females had the highest life expectancy of 83.8 years (Murphy et al, 2012).

African Americans have significantly higher death rates from prostate and breast cancer and from heart disease than non-Hispanic whites living in the United States. Hispanics have higher mortality rates from diabetes than non-Hispanic whites living in the United States. Race and ethnicity are not thought to be the causes of these disparities, although research is underway to determine biological susceptibilities by race, ethnicity, and gender. Rather, poverty and low educational levels are more likely to contribute to social conditions in which disparities develop. People who are poor often live in unsafe areas, work in stressful environments, have less access to healthful foods and opportunities for exercise, and are more likely to be uninsured or underinsured.

FACTORS CONTRIBUTING TO VULNERABILITY

Vulnerability results from the combined effects of limited resources. Limitations in physical resources, environmental resources, personal resources (or human capital), and biopsychosocial resources (e.g., the presence of illness, genetic predispositions) combine to cause vulnerability (Aday, 2001). Poverty, limited social support, and working in a hazardous environment are examples of limitations in physical and environmental resources. People with pre-existing illnesses, such as those with communicable or infectious diseases or chronic illnesses such as cancer, heart disease, or chronic airway disease, have less physical ability to cope with stress than those without such physical problems. **Human capital** refers to all of the strengths, knowledge, and skills that enable a person to live a productive, happy life. People with little education have less human capital because their choices are more limited than those of people with higher levels of education.

Vulnerability has many aspects. It often comes from a feeling of lack of power, limited control, victimization, disadvantaged status, disenfranchisement, and health risks. Vulnerability can be reversed by obtaining resources to increase resilience. Useful nursing interventions to increase resilience include case finding, health education, care coordination, and policy making related to improving health for vulnerable populations.

One aspect of vulnerability, **disenfranchisement**, refers to a feeling of separation from mainstream society. The person does not seem to have an emotional connection with any group in particular or with the larger society. Some groups such as the poor, the homeless, and migrant workers are “invisible” to society as a whole and tend to be forgotten in health and social planning. Vulnerable populations are at risk for disenfranchisement because their social supports are often weak, as are their linkages to formal community organizations such as churches, schools, and other types of social organizations. They also may have few informal sources of support, such as family, friends, and neighbors. In many ways, vulnerable groups have limited control over potential and actual health needs. In many

communities, these groups are in the minority and disadvantaged because typical health planning focuses on the majority. Disadvantage also results from lack of resources that others may take for granted. Vulnerable population groups have limited social and economic resources with which to manage their health care. For example, women may endure domestic violence rather than risk losing a place for them and their children to live. Women who are among the working poor are more likely to become homeless when they leave an abusive partner. They may not be able to pay for a place to live when they lose their partner's income.

Social Determinants of Health

Social and economic factors contribute heavily to vulnerability. **Social determinants of health** include a range of social, political and economic factors that include socioeconomic status, living conditions, geographic location, social class, education, environmental factors, nutrition, stress, and prejudice that lead to resource constraints, poor health, and health risk (Wilensky and Satcher, 2009; Lathrop, 2013). From an international perspective, the World Health Organization (WHO, 2015) states that many factors in combination affect the health of individuals and communities. Specifically, “whether people are healthy or not is determined by their circumstances and environment.” The WHO, consistent with *Healthy People 2020*, describes three overall **determinants of health** to be (1) the social and economic environment, (2) the physical environment, and (3) the person's individual characteristics and behaviors. The WHO also notes that individuals are unlikely to be able to directly control many of the determinants of health, and this is directly related to vulnerability. That is, when people experience adverse determinants of health that they cannot control, they are predisposed to becoming vulnerable. The WHO, 2015 cites seven examples of factors that affect health. There are many more factors that affect health, as noted later in the *Healthy People 2020* document. The seven WHO factors are as follows (WHO, 2015, pp. 1-2):

1. Income and social status: Higher income and social status are associated with better health.
2. Education: Low education is linked with poor health, more stress, and lower self-confidence.
3. Physical environment: Safe water and clean air; healthy workplaces; safer homes, communities, and roads; and good employment and working conditions, especially when the person has more control, all contribute to good health.
4. Social support networks: Family, friends, and community as well as culture, customs, traditions, and beliefs affect health.
5. Genetics, as well as personal behavior and coping skills, affect health.
6. Health services: Access and use of services affect health.
7. Gender: Men and women suffer from different types of diseases at different ages. See Figure 32-1 for a street scene that depicts factors that could influence the determinants of health.

Healthy People 2020 (USDHHS, 2010) discusses the importance of social determinants of health by including “Create social and physical environments that promote good health for

FIG 32-1 Example of a street scene that could influence the determinants of health.

all” as one of the four overarching goals. This document explains that it is important to understand the relationship between how population groups experience “place” and the effect that “place” has on the social determinants of health. This concept is consistent with an ecologic framework that examines the effect that people have on the environment and vice versa. *Healthy People 2020* lists 15 examples of social determinants of health: (1) availability of resources to meet daily needs; (2) access to educational, economic, and job opportunities; (3) access to health services; (4) quality of education and job training; (5) availability of community-based resources in support of community living and opportunities for recreation; (6) transportation options; (7) public safety; (8) social support; (9) social norms and attitudes; (10) exposure to crime, violence, and social disorder; (11) socioeconomic conditions; (12) residential segregation; (13) language/literacy; (14) access to mass media and emerging technologies; and (15) culture. This document also lists seven examples of physical determinants of health: (1) natural environment, such as green space and weather; (2) built environment, such as buildings, sidewalks, bike lanes, and roads; (3) worksites, schools, and recreational settings; (4) housing and community design; (5) exposure to toxic substances and other physical hazards; (6) physical barriers, especially for people with disabilities; and (7) aesthetic elements (USDHHS, 2010, pp. 3-4). A useful diagram is also provided that depicts how the five key areas (determinants) of economic stability, education, social and community context, health and health care, and neighborhoods and the built environment serve as a framework for an approach to understanding the social determinants of health (USDHHS, 2010, p. 4) (Figure 32-2).

As mentioned, social status influences health in a variety of ways. First, the more wealth the person has, the more likely the person is to have access to better foods, more education, a safer community, recreation, and health care. These resources serve as protective barriers against chronic disease, injury, and premature mortality (Lathrop, 2013). Nursing interventions are designed to help vulnerable populations gain the resources needed for better health and reduction of risk factors.

FIG 32-2 Five key areas of social determinants of health as found in *Healthy People 2020*. (Retrieved February 2015 from <http://www.healthypeople.gov/2020/topics-objectives/topic/social-determinants-health?topicid=39>.)

Poverty is a primary cause of vulnerability, and it is a growing problem in the United States. The chronic stress of factors such as poverty, unemployment, and poor education can lead to maladaptive physical responses and disease (Lathrop, 2013). Poverty is a relative state. The federal definition of poverty is used to develop eligibility criteria for programs such as Medicaid and welfare assistance. In 2014 the **federal poverty guideline** for a family of four was \$23,850 for all states except Hawaii and Alaska. Both Alaska and Hawaii have higher poverty guideline levels (USDHHS, 2010). However, many people who earn just a little more than the federal poverty guideline are unable to pay for their living expenses but are ineligible for assistance programs. See Chapter 3 for a discussion of the Patient Protection and Affordable Care Act of 2010, and its implementation and effect on individuals and families. The implementation of this Act is bringing substantial changes to the U.S. health care system including a new emphasis on prevention (Lathrop, 2013).

As discussed in Chapter 10, people who are poor are more likely to live in hazardous environments that are overcrowded and have inadequate sanitation, work in high-risk jobs, have less nutritious diets, and have multiple stressors, because they do not have the extra resources to manage unexpected crises and may not even have adequate resources to manage daily life. Poverty often reduces an individual's access to health care. In the developed countries of the world, this is more likely to be a problem for those just above the poverty line, who are not eligible for public support, whereas in developing countries poverty is correlated with decreased access to health care. Chapter 33 provides a more thorough discussion of poverty and also discusses how poverty can lead to homelessness.

Education plays an important role in health status. Although education is related to income, educational level seems to

influence health separately. Higher levels of education may provide people with more information for making healthy lifestyle choices. More highly educated people are better able to make informed choices about health insurance and providers. Education also may influence perceptions of stressors and problem situations and give people more alternatives (Shi and Stevens, 2010). Finally, education and language skills affect health literacy. Chapter 16 discusses health literacy and its effect on health.

Access to health care may be more limited for low socioeconomic groups. **Barriers to access** are policies and financial, geographic, or cultural features of health care that make services difficult to obtain or so unappealing that people do not seek care. Examples include offering services only on weekdays without providing evening or weekend hours for working adults, being uninsured or underinsured, not having reasonably convenient or economical transportation, or providing services only in English and not in the population's primary language. Also, services for families may be offered in locations that make it difficult for people who do not have reliable forms of transportation. Removing these barriers by providing extended clinic hours, low-cost or free health services for people who are uninsured or underinsured, transportation, mobile vans, and professional interpreters helps improve access to care (Shi and Stevens, 2005). The interactions among multiple socioeconomic stressors make people more susceptible to risks than others with more financial resources, who may cope more effectively.

As discussed in Chapter 33, extreme poverty, in the form of homelessness or marginal housing, is related to risk for physical, dental, and mental health problems; food insecurity; and limited access to health care (Baggett et al, 2010). Those who are homeless or marginally housed have even fewer resources than poor people who have adequate housing. Homeless and marginally housed people must struggle with heavy demands as they try to manage daily life. These individuals and families do not have the advantage of consistent housing and must cope with finding a place to sleep at night and a place to stay during the day or must move frequently from one residence to another, as well as find food, before even thinking about health care. Lack of access to nutritious food on a regular basis poses serious health problems (Borre et al, 2010).

Health Status

Age is related to vulnerability, because people at both ends of the age continuum are often less able physiologically to adapt to stressors. For example, infants of substance-abusing mothers risk being born addicted and having severe physiological problems and developmental delays. Because mental and physical problems in adulthood are often associated with childhood stressors such as poverty and emotional deprivation it is important to reduce or eliminate early health disparities (Hillemeier et al, 2013). See Figure 32-3. *Healthy People 2020* includes objectives related to equity for young children for prenatal and early childhood health promotion, decrease in preterm birth and low birth weight, optimal intake of nutrition, and weight and healthy development for school readiness (USDHHS, 2010). Elderly individuals are more likely to develop active infections

FIG 32-3 People who become homeless often once had a home and a family. (© 2012 [Photos.com](#), a division of Getty Images. All rights reserved. Image #135090280.)

from communicable diseases such as the flu or pneumonia and generally have more difficulty recovering from infectious processes than younger people because of their less effective immune systems. Older people also may be more vulnerable to safety threats and loss of independence because of their age, multiple chronic illnesses, and impaired mobility. [Chapter 37](#) discusses substance abuse, and [Chapter 13](#) describes communicable disease risk.

Also, changes in normal physiology can predispose people to vulnerability. This may result from disease processes, such as in someone with single or multiple chronic diseases. As discussed in [Chapter 14](#), infection with HIV is a pathophysiological situation that increases vulnerability to opportunistic infections.

A person's life experiences, especially those early in life, influence vulnerability or resilience. For example, children who survive disasters may experience difficulties in later life if they do not receive adequate counseling. Examples of protective social factors include social support, self-esteem, and self-efficacy (thinking you can handle situations and cope) ([Braveman and Gottlieb, 2014](#)). Specifically, higher levels of confidence in one's ability or internal locus of control appears to protect children (particularly adolescents) from the negative effects of disaster and trauma. Persons with an internal locus of control believe that they control their behavior and do not depend entirely on external people, events, or forces to control behavior. It is the person's perception of his or her level of personal control that influences the person's decisions. Persons with a high level of internal locus of control are more likely to participate in health screenings and take responsibility for their health. That is, they believe they can control to some extent their health outcomes. For example, a woman with a high internal locus of control would participate regularly in yoga and exercise classes to increase flexibility and build strength to preserve her bone and muscle tone. Vulnerable population groups often develop an external locus of control. They may believe that events are outside their control and result from bad luck or fate. People with an external locus of control have more difficulty

taking action or seeking care for health problems. They may minimize the value of health promotion or illness prevention because they do not think they have control over their health destinies. Also, people who have been abused or have experienced chronic stress may have used up a lot of the reserves that others would normally have for coping with new forms of stress. A study by investigators at the Centers for Disease Control and Prevention ([Middlebrooks and Audage, 2008](#)) looked retrospectively at the link between childhood stressors and adult health. This study was referred to as the Adverse Childhood Experiences Study. In particular, the investigators looked at the stress caused by child abuse, neglect, and repeated exposure to intimate partner violence. They discussed three kinds of stress: (1) positive stress, which comes from short-lived adverse events and which children can manage with the help of supportive adults; (2) tolerable stress, which is more intense but still short-lived, such as stress arising from a natural disaster or frightening accident; or (3) toxic stress, which results from intense adverse experiences sustained over time. Children cannot handle toxic stress alone. Stress response activated for an extended length of time can lead to permanent developmental changes in the brain. The support of helping adults can enable the child's stress response to return to normal. As is discussed in [Chapter 38](#), child maltreatment can be a source of toxic stress.

OUTCOMES OF VULNERABILITY

Outcomes of vulnerability may be negative, such as a lower health status than the rest of the population, or they may be positive with effective interventions. Vulnerable populations often have worse health outcomes than other people in terms of morbidity and mortality. These groups have a high prevalence of chronic illnesses, such as hypertension, and high levels of communicable diseases, including tuberculosis (TB), hepatitis B, and sexually transmitted diseases (STDs), as well as upper respiratory tract infections, including influenza. They also have higher mortality rates than the general population because of factors such as poor living conditions, diet, and health status, as well as crime and violence, including domestic violence.

There is often a cycle to vulnerability. That is, poor health creates stress as individuals and families try to manage health problems with inadequate resources. For example, if someone with acquired immunodeficiency syndrome (AIDS) develops one or more opportunistic infections and is either uninsured or underinsured, that person and the family and caregivers will have more difficulty managing than if the person had adequate insurance. Vulnerable populations often suffer many forms of stress. Sometimes when one problem is solved, another quickly emerges. This can lead to feelings of hopelessness, which result from an overwhelming sense of powerlessness and social isolation. For example, substance abusers who feel powerless over their addiction and who have isolated themselves from the people they care about may see no way to change their situation. Nursing interventions should include strategies that will increase resources or reduce health risks to decrease health disparities between vulnerable populations and populations with more advantages ([Flaskerud and Winslow, 2010](#)).

PUBLIC POLICIES AFFECTING VULNERABLE POPULATIONS

Three pieces of legislation have provided direct and indirect financial subsidies to certain vulnerable groups. The Social Security Act of 1935 created the largest federal support program in history for elderly and poor Americans. This act was intended to ensure a minimal level of support for people at risk for problems resulting from inadequate financial resources. This was accomplished by direct payments to eligible individuals. Later, the Social Security Act Amendments of 1965, Medicare and Medicaid, provided for the health care needs of older adults, the poor, and disabled people who might be vulnerable to impoverishment resulting from high medical bills or poor health status from inadequate access to health care. These acts created federal and state third-party health care payers. Title XXI of the Social Security Act, enacted in 1998, created the State Children's Health Insurance Program (SCHIP), which provides funds to insure currently uninsured children. The SCHIP is jointly funded by the federal and state governments and administered by the states. Using broad federal guidelines, each state designs its own program, determines who is eligible for benefits, sets the payment levels, and decides on the administrative and operating procedures. President Obama signed the Children's Health Insurance Program Reauthorization Act of 2009 (CHIPRA). This legislation provided states with new funding, new program options, and a range of new incentives for covering children through Medicaid and the Children's Health Insurance Program (CHIP) (Centers for Medicare and Medicaid Services, 2009).

The Balanced Budget Act of 1997 also influenced the use of resources for providing health services. In an attempt to curb the rapid growth in spending on home health and financial fraud in that industry, the Health Care Financing Administration (HCFA) moved toward prospective payment for home health services. HCFA also set more stringent regulations about which services were reimbursed and for how long and limited access to care for certain vulnerable groups, such as frail elders, chronically ill individuals whose care is largely home based, and people who are HIV positive. The goal is to ensure that care is appropriate, rather than to limit access. Nurses and other health care providers must work closely with families to determine the kinds of services needed to foster self-care and the optimal timing of these services. The Balanced Budget Act of 1997 also reduced payments for services for Medicare beneficiaries, resulting in some providers choosing not to treat them. This means that people with major health needs (i.e., some chronically ill and the elderly) may have limited access to care. There are a variety of Medicare supplemental insurance plans, including those for prescription drugs, and the costs of the plans vary considerably depending on the level of coverage provided. Choosing the right supplemental plan is complex. Two useful sources of information about supplemental plans are the American Association of Retired Persons (<http://www.aarp.org>) and the U.S. government website for Medicare (<http://www.Medicare.gov>).

Finally, one law focuses on the privacy and security of personal health information. The Health Insurance Portability and

Accountability Act of 1996 (HIPAA) was intended to help people keep their health insurance when moving from one place to another. Ensuring the privacy and security of personal health information means that electronic and paper health records, case management, referrals, and physical space layouts (such as computer screen visibility and clinic registration sheets) must be managed to protect the client's privacy and safeguard the privacy of personal health information. In certain cases, health information for public health uses may be shared with appropriate public health agencies, such as in cases of suspected abuse or when investigating a communicable disease outbreak. As electronic health networks become more widely used, some provisions of this law may need to be updated (Greenberg et al, 2009).

The Balanced Budget Act of 1997 had some shifts in payment with the stipulations related to home health care. In an attempt to curb the rapid growth in spending on home health care and financial fraud in that industry, the Health Care Financing Administration (now the Centers for Medicare and Medicaid Services [CMS]) instituted prospective payment for home health services. The goal was to ensure that care was needed, rather than to limit access. Nurses and other health care providers work closely with families to determine the kinds of services needed to foster self-care, and the optimal timing of these services. The Patient Protection and Affordable Care Act of 2010 has provisions for reducing the growth of future Medicare expenditures (Newhouse, 2010). See Chapters 3, 5, and 8 for more detail on health care financing and the economics of health care. See also <http://www.healthcare.gov/law/index.html> and <http://healthlawguide.aarp.org/>.

NURSING APPROACHES TO CARE IN THE COMMUNITY

As discussed in Chapter 2, the history of public health nursing, nurses beginning with Florence Nightingale, have known that the physical and social environments influenced the health of patients. Later Lillian Wald, when she established the Henry Street Settlement, provided nursing care and education to the community through health promotion including education, modification of the environment, and disease control (Lathrop, 2013). There is a trend toward providing more comprehensive, family-centered services when treating vulnerable population groups. It is important to provide comprehensive, family-centered, "one-stop" services. Providing multiple services during a single clinic visit is an example of one-stop services. If social assistance and economic assistance are provided and included in interdisciplinary treatment plans, services can be more responsive to the combined effects of social and economic stressors on the health of special population groups. This situation is sometimes referred to as providing **wrap-around services**, in which comprehensive health services are available and social and economic services are "wrapped around" these services. Although this is an excellent approach to care, it is not available in all or even most areas in the United States.

It is helpful to provide comprehensive services in locations where people live and work, including schools, churches,

neighborhoods, and workplaces. **Comprehensive services** are health services that focus on more than one health problem or concern. For example, some nurses use stationary or mobile outreach clinics to provide a wide array of health promotion, illness prevention, and illness management services in migrant camps, schools, and local communities. A single client visit may focus on an acute health problem such as influenza, but it also may include health education about diet and exercise, counseling for smoking cessation, and a follow-up appointment for immunizations once the influenza is over. The shift away from hospital-based care includes a renewed commitment to the public health services that vulnerable populations need to prevent illness and promote health, such as reductions of environmental hazards and violence and assurance of safe food and water.

Referring clients to community agencies involves much more than simply making a phone call or completing a form. Nurses should make certain that the agency to which they refer a client is the right one to meet that client's needs. Nurses can do more harm than good by referring a stressed, discouraged client to an agency from which the client is not really eligible to receive services. Nurses should help the client learn how to get the most from the referral. As discussed in the chapter related to nurse managed health centers (see [Chapter 21](#)), nurses are critical safety net providers to vulnerable populations. Nurses in these centers aim to provide comprehensive care that includes referrals, follow-up, and advocacy. They often serve populations that have low incomes, may be members of minority groups, may be homeless, or may lack adequate insurance coverage, as well as other groups of vulnerable people.

Nurses also focus on advocacy and social justice concerns. **Advocacy** refers to actions taken on behalf of another. Nurses may function as advocates for vulnerable populations by working for the passage and implementation of policies that lead to improved public health services for these populations. For example, a nurse may serve on a local coalition for uninsured people and another may work to develop a plan for sharing the provision of free or low-cost health care by local health care organizations and providers.

Social justice includes the concepts of egalitarianism and equality. [Braveman \(2014, p. 129\)](#) says that at the heart of social justice is “justice with respect to the treatment of more advantaged vs. less advantaged socioeconomic groups when it comes to health and health care.” A society that subscribes to the concept of social justice would be one that values equality and recognizes the worth of all members of that society. Such a society would provide humane care and social supports for all people. Nurses who function in advocacy roles and facilitate change in public policy are intervening to promote social justice. Nurses can be advocates for policy changes to improve social, economic, and environmental factors that predispose vulnerable populations to poor health. The overriding nursing goal for care of all people, including those who come from vulnerable populations, is to provide safe and quality care. See the [Quality and Safety Education for Nurses \(QSEN\)](#) box for information on quality care.

It is important for nurses to provide culturally and linguistically appropriate health care. **Linguistically appropriate health**

care means communicating health-related information in the recipient's primary language when possible and always in a language the recipient can understand. It also means using words that the recipient can understand. The factors that predispose people to vulnerability and the outcomes of vulnerability create a cycle in which the outcomes reinforce the predisposing factors, leading to more negative outcomes. Unless the cycle is broken, it is difficult for vulnerable populations to improve their health. Nurses can identify areas in which they can work with vulnerable populations to break the cycle. The nursing process guides nurses in assessing vulnerable individuals, families, groups, and communities; developing nursing diagnoses of their strengths and needs; planning and implementing appropriate therapeutic nursing interventions in partnership with vulnerable clients; and evaluating the effectiveness of interventions.

QSEN FOCUS ON QUALITY AND SAFETY EDUCATION FOR NURSES

Targeted Competency: Quality Improvement—Use data to monitor the outcomes of care processes and use improvement methods to design and test changes to continuously improve the quality and safety of health care systems.

Important aspects of quality improvement include:

- **Knowledge:** Explain the importance of variation and measurement in assessing quality of care.
- **Skills:** Use quality measures to understand performance.
- **Attitudes:** Value measurement and its role in good client care.

Quality Improvement Question

Examine health statistics and demographic data in your geographic area to determine which vulnerable groups are predominant. Look on the web for examples of agencies you think provide services to these vulnerable groups. If the agency has a web page, read about the target population they serve, the types of services they provide, and how they are reimbursed for services. Learn about different agencies and share results during class. On the basis of your findings, identify gaps or overlaps in services provided to vulnerable groups in your community. Which data do these agencies collect to demonstrate the efficacy of their services? How could you deal with these gaps and overlaps to help clients receive needed services?

Prepared by Gail Armstrong, PhD(c), DNP, ACNS-BC, CNE, Associate Professor, University of Colorado Denver College of Nursing.

It is also important to consider that there can be ethical dilemmas associated with working with vulnerable populations. The Evidence-Based Practice box describes ethical dilemmas that arose in an academic-community partnership designed to learn about the experiences of undocumented immigrants who sought health care in Toronto, Canada.

In some situations, the nurse works with individual clients. The nurse also develops programs and policies for populations of vulnerable persons. In both examples, planning and implementing care for members of vulnerable populations involve partnerships between the nurse and client and build on careful assessment. Nurses need to avoid directing and controlling clients' care because this might interfere with their being able to establish a trusting relationship and may inadvertently foster a cycle of dependency and lack of personal health control. The

EVIDENCE-BASED PRACTICE

Using an academic-community partnership, a study was conducted to understand the experiences of undocumented immigrants seeking health care in Toronto, Canada. A team composed of the principal investigator, three researchers, and a group of nine undocumented immigrants used a community-based participatory research process to examine the experiences of the immigrants. Representatives from the community-based organization (CBO) had a pre-existing, strong and trusting relationship with the study participants. Two ethical dilemmas arose. Two of the participants thought that the researcher who was asking them questions was a spy for the Canadian Border Services Agency (CBSA). These two participants had not attended the orientation session. They were concerned when asked about their immigration status during the informed consent process. To solve this dilemma, the team decided that the CBO worker should ask for the informed consent because trust was present in that relationship. A second ethical dilemma arose when one participant told the principal investigator (PI) that she was suicidal. The PI was unprepared to deal with this information, and the team decided that in future interviews the PI would tell the participants that she was not a mental health professional. They also determined that the team needed to have access to a mental health professional in the event they learned information that needed follow-up.

Nurse Use

When ethical dilemmas arise in either research or client care, it is essential to identify them and immediately try to seek a solution. This study is a good example of how the team learned a great deal from their project. They put the project on hold in order to reflect, analyze, synthesize, and evaluate the facts.

Source: [Campbell-Page RM, Shaw-Ridley MS](#): Managing ethical dilemmas in community-based participatory research with vulnerable populations. *Health Promot Pract* 17:485–490, 2013.

most important initial step is for nurses to demonstrate they are trustworthy and dependable. For example, nurses who work in a community clinic for substance abusers must overcome any suspicion that clients may have of them and eliminate any fears clients may have of being manipulated.

Nurses working with vulnerable populations may fill numerous roles, including those listed in [Box 32-1](#). They identify vulnerable individuals and families through outreach and case finding. They encourage vulnerable groups to obtain health services, and they develop programs that respond to their needs. Nurses teach vulnerable individuals, families, and groups

strategies to prevent illness and promote health. They counsel clients about ways to increase their sense of personal power and help them identify strengths and resources. They provide direct care to clients and families in a variety of settings, including storefront clinics, mobile clinics, shelters, homes, neighborhoods, worksites, churches, and schools.

The following are some examples of care to clients, families, and groups: (1) a nurse in a mobile migrant clinic might administer a tetanus booster to a client who has been injured by a piece of farm machinery and may also check that client's blood pressure and cholesterol level during the same visit; (2) a home health nurse seeing a family referred by the courts for child abuse may weigh the child, conduct a nutritional assessment, and help the family learn how to manage anger and disciplinary problems; (3) a nurse working in a school-based clinic may lead a support group for pregnant adolescents and conduct a birthing class; and (4) a nurse may work with people being treated for TB to monitor drug treatment compliance and ensure that they complete their full course of therapy.

**LINKING CONTENT TO PRACTICE**

Generalist and staff public health nurses should have competencies in eight domains as defined by the [Quad Council of Public Health Nursing Organizations \(2011\)](#). Each of the eight competencies is important in working with vulnerable populations. Public health nurses working with vulnerable populations should be able to analyze data and determine when a problem exists with an individual and within a vulnerable population group. They should be able to identify options for programs or policies that could be helpful to these populations and communicate their ideas and recommendations clearly. Public health nurses should be able to provide culturally competent interventions for individuals or for vulnerable populations. As an example, a public health nurse should be able to collect and analyze data related to the prevalence of violence among women in the community; identify key stakeholders; evaluate the cultural preferences of the population; work with others to develop a program to meet a defined need within this population, including preparation of a basic budget for the program; and ensure that the program is culturally appropriate for the population. [The Council on Linkages between Academia and Public Health Practice \(2010\)](#) published a similar list for public health professionals, including but not limited to public health nurses. This list includes an emphasis on evaluation and ongoing improvement of programs. In this example, the nurse would evaluate the program developed for women who are victims of violence and work with others to develop and implement quality improvements on a regular basis.

BOX 32-1 Nursing Roles When Working with Vulnerable Population Groups

- Case manager
- Health educator
- Counselor
- Direct care provider
- Population health advocate
- Community assessor and developer
- Monitor and evaluate of care
- Case manager
- Advocate
- Health program planner and implementer
- Participant in developing health policies

Public health nurses also serve as population health advocates and work with local, state, or national groups to develop and implement healthy public policy. They also collaborate with community members and serve as community assessors and developers, and they monitor and evaluate care and health programs. Nurses often function as case managers for vulnerable clients, making referrals and linking them to community services. Case management services are especially important for vulnerable persons because they often do not have the ability or resources to make their own arrangements. They may not be able to speak the language, or they may be unable to navigate the complex telephone systems that many agencies establish. They also serve as advocates when they refer clients to other

agencies, work with others to develop health programs, and influence legislation and health policies that affect vulnerable populations.

The nature of nurses' roles varies depending on whether the client is a single person, a family, or a group. For example, a nurse might teach an HIV-positive client about the need for prevention of opportunistic infections, may help a family with an HIV-positive member understand myths about transmission of HIV, or may work with a community group concerned about HIV transmission among students. In each case, the nurse teaches individuals how to prevent infectious and communicable diseases. The size of the group and the teaching method for each group differ.

Health education is often used in working with vulnerable populations. The nurse should teach members of populations with low educational levels what they need to do to promote health and prevent illness rather than directing health education to groups that the nurse thinks might be at high risk even though there is no evidence to support the perception.

Levels of Prevention

Healthy People 2020 (USDHHS, 2010) objectives emphasize improving health by modifying the individual, social, and environmental determinants of health. One way to do this is for vulnerable individuals to have a primary care provider who both coordinates health services for them and provides their preventive services. This primary care provider may be an advanced practice nurse or a primary care physician. Another approach is for a nurse to serve as a case manager for vulnerable clients and, again, coordinate services and provide illness prevention and health promotion services.

One example of primary prevention is to give influenza vaccinations to vulnerable populations that are immunocompromised (unless contraindicated). Secondary prevention is seen in conducting screening clinics for vulnerable populations. For example, nurses who work in homeless shelters, prisons, migrant camps, and substance abuse treatment facilities should know that these groups are at high risk for acquiring communicable diseases. Both clients and staff need routine screening for TB. Screening homeless adults and providing isoniazid to those who test positive for TB are examples of secondary prevention. An example of tertiary prevention is conducting a therapy group with the residents of a group home for severely mentally ill adults. Nurses who work with abused women to help them enhance their levels of self-esteem are also providing tertiary preventive activities.

Assessment Issues

Nurses who work with vulnerable populations need good assessment skills, current knowledge of available resources, and the ability to plan care based on client needs and receptivity to help. They also need to be able to show respect for the client. The How To box entitled "Assess Members of Vulnerable Population Groups" lists guidelines for assessing members of vulnerable population groups.

Because members of vulnerable populations often experience multiple stressors, assessment must balance the need to be

LEVELS OF PREVENTION

Related to Vulnerable Populations

Primary Prevention

- Provide culturally and economically sensitive health teaching about balanced diet and exercise.
- Develop a portable immunization chart, such as a wallet card, that mobile population groups such as the homeless and migrant workers can carry with them.

Secondary Prevention

- Conduct screening clinics to assess for things such as obesity, diabetes, heart disease, or tuberculosis (TB).
- Develop a way for homeless individuals to read their TB skin test, if necessary, and to transfer the results back to the facility at which the skin test was administered.

Tertiary Prevention

- Develop community-based exercise programs for people identified as obese or who have increased blood pressure or increased blood sugar.
- Provide directly observed medication therapy for people with active TB.

HOW TO Assess Members of Vulnerable Population Groups

Setting the Stage

- Create a comfortable, nonthreatening environment.
- Learn as much as you can about the culture of the clients you work with so that you will understand cultural practices and values that may influence their health care practices.
- Provide a culturally competent assessment by understanding the meaning of language and nonverbal behavior in the client's culture.
- Be sensitive to the fact that the individual or family you are assessing may have other priorities that are more important to them. These might include financial or legal problems. You may need to give them some tangible help with their most pressing priority before you will be able to address issues that are more traditionally thought of as health concerns.
- Collaborate with others as appropriate; you should not provide financial or legal advice. However, you should make sure to connect your client with someone who can and will help them.

Nursing History of an Individual or Family

- You may have only one opportunity to work with a vulnerable person or family. Try to complete a history that will provide all the essential information you need to help the individual or family on that day. This means that you will have to organize in your mind exactly what you need to ask. You should also understand why you need any information that you gather.
- It will help to use a comprehensive assessment form that has been modified to focus on the special needs of the vulnerable population group with whom you work. However, be flexible. With some clients, it will be both impractical and unethical to cover all questions on a comprehensive form. If you know that you are likely to see the client again, ask the less pressing questions at the next visit.
- Be sure to include questions about social support, economic status, resources for health care, developmental issues, current health problems, medications, and how the person or family manages their health status. Your goal is to obtain information that will enable you to provide family-centered care.
- Determine whether the individual has any condition that compromises his or her immune status, such as AIDS, or if the individual

is undergoing therapy that would result in immunodeficiency, such as cancer chemotherapy.

Physical Examination or Home Assessment

- Again, complete as thorough a physical examination (on an individual) or home assessment as you can. Keep in mind that you should collect only data for which you have a use.
- Be alert for indications of physical abuse, substance use (e.g., needle marks, nasal abnormalities), or neglect (e.g., underweight, inadequate clothing).
- You can assess a family's living environment using good observational skills. Does the family live in an insect- or rat-infested environment? Do they have running water, functioning plumbing, electricity, and a telephone?
- Is perishable food left sitting out on tables and countertops? Are bed linens reasonably clean? Is paint peeling on the walls and ceilings? Is ventilation adequate? Is the temperature of the home adequate? Is the family exposed to raw sewage or animal waste? Is the home adjacent to a busy highway, possibly exposing the family to high noise levels and automobile exhaust?

comprehensive while focusing only on information that the nurse needs and the client is willing to provide. Remember to ask questions about the client's perceptions of his or her socioeconomic resources, including identifying people who can provide support and financial resources. Support from other people may include information, caregiving, emotional support, and help with instrumental activities of daily living, such as transportation, shopping, and babysitting. Financial resources may include the extent to which the client can pay for health services and medications, as well as questions about eligibility for third-party payment. The nurse should ask the client about the perceived adequacy of both formal and informal support networks.

When possible, assessment should include an evaluation of clients' preventive health needs, including age-appropriate screening tests such as immunization status, blood pressure, weight, serum cholesterol, Papanicolaou (Pap) smears, breast examinations, mammograms, prostate examinations, glaucoma screening, and dental evaluations. It may be necessary to make referrals for some of these tests. Assessment should also include preventive screening for physical health problems, for which certain vulnerable groups are at particularly high risk. For example, people who are HIV positive should be evaluated regularly for CD4 cell counts and common opportunistic infections, including TB and pneumonia. Intravenous drug users should be evaluated for HBV, including liver palpation and serum antigen tests as necessary. Alcoholic clients should also be asked about symptoms of liver disease and should be evaluated for jaundice and liver enlargement. Severely mentally ill clients should be assessed for the presence of tardive dyskinesia, indicating possible toxicity from their antipsychotic medications.

Vulnerable populations should be assessed for congenital and genetic predisposition to illness and either receive education and counseling as appropriate or be referred to other health professionals as necessary. For example, pregnant adolescents who are substance abusers should be referred to programs to help them quit using addictive substances during their pregnancies and, ideally, after delivery of their infants. Pregnant women

older than 35 years should receive amniocentesis testing to determine whether genetic abnormalities exist in the fetus.

The nurse should also assess the amount of stress the person or family is having. Does the family have healthy coping skills and healthy family interaction? Are some family members able and willing to care for others? What is the level of mental health in each member? Also, are diet, exercise, and rest and sleep patterns conducive to good health?

The nurse should assess the living environment and neighborhood surroundings of vulnerable families and groups for environmental hazards such as lead-based paint, asbestos, water and air quality, industrial wastes, and the incidence of crime.

PLANNING AND IMPLEMENTING CARE FOR VULNERABLE POPULATIONS

Nurses who work in community settings may have considerable involvement with vulnerable populations. The relationship with the client will depend on the nature of the contact. Some will be seen in clinics and others in homes, schools, and at work. Regardless of the setting, the following key nursing actions should be used:

- **Create a trusting environment:** Trust is essential, because many of these individuals have previously been disappointed in their interactions with health care and social systems. It is important to follow through and do what you say you are going to do. If you do not know the answer to a question, the best reply is "I do not know, but I will try to find out."
- **Show respect, compassion, and concern:** Vulnerable people have been defeated again and again by life's circumstances. They may have reached a point at which they question whether they even deserve to get care. Listen carefully, because listening is a form of respect, as well as a way to gather information to plan care.
- **Do not make assumptions:** Assess each person and family. No two people or groups are alike.
- **Coordinate services and providers:** Getting health and social services is not always easy. Often people feel like they are traveling through a maze. In most communities a large number of useful services exist. People who need them simply may not know how to find them. For example, people may need help finding a food bank or a free clinic or obtaining low-cost or free clothing through churches or in second-hand stores. Clients often need help in determining whether they meet the eligibility requirements. If gaps in service are found, nurses can work with others to try to get the needed services established. Care for vulnerable populations requires interprofessional collaboration to meet their multiple needs. For example, nurses can work with business and public health leaders to reduce hazardous exposures, develop accessible services, and improve working conditions for low-income employees (Lathrop, 2013). Nurses may need to work with lawmakers, union leaders, urban developers, business leaders, and a range of public health and other health care workers. The following Case Study describes a situation in which a mother faced many obstacles in getting care for her two children (Box 32-2).

BOX 32-2 Case Study

Felicia is a 22-year-old single mother of three children whose primary source of income is Temporary Assistance to Needy Families (TANF). She is worried about the future because she will no longer be eligible for welfare by the end of the year. She has been unable to find a job that will pay enough for her to afford childcare. Her friend Maria said that Felicia and her children can stay in Maria's trailer for a short time, but Felicia is afraid that her only choice after that will be a shelter.

Felicia recently took all three children with her to the health department because 15-month-old Hector needed immunizations. Felicia was also concerned about 5-year-old Martina, who had had a fever of 100 to 101° F on and off for the past month. Felicia and her friends in the trailer park think that some type of hazardous waste from the chemical plant next door to the park is making their children sick. Now that Martina was not feeling well, Felicia was particularly concerned. However, the health department nurse told her that no appointments were available that day and that she would need to bring Martina back to the clinic on the next day. Felicia left discouraged because it was so difficult for her to get all three children ready and on the bus to go to the health department, not to mention the expense. She thought maybe Martina just had a cold and she would wait a little longer before bringing her back. However, she wanted to take care of Martina's problem before losing her medical card. Felicia is desperate to find a way to manage her money problems and take care of her children.

- **Advocate for accessible health care services:** Vulnerable people have trouble getting access to services. Neighborhood clinics, mobile vans, and home visits can be valuable for them. Also, coordinating services at a central location is helpful. These multiservice centers can provide health care, social services, daycare, drug and alcohol recovery programs, and case management. When working with vulnerable populations, it is a good idea to arrange to have as many services as possible available in a single location and at convenient times. This “one-stop shopping” approach to care delivery is very helpful for populations experiencing multiple social, economic, and health-related stresses. Although it may seem difficult and costly to provide comprehensive services in one location, it may save money in the long run by preventing illness.
- **Focus on prevention:** Use every opportunity to teach about preventive health care. Primary prevention may include child and adult immunizations and education about nutrition, foot care, safe sex, contraception, and the prevention of injuries or chronic illness. It also includes providing prophylactic antituberculosis drug therapy for HIV-positive people who live in homeless shelters or giving flu vaccine to people who are immune-compromised or older than 65 years of age. Secondary prevention would include screening for health problems such as TB, diabetes, hypertension, foot problems, anemia, or drug use or abuse. People who spend time in homeless shelters, substance abuse treatment facilities, and prisons often get communicable diseases such as influenza, TB, and methicillin-resistant *Staphylococcus aureus* (MRSA). Nurses who work in these facilities should plan regular influenza vaccination clinics and TB screening clinics. When planning these clinics, nurses should work with local physicians to develop signed protocols and should

plan ahead for problems related to the transient nature of the population. For example, nurses should develop a way for homeless individuals to read their TB skin test if necessary and transfer the results back to the facility where the skin test was administered. It is helpful to develop a portable immunization chart, such as a wallet card, that mobile population groups such as the homeless and migrant workers can carry with them.

- **Know when to “walk beside” the client and when to encourage the client to “walk ahead”:** At times it is difficult to know when to do something for people and when to teach or encourage them to do for themselves. Nursing actions range from providing encouragement and support to providing information and active intervention. It is important to assess for the presence of strength and the ability to problem solve, cope, and access services. For example, a local hospital might provide free mammograms for women who cannot pay. The nurse would need to decide whether to schedule the appointments for clients or to give them the information and encourage them to do the scheduling.
- **Know what resources are available:** Be familiar with community agencies that offer health and social services to vulnerable populations. Also follow up after you make a referral to make sure the client was able to obtain the needed help. Examples of agencies found in most communities are health departments, community mental health centers, voluntary organizations such as the American Red Cross, missions, shelters, soup kitchens, food banks, nurse-managed or free clinics, social service agencies such as the Salvation Army or Travelers Aid, and church-sponsored health and social services.
- **Develop your own support network:** Working with vulnerable populations can be challenging, rewarding, and at times exhausting. Nurses need to find sources of support and strength. This can come from friends, colleagues, hobbies, exercise, poetry, music, and other sources.
- In addition to the nursing actions described, the How To box entitled “Intervene with Vulnerable Populations” summarizes goals and interventions and evaluates outcomes with vulnerable populations.

HOW TO Intervene with Vulnerable Populations**Goals**

- Set reasonable goals based on the baseline data you collected. Focus on reducing disparities in health status among vulnerable populations.
- Work toward setting manageable goals with the client. Goals that seem unattainable may be discouraging.
- Set goals collaboratively with the client as a first step toward client empowerment.
- Set family-centered, culturally sensitive goals.

Interventions

- Set up outreach and case-finding programs to help increase access to health services by vulnerable populations.
- Do everything you can to minimize the “hassle factor” connected with the interventions you plan. Vulnerable groups do not have the extra energy, money, or time to cope with unnecessary waits, complicated treatment plans, or confusion. As your

client's advocate, you should identify possible hassles and develop ways to avoid them. For example, this may include providing comprehensive services during a single encounter, rather than asking the client to return for multiple visits. Multiple visits for more specialized aspects of the client's needs, whether individual or family group, reinforce a perception that health care is fragmented and organized for the professional's convenience rather than that of the client.

- Work with clients to ensure that interventions are culturally sensitive and competent.
- Focus on teaching skills in health promotion and disease prevention. Also, teach clients how to be effective health care consumers. For example, role-play asking questions in a physician's office with a client.
- Help clients learn what to do if they cannot keep an appointment with a health care or social service professional.

Evaluating Outcomes

- It is often difficult for vulnerable clients to return for follow-up care. Help your client develop self-care strategies for evaluating outcomes. For example, teach homeless individuals how to read their own tuberculosis (TB) skin test, and give them a self-addressed, stamped card they can return by mail with the results.
- Remember to evaluate outcomes in terms of the goals you have mutually agreed on with the client. For example, one outcome for a homeless person receiving isoniazid therapy for TB might be that the person returns to the clinic daily for direct observation of compliance with the drug therapy.

In general, more agencies are needed that provide comprehensive services with nonrestrictive eligibility requirements. Communities often have many agencies that restrict eligibility to make it possible for more people to receive services. For example, shelters may prohibit people who have been drinking alcohol from staying overnight and limit the number of sequential nights a person can stay. Food banks usually limit the number of times a person can receive free food. Agencies are often very specialized as well. For vulnerable individuals and families, this means that they must go to several agencies to obtain services for which they qualify and that meet their health needs. This is tiring and discouraging, and people may forgo help because of these difficulties.

Nurses need to know about community agencies that offer various health and social services. It is important to follow-up with the client after a referral to ensure that the desired outcomes were achieved. Sometimes excellent community resources may be available but impractical because of transportation or reimbursement issues. Nurses can identify these potential problems by following through with referrals, and they can also work with other team members to make referrals as convenient and realistic as possible. Although clients with social problems such as financial needs should be referred to social workers, it is useful for nurses to understand the close connections between health and social problems and know how to work effectively with other professionals. A list of community resources can often be found in the telephone directory or online. The following are examples of agency resources found in most communities:

- Health departments
- Community mental health centers

FIG 32-4 Nurse-managed clinics provide many services to individuals and families. (© 2012 Photos.com, a division of Getty Images. All rights reserved.)

- American Red Cross and other voluntary organizations
- Food and clothing banks
- Missions and shelters
- Nurse-managed clinics
- Social service agencies such as Travelers Aid and the Salvation Army
- Church-sponsored health and service assistance
- Free clinics and other community services

As seen in [Figure 32-4](#) nurses who work with vulnerable populations often need to coordinate services across multiple agencies for members of these groups. It is helpful to have a strong professional network of people who work in other agencies. Effective professional networks make it easier to coordinate care smoothly and in ways that do not add to clients' stress. Nurses can develop strong networks by participating in community coalitions and attending professional meetings. When making referrals to other agencies, a phone call can be a helpful way to obtain information that the client will need for the visit. When possible, having an interdisciplinary, interagency team plan care for clients at high risk for health problems is effective. Obtain the clients' written and informed consent before engaging in this kind of planning because of confidentiality issues. The following list of tips can be helpful:

- Involve clients in making decisions about the kinds of services they are willing and able to use.
- Work with community coalitions to coordinate services for targeted vulnerable populations.
- Collaborate with legal counsel from the agencies involved in the coalitions to ensure that legal and ethical issues related to care coordination have been properly addressed. Examples of issues to address include privacy and security of clinical data and ensuring compliance with HIPAA, contractual provisions for coordinating care across agencies, and consent to treatment from multiple agencies.
- Develop policies and protocols for making referrals, following up on referrals, and ensuring that clients receiving care from multiple agencies experience the process as smooth

and seamless. The following discussion and box provides information about how to use case management with vulnerable groups.

HOW TO Use Case Management in Working with Vulnerable Populations

- Know available services and resources.
- Find out what is missing; look for creative solutions.
- Use your clinical skills.
- Develop long-term relationships with the families you serve.
- Strengthen the family's coping and survival skills and resourcefulness.
- Be the roadmap that guides the family to services, and help them get the services.
- Communicate with the family and the agencies that can help them.
- Work to change the environment and the policies that affect your clients.

Two other important categories of resources for vulnerable people are their own personal coping skills and social supports (Aday, 2001). These groups often are resourceful and creative in managing multiple stressors. Nurses can work with clients to help them identify their strengths and draw on those strengths when managing their health needs. Also, clients may be able to depend on informal support networks. Even though social

isolation is a problem for many vulnerable clients, nurses should not assume they have no one who can or will help them. **Case management** involves linking clients with services and providing direct nursing services to them, including teaching, counseling, screening, and immunizing. Lillian Wald was the first case manager. She linked vulnerable families with various services to help them stay healthy (Buhler-Wilkerson, 1993). Nurses are often the link between personal health services and population-based health care. Linking, or brokering, health services is accomplished by making appropriate referrals and following up with clients to ensure that the desired outcomes from the referral were achieved. Nurses are effective case managers in community nursing clinics, health departments, hospitals, and various other health care agencies. Nurse case managers emphasize health promotion and illness prevention with vulnerable clients and focus on helping them avoid unnecessary hospitalization. **Figure 32-2** illustrates the coordination and brokering aspect of the nurse's role as case manager for vulnerable populations.

As can be seen, many of these nursing actions are in the realm of case management, in which the nurse makes referrals and links clients with other community services. In the case manager role, the nurse often is an advocate for the client or family. The nurse serves as an advocate when referring clients to other agencies, when working with others to develop health programs, and when trying to influence legislation and health policies that affect vulnerable population groups.

PRACTICE APPLICATION

Ms. Green, a 46-year-old farm worker pregnant with her fifth child, has come to the clinic requesting treatment for swollen ankles. During your assessment, you learned that she had seen the nurse practitioner at the local health department 2 months ago. The nurse practitioner gave her some sample vitamins, but Ms. Green lost them. She has not received regular prenatal care and has no plans to do so. Her previous pregnancies were essentially normal, although she said she was “toxic” with her last child. She also said that her middle child was “not quite right.” He is in the seventh grade at age 15. Ms. Green is 5 feet 2 inches tall, weighs 180 pounds, and has a blood pressure of 160/90. She has pitting edema of the ankles and a mild headache.

Ms. Green says that she usually takes chlorpromazine hydrochloride (Thorazine) but has run out of it and cannot afford to

have her prescription refilled. She says that she has been in several mental hospitals in the past and that she has been more agitated lately and now has problems managing her daily activities. As her agitation grows, she says that she usually hears voices and this really makes her aggressive.

None of her children lives with her, and she has no plans for taking care of the infant. She thinks she will ask the child's father, a race track worker, to help her, because she usually travels around the country with him.

- A. What additional information do you need to help you adequately assess Ms. Green's health status and current needs?
- B. What nursing activities are suggested by her history, physical, and psychological descriptions?

Answers can be found on the Evolve website.

KEY POINTS

- All countries have population subgroups that are more vulnerable to health threats than the general population.
- Vulnerable populations are more likely to develop health problems as a result of exposure to risk or to have worse outcomes from those health problems than the population as a whole.
- Vulnerable populations are more sensitive to risk factors than those who are more resilient, because they are often

exposed to cumulative risk factors. These populations include poor or homeless persons, pregnant adolescents, migrant workers, severely mentally ill individuals, substance abusers, abused individuals, people with communicable diseases, and people with sexually transmitted diseases.

- Factors leading to the growing number of poor people in the United States include reduced earnings, decreased availability of low-cost housing, more households headed by women,

KEY POINTS—cont'd

- inadequate education, lack of marketable skills, welfare reform, and reduced Social Security payments to children.
- Poverty has a direct effect on health and well-being across the life span. Poor people have higher rates of chronic illness and infant morbidity and mortality, shorter life expectancy, and more complex health problems.
- Child poverty rates are twice as high as those for adults. Children who live in single-parent homes are twice as likely to be poor than those who live with both parents.
- The complex health problems of homeless people include the inability to obtain adequate rest, sleep, exercise, nutrition, and medication; exposure; infectious diseases; acute and chronic illness; infestations; and trauma and mental health problems.
- Health care is increasingly moving into the community. This began with deinstitutionalization of the severely mentally ill population and is continuing today as hospitals reduce inpatient stays. Vulnerable populations need a wide variety of services, and because these are often provided by multiple community agencies, nurses coordinate and manage the service needs of vulnerable groups.
- Socioeconomic problems, including poverty and social isolation, physiological and developmental aspects of age, poor health status, and highly stressful life experiences, predispose people to vulnerability. Vulnerability can become a cycle, with the predisposing factors leading to poor health outcomes, chronic stress, and hopelessness. These outcomes increase vulnerability.
- Nurses assess vulnerable individuals, families, and groups to determine which socioeconomic, physical, biological, psychological, and environmental factors are problematic for clients. They work as partners with vulnerable clients to identify client strengths and needs and develop intervention strategies designed to break the cycle of vulnerability.

CLINICAL DECISION-MAKING ACTIVITIES

- Examine health statistics and demographic data in your geographic area to determine which vulnerable groups are predominant. Look through your phone book or on the Internet for examples of agencies you think provide services to these vulnerable groups. If the agency has a web page, read about the target populations they serve, the types of services they provide, and how they are reimbursed for services. Learn about different agencies and share results during class. On the basis of your findings, identify gaps or overlaps in services provided to vulnerable groups in your community. How could you deal with these gaps and overlaps to help clients receive needed services?
- Identify nurses in your community who work with vulnerable groups. Invite these nurses to come to class and talk about their experiences. What is their typical day? What are the rewards? What are the challenges? How do they deal with frustration, competing demands, and stress?
- Discuss welfare reform with your classmates. How does the U.S. welfare system work? Who gets welfare? What should be done to improve the system? Is your state a leader in welfare reform?
- Suppose you are making a home visit to a person whose home is not clean. Food is everywhere, and roaches are crawling around the house. What do you do if the person asks you to sit down? What if you are offered food?

Poverty and Homelessness

Ann Connor, DNP, MSN, RN, FNP-BC

Ann Connor holds the BSN, MSN, DNP, and the FNP certificate from the University of Alabama in Birmingham. She is an Assistant Professor-Clinical at the Nell Hodgson Woodruff School of Nursing at Emory University. Her research focuses on *Health literacy and self-management of prescription medications among persons who are homeless*. Dr. Connor has worked with persons who are homeless for 30+ years, for 12 of those years she and her family shared their home, The Community of Hospitality, with persons who were homeless. In 1988, she helped establish Café 458, a restaurant for persons who are homeless, serving as the Chair of the Board of Directors. Since its beginning, Café 458 has served as an interdisciplinary clinical learning site. In the early 1980's Dr. Connor began offering foot care and intentional comfort touch to persons who were living on the streets. Her work served as a catalyst to increase health care access for persons who were homeless. She served as a Family Nurse Practitioner with the Georgia Nurses Foundations Clinics for the Homeless, one of the earliest health care clinics for the homeless. She continues to work with many vulnerable populations including migrant farm worker families in South Georgia.

OBJECTIVES

After reading this chapter, the student should be able to do the following:

1. Analyze the concept of poverty.
2. Discuss how nurses view and understand poverty, homelessness, and health.
3. Describe the social, political, cultural, and environmental factors that influence poverty and homelessness.
4. Discuss the effects of poverty on the health and well-being of individuals, families, and communities.
5. Analyze the concept of homelessness.
6. Discuss the effects of homelessness on the health and well-being of individuals, families, and communities.
7. Discuss nursing interventions for poor and homeless individuals.

Role of the Nurse

American society values self-reliance, individual responsibility, and personal accountability. Although these cultural expectations are important, our beliefs about personal autonomy can work against the needs of persons who are unable to live independent, successful lives. Discussions about those who are poor and homeless arouse feelings in many Americans. The spectrum of feelings includes those who think people should work hard, save some money, plan for the future, and be able to take care of themselves to others who believe there is a need for society to care for and assist those who are vulnerable and poor. Changes in economic conditions affect many people. In an economic downturn, people often lose their jobs and are no longer able to keep their homes. Some become homeless.

Nurses encounter poor persons, families, and populations in a variety of settings, such as private homes, congregate living situations, schools, churches, clinics, and meal sites. To provide effective care and to advocate for individuals, families, and populations living in poverty, nurses need to understand poverty as a concept with historical, social, political, economic, biological, psychological, and spiritual dimensions. Understanding the concepts of poverty and homelessness begins with an examination of one's beliefs, values, and personal experience. It is also important to develop an appreciation for the history of public responses to poor and homeless persons, and the relationship of this history to contemporary public and personal debates. Nurses must be able to identify health care needs, barriers to care, and essential health care services for poor and homeless individuals, families, and populations. Providing effective nursing interventions requires an understanding of the epidemiology, health problems, and risk factors associated with poverty as well as sources of support and existing programs for these vulnerable populations.

This chapter describes the many ways that poverty and homelessness affect the health status of individuals, families, and communities, and it suggests effective nursing interventions for poor and homeless people. The concepts of poverty and homelessness are examined in historical, economic, political, and spiritual contexts.

CONCEPT OF POVERTY

Individual perceptions of poverty and poor persons are rooted in social, political, cultural, and environmental factors. Personal

beliefs, social values, personal experience, cultural attitudes, media portrayals, and historical factors influence our understanding of poverty. It is important for each of us to be aware of our values and beliefs about poor and homeless persons.

To be effective, nurses must recognize and acknowledge the beliefs, values, and knowledge that form their worldviews and influence the way they practice. **Personal beliefs** are ideas about the world that a person believes to be true; these beliefs are rooted in societal values. Our attitudes toward poor persons are influenced by societal/cultural values of personal responsibility, individual autonomy, and personal accountability. Although these societal and cultural values have changed little throughout history, there is some evidence that they may be changing because of the magnitude of people affected by the current economic situation.

Historical Views of Poverty

Public perceptions about poor persons and individual attitudes about what should be done for the poor go back to the **Elizabethan Poor Laws**. In seventeenth-century England, being poor was no disgrace because nearly everyone lived in poverty. Therefore, people often shared what they had with one another and frequently banded together to help those whose luck had taken a downturn. People become more mobile when the Industrial Revolution began. Increased migration, from rural areas to urban industrial townships, brought with it questions of whom among the downtrodden should be helped. In short, how could society distinguish poor persons deserving assistance from those who did not (Katz, 1989). According to Elizabethan Poor Laws, established in the seventeenth century, persons born within the boundaries of the community should be given assistance by that community. Needy travelers from another community would not be helped and were sent back to their original community, where they would be helped by their own folk.

Society changed to adapt to the Industrial Revolution. It became more difficult to differentiate between the deserving and the undeserving poor. Persons who were down-and-out were classified as deserving of assistance if their poverty was considered to be beyond their control. Widowed women, orphaned children, laborers who were injured on the job, and persons with chronic illness not caused by personal failure were considered deserving of public assistance. Alcoholics,

prostitutes, mentally ill persons, and those considered to be lazy were the undeserving poor, and they were denied any type of aid (Katz, 1989).

Societal responses to poverty and homeless persons are deeply rooted in history. This history has helped to shape our cultural attitudes. Our cultural attitudes affect, and are affected by, the media. Therefore, it is important to consider the effects of cultural attitudes and the media on societal responses to poverty and homelessness. As is seen in the next sections, there is no one definition of poverty. The definitions vary depending on the person or agency that is using the definition.

Cultural Attitudes and the Media's Influence

Cultural attitudes are the beliefs and perspectives that a society values. Perspectives about individual responsibility for health and well-being are influenced by prevailing cultural attitudes. **Media discourses**, or views, are a way to communicate thoughts and attitudes through literature, film, art, television, newspapers, and the Internet. Media images of persons who are poor influence and are influenced by cultural attitudes and values. Poor persons may be cast in negative ways by the media, which influence what we believe to be true about poor persons.

You can examine your own beliefs, values, and knowledge about vulnerable groups by thinking about the following clinical situations and questions:

- You are conducting health screening at a homeless shelter and one of the clients asks you for money for bus fare. Do you give it to her?
- You are in the home of an older person, and there are many roaches on the kitchen floor. What are your obligations in terms of the client's home environment? Where do you sit if he offers you a chair?
- What is your opinion of individual versus societal responsibility for health and well-being? In other words, who is responsible for helping poor and/or homeless persons? Is it society's responsibility? Is it up to poor or homeless persons to help themselves?
- What interventions would you initiate for a population of poor or homeless families in a local shelter? Would you begin with health screening or elsewhere?
- How do you help people who are homeless adhere to their medication regimen?
- How could you effectively advocate for a group of medically indigent men?
- What do you think about your community conducting a town meeting to consider building a homeless shelter?

There are no easy answers to these questions. However, nurses' behaviors in these situations influence, and are influenced by, their relationships with clients who are poor. It is important to evaluate clients and populations in the context of the environment to develop effective nursing interventions. Treating medical problems alone is inadequate. Instead, care must be multidimensional and include biological, psychological, social, political, cultural, environmental, economic, and spiritual factors.

DEFINING AND UNDERSTANDING POVERTY

The official poverty measure in the United States is a specific dollar amount that varies by family size but is consistent across the country with the exception of Alaska and Hawaii. It does take into account a family's assets and debt and other factors such as cost of living (which varies in different areas of the country). The 2014 poverty level for a family of four was \$23,850 (\$1,987/month) and \$19,790 (\$1,649/month) for a family of three (in the 48 contiguous states and the District of Columbia). The higher levels in both Alaska and Hawaii are adjusted for cost of living in these areas (U.S. Department of Health and Human Services [USDHHS], 2014). The poverty guidelines are used to determine whether a family is eligible for public programs (and in some instances private program eligibility). It is thought that across the nation, families actually need about twice the amount of the official poverty level to meet their basic needs (National Center for Children in Poverty [NCCP], 2014a). There are a number of calculators available to determine basic budget needs. The NCCP (2014b) has a calculator to differentiate between basic needs for families of four living in urban (north vs. south), suburban, and rural areas (see the NCCP's Basic Needs Budget Calculator at <http://www.nccp.org/tools/frs/budget.php>).

In making their calculations, the NCCP assumes that a family is composed of two parents with one child in school and a preschool child. The calculation below assumes that both parents work full-time. The items included in the basic needs budgets are as follows: rent and utilities, food, child care, health insurance premiums, out-of-pocket medical costs, transportation, other necessities, payroll taxes, and income taxes. To compare the need versus the poverty level, in 2008 (most current figures available using the calculator), a family of four in Houston, Texas, would need \$50,624 compared with the same family in rural Decatur County, Iowa, who would need \$42,749 per year.

In 2013, the official poverty rate was 15.4%, with 45.3 million people living below the federal poverty level; 19.9% of those 18 years of age or less were living in poverty. This does not include the millions more living near poverty (U.S. Census Bureau, 2014). As mentioned earlier, the number of people living in poverty increases during times of economic stress and when unemployment rates rise.

Because people who live in poverty are not all alike, be sure to listen in order to individualize care and avoid making inappropriate assumptions about their needs. It is important to take the time to know clients by name and to listen to the stories of their lives. Getting to know your clients can begin to break down barriers caused by their fears and isolation as well as barriers caused by your fears as a nurse, which can lead to misunderstandings. It is also helpful to examine social and cultural definitions and considerations related to poverty. Table 33-1 lists the 2014 poverty guidelines for the United States.

Social and Cultural Definitions of Poverty

As mentioned, income level is used as the key criterion that determines whether someone is poor. Although income

TABLE 33-1 2014 Poverty Guidelines for the 48 Contiguous States and the District of Columbia

Persons in Family/Household	Poverty Guideline
1	\$11,670
2	\$15,730
3	\$19,790
4	\$23,850
5	\$27,910
6	\$31,970
7	\$36,030
8*	\$40,090

*For families/households with more than eight persons, add \$4060 for each additional person.

From U.S. Department of Health and Human Services (2014).

continues to be the measurement of choice, poverty is not adequately defined solely by income level. Understanding the social and cultural dimensions of poverty helps to broaden our view of the concept. **Poverty** refers to having insufficient financial resources to meet basic living expenses. These expenses include costs of food, shelter, clothing, transportation, and medical care. In addition to its economic outcomes, however, poverty has important physical, psychological, and spiritual consequences. People who are poor are more likely to live in dangerous environments, work at high-risk jobs, eat less nutritious foods, and have multiple and unrelenting stressors, such as unemployment, inadequate housing, lack of affordable daycare, and lack of access to regular health care.

Meanings and perceptions of poverty differ across cultures. Most Western cultures view poverty negatively, whereas other cultures often respect the poor. Religious and political differences affect the perceptions people hold of poor and underserved groups. Meanings of lower socioeconomic status can also vary among various groups within a culture.

Political Dimensions and Causes of Poverty

It is important to examine poverty in terms of its political dimensions. Poverty involves a lack of control over critical resources needed to function effectively in society. The federal government uses two types of guidelines to define poverty: (1) The **Poverty Threshold Guidelines** are issued by the U.S. Bureau of the Census and are used primarily for statistical purposes; and (2) the Federal Income Poverty Guidelines are issued by the USDHHS and are used to determine whether a person or family is financially eligible for assistance or services from various federal and state programs. The programs include **Temporary Assistance to Needy Families** (TANF [formerly called Aid to Families with Dependent Children, or AFDC]); Medicaid; the Supplemental Nutritional Assistance Program (SNAP [formerly Food Stamps]); **Women, Infants, and Children Program** (WIC); and Head Start. Federal poverty guidelines are updated annually to be consistent with the **consumer price index** (CPI), also called the cost-of-living index. The CPI is a measure of the average change over time in the prices paid by households for a fixed market basket of consumer goods and

services, including housing; electricity; food; clothing; fuels; doctor, dentist, and drug charges; transportation; and other goods and services that people buy for day-to-day living (Bureau of Labor Statistics, 2014).

Many people who earn slightly more than the government-defined income levels (see Table 33-1) are unable to meet living expenses but are not eligible for government assistance programs. Persons whose income is above the federal poverty guidelines but still inadequate are called the **near poor**. An example would be a family of four with an income of \$24,000 (poverty level, \$23,850); they are near poor and may not qualify for Medicaid. Although the federal government funds part of Medicaid, each individual state determines eligibility criteria.

The terms **persistent poverty** and **neighborhood poverty** are often used to describe social aspects of poverty. Persistent poverty refers to individuals and families who remain poor for long periods and whose poverty is multigenerational. Neighborhood poverty refers to geographically defined areas of high poverty, characterized by run-down housing, high unemployment rates, and poorer health outcomes (Raphael, 2011). It is important for nurses who work with poor populations to know these definitions and to respect poor clients as human beings whose life situations influence their health and well-being.

Poverty in the United States was not recognized as a social problem before the Civil War (Katz, 1989). The prevalent attitude during that time was that poverty was an individual's problem, and poor individuals had only themselves to blame. In general, society did not assume responsibility for alleviating the plight of the poor. However, during the post-Civil War industrialized era, this attitude changed significantly. Widespread unemployment, undesirable working conditions, insufficient wages, and substandard housing forced a rethinking of public responsibility for the poor (Wilson, 1990). Many laws concerning public health and housing were passed. Social reform movements after the Civil War led to an interest in urban poverty research (Bremner, 1956; Miller, 1966). Despite influences of the Depression of the 1930s and national discussion of New Deal legislation, such as the Social Security Act of 1935, the public's interest in the plight of the poor declined (Wilson, 1990).

A resurgence of political activity on behalf of disadvantaged groups occurred during the late 1950s and early 1960s. In 1959 the Kerr-Mills Act increased funds for health care for aged persons (Fine, 1998). In 1961 President Kennedy approved a pilot food program in response to the hunger he observed on the campaign trail (Price, 1994); in 1963 he instructed his administration to develop a major policy effort to combat poverty. After Kennedy's assassination, President Johnson sustained the interest in the antipoverty campaign. Johnson established the War on Poverty in 1964, which emphasized job-training programs and community organization and involvement (Pilisuk and Pilisuk, 1973; Wilson, 1990). In 1964 the Social Security Administration established the income level of the official poverty line. Individuals and families with incomes below the federal poverty line were considered to be living in poverty. In 1965 the Medicare amendments to the Social Security Act were passed. After 1965 considerable research focused

on poverty as it related to education, health, housing, the law, and public welfare (Wilson, 1990).

Policy changes during the 1980s led to an emphasis on defense spending rather than on social programs. The visibility of the homeless and the media attention on an underclass of individuals seemed to blame the poor for being poor. However, being poor is often the result of a complex web including the economic environment, income levels, and race. The poverty rate for blacks and Hispanics exceeds the average. In 2011, the rate was 25% to 27% whereas the rate for whites (non-Hispanic) was about 10% (U.S. Census Bureau, 2012).

During the 1990s, record numbers of people received welfare benefits, and this stimulated enthusiasm for reform of the health and welfare systems (Zedlewski, 2002). In 1996 a bill creating the TANF program was enacted. This welfare reform legislation replaced the Aid to Families with Dependent Children program with a program of temporary welfare benefits. Under TANF, eligible persons are provided with benefits for a limited time, and are required to find jobs and/or to enroll in job-training programs. Low-income working families often do not bring home enough money to cover the costs of everyday living. Although there are governmental programs such as tax credits, SNAP (food stamps), WIC, and childcare subsidies, often these supports are not sufficient or not available to all who need them or meet eligibility. Low-income working families are at great risk during times of a weak economy. The loss of a job or a cut in hours of work can disrupt their precarious financial situation. Most of these persons cannot save for a time when times get rough because they barely earn enough to cover regular expenses. Also, many of these workers do not have employee-sponsored health insurance, and an illness can therefore be a devastating financial crisis. Although these employees may be eligible for health insurance through the Affordable Care Act, they may not have enrolled because of reluctance, uncertainty about eligibility or how to enroll, lack of health navigators, etc.

Opinions and beliefs about how to assist those who are poor differ among recipients, taxpayers, politicians, economists, health care providers, and others. Some people believe that welfare benefits for the poor are inadequate, whereas others argue that welfare breeds dependency and illegitimacy. Families receiving welfare benefits also have differing views. There are ongoing political debate about whether to abolish or to reform the benefits available through the TANF, SNAP, and other programs.

The causes of poverty are complex and interrelated. In recent decades the number of adult and older adult Americans living in poverty has decreased in part because of the support provided through Social Security and Medicare benefits, as discussed later. In contrast, the number of women and children living in poverty has increased. The following factors affect the growing number of poor persons in the United States:

- Decreased earnings
- Increased unemployment rates
- Changes in the labor force
- Increase in female-headed households
- Inadequate education and job skills
- Inadequate antipoverty programs

- Inadequate welfare benefits
- Weak enforcement of child support statutes
- Dwindling Social Security payments to children
- Increased numbers of children born to single women
- Trade deficits, debt, involvement in wars
- Outsourcing of American jobs

As most industrialized nations have moved from being industrial economies to service economies, job opportunities have increasingly excluded workers who do not have at least a high school education. Many manufacturing and other jobs at the lower end of the pay scale do not pay sufficient salary to support a family. Lack of adequate health care compounds the effects of poverty on health.

POVERTY AND HEALTH: EFFECTS ACROSS THE LIFE SPAN

Poverty directly affects health and well-being, leading to the following:

- Higher rates of chronic illness
- Higher infant morbidity and mortality
- Shorter life expectancy
- More complex health problems
- More significant complications and physical limitation from chronic diseases such as asthma, diabetes, and hypertension
- Hospitalization rates greater than those for persons with higher incomes

Poor health outcomes are related to decreased access to health care. Lack of access to health care can be related to inability to pay for care, lack of or inadequate insurance, geographic location, language, provider shortage areas, transportation difficulties, immigration status, inconvenient clinic hours, and negative attitudes of health care providers toward poor clients. These access issues tend to disproportionately impact those who are poor. The first topic area in *Healthy People 2020* deals with access to health services. This area and its objectives are relevant to meeting the needs of poor and homeless people. See the *Healthy People 2020* box for specific objectives.

HEALTHY PEOPLE 2020

The following are a sampling of health access goals that affect poor and homeless people:

- AHS-1: Increase the proportion of persons with health insurance.
- AHS-2: Increase the proportion of insured persons with coverage for clinical preventive services.
- AHS-3: Increase the proportion of persons with a usual primary care provider.
- AHS-5: Increase the proportion of persons who have a specific source of ongoing care.
- AHS-6: Reduce the proportion of individuals who experience difficulties or delays in obtaining necessary medical care, dental care, or prescription medicines.

From U.S. Department of Health and Human Services (USDHHS): *HealthyPeople.gov: Access to Health Services*. Washington, DC, 2010, USDHHS. Retrieved February 2015 from <http://www.healthypeople.gov/2020/topics-objectives/topic/Access-to-Health-Services/objectives>

The Affordable Care Act (ACA) is designed to help meet *Healthy People 2020* goals by providing increased health care access through affordable health insurance. The ACA focuses on access to clinical preventive services, increased access to health care providers, and establishing a medical home. At this time the ACA's mechanism for enrolling those who are poor is through Medicaid expansion in each state. This process has been slowed by states that have not expanded their Medicaid enrollment. This delay in the implementation of the ACA presents a significant barrier to assisting the very poorest in accessing health care.

Poverty among Women

In 2012, just over half (50.3%) of poor families were headed by women (Pew Research Center, 2014). Approximately 14% of the adult female population lives in poverty compared with 10.5% of adult men. Minority women are also disproportionately affected by diabetes, hypertension, overweight and obesity, asthma, HIV/AIDS, and sexually transmitted infections (STIs). Two thirds of newly diagnosed cases of HIV and the highest rates of chlamydia and gonorrhea occur in African American females. Women living in rural areas face additional barriers. They have less income, education, and socioeconomic status and live in areas with fewer providers. These issues contribute to increased rates of chronic disease, injury, and mortality for rural women (USDHHS, 2012).

The relationship between poverty and health is significant. Poverty presents a formidable obstacle to positive health across the life span. Those in lower income groups have poorer health status, and those with poor health have decreased ability to work and improve their socioeconomic status. Many health risks and conditions are linked to education and income. For example, among women aged 25 years and older, 31.0% of those without a high school diploma were living in poverty compared with 4.3% of those with a bachelor's degree. Education is also a strong predictor of health; the more years of schooling, the stronger one's health (National Coalition for the Homeless, 2014; USDHHS, 2012; NCCP, 2014a; Zlotnick et al, 2013).

As discussed earlier, there have been significant changes to welfare support. These reforms affect the health and well-being of childbearing women and their families. When changes in the benefit levels are made, women and their children are often affected. TANF requires that more families work to receive assistance. Funds are targeted to provide childcare subsidies so that women can work. When governmental funds are targeted for a specific area it typically means they are taken from other areas. In this instance there is less funding available to assist those women and children living in poverty who have needs unrelated to child care subsidies. More changes are expected as financial and health care reform in the United States continues and as state and federal budgets continue to be challenged to meet many needs.

Children and Poverty

Poverty among children in the United States has risen in all racial and ethnic groups and in all geographic settings—urban, suburban, and rural. The poverty rate for children in 2012 was 21.8% higher than for any other age group (U.S. Census Bureau,

2012). Poverty is highest among the youngest children: whereas children represent 24% of the population they comprise 34% of those in poverty. Forty-five percent of all children live in low-income families. Poverty among young African American and Hispanic children is more than three times that of white, non-Hispanic children. Since data were first collected, African American children have experienced significantly high rates of poverty (Children's Defense Fund, 2014; NCCP, 2014a).

Any decrease in social support services increases the number of children living in poverty or near poverty. The decrease in support affects income and access to services, and produces added stress in families. These changes affect the health and well-being of poor children. Young children are at highest risk for the most harmful effects of poverty, especially lack of adequate nutrition, and brain development (Children's Defense Fund, 2014). Children in poverty are more likely to be hungry, sicker, miss more school, and have poorer academic success. Other risk factors for children in poverty include maternal substance abuse or depression, exposure to environmental toxins, trauma, abuse, and lower quality daily care (Children's Defense Fund, 2014; NCCP, 2014a). Poor health in early childhood negatively affects a child's future health. Some of the effects of poverty on children include higher rates of prematurity, low birth weight, birth defects, and infant mortality; an increased incidence of chronic disease, traumatic injuries, or death, nutritional deficits, growth retardation or developmental delays, iron deficiency anemia, and infections; and an increased risk of homelessness and decreased chances for education (Morrell-Bellai et al, 2000). See Box 33-1 for a list of ways in which poverty affects the health of children.

Adolescents are sometimes included in statistics related to childhood poverty. Teens in lower socioeconomic groups have poorer academic achievement, more risky sexual behavior, and higher rates of pregnancy. Teen moms are more likely to drop out of school, be unemployed, and be dependent on welfare programs. African American teens have higher birth rates than white teens and are less likely to graduate from high school (Basch, 2011; Lacour and Tissington, 2011; NCCP, 2014a). See Table 33-2 for the percent of children under 18 years of age who live in low-income families.

BOX 33-1 Effects of Poverty on the Health of Children

- Higher rates of prematurity, low birth weight, and birth defects
- Higher infant mortality rates
- Increased incidence of:
 - Chronic disease
 - Traumatic death and injuries
 - Nutritional deficits
 - Growth retardation and developmental delays
 - Iron deficiency anemia
 - Elevated blood lead levels
 - Infections
- Increased risk for homelessness
- Decreased opportunities for education, income, and occupation

From Morrell-Bellai T, Goering PN, Boydell KM: Becoming and remaining homeless: a qualitative investigation, *Issues Ment Health Nurs* 21:581-604, 2000.

TABLE 33-2 Percentage of Children under 18 Years of Age in Low-Income Families, by Race/Ethnicity

Race/Ethnicity	Percentage in Low-Income Families
White children	32%
Black children	66%
Asian children	32%
American Indian children	64%
Children of some other race	44%
Hispanic children	64%

National Center for Children in Poverty (2014a).

Noncustodial Parents

Under current federal law, noncustodial parents are required to provide financial support to their children. Current child support policies are designed to provide financial security to children, prevent single-parent families from entering the welfare system, help single-parent families get off welfare as quickly as possible, and decrease welfare expenditures. Individual states are responsible for locating nonsupporting custodial parents, establishing paternity, and enforcing financial responsibility. In most states, government involvement in locating noncustodial parents begins when the custodial parent applies for TANF.

The current system is criticized because public expectations of financial responsibility for noncustodial parents are based on an assumption that the noncustodial parent is working full time. However, many low-income parents were never married, and many have intermittent work histories. Current policy requires the custodial parent to assign all financial support from the noncustodial parent to the state to equal the amount that the family receives from the welfare (TANF) system. In response to these regulations, many low-income parents often make private, informal arrangements for child support payments. Under these verbal arrangements, the noncustodial parent pays the custodial parent directly. The pejorative term “deadbeat dad” refers to fathers who do not contribute to the financial support of their children. As the number of custodial single fathers increases there may be greater attention to noncustodial mothers who do not contribute to the financial support of their children, because noncustodial mothers are equally responsible under the law to provide for the economic well-being of their children.

Older Adults and Poverty

An estimated 9.5% of older adults (65 years and older) live in poverty (U.S. Census Bureau, 2014). Poverty rates for this age group are lower, largely because of improvements in Social Security and the Supplemental Security Income (SSI) program. SSI is a federal income supplement program funded by general tax revenues (not Social Security taxes). The SSI program is designed to help older people, those who are blind or disabled, and those who have little or no income. SSI provides cash to meet basic needs for food, clothing, and shelter. The Social

Security website (<http://www.ssa.gov/>) has vast information about eligibility for SSI for children, survivors, retirees, and those with a disability. The site also discusses the benefits available through Medicare and SSI via SNAP (food stamps) and other nutrition programs (Social Security Administration, 2014). Despite the federal benefits available to older persons, certain groups of older adults remain vulnerable to the effects of poverty. Approximately 20% of all black and Hispanic adults (65 years and older) live in poverty compared with only 7.6% whites. Across all groups more than 25% of unmarried older women live at or just above the poverty level (AARP, 2014).

Older adults living at or near poverty are disproportionately more likely to report poor health outcomes compared with those living at higher incomes. They are more likely to have a disability (physical, vision, hearing, or cognitive). Older adults who live in poverty are particularly at risk because they may be alone, unable to manage their personal affairs, and have greater limitations in their functional abilities (bathing, preparing meals, and other daily activities). More than half of those who are poor and old spend greater than 50% of their income on housing costs. This is particularly worrisome because housing costs that exceed 30% are typically considered unaffordable. Food insecurity is another issue affecting this group. Low-income elderly often are unable to access adequate and safe food. Those who are elderly and poor are more likely to seek acute crisis care rather than preventive health care. Many older adults are eligible for benefits and yet do not know how to access them (AARP, 2014).

One client gave the following advice to nurses who care for poor people: (1) treat the poor like everyone else; (2) do not be condescending and do not prejudge; instead ask whether the person can pay his bill, although not everyone can pay for his medications; (3) recommend programs such as food banks, churches, and clothing centers. Remember that poor people have complex needs and they need strong advocates to help them find needed services.

The Community and Poverty

Conditions in neighborhoods influence health. Poverty is a strong and powerful determinant of health (Zlotnick et al, 2013). Lower socioeconomic neighborhoods have been linked with poorer general health status, chronic conditions, higher mortality and morbidity, poorer birth outcomes, disability, and higher levels of injury and violence. They are more likely to have environmental hazards, rodent and pest infestations, and higher crime rates. They lack safe areas for exercise such as parks, good sidewalks, safe playgrounds, after-school programs, and other options that promote healthy behaviors. The concentration of substandard housing in poorer neighborhoods adds to socioeconomic health disparities. Poorer neighborhoods tend to be targets for drug and alcohol advertising and the presence of liquor stores, where paychecks may be cashed (Robert Wood Johnson Foundation, 2014).

Neighborhood conditions affect whether residents have access to healthy affordable food choices. Access to health care continues to be difficult for those who live in poorer

FIG 33-1 Many families find themselves living in poverty due to circumstances that they could not control. (Copyright © 1973, Picture History LLC. All rights reserved.)

neighborhoods. A neighborhood's condition also impacts access to strong schools. Poor neighborhoods have fewer good employment opportunities, inadequate transportation, and problems related to insufficient police numbers and instances of police brutality. Strong neighborhood ties and a sense of trust among neighbors are associated with better health. Not all neighborhoods have access to the same opportunities and resources ([Robert Wood Johnson Foundation, 2014](#)). It is also important to consider that poverty and homelessness are affected by the unemployment rate. When companies close, downsize, or relocate, workers may lose or have considerably reduced wages. See [Figure 33-1](#).

Being poor affects the health and well-being of individuals, families, and communities. Nurses must examine individual and community strengths, resources, and sources of support in order to provide effective nursing interventions for persons living in poverty. Poverty and homelessness are linked. Similar to understanding poverty and its many implications, understanding the concept of homelessness requires reflection and analysis.

UNDERSTANDING THE CONCEPT OF HOMELESSNESS

Several variables, such as personal beliefs, personal/societal values, cultural norms, political debate, and personal knowledge/experience, influence nurses' perceptions of homelessness. Nurses who work with homeless persons need to understand homelessness from a conceptual perspective and be aware of the causes and effects of this public health problem. To implement effective nursing interventions for homeless clients, nurses need to be aware of their own beliefs and values about homelessness.

Homelessness, like poverty, is a complex concept. The term **homelessness** is defined in the following section on homelessness in the United States. Although people who have never been homeless cannot truly understand what it means to be homeless, nurses can increase their sensitivity about homeless persons

and aggregates by examining their own personal beliefs, values, and knowledge of homelessness. The questions in the How To box entitled "Test Values and Beliefs about Poverty" can help nurses to constructively evaluate their own knowledge, beliefs, and values.

HOW TO Test Values and Beliefs about Poverty

Nurses should ask themselves the following questions about poverty and persons living in poverty:

- What do I believe to be true about being poor?
- What do I personally know about poverty?
- How have family and friends influenced my ideas about being poor?
- Have I ever personally been poor?
- How have media images of poor persons helped to shape my images of poverty and poor persons?
- What do I feel when I see a hungry child? What do I feel when I see a hungry adult?
- Do I believe that people are poor because they just do not want to work? Alternatively, do I believe that society has a significant influence on one's becoming poor?
- What really causes poverty?
- What do I really think can be done to prevent poverty and homelessness?

Perceptions of Homelessness

People who live on the street are the poorest of the poor. They can easily remain faceless, nameless, invisible, inaudible entities. The same demographic groups that are at risk for being impoverished are likewise at risk for homelessness. It is important for nurses to respect the individuality of all clients, including those who are homeless. People become homeless for many reasons and there is no one set of circumstances or patterns that leads to homelessness. Although it is difficult to count those who are homeless, it is estimated that 1.5 million people are homeless every year ([Doran et al, 2013](#); [Kertesz et al, 2013](#)). Those who are poor are frequently unable to pay for housing, food, child care, transportation, health care, and education with the limited resources they have. Because housing is the item that typically costs the most, it may be given up in order to make ends meet. Other issues that result in homelessness for a low-income family include an unexpected illness, or accident, which begins the downward spiral into homelessness ([National Coalition for the Homeless, 2014](#)).

When unemployment rates are high, jobs are difficult to find and keep, and the rate of homelessness rises. And even if people can find work the income earned may not be sufficient to pay the bills. The lack of affordable housing and the decrease in governmental support programs are factors related to homelessness. Domestic violence, which causes a woman to flee her home, can leave her and her children homeless. In addition, mental illness and substance abuse are factors that cause homelessness ([National Coalition for the Homeless, 2014](#)).

Homelessness in the United States

The Stewart B. McKinney Homeless Assistance Act of 1987 (PL 100-77) defines a homeless person as "(1) an individual who

lacks a fixed, regular, and adequate nighttime residence and (2) an individual who has a primary nighttime residence that is (a) a supervised publicly or privately operated shelter designated to provide temporary living accommodations...; (b) an institution that provides a temporary residence for individuals intended to be institutionalized; or (c) a public or private place not designed for, or ordinarily used as, a regular sleeping accommodation for human beings” (cited in [National Coalition for the Homeless, 2014](#)). This definition generally refers to persons who are homeless on the streets or who are in shelters, or who face eviction within 1 week.

There are two predominant ways to determine the number of people who are homeless: (1) point-in-time counts, counting the number of persons who are homeless on a given day or during a given week, or (2) period prevalence counts, which examine the number of people who are homeless over a given period of time. These methods typically undercount those who are homeless because they fail to visit many locations where those who are homeless stay ([National Coalition for the Homeless, 2014](#)).

Those who are homeless are difficult to find because they may:

- Sleep in boxcars, on building roofs, in doorways, or under freeways or pedestrian overpasses
- Stay temporarily with family or friends
- Refuse to be interviewed or deliberately hide the fact that they are homeless
- Have only short or intermittent episodes of being without a home
- May not fit in a general category; for example, patterns of homelessness differ in large versus small cities, and in rural versus urban areas

The concept of homelessness encompasses two broad categories. The first category includes persons living in **crisis poverty**. These are people whose lives are generally marked by hardship and struggle. For them, homelessness is often transient or episodic. Persons living in crisis poverty may have brief stays in shelters or other temporary accommodations. This group tends to be younger. And they represent the majority of those who are homeless. Their homelessness may result from a recent housing disruption, unemployment or underemployment, mental illness, substance abuse, lack of education, obsolete job skills, divorce, and domestic violence ([Bharell et al, 2013](#); [National Coalition for the Homeless, 2014](#); [Zazworsky and Johnson, 2014](#)). A complex web of social supports is needed to help someone rebound from homelessness. Although housing is key, other essential elements include food, clothing, health care, education, job training, child care, parenting support, mental health and substance abuse treatment, and advocacy. The web of causation for these underlying issues needs to be addressed by nurses caring for this population. Although finding stable housing is important, it is only a piece of the puzzle, and a wide network of referral agencies and providers is needed to ensure that the scope of the problem is addressed ([Goodman et al, 2014](#); [Grant et al, 2013](#); [Weber et al, 2013](#); [Zlotnick et al, 2013](#)). For example, a multisite study demonstrated better overall outcomes with the use of case managers

compared with conventional approaches in order to improve the lives of patients who were homeless and chronically mentally ill. This systemic, multipronged approach tends to be more beneficial than a piecemeal one ([Zlotnick et al, 2013](#)).

The second category, persistent poverty, includes persons who are chronically homeless. A person who is chronically homeless typically has been homeless for more than a year or has had four episodes of homelessness in the last 3 years ([National Coalition for the Homeless, 2014](#)). Homeless people in this group are typically older, with physical and mental disabilities, alcohol and other drug abuse, severe mental illness, chronic health problems, and significant family difficulties ([Linton and Shafer, 2014](#); [van den Berk-Clark and McGuire, 2013](#)). Although this is the group that is most frequently identified with homelessness in the United States, they represent a much smaller proportion of the population, accounting for just fewer than 16% of the entire homeless population ([National Alliance to End Homelessness, 2014](#)). The chronically homeless need economic assistance, rehabilitation, supportive housing, and significant social support. Inadequate accessible and affordable housing along with a decline in housing assistance programs are significant contributors to chronic homelessness. These issues have pushed people into homelessness and put many others at risk for homelessness. In many cities full-time minimum wage workers do not earn enough to afford adequate housing ([National Coalition for the Homeless, 2014](#)). There are increased efforts to rapidly rehouse those who are recently homeless in order to minimize the negative effects and interrupt a trajectory toward chronic homelessness.

Many homeless people previously had homes and managed to survive on limited incomes. Today’s homeless include people of every age, sex, ethnic group, and family type. They do not fit the old stereotype of the older, male alcoholic. Surprisingly, the single person who is homeless tends to be younger and better educated than stereotypes would suggest. Many are long-standing residents of their communities and have some history of job success. The lack of affordable housing, the paucity of housing assistance programs, the recent foreclosure crisis, and rents that are far more costly than what many low-income workers earn has pushed more people into homelessness ([National Coalition for the Homeless, 2014](#)).

Those who are homeless sleep at night in shelters that they must vacate during the day. This means that during the day, they sit or stand on the street; in parks, alleys, shopping centers, and libraries; and in places such as trash bins, cardboard boxes, or under loading docks at industrial sites. Homeless persons may seek shelter in public buildings, such as train and bus stations. Those who do not sleep in shelters may sleep in single-room-occupancy (SRO) hotels, all-night movie theaters, abandoned buildings, and vehicles. Some people choose to be homeless rather than live with family, with friends, or in shelters.

Rural communities, despite their peaceful images, are not immune to homelessness. The problem may not be as visible in rural areas because homelessness is concentrated in cities. However, homeless individuals and families living in rural areas suffer from the same issues of poverty and lack of affordable housing and the same health problems as their urban

counterparts. The odds of being poor are about two times higher for those in nonmetropolitan areas. The extent of homelessness in rural areas may be less apparent because rural people may have stronger community and family ties. People in rural areas may be more likely to provide temporary housing to those in their community who have no place to live. Those who are homeless in rural areas are more likely to be married, white females who are homeless for the first time and for a shorter period of time. The homeless in rural areas may be undercounted because estimates of those homeless rely on service provider counts, which are often fewer in number in rural areas (National Coalition for the Homeless, 2014).

Who is most likely to be homeless? Single homeless adults are more likely to be male, and more likely to be black. The number of homeless families has increased significantly over the last decade; they are estimated to comprise about 40% of the homeless, while individuals who are homeless comprise about 60% of the population. Victims of domestic violence and veterans also comprise sizable populations within the homeless cohort. Over the past few years, increased efforts have been made to house veterans (National Coalition for the Homeless, 2014).

Homeless children and youth fall into one of two groups: those who are part of a homeless family and those who are unaccompanied. In the 2012-13 school year nearly 1.3 million homeless children were enrolled in schools representing an 8% increase over the previous school year (Paulson, 2014; Grant et al, 2013; National Center for Homeless Education, 2014). Homeless children live in families that are often led by a single mother in her 20s with young children. These mothers have less social support, greater housing instability, dramatic changes in life routines, and higher rates of substance abuse and mental illness. They are at risk for depression, parental stress, and negative parenting practices (Grant et al, 2013; Holtrop et al, 2013). The National Incidence Studies of Abducted, Runaway, and Thrownaway Children (NISMA) estimates the number of homeless persons under 18 at 1.7 million. See www.missingkids.com/Publications/PDF23A. As is true for all homeless subpopulations, it is difficult to get an accurate count. Adolescents are particularly reticent about identifying as homeless. They do this in an effort to blend in with their peers, or if they are unaccompanied they may fear being picked up by police (National Alliance to End Homelessness, 2014). Factors that lead to homelessness among children and youth are similar to those discussed earlier. Other issues include unstable family life and domestic violence, difficult school and social relationships, substance abuse, and mental illness. Traumatic life events are common in this population and the nurse should consider the use of trauma-screening and trauma-informed care when working with youth who are homeless (Yoder et al, 2014). See Box 33-2 for details on who are America's Homeless. Figure 33-2 depicts a homeless mother.

Why Are People Homeless?

Two trends are largely responsible for the growth in homelessness over the past 20 to 25 years. These trends are a growing shortage of affordable rental housing and a simultaneous increase in poverty. In recent times, foreclosures and high unemployment rates have increased the number of homeless

FIG 33-2 Women, many with children, are becoming part of the homeless population. This woman is a resident in a homeless shelter where residents help with the cooking, laundry, and other chores.

people. As cities upgraded their housing stock, fewer low-cost housing options were available and former residents were unable to afford the new and improved housing. These residents were not able to move to new housing elsewhere. Specifically, in many older neighborhoods, people who are now homeless once lived in single-room-occupancy (SRO) buildings where they rented inexpensive rooms on a long-term basis. Urban renewal eliminated many of the SROs and in exchange developed more attractive, better-maintained neighborhoods. It is often said that when neighborhoods were “gentrified” or upgraded, they reduced the ability of poor people to live in them because they became unaffordable for poorer former residents.

The lack of affordable housing has led to overcrowding, substandard housing, and increased homelessness. The wait to get into a shelter has grown because people are staying longer in shelters and new shelter beds are not opening quickly enough to meet the need. In addition to fewer beds, the availability of public assistance has simultaneously decreased as states and the federal government reduced their budgets and support for many programs. Programs such as TANF are unable to keep

BOX 33-2 Who Are America's Homeless?

- Families
- Children
- Single women
- Female heads of household
- Adults who are unemployed, earn low wages, or are migrant workers
- People who abuse alcohol or other substances
- Abandoned children
- Adolescent runaways
- Older adults with no place to go and no one to care for them
- Persons who are mentally ill
- Veterans
- Immigrants and migrant workers

pace with inflation and the growing numbers of people needing help. **Box 33-2** summarizes the characteristics of America's homeless.

Deinstitutionalization of chronically mentally ill individuals from public psychiatric hospitals in the 1980s increased the number of homeless persons. The goal of deinstitutionalization was to replace large state psychiatric hospitals with community-based treatment centers. Clients were to have shorter stays in mental health facilities and move into appropriately designed and readily available community-based care. Unfortunately, after the hospitals were downsized or closed, federal and state governments failed to allocate the needed funds to provide community-based services. Furthermore, few of the intended community mental health centers were ever built (Zlotnick et al, 2013). Persons with severe mental illness account for about 30% of all homeless people in shelters, and the rate of substance abuse and dual diagnosis is disproportionately high among persons who are homeless. It is estimated that those who are homeless abuse alcohol at a rate of 54% compared with 8% of the general population (Gerber, 2013; U.S. Conference of Mayors, 2013).

EFFECTS OF HOMELESSNESS ON HEALTH

Poor health is both a cause and an outcome of homelessness. Poor health can lead to work absences, job loss, financial crisis, and subsequent homelessness. Issues related to poor health are a major contributor to homelessness, with over half of personal bankruptcies in the United States due to medical issues (National Coalition for the Homeless, 2014).

Intended and unintended injuries such as head trauma, stab-bings, lacerations, gunshot wounds, and fractures are a significant cause of morbidity and mortality in the homeless. Those who are homeless have higher rates of chronic disease and comorbidities than the general population (Connor and Donohue, 2010; Doran et al, 2013; Gerber, 2013; Kertesz et al, 2013; Weber et al, 2013). Their exposure to the elements, crowded and unsanitary living conditions, malnutrition, lack of sleep, and stress puts them at risk for illness. The prevalence of diabetes, poor skin integrity, chronic disease, nutritional deficits, and trauma and the use and abuse of alcohol and illicit drugs compound the effects of exposure. Because of their poor

living conditions a minor skin injury or infections left untreated can result in deeper infection, or cellulitis, as well as much more serious or systemic infection (Connor and Donohue, 2010; Howett et al, 2010). The prevalence of illness in those who are homeless is estimated to be as high as 55% (range, 33 to 55%), and the average life expectancy is 44 years compared with 78 years for the general U.S. population (Gerber, 2013).

Prolonged environmental exposure to cold and wet environments can lead to life-threatening hypothermia, particularly under conditions of impaired thermoregulation. Homeless persons are at increased risk of life-threatening hypothermia due to poor mobility, poor nutrition, and substance abuse, which depresses the sensorium. Elevated summer temperatures can result in heatstroke, and dehydration. Coupled with the abuse of street drugs and alcohol, which depress sensory input, the risk of significant hyperthermia may result (Cheshire, 2010; Gerber, 2013).

Homeless individuals suffer significantly greater incidences of acute and chronic illness compared with those who are housed. They suffer higher rates of cardiovascular diseases such as peripheral vascular disease and hypertension; respiratory diseases including tuberculosis, pneumonia, and chronic obstructive pulmonary disease; HIV; hepatitis C; and skin infections and infestations (Weber et al, 2013; Zlotnick et al, 2013). These conditions are exacerbated by their living conditions, nutritional intake, and inability to pay for or safely store medications, and so on. Hypertension among the homeless is often exacerbated by high rates of alcohol abuse and high sodium content in processed foods. Homeless persons spend many hours on their feet and often sleep in positions that compromise their peripheral vascular circulation. Crowded living conditions place them at risk for exposure to viruses and bacteria that cause pneumonia and tuberculosis. The high rates of tobacco, alcohol, and illicit drug use diminish immune responses and contribute to an increased prevalence of chronic obstructive pulmonary disease.

AIDS continues to be a concern among the homeless population. The HIV infection rate in the homeless is estimated to be 16 times higher than found in those with stable housing (National Alliance to End Homelessness, 2014). The use of intravenous drugs and higher rates of sexual assault are other risk factors for HIV. Homeless persons with AIDS engage in risky sexual behavior, develop higher viral loads, have poorer health status, more emergency department visits and hospitalizations, and early death (National AIDS Housing Coalition, 2014).

Innovative responses to serving the health care needs of those who are homeless include nurse practitioner clinics situated in soup kitchens, emergency night shelters and day shelters, and other mobile health care units that bring health services to where people who are homeless congregate. Another response has been the development of respite facilities for those discharged from hospitals but still quite vulnerable, with no home to which to return to recover from surgery or other medical procedures. Research on the effectiveness of respite care has demonstrated positive outcomes for these patients (Zlotnick et al, 2013).

Table 33-3 lists significant health problems of homeless persons.

TABLE 33-3 Common Health Problems of Homeless Persons

Psychosocial	Infectious	Other
Depressive symptoms	HIV/AIDS	Trauma
Mental/psychiatric illness	TB/MDR TB	Preterm birth
Alcohol/substance abuse	Other infectious diseases	COPD
		Low birth weight
		Musculoskeletal problems
		Decreased access to care
		Foot problems
		Malnutrition
		Increased ED use rates

AIDS, Acquired immunodeficiency syndrome; COPD, chronic obstructive pulmonary disease; ED, emergency department; HIV, human immunodeficiency virus; MDR TB, multidrug-resistant tuberculosis; TB, tuberculosis.

From Darmon N, Coupel J, Deheeger M, et al: Dietary inadequacies observed in homeless men visiting an emergency shelter in Paris. *Public Health Nutr* 4:155–161, 2001; Hwang SW: Homelessness and health. *CMAJ* 164:229–233, 2001; Kamieniecki GW: Prevalence of psychological distress and psychiatric disorders among homeless youth in Australia. *Austr N Z J Psychiatry* 35:352–358, 2001; Stein JA, Lu MC, Gelberg L: Severity of homelessness and adverse birth outcomes. *Health Psychol* 19:524–534, 2000.

Even though they are at higher risk of physiological problems, homeless persons have greater difficulty accessing health care services. Health care is usually crisis oriented and sought in emergency departments. Those who do access health care have a hard time following prescribed regimens (Bharel et al, 2013; Weber et al, 2013; Zlotnick et al, 2013).

Consider the case of an insulin-dependent diabetic man who lives on the street and sleeps in a shelter. His ability to get adequate rest and exercise, take insulin on a schedule, eat regular meals, or follow a prescribed diet is virtually impossible. Consider the following issues:

- How does a person buy an antibiotic without money?
- How is a child treated for scabies and lice when there are no bathing facilities?
- How does an older adult with peripheral vascular disease elevate his legs when he must be out of the shelter at 7 AM and is on the streets all day?

Just as people living in poverty have poor access to health care, so do homeless people. As discussed earlier, one of the topic areas in *Healthy People 2020* deals with access to health care. See the [Healthy People 2020](#) box for objectives that pertain to homeless persons. See the [evidence-based practice box](#) for a study of homeless women residing in shelters and their experience with caring for a garden.

In addition to facing challenges related to self-care, homeless people usually give lower priority to health promotion and health maintenance than to obtaining food and shelter. They spend most of their time trying to survive. Just getting money to buy food is a major chore. Some homeless persons are eligible

EVIDENCE-BASED PRACTICE

A qualitative descriptive study using a narrative content analysis was used to explore the perceptions of homeless women regarding their experience in a homeless shelter–based garden project. Participants planted and tended the vegetable garden and prepared and ate the fruits of their labor. Participants were homeless women in a daytime shelter who participated in eight gardening sessions over 4 weeks. Data were gathered in semistructured interviews.

Nurse Use

The findings indicated that the gardening experience interrupted the participants' negative ruminations, offering stress relief and elements of social inclusion and self-actualization. Gardening is an inexpensive and positive intervention for promoting mental wellness within a population that has a high incidence of mental illness and distress.

Grabbe L, Ball J, Goldstein A: Gardening for the mental well-being of homeless women. *J Holist Nurs* 31:258–266, 2013.

for entitlement programs, such as TANF, WIC, or Social Security. However, they may or may not know they are eligible or how to apply for benefits. In order to gain income they may pick up odd jobs, beg, sell their blood or plasma, or sell drugs or sex for money.

As mentioned, deinstitutionalization has contributed to the growing number of homeless persons who suffer from mental illnesses, including schizophrenia and affective disorders. The prevalence of alcohol and substance abuse compounds the effects of mental illness. Many homeless persons were mentally ill before becoming homeless, whereas others develop acute mental distress as a result of being homeless. Although treatment options may exist, homeless persons are often unable to gain access to mental health treatment facilities. Barriers to treatment include lack of awareness of treatment options, lack of available space in treatment facilities, inability to pay for treatment, lack of transportation, unsupportive attitudes of service providers, and lack of coordination of services.

In addition to its effects on physical health, homelessness also affects psychological, social, and spiritual well-being. Becoming homeless means more than losing a home, or a regular place to sleep and eat; it also means losing friends and family, personal possessions, and familiar surroundings. Homeless persons live in chaos, confusion, and fear. Many describe experiencing loss of dignity, low self-esteem, lack of social support, and generalized despair.

Homelessness and At-Risk Populations

Being homeless affects health across the life span. Imagine the effect of homelessness on pregnancy, childhood, adolescence, or older adulthood; each group has different needs. Nurses need to recognize the unique needs of homeless clients and the many factors including joblessness; inability to maintain housing, pay utilities, and buy food; dysfunctional family life; and illness, among others, that lead to homelessness (Zazworsky and Johnson, 2014).

Single, young women with limited education usually head homeless families. Disparities in health care are higher for homeless women than for the general population of women.

These include higher rates of poor health status, mental illness, drug abuse, sexual assault and domestic violence, intergenerational poverty, dysfunctional home and social lives, poor birth outcomes, and mortality. They are less likely to have regular health care, screenings, and appropriate primary or specialty care health (Teruya et al, 2010). Pregnancy is a significant risk for women on the streets. Pregnancy outcomes and general health status are negatively impacted by higher rates of sexually transmitted infections, addiction to drugs and alcohol, poorer nutritional status, and sleep patterns. Their lack of stable housing and vulnerability on the streets put them at higher risk for violence and complex health issues. The evidence-based practice example illustrates one way to help homeless women relieve some of their stress.

The health problems of homeless children, although similar to those of poor children, often have more serious consequences. Homeless children have poorer health than children in the general population. As with their adult counterparts, minor conditions may go untreated, resulting in higher rates of acute illness such as fever, ear infection, diarrhea, and asthma. Homeless children have higher levels of anxiety, are more depressed, and are at higher risk for physical and mental health problems. Homeless children are at greater risk for inadequate nutrition, which can lead to delayed growth and development, failure to thrive, or obesity. Homeless children also experience higher rates of school absenteeism, academic failure, depression, and emotional and behavioral maladjustments. These children change schools frequently, which affects them and the school itself. When the children have inconsistent attendance or frequent school changes, they have a hard time keeping up with schoolwork and academic progression. The school also suffers when children drop in and out. This inconsistent attendance affects the teacher and classroom behavior, and it may affect school funding. That is, some schools are funded at the end of the year depending on how many students complete that year. The stress of homelessness can be manifested in behaviors such as withdrawal, depression, anxiety, aggression, regression, and self-mutilation. Homeless children may have delayed communication, more mental health problems, and histories of abuse. They attend school less and move from one school to another more often than those in stable households (Grant et al, 2013).

Statistics related to the number of homeless adolescents are often subsumed under the title **homeless children**. Homeless adolescents living on the streets have greater risk-taking behaviors, poorer health status, and decreased access to health care than do teens in the general population. They are at high risk of contracting serious communicable diseases, such as AIDS and hepatitis B, and are more likely to use alcohol and illicit substances. Homeless teens often have histories of runaway behavior, physical abuse, and sexual abuse. Once on the streets, many homeless adolescents exchange sex for food, clothing, and shelter. In addition to the increased risk of sexually transmitted diseases and other serious communicable diseases, homeless adolescent girls who exchange sex for survival are at high risk for unintended pregnancy. Homeless youths often initiate sexual activity at an earlier age, are less likely to use contraception during the first sexual experience, are more likely to become pregnant, and are

more likely to have multiple sex partners. The psychological and behavioral problems for adolescents living on the streets are complex and include poor quality of life, self-concept, mental health, and community integration. Contributory factors for this population include problems within a poorly functioning child welfare system and adolescents who are aging out of foster care. These children are at high risk for becoming homeless (Dworsky et al, 2013; Kidd et al, 2013).

Homeless older adults are the most vulnerable of the impoverished older adult population. They have lived in long-standing poverty, have fewer supportive relationships, and are likely to have become homeless as a result of catastrophic events. Life expectancy for homeless older adults is significantly lower than for older, housed adults. The average life expectancy for someone who is homeless is 44 years (Gerber, 2013). Homeless older adults suffer from untreated or poorly treated chronic conditions, including tuberculosis, hypertension, arthritis, cardiovascular disease, injuries, malnutrition, poor oral health, and hypothermia. As with younger homeless persons, older adults who are homeless must focus their energy on survival, leaving little time for health promotion activities (van den Berk-Clark and McGuire, 2013).

In summary, homelessness negatively affects the health of persons across the life span. Nurses must be able to identify the precursors to homelessness and anticipate the effects of homelessness on physical, emotional, and spiritual well-being in order to be able to advocate for effective prevention.

Federal Programs for the Homeless

The need for comprehensive, affordable, and accessible care for the nation's homeless population is huge. The federal government officially became involved with meeting the needs of the homeless in 1987 with the passage of the **Stewart B. McKinney Homeless Assistance Act of 1987** (PL 100-77). Title 11 of the McKinney Act provided funding for outpatient health services; however, the monies for these services were not large, and many needs go unmet. The McKinney Act grants homeless children the same access to education as permanently housed children. This act also created the **Interagency Council on the Homeless** (ICH) to coordinate and direct federal homeless activities. Housing assistance is available through the U.S. Department of Housing and Urban Development (HUD), which, along with many other federal agencies, funds programs to help the homeless. In the following section on prevention, an illustration is given of how to access services in a state to assist homeless persons.

The ICH is made up of the heads of 19 federal agencies that have programs or activities for the homeless. The general goals of the ICH are to improve federal programs for the homeless through better coordination and linkages, and by decreasing the amount of documentation required to qualify for benefits. By targeting the most vulnerable segments of the homeless population, the ICH intends to influence the problem of homelessness. Children are a priority for the ICH.

Homeless families with children are eligible to receive shelter and nutrition assistance from the U.S. Department of Agriculture's WIC program. Persons receiving WIC benefits receive vouchers entitling them to free nutritious foods and

infant formulas from local grocers. The TANF program can be a key source of income for homeless families.

Unfortunately, health care for **homeless persons** tends to be fragmented and limited in scope. Some of the most useful health care programs for the homeless begin with grants from private funding agencies, such as the Robert Wood Johnson Foundation and the Pew Charitable Trusts. Projects funded by these agencies have followed sound public health principles by encouraging community involvement, public/private partnerships, and commitment to outreach. Most of these projects rely heavily on nurse practitioners and physician assistants to deliver care in collaboration with physicians, nurses, and social workers. In recent years, many schools of nursing have received funding from the Division of Nursing in the USDHHS to establish nurse-managed centers for the homeless. Both faculty and students provide a range of services in these centers.

Nurses need to understand how to apply the levels of prevention to homeless persons. When nurses advocate for preventive measures for people who are either poor or are homeless, they often invest time in activities outside the traditional areas of nursing practice. Nurses working in communities often need to advocate for affordable housing, community outreach services, health services, and other assistance programs for poor and homeless persons. The website <http://www.hud.gov> lists a range of services for homeless persons that are organized by state. Go to the website and look at the topics for homelessness. There are several useful topics in the Homelessness drop-down menu. In addition, you can select a state and find contact information about shelters or other assistance. Each state site offers extensive information for homeless persons beyond housing. Although each state has some unique offerings, they typically provide information about shelters, including special shelters for victims of domestic and sexual violence. The sites generally provide information about services for homeless veterans, persons with disabilities, transitional housing for offenders who are re-entering the community, and about meals, clothing, health care, skills training, counseling, and legal assistance. In each state, the agencies that provide the service are unique to the state. There are at least three common agencies in the states: the Salvation Army, United Way, and Medicaid (U.S. Department of Housing and Urban Development, 2014).

Preventive services related to homelessness include providing affordable, adequate housing. Typically those who are homeless are housed in emergency shelters. These shelters typically are only open at night and in many cities only on extremely cold nights. **Emergency shelters** are an important stopgap during a crisis. Those who have been homeless longer may find assistance in supportive housing. This type of housing is subsidized by the federal, state, or local governments or nonprofit organizations. **Supportive housing** is typically reserved for vulnerable homeless population groups, such as persons with physical and mental disabilities, women and children who are victims of abuse, and those recovering from alcohol and drug users. **Low-income housing** if available would be accessible through vouchers or after a homeless person has stabilized, and had access to employment income or SSI.

It is difficult to separate services for homelessness into primary, secondary, and tertiary levels of prevention because interventions related to homelessness can be assigned to more than one level. Affordable housing, for example, may qualify as primary prevention, but it could also be an important secondary or tertiary preventive intervention.

Primary preventive services include affordable housing, housing subsidies, effective job-training programs, employer incentives, preventive health care services, multisystem case management, birth control services, safe sex education, needle exchange programs, and counseling programs. Nurses can form networks with other health professionals to educate policy makers and the public about the value of these preventive services. These programs could prevent homelessness from occurring at all, which would prevent many of its devastating sequelae.

Secondary preventive services target persons on the verge of homelessness as well as those who are newly homeless. Examples include supportive and emergency housing, targeted case management, housing subsidies, soup kitchens and meal sites, and comprehensive physical and mental health services. Nurses can work with homeless and near-homeless aggregates to provide education about existing services and strategies for influencing public policy that will provide more comprehensive services for homeless and near-homeless persons.

Tertiary prevention for homelessness includes comprehensive case management, physical and mental health services, emergency shelter housing, needle exchange programs, and drug and alcohol treatment. An important prerequisite for population-focused practice is a sound understanding of the sociopolitical milieu in which problems occur. Nurses can influence politicians and other policy makers at the federal, state, and local levels about the plight of vulnerable homeless populations in their community.

For example, many states have programs that provide a broad spectrum of services that may interrupt the pattern of homelessness. Several follow the guidance of a program called Shelter Plus Care (formerly HomeBase). Shelter Plus Care is a housing program for individuals who need housing and structured social support; the goal is to stabilize those who are homeless and help them transition into permanent housing. The program offers long-term housing and supportive services for those who are homeless and who have mental illness, are in recovery from alcohol and drug abuse, or have AIDS/HIV. It also assists people on the brink of homelessness. Before the creation of Shelter Plus Care many low-income persons found shelters to be their only resource when faced with a housing crisis. Shelter Plus Care offers an extensive set of neighborhood-based services to help people remain in their housing. The services offered include landlord mediation, budgeting, emergency rental assistance, job training and assistance with accessing benefits (New York City Department of Homeless Services, 2014; <http://www.nyc.gov/html/dhs/html/home/home.shtml>).

The Shelter Plus Care program in the Midlands of South Carolina was cited by the U.S. Department of Housing and Urban Development (HUD) as one of the 75 Best High Performance Projects sponsored by the HUD. It is located in the Midlands of South Carolina as a project of the Mental Illness

Recovery Center, Inc. (MIRCI). The MIRCI is a nonprofit organization whose mission is to provide community-based services to persons recovering from mental illness or emotional disorders in their service area (*Mental Illness Recovery Center, 2014*). For more information go to: <http://www.mirci.org>.

LEVELS OF PREVENTION

Poverty and Homelessness

Primary Prevention

Provide health education in the local area for prevention of diseases related to multiuse of needles.

Secondary Prevention

Screen clients for early detection of drug use and the possibility of multiple users of needles; screen for diseases that may result from injection drug use: HIV, hepatitis, and other blood borne diseases.

Tertiary Prevention

Implement more systematic programs for needle exchange; begin treatment for any diseases that are detected.

QSEN FOCUS ON QUALITY AND SAFETY EDUCATION FOR NURSES

Quality and Safety Focus

Targeted Competency: Client-Centered Care

Recognize the client or designee as the source of control and full partner in providing compassionate and coordinated care based on respect for client's preferences, values, and needs.

Important aspects of client-centered care include the following:

Knowledge: Describe how diverse cultural, ethnic, and social backgrounds function as sources of client, family, and community values.

Skills: Provide client-centered care with sensitivity and respect for the diversity of human experience.

Attitudes: Recognize personally held attitudes about working with clients from different ethnic, cultural, and social backgrounds.

Client-Centered Care Question

Self-awareness is a key component of providing authentic, genuine client-centered care. In order to clarify their own values and perspectives about poverty, nurses should ask themselves the following questions about poverty and persons living in poverty:

- What do I believe to be true about being poor?
- What do I personally know about being poor?
- How have family and friends influenced my ideas about being poor?
- Have I ever personally been poor?
- How have media images of poor persons helped shape my images of poverty and poor persons?
- What do I feel when I see a hungry child? A hungry adult?
- Do I believe that people are poor because they just don't want to work? Or do I believe that society has a significant influence on one becoming poor?
- What really causes poverty?
- What do I really think can be done to prevent poverty and homelessness?

ROLE OF THE NURSE

Nurses play a critical role in the delivery of health care to poor and homeless people. To be effective, nurses need strong physical and psychosocial assessment skills, current knowledge of available resources, and an ability to convey respect, dignity, and value to each person. Nurses need to be able to work with poor and homeless clients to promote, maintain, and restore health. Nurses must be prepared to look at the whole picture: the person, the family, and the community interacting with the environment. The following strategies are important to consider when working with homeless individuals, families, and populations:

- *Create a trusting environment.* Trust is essential to the development of a therapeutic relationship with poor or homeless persons. Many clients and families have been disappointed by their interactions with health care and social systems; they become mistrustful and see little hope for change. By following through and doing what they say they will do, nurses can establish trusting relationships with clients. If you don't know the answer to a question, say "I don't know the answer, but I will try to find out. Let me make a few phone calls and I will let you know Friday." Reliability helps to build the foundation for a trusting relationship.
- *Show respect, compassion, and concern.* Poor and homeless clients are defeated so often by life's circumstances that they may feel they do not deserve attention. Listen carefully and empathize with clients so they know you believe they are worthy of care. Often, health care and social services personnel do not treat poor and homeless persons with respect and dignity. Because clients respond well to nursing interactions that demonstrate respect, it is helpful to use reflective statements that convey acceptance and understanding of their situation.
- *Do not make assumptions.* A comprehensive and holistic assessment is crucial to identifying underlying needs. Just because a young mother with three preschool children misses a clinic appointment does not mean that she does not care about the health of her children. She may not have transportation, one child may be sick, or she may be sick. Find out the reason for the absence and help solve the problem.
- *Coordinate a network of services and providers.* Working with poor and homeless people is challenging because of their multiple and complex needs. Many services exist, but often the people who could benefit are unaware of their existence. Developing a coordinated network of providers involves conducting a thorough assessment of the service area to identify federal, state, and local services available for poor and homeless clients. Where are the food banks? Where can you get clothing? What programs are available in the local churches and schools? How do people access these services? What are the eligibility requirements? How helpful are the people who work at the service agencies? What service is provided to eligible individuals and families? Nurses can identify these services and help link families with appropriate resources. In addition, a thorough assessment of available services for homeless persons in a nurse's service area can

identify significant gaps in essential services. Once these gaps are identified, nurses can serve as case managers and work with other health care providers and with community members to advocate for necessary services for homeless clients.

- *Advocate for accessible health care services.* Poverty and homelessness create barriers that prevent access to health care services. Nurses can advocate for accessible and convenient locations of health care services. Neighborhood clinics, mobile vans, and home visits can bring health care to people unable to access care. Coordinating services at a central location often improves client compliance because it reduces the complexity and stress of getting to multiple places. Many homeless shelters and transitional housing units have clinics on site. These multiservice centers provide health care, social services, daycare, drug and alcohol recovery programs, and comprehensive case management. Multiservice models are usually multidisciplinary. For example, midlevel practitioners (nurse practitioners and physician assistants), nurses, social workers, psychologists, child psychologists, and administrative personnel might provide a network of support for clients in shelters and low-income housing facilities.
- *Focus on prevention.* Nurses can use every opportunity to provide preventive care and health teaching. Important health promotion (primary prevention) topics include child and adult immunization, and education regarding sound nutrition, foot care, safe sex, contraception, and prevention of chronic illness. Screening for health problems such as tuberculosis, diabetes, hypertension, foot problems, and anemia is an important form of secondary prevention. Know what other screening and health promotion services are available in the target area, such as nutrition programs, job-training programs, educational programs, housing programs, and legal services. All these services may be included in a comprehensive plan of care. See the [How To](#) box below to learn ways to evaluate the concept of homelessness.

HOW TO Evaluate the Concept of Homelessness

- *What is it like to live on the streets?*
 - *What issues might confront a young mother and her children inside a homeless shelter?*
 - *How is it that people are so poor that they have no place to go?*
 - *What really causes homelessness?*
 - *How do you respond to the person on the street asking for money to buy a sandwich or catch a bus?*
 - *How is your response different (or not) when a young mother with children asks you for money?*
 - *How do you react to the smell of urine in a stairwell or elevator?*
-
- *Know when to walk beside the client and when to encourage the client to walk ahead.* This area is often difficult for the nurse to implement. Nursing interventions range from extensive care activities to minimal support. At times, nursing

actions include providing encouragement and support, or providing information. At other times, nurses may actually call a pediatrician to set up an appointment for a sick child and may call again to see that the appointment was kept. Nurses assess for the presence of strengths, problem-solving ability, and coping ability of an individual or family while providing information on where and how to gain access to services. For example, a local hospital may provide free mammograms for uninsured women. Women who qualify for this free service may not take advantage of it because they are afraid that they may have breast cancer. Nurses can find out about this important service, inform the women of the service, teach them about the importance of preventive care, and assess and deal with fear and anxiety. The challenge for the nurse becomes choosing whether to schedule the appointments for the women or to simply provide them with a referral sheet, knowing that many will not follow through. The choice is not clear, but the goal is to make available a needed screening intervention without taking away the woman's right to have control within the process.

- *Develop a network of support for yourself.* Caring for poor and homeless persons is challenging, rewarding, and at times exhausting. It is important to find a source of personal strength, renewal, and hope. The people you encounter are often looking to you to maintain hope and provide encouragement. Discover for yourself what restores and encourages you. For some nurses it is poetry, music, painting, or weaving. For others it is a walk in a peaceful place, a weekend retreat, a good run, a workout at the gym, or meeting with other nurses who are engaged in the same work. Be attentive to your own needs, and create the time and space to restore your spirit.

LINKING CONTENT TO PRACTICE

When nurses provide care to people who are poor and/or homeless, they use the nursing process, which is a problem-solving process that is fully developed for public health nursing practice in the American Nurses Association (ANA) standards of practice (ANA, 2013). Specifically, nurses assess by gathering a comprehensive set of data of a population's health status (standard 1); make a diagnosis and set priorities (standard 2); identify expected outcomes (standard 3) to develop a plan based on the population diagnosis and best practices (standard 4) for implementing and evaluating the chosen plan (standards 5 and 6).

Similarly, selected core competencies for public health professionals can be clearly used in providing care to this vulnerable population. For example, the ecologic model of health can be used to assess the relationship of multiple determinants of health and health status and outcomes for vulnerable populations. The competencies pertaining to cultural competency are important. It is essential that the nurse develop strategies to appropriately care for those with diverse backgrounds, taking into consideration socio-cultural and behavioral factors relative to access, availability, acceptability, and delivery of services in public health (Public Health Foundation, 2014).

The Linking Content to Practice box describes how to apply selected core public health and public health nursing competencies to the care of poor and homeless people.

PRACTICE APPLICATION

Tonya Sims, a single mother with AIDS, lives in an apartment with seven other family members and her children, who are HIV positive. Ms. Sims does not often keep her children's numerous appointments at the immunology clinic. How do you respond?

A. Make an unsolicited telephone call or visit Ms. Sims and her family to let them know they are important and that you are thinking about them.

B. Call child protective services to report the failure of Ms. Sims to keep her children's appointments; she is noncompliant and neglectful of her children.

C. Do a more thorough assessment to determine why appointments are missed.

Answers can be found on the Evolve website.

KEY POINTS

- Poverty and homelessness affect the health status of people.
- To understand the concepts of poverty and homelessness, consider your personal beliefs and attitudes, your clients' perceptions of their condition, and the social, political, cultural, and environmental factors that influence poverty and homelessness.
- The definition of poverty varies depending on the source consulted. The federal government defines poverty on the basis of income, family size, age of the head of household, and number of children less than 18 years of age. Those who are poor insist that poverty has less to do with income and more to do with a lack of family, friends, love, and support.
- Factors leading to the growing number of poor persons in the United States include decreased earnings, unemployment, diminishing availability of low-cost housing, increased number of households headed by women (women's incomes are traditionally lower than men's), inadequate education, lack of marketable job skills, welfare reform, and reduced Social Security payments to children.
- Poverty has a direct effect on health and well-being across the life span. Poor persons have higher rates of chronic illness, higher infant morbidity and mortality, shorter life expectancy, and more complex health problems.
- Child poverty rates remain twice as high as those for adults. Children in single-parent homes are twice as likely to be poor as those who live in homes with two parents. Younger children (up to 5 years) are at highest risk for developmental delays and damage caused by inadequate nutrition or lack of health care.
- Poverty affects both urban and rural communities. The poorer the neighborhood, the greater the proportion of residents who are members of minority groups.
- At present, the following groups often constitute the homeless in both rural and urban areas: families, single mothers, single women, recently unemployed persons, substance abusers, adolescent runaways, mentally ill individuals, immigrants, migrant workers, and single men.
- Factors contributing to homelessness include an increase in the number of persons living in poverty, diminishing availability of low-cost housing, increased unemployment, substance abuse, lack of treatment facilities for mentally ill persons, domestic violence, and family situations causing children to run away.
- The complex health problems of homeless persons include inability to get adequate rest, exercise, and nutrition; exposure; infectious diseases; acute and chronic illnesses; infestations; trauma; and mental health problems.
- Nurses have a critical role in the delivery of care to persons who are poor and homeless. Nurses bring to each client encounter the ability to assess the client in context and to intervene in ways that restore, maintain, or promote health.
- In addition to interactions with individuals who are poor or homeless, nurses use the nursing process to assess and diagnose, and to plan, implement, and evaluate population-focused interventions.

CLINICAL DECISION-MAKING ACTIVITIES

1. Examine health statistics and demographic data to identify the rate of poverty and homelessness in your geographic area. What resources and agencies are available in your area to support homeless persons? What services are available from federal, state, and local sources? Identify a specific geographic region and assess this target area in terms of services for poor and homeless persons. Do a literature search to identify recommended state-of-the-art interventions for poor and homeless persons. Compare the recommended programs and interventions with those available in your target area. How does your area measure up? Give some specific recommendations about how you would fill the gaps.
2. Discuss welfare reform with other students. How does our welfare system work? Who receives welfare? Who is eligible for benefits? How do people apply for welfare? What are the strengths and weaknesses of welfare reform in the United States? What are the financial and personal costs of welfare reform? Identify federal and state senators and representatives in your districts. Where do they stand on the issue of welfare reform? Give details of your ideas for changing our welfare system. What programs are needed in your

CLINICAL DECISION-MAKING ACTIVITIES—cont'd

community and how could state senators and representatives support such programs?

3. Examine the specific programs identified in the preceding assessment. How do those who need services access them? Working with other students, make appointments with key persons in the agencies identified to find out what each agency offers, which particular aggregate is served, how clients access the services, who is eligible, how the agency receives funding, and what methods are used to evaluate the agency's ability to meet the needs of its targeted aggregates. Give some examples.
4. Identify nurses in your community who work with the homeless or with other vulnerable groups. Invite these nurses

to come to a class meeting to share their experiences. What constitutes a typical workday? What are the rewards and challenges of working with vulnerable populations? How do they deal with the frustrations and challenges of their work? What advice might they offer to students working with vulnerable populations? What programs do they recommend? How would you advocate for vulnerable populations in your practice?

5. Imagine yourself as a nurse working in a homeless shelter or making a home visit to a family in an impoverished neighborhood. How have your life experiences and education prepared you (or not) for these situations?

Migrant Health Issues

Marie Napolitano, PhD, RN, FNP

Dr. Marie Napolitano is an associate professor and the Director of the Doctor of Nursing Practice/Family Nurse Practitioner Program at the University of Portland. She earned the BA in nursing from Louisiana State University, the MA in Nursing from the University of Washington, and the PhD from the Oregon Health and Sciences University. She has extensive clinical practice with migrant farmworkers and their families and has been a co-investigator on NIH pesticide exposure studies. Her areas of expertise include nurse practitioner education in the United States and internationally, doctor of nursing practice education, and the integration into practice of cultural considerations regarding immigrant and Latino populations. Her clinical interests include chronic illness self-care management for Latino individuals and families. She is a board member of Project Access Now and a member of the advisory committee of the Migrant Head Start Program in Oregon.

- Resource Tool 34.A: Resources for the Nurse Who Is Working with Migrant Farm Workers

OBJECTIVES

After reading this chapter, the student should be able to do the following:

1. Define the terms *migrant farmworker* and *seasonal farmworker* and discuss the lifestyle and work environments that contribute to their health status.
2. Discuss the difficulties with obtaining epidemiologic and health data on this population.
3. Describe occupational and common health problems of migrant farmworkers and their families and the barriers in securing health care.
4. Evaluate programs to determine effectiveness with encouraging health-seeking and health-promoting behaviors among migrant farmworkers and their families.
5. Analyze the role of the nurse in planning and providing culturally appropriate care to migrant farmworkers and their families.
6. Advocate for legislation and policy that would improve the lives and working conditions of migrant farmworkers and their access to health care services.

KEY TERMS

food insecurity, p. 757
 health disparities, p. 756
 migrant farmworker, p. 751
 Migrant Health Act, p. 753
 migrant health centers, p. 753
 migrant lifestyle, p. 752

occupational health risks, p. 755
 pesticide exposure, p. 755
 political advocates, p. 762
 seasonal farmworker, p. 751
 traditional beliefs and practices, p. 760
 —See Glossary for definitions

CHAPTER OUTLINE

Children and Youth

Cultural Considerations in Migrant Health Care

Nurse-Client Relationship

Health Values

Health Beliefs and Practices

Health Promotion and Illness Prevention

Role of the Nurse

Imagine yourself attempting to deliver treatment in a migrant camp to a toddler whose pertussis culture returned positive. The camp is located in an isolated rural community. The toddler lives in a trailer with her parents and siblings and extended family members (13 individuals). The family must also be treated as contacts. No one speaks English, so you have an interpreter with you. The family has just returned from picking strawberries all day in the fields, and they are tired and hungry. The family is willing to give medicine to the toddler because she is sick; however, they do not understand why they must take the medicine also, because they are not sick. The family tells you that they will not be able to take the noon dose because they have no water with them at work. Walking to the drinking barrel will take too long and they will lose income. As a nurse, what would you do? As a starting point, nurses need to be informed about the cultures, lifestyle, and health picture of the migrant and seasonal farmworkers and families that they serve.

Migrant and seasonal farmworkers (MSFWs) are essential to the agricultural industry in the United States, especially with the decrease in family farms and the increase in labor-intensive crop production such as vegetables, fruit, nuts, and ornamental plants. Although the availability and affordability of food in the United States depend on these individuals, their economic status and social acceptance have not reflected the importance of their work. Estimates of the numbers of MSFWs in the United States vary, with sources identifying approximately 1.0 to 1.8 million hired farmworkers. Five states account for 65% of all farmworkers: California, Florida, Washington, Oregon, and North Carolina (U.S. Department of Agriculture, 2007). Numbers vary because of divergent methodologies for estimating numbers and difficulties in counting mobile populations. Large data sources each have unique limitations prohibiting a clear picture of the MSFW population.

According to the U.S. Department of Labor (2013), a **migrant farmworker** is a seasonal farmworker who must travel to do farm work and is unable to return to a permanent residence within the same day. A **seasonal farmworker** returns to his permanent residence, works in agriculture for at least 25 days or parts of days, and does not work year round only in agriculture. The term *MSFW* also includes migrant food-processing workers, who are defined in the same way as seasonal farmworkers but work in food processing and are unable to return to a permanent residence on the same day. Numbers of migrant crop farmworkers (about 26%) are decreasing whereas those of seasonal farmworkers are increasing (Carroll et al, 2011). Migrant and seasonal farmworkers share many demographic, cultural, and occupational characteristics. Much of the available information on agricultural farmworkers does not distinguish between migrant and seasonal farmworkers.

The majority of MSFWs are foreign-born (72%) and predominantly Mexican (68%) (Carroll et al, 2011). Traditionally, Mexican MSFWs have come from the west central states of Guanajuato, Jalisco, and Michoacán; however, in 2009, 20% of MSFWs came from the nontraditional sending states of southern Mexico including Oaxaca, Guerrero, Chiapas, Puebla, Morelos, and Veracruz (Carroll et al, 2011). The numbers of newly arrived indigenous migrant workers from southern

Mexico and Central America are increasing. These individuals are at higher risk for exploitation due to language difficulties, poverty, and fear. Other workers include African Americans, Jamaicans, Haitians, Laotians, and Thais. The composition of the migrant and seasonal population can vary from region to region in the United States. Of the MSFWs, 52% have legal authorization to work in the United States. Less than 5% of farmworkers are in the United States as a H-2A guest worker (Villarejo, 2012). Foreign-born farmworkers have spent an average of 13 years working in the United States, with more than 50% for 10 to 20 years. Approximately 29% have been in the United States for at least 20 years whereas 26% have been in the country 4 years or less (Carroll et al, 2011). The average number of farm workdays by farmworkers in 2009 was 190 per year, not necessarily on one farm only.

According to the latest analyzed National Agricultural Workers Survey (NAWS) data from 2007 to 2009 (Carroll et al, 2011), MSFWs are young, with an average age of 36 years; 24% are less than 25 years of age. Interestingly, considering the nature of the work, 18% of MSFWs are older than 45 years of age. The majority of MSFWs are male (79%); more than 50% are married with an average of two children. Approximately 59% live with their spouses during their agricultural work. Thirty percent speak English well and 35% cannot speak English at all. The average school grade completed is eighth grade. Up to 40% have completed up to the sixth grade and 28% completed up to the tenth to twelfth grades.

In comparison, the Migrant and Seasonal Farmworker Descriptive Profiles Project (Migrant Clinicians Network [MCN], 2010b) found more single men; fewer women and children (except on the West Coast); an increase in seasonal workers who no longer migrate; greater representation from Central America, the Caribbean, and Pacific; and shifting industry reducing traditional labor crops with less processing. Some regional results were that housing varied in terms of availability and quality, more indigenous individuals were found in the West with corresponding language challenges, and greater labor shortages existed in the West.

MIGRANT LIFESTYLE

Migrant farmworkers traditionally have followed one of three migratory streams: Eastern, originating in Florida; Midwestern, originating in Texas; and Western, originating in California. However, as workers increasingly travel throughout the country seeking employment, these streams are becoming less distinct. Migrant farmworkers are employed in fruit and nut (35%), vegetable (23%), horticultural (20%), field (16%), and miscellaneous (5%) agricultural venues (Carroll et al, 2011). Eighty-eight percent of farmworkers are hired directly and 12% are labor contracted; however, this method is increasing. The cyclic nature of agricultural work along with its dependence on weather and economic conditions results in considerable uncertainty for migrant farmworkers. These individuals and families leave their homes with the expectation of work at certain sites. Word of mouth from friends or family, newspaper announcements, or previous employment most often determines their

destinations. However, on arrival migrant farmworkers may find that other workers have arrived first or that the crops are late, leaving the farmworkers unemployed.

Migrant farmworkers are vulnerable to forced labor (labor trafficking). Labor trafficking is defined as “the recruitment, harboring, transporting, providing, or obtaining of people for forced or coerced labor” (Polaris Project, 2013). Trafficked individuals, especially undocumented, need to work but can find themselves in appalling work conditions and housing without means to leave or report, fearful of retaliation. They may owe debt to their employers or the recruiters from their home countries. Federal and state legislation exist against human trafficking, but in isolated agricultural areas enforcement is difficult. Although exact numbers are not available, it is estimated that the agricultural sector comprises 10% of all foreign nationals trafficked in the United States annually, which is approximately 1450 to 1750 individuals per year (Human Rights Center, 2004) or 5% of all farmworkers (Polaris Project, 2013). The psychological stress can result in physical and mental health problems. Certain questions can be asked to possibly identify a victim of forced labor and should be asked as part of a nursing assessment in an attempt not to frighten the individual. These include:

- What type of work do you do? Are you paid for your work? Are you able to leave your work at any time for another job? Do you owe money to your employer or someone else here? Are you able to leave your living space? Are you required to ask permission to obtain food and medical care?

If a minor is identified, then child-protective services and law enforcement should be notified (Clawson et al, 2009). Richards (2014) recommended involving social workers and others in the plan to assist. The minor should not be left alone until services arrive. For an adult, obtain permission to contact authorities and get a social worker or agency involved. The National Human Trafficking Resource Center hotline (888-373-7888) should be contacted.

The way of life for any migrant farmworker is stressful. Some of the challenges of the **migrant lifestyle** include leaving one's home every year, traveling, and experiencing uncertainty regarding work and housing, isolation in new communities, and a lack of resources. Farmworkers usually are paid an hourly rate (83%) followed by piece rate pay (11%). The specifics for payment differ depending on the location and type of work. Reports of average income for farmworkers have varied. According to the NAWS 2007-2009 statistics, farmworker families averaged \$17,500 to \$19,999 per year. Almost 25% of families live below federal poverty limits; however, the numbers of families with incomes below poverty has decreased. Although many farmworker families meet the income tests for federal and state assistance programs, less than 1% of farmworker families receive any assistance (Villarejo, 2012). Undocumented workers are not eligible for these programs; for others, changing residence from state to state, lack of knowledge and lack of access to programs impede use of program assistance. See Figure 34-1 for an example of a group of migrant farmworkers.

FIG 34-1 Migrant farmworkers working in fields.

Laws have been enacted that should protect farmworkers. These include the Fair Labor Standards that addresses minimum wage, overtime pay, record keeping, and child labor standards. Farms with fewer than seven workers in a calendar quarter are exempt from minimum wage requirements and farmworkers are not included in overtime pay. The Migrant and Seasonal Agricultural Worker Protection Act mandates that farm contractors, employers, and agricultural associations must disclose employment terms, post information about worker protection at the worksite, pay workers what is due and provide itemized statements, and ensure that housing complies with federal and state safety and health standards. Employers and agricultural associations continuously attempt to weaken or void the law (*Farmworker Justice*, 2014). The Occupational Safety and Health Act's Field Sanitation Standards (<http://www.dol.gov/whd/regs/compliance/whdfs51.htm>) ensure drinkable water and accessible sanitation facilities. One section of the Immigration and Nationality Act protects H-2A workers who have permission to work in the United States. As of February 2015, the U.S. Environmental Protection Agency (EPA) has accepted comments and is proposing a stronger Worker Protection Standard (WPS) to safeguard farmworkers from harmful exposures to pesticides. Migrant and seasonal workers often are exempt from the protection of these laws as well as from some Occupational Safety and Health Administration (OSHA) protective provisions due to such allowances as small farm exemptions. Where laws do exist to protect agricultural workers, they may be minimally enforced because of lack of staff and resources. Only three states enforce workplace safety standards regardless of size of farm and numbers of employees: Washington, Oregon, and California.

Migrant and seasonal agricultural workers are considered a unique vulnerable population because of their mobility, the physical demands of the work, social and often geographic isolation, language differences, and high rates of financial impoverishment (*National Center for Farmworker Health [NCFH]*, 2012b). Although MSFW problems are numerous and creating solutions is difficult, some progress has been made in improving the condition of the farmworker population. For example, the latest analyzed NAWS data showed improvement in field sanitation conditions such as the provision of drinking water, field toilets, and hand-washing facilities.

Housing

Migrant farmworkers often have trouble finding available, decent, and affordable housing. Housing conditions vary between states and localities, and housing arrangements and locations and types of housing differ for migrant and seasonal farmworkers. Housing for migrant farmworkers varies by region; it can be located in camps with cabins, trailers, or houses and be near farms. The author has seen migrant farmworker families living in cars and tents when housing was not available. A recent trend shows that fewer employers provide on-farm housing or labor camps, and farmworkers must rely on private market housing such as apartments. The Housing Assistance Council (HAC), a nonprofit organization whose mission is to improve affordable housing in rural areas, surveyed 4600

farmworker housing units across the country and found 52% of these units to be crowded by federal standards. More than half of the units lacked showers, a laundry machine, or both (*Culp and Umbarger*, 2004). This prevented farmworkers from removing pesticides from themselves and their clothing in a timely manner. In North Carolina, a study found that substandard housing conditions worsened as the agricultural season progressed (*Vallejos et al*, 2011). In addition to crowded conditions, housing may lack individual sanitation, bathing or laundry facilities, screens on windows, or fans or heaters. Housing may be located next to fields that have been sprayed with pesticides or where farming machinery poses a danger to children.

Because housing may be expensive, 50 men may live in one house or three families may share one trailer. The health risks of overcrowded housing range from spread of infectious disease to psychosocial effects. While paying for housing during the agricultural season, many farmworker families also support a home-base household. More federal and state programs are seeking to provide private sector housing to farmworker families such as by providing grants to nonprofit agencies serving farmworkers. However, insufficient funds have been provided to meet the demand for farmworker housing.

HEALTH AND HEALTH CARE

The literature provides only a glimpse into the health status of migrant farmworkers. National data needed to present a clear picture of their health status are unavailable because of such factors as high annual turnover, language, mobility, and concern for immigration status. Regional and local cross-sectional health status studies allow some insights. In the past, the most inclusive health data came from two reports from California: *Suffering in Silence: A Report on the Health of California's Agricultural Workers* (*Villarejo et al*, 2000) and the California Institute for Rural Studies (CIRS) Agricultural Workers Health Study (*Ayala et al*, 2001). These reports showed a population at high risk for chronic disease, poor dental health, and mental health problems; higher rates of certain diseases such as tuberculosis (TB), anemia, diabetes, and hypertension; high levels of work injuries and chemical exposures; and detrimental physical and social environments for the children. Accurate morbidity and mortality data are difficult to obtain because of such factors as Mexican-born farmworkers returning to Mexico when no longer working, farmworkers going back to Mexico to receive health services, and easy-to-record infectious diseases decreasing (*Villarejo*, 2003).

Access to Health Care

The *Migrant Health Act*, signed in 1962, provides funds for primary and supplemental health services to migrant workers and their families. These funds are dispersed to 156 migrant health centers in 42 states that serve as models for delivery of services to a difficult-to-reach migrant population. *Migrant health centers* serve more than 903,089 individuals across the country (*Health Resources and Services Administration [HRSA]*, 2012). However, estimates show that these clinics serve

less than 15% of the entire migrant farmworker population. The others will seek medical care from a private physician or an emergency department, or they will not seek help at all. Approximately 55% of farmworkers received health care services of some type over a 2-year period in 2007 to 2008, mainly dental and well-child examinations, including immunizations (Carroll et al, 2011).

Migrant farmworkers have limited access to health care. NAWS findings from 2008 showed that gender, immigration status, migrant status, English proficiency, access to transportation, health status, and access to health care services outside of the United States were associated with health care use. Other nonindependent factors were proximity to the United States–Mexican border, health insurance status, and workplace payment structure (Hoerster et al, 2011).

Factors that limit adequate provision of health care services include the following:

- *Lack of knowledge about services:* Because of their isolation, migrant farmworkers lack the usual sources for information regarding available services, especially if they are not receiving public benefits.
- *Inability to afford care:* According to Villarejo (2012), 75% of hired farmworkers lack health insurance. The Medicaid program, which is intended to serve the poor, often is not available to migrant farmworkers. Workers may not remain in a geographic area long enough to be considered for benefits, or they may lose benefits when they relocate to a state with different eligibility standards. Their salaries may fluctuate each month, making them ineligible during the times

their salaries rise. Employers may not offer health insurance. Undocumented farmworkers are not eligible for Medicaid coverage. Therefore, migrant farmworkers lack health insurance and state program assistance, which further hinders their access to care. Box 34-1 provides information about what migrant farmworkers have said about several factors in their lives. Also, 16 states do not require employers to provide any workers' compensation insurance for migrant or seasonal farmworkers.

- *Affordable Care Act or health insurance subsidies:* Although it is difficult to determine numbers, many farmworkers will not receive employer-mandated health coverage or subsidies because of the small farm exemption and the exclusion of seasonal workers who are employed less than 120 days in the employer's tax year. Undocumented workers are excluded from any employer and individual insurance mandates.
- *Availability of services:* Immigrants are treated differently, depending on whether they were in the United States before the welfare reform legislation of 1996, and depending on the category of their immigration status. Each state determines whether to fill any or part of the services' gap to immigrants. As a result, many legal immigrants and unauthorized immigrants are ineligible for services such as Supplemental Security Income (SSI) and the Supplemental Nutrition Assistance Program (SNAP; food stamps).
- *Transportation:* Health care services may be located a great distance from work or home, and transportation may not be available or may be too costly.

BOX 34-1 What Migrants Say About...

Health and Health Care

"What we have to do is re-educate our people and let them know that we have many rights to live and work and to educate and to have health care. And without health care, we cannot have the other three." Unidentified male farmworker, California

Work Conditions

"We're used to working. We don't want to be given things. We just want to be respected and to be paid the salaries." Teresa, California

"Right now, because I'm here today [testifying at hearing on work conditions], I may not have my job. Possibly I may not have my job tomorrow." José, California

"We have to get up at 4:00 in the morning so we can pick the strawberries until late—like 7 or 9—before they are too ripe." Unidentified male farmworker, Hillsboro, Oregon

Pesticide Exposure

"You go to the fields and you think that it's a foggy day because it's so pretty and it's white, but it's actually the chemicals that have been sprayed." Adelaide, California

"Pesticides presently occupy us tremendously during our work. We wear rubber gloves and that in itself creates a problem because it takes flesh, pieces of flesh from our hands." Guadalupe, California

"Pesticides only cause problems for people who are new to the work or have some physical problem or are weak." Unidentified male farmworker, Parksedale, Oregon

Housing

"My slogan is there must be a way to build houses. I believe we have the right to live in a decent way. We are the labor force. It's like we are foreigners—I am a U.S. citizen. Farmworkers come here with hope, but go home worse off than before." Unidentified male farmworker, Colorado

"We have no coolers in the summer and no heaters in the winter. Temperatures range up to 100 degrees in the summer and 30 degrees in the winter. We work out in the open for 12 or more hours and after working there for more than 12 hours, we have no place to rest. This creates a tremendous amount of frustration, not being able to provide the children with the minimum for comfort." Margarita, California

"The foremen even charged (the farmworkers) for sleeping under the trees." Teresa, California

Women

"...Another thing I would like to mention is the way we are treated as women. As women we are discriminated with our co-workers because they see us as insignificant beings. The men think that they are superior." Maria, California

"I come with my uncle and cousin and I cook and clean for them—after I come home from the fields." Unidentified female farmworker, Cornelius, Oregon

Children and Youth

"...[The children] go out to the fields. They lay under the trees and there is a residue falling on the children. They are picking grapes, what happens? The sprayers are there with the residue falling on the children." Irma, Oregon

"We have worked in the fields! Well, I'm not very young but I've left some of my youth in the work." Juliana, Washington

- *Hours of services:* Many health services are available only during work hours; therefore, seeking health care during work hours leads to loss of earnings and potential loss of employment.
- *Mobility and tracking:* Migrant families move from job to job, but their health care records do not typically travel with them, leading to fragmented services in such areas as TB treatment, chronic illness management, and immunizations. For example, health departments are known to dispense TB medications on a monthly basis. Adequate treatment for TB requires 6 to 12 months of medication. The migrant farmworker who relocates must independently seek out new health services in order to continue medications. The Migrant Clinicians Network (MCN) TB tracking program makes available to a farmworker's current provider any previous provider information that was entered into the tracking program. This tracking helps maintain continuity of TB care for a mobile population (MCN, 2010a).
- *Discrimination:* Although migrant farmworkers and their families bring revenue into the community, they are often perceived as poor, uneducated, transient, and ethnically different. These perceptions foster attitudes and acts of discrimination against them.
- *Documentation:* Unauthorized individuals fear that securing services in a federally funded or state-funded clinic may lead to discovery and deportation.
- *Language:* The majority of migrant farmworkers speak another language as their first language, mostly Spanish, with a growing number speaking dialects. Although migrant health centers may hire bilingual Spanish-speaking staff, interpreters may be difficult to locate for farmworkers speaking local dialects.
- *Cultural aspects of health care:* See the section “Cultural Considerations in Migrant Health Care” (following).

OCCUPATIONAL AND ENVIRONMENTAL HEALTH PROBLEMS

Agricultural work ranks as one of the most dangerous industries in the United States (Bureau of Labor Statistics, 2012). Hired farmworkers have a five times higher occupational mortality rate than other workers combined (Villarejo, 2012). Heat illness fatalities were identified as especially significant. Heat-related deaths for crop workers exceed those among other types of workers (Centers for Disease Control and Prevention [CDC], 2008). Working conditions, such as standing on ladders, being exposed to chemicals, and using machinery, produce **occupational health risks** for the migrant farmworkers who may be inadequately protected or educated. Lack of a comprehensive surveillance system makes it difficult to know the extent of all injuries within the farmworker population. Because small farms are excluded from governmental annual injury surveys and maintenance of written injury reports, injury statistics for farmworkers are incomplete (Villarejo, 2012). Injuries are unreported by farmworkers themselves for fear of loss of work and deportation. Injuries such as sprains and strains, fractures, and lacerations are the most common (Cooper et al, 2006). Other injuries include amputations; crush injuries from tractors,

trucks, or other machinery; acute pesticide poisoning; electrical injuries; and drowning in ditches. Safety practices help prevent injuries; however, one study in North Carolina found that safety regulations are not consistently met, especially during the middle of the season, and that farmworkers, especially undocumented farmworkers, tend not to practice safety behaviors (Whalley et al, 2009). This may be due to lack of knowledge, fear of losing time to work, or beliefs regarding who may be harmed. MSFWs rarely have access to workers' compensation or disability benefits (NCFH, 2012a). Farmworkers tend to self-treat with over-the-counter remedies for injuries (Anthony et al, 2010).

The physical demands of harvesting crops 12 to 14 hours a day take their toll on the musculoskeletal system. Stooping to pick strawberries, reaching overhead while on a ladder to pick pears, or lifting heavy crates with straight legs all cause musculoskeletal pain. In one study, prevalence of chronic back pain among farmworkers and family members was 33% during the last migrant season (Shipp et al, 2009).

Naturally occurring plant substances or applied chemicals can cause irritation to the skin (contact dermatitis) or to the eyes (allergic or chemical conjunctivitis). Farmworkers also spend considerable time in the sun, which is dangerous to the skin. Although skin diseases and skin exposure are common, farmworkers seldom seek care from health centers and mostly use self-treatments (Feldman et al, 2009). Infectious diseases caused by poor sanitary conditions at work and home, poor-quality drinking water, and contaminated foods take the form of acute gastroenteritis and parasites. Farmworkers are at higher risk for eye injuries because of the lack of eye protection devices; lack of knowledge about prevention of eye injuries; taking risks to save time (Verma et al, 2011); and exposure to chemicals, pollen, and dust. Chronic eye irritation and sun exposure leads to cataracts, pterygium, and cloudy lens.

Pesticide Exposure

The majority of the North American food supply is treated with pesticides. Organophosphate pesticides make up the largest group of pesticides in current use. These pesticides are known to be potential hazards. Farmworkers are exposed not only to the immediate effects of working in fields that are foggy or wet with pesticides, but also to the unknown long-term effects of chronic exposure to pesticides. The location of the migrant farmworker's dwelling near fields or orchards can also be a major source of contamination for the worker and his family. Chemicals on clothes worn at work come into contact with farmworker children as parents embrace or carry their children (NCFH, 2009). Organophosphate pesticide metabolites have been confirmed in farmworkers and their children. Studies have found that farmworkers including pregnant women eat fruits and vegetables directly from the fields without washing them (Goldman et al, 2004; Flocks et al, 2007). The U.S. Environmental Protection Agency (EPA) and the Occupational Safety and Health Administration (OSHA) require that farmworkers be given information about **pesticide exposure** safety. However, migrant farmworkers may not receive this information, they may receive ineffectual training, or they may not understand the information (Napolitano et al, 2002; Whalley et al, 2009).

Also, migrant farmworkers may have preconceived beliefs about pesticides, such as that only weak workers are harmed by them.

The use of personal protection equipment is not prevalent but the provision of gloves, hats, and so forth by employers has been associated with greater use (Levesque et al, 2012). Farmworkers may not have access to protective clothing or they may be unable to afford its purchase; alternatively, they may choose to disregard precautionary procedures and behaviors (such as wearing gloves) that affect their productivity (Arcury and Quandt, 2009; Napolitano et al, 2002). Some workers do not shower when they return from the fields because of their cultural beliefs about being exposed to cooler water while feeling hot from working. Although the worker protection standards are in effect to minimize pesticide risk, migrant farmworker families remain at high risk for exposure. Lack of resources for monitoring pesticide exposure, culturally inappropriate educational methods, migrants' fear of reporting violations and being fired, and language differences are just a few barriers that hinder a safer pesticide environment for migrant farmworkers. The **How To** box lists ways to recognize the signs and symptoms of pesticide exposure.

HOW TO Recognize the Signs and Symptoms of Pesticide Exposure

Signs and symptoms of pesticide exposure vary according to the amount and length of time of exposure. The majority of body systems can be affected by pesticide exposure.

- Acute health effects of pesticide exposure include neuromuscular symptoms (headache, dizziness, confusion, irritability, twitching muscles, muscle weakness, and seizures), respiratory symptoms (shortness of breath, difficulty breathing, and nasal and pharyngeal irritation), gastrointestinal symptoms (nausea, vomiting, diarrhea, and stomach cramps), skin rashes, eye irritation, memory loss, difficulty with concentration, mood changes, and unconsciousness. Symptoms vary depending on whether the pesticide poisoning is mild or severe.
- Effects of chronic exposure are not entirely known but have been related to such illnesses as cancer, Parkinson disease, infertility or sterility, liver damage, and polyneuropathy and neurobehavioral problems.
- Migrant workers may not understand exposure and may relate any symptom to pesticide exposure when the symptom cannot otherwise be explained.
- If symptoms of pesticide exposure are suspected, the nurse should develop a pesticide exposure history. A good example of an exposure form can be found at <http://pesticide.umd.edu>.

Not all health professionals are educated to recognize and treat pesticide illness and therefore might attribute the farmworkers' symptoms and physical findings to other causes.

Cancer is an identified but not well-documented health problem for migrant farmworkers associated with their exposure to chemicals. A high prevalence of breast cancer, brain tumors, non-Hodgkin's lymphoma, and leukemia has been found in agricultural communities (Larson, 2001; Ray and Richards, 2001). Farmworkers in California were found to have a higher risk for certain cancers such as lymphomas, prostate

cancer, brain cancer, leukemia, cervical cancer, and stomach cancer (Mills et al, 2009). A registry-based case-control study of breast cancer in farm labor union members in California found that one crop (mushroom) and three chemicals (an organophosphate, malathion, and an organochlorine) were associated with breast cancer risk (Mills and Yang, 2005).

Pesticides also lead to adverse reproductive and developmental outcomes (Arcury and Quandt, 2009); however, study findings differ regarding pesticides and reproductive health. In California, the rate of pesticide poisoning for females is twice that for males (Calvert et al, 2008) while the California Agricultural Workers Health Survey (CAWHS) found that fewer females received training in pesticide safety (Villarejo and McCurdy, 2008). Goldman and colleagues (2004) found that pregnant women were not taking precautions against pesticide exposure; for example, they did not wash their hands before eating, wear protective clothing, or wash their clothes separately from other family members' clothing; they wore clothing and shoes from work into the home and ate fruits and vegetables directly from the fields.

COMMON HEALTH PROBLEMS

Migrant and seasonal farmworkers suffer from the same acute and chronic health problems as other populations in the United States. However, their lifestyle and racial or ethnic group membership place them at risk for certain **health disparities** compared with the general population and to have more frequent and more severe health problems than the general population. Health Center Program data (NCFH, 2014), collected in 2010 from 155 Health Resources and Services Administration health centers serving this population, showed that hypertension, diabetes, otitis media, asthma, contact dermatitis and other eczema, depression, and anxiety affected the greater number of patients seen. All dental needs were numerous.

MSFWs may not know that symptoms such as diarrhea or fever might indicate a more serious health problem, and they often do not seek early treatment. The CAWHS found many undiagnosed health problems during physical examinations. These included sexually transmitted infections (STIs), cervical cancer, high blood glucose, high blood pressure, high serum cholesterol, anemia, and untreated dental problems. In addition, there was a high prevalence of obesity (29% male, 38% female). All of these findings left untreated lead to serious health problems such as heart disease, diabetes, and periodontal disease. For children, the most frequently seen minor problems were "rashes, strains, sprains, upper respiratory infections, otitis media, abdominal discomfort, diarrhea, urinary tract infections, anemia, lacerations, headaches, and dizziness" (MCN, 2008, p. 2). Lack of continuity of care and good record keeping often leads the children to being both over- and underimmunized.

Because of the lack of access to health care and health care information, migrant women may not receive prenatal care. One study found that only 42% of farmworker women reported accessing prenatal services early in their pregnancy (first 3 months) compared with 76% nationally (Rosenbaum and Shin,

2005). The Pregnancy Nutrition Surveillance System found that more than 50% of migrant women had less than the recommended weight gain throughout their pregnancies and almost 25% had undesirable birth outcomes, such as low-birth-weight, preterm births, and small-for-gestational-age babies (CDC, 1998). Unfortunately, current data on migrant women are not available from updated reports from the Pregnancy Nutrition Surveillance. Loss of Medicaid coverage for prenatal care for migrant women and lack of state coverage through the Children's Health Insurance Program (CHIP) in Nebraska has resulted in late entry to prenatal care and an increase in pregnancy complications such as fetal abnormalities (Hopewell, 2011). Study findings related to pesticide exposures and pregnancy outcomes have been inconsistent. One study in North Carolina found that if pregnant women were exposed to pesticides, their newborns' risks for various severe physical and neurological developmental abnormalities were increased (Chelminski et al, 2004).

Food insecurity is a more prevalent problem for farmworkers than for the general U.S. population (Cason et al, 2004; Quandt et al, 2004). In Texas and New Mexico, 82% of farmworker families were found to have experienced food insecurity, of which 49% experienced hunger (Weigel et al, 2007). In Georgia, 63% of migrant farmworkers surveyed were found to be food insecure, with 58% of those being hungry (Hill et al, 2011). The risk for workers with children was three times higher than those without children. Lack of transportation, and lack of access to a refrigerator and stove also were risk factors for food insecurity. Quandt and colleagues (2004) found that households with children had a higher prevalence of food hunger and used strategies such as borrowing money, reducing food variety, giving food to children first, and consuming less to cope with not having enough food.

Specific Health Problems

Among the Latino population in the United States, the prevalence of diabetes is estimated to be three to five times greater than that of the general population, with higher rates of end-stage complications. In 2000, 2 million people, or 10% of Latinos (including farmworkers), were diagnosed with diabetes (Heuer et al, 2004). Data from the NCFH report from the Health Center Program (2014) showed that migrant and seasonal farmworkers had a slightly higher rate of diabetes than nonagricultural patients. The lifestyle of migrant farmworkers makes it difficult to obtain proper nutrition, adhere to weight control measures, and procure continuity of health care and medication administration necessary for good diabetes control. Migrant health centers participating in the Bureau of Primary Health Care's Diabetes Collaborative provide comprehensive and continuous diabetes care and monitoring for their clients. The MCN Health Net allows providers to access information from any of the farmworkers' previous providers who participated in the tracking program, thereby allowing for better continuity of care for diabetes (Box 34-2 provides a brief example of an assessment with migrant farmworkers).

Dental disease is one of the most common health problems for farmworkers of all ages. According to the Centers for Disease

BOX 34-2 Example of Assessment with Migrant Farmworkers

The nurse, working with community partners and migrant camp gatekeepers, visits migrant camps to screen for diabetes (secondary prevention). If a high glucose level is obtained, the nurse refers the individual to a migrant health center or county health department clinic for a complete assessment. For those individuals in a given camp diagnosed with diabetes, the nurse plans and executes a culturally appropriate educational program on self-care for diabetes (tertiary prevention).

Control and Prevention (2013b), Mexican Americans experience higher rates of tooth decay and periodontal disease than do non-Hispanic whites. Disparities in oral health have been documented with the migrant farmworker population (Finlayson et al, 2010). Migrant children also have significantly higher rates of tooth decay and lower rates of treatment (Quandt et al, 2007). Quandt and colleagues (2007) found that 80% of farmworkers in North Carolina had not received dental care in the last year, and that the few who did receive care returned to Mexico for dental care. Many of the people surveyed had inadequate knowledge of oral health and lack of access to care (and the resources to pay). Funding for increasing access to dental care has been insufficient to meet the needs of this population. Without insurance or personal resources and low Medicaid reimbursement, private dentistry is usually not an option for the farmworker. Those migrant health centers with dental care have a high rate of use (NCFH, 2013a), with visits for dental services accounting for one-third of all visits to migrant health centers.

Depression and stress are areas of concern for adult migrants, and this may be related to isolation, economic hardship, their legal status, poor living conditions, and weather conditions that interrupt their work (MCN, 2008). Hiott and colleagues (2008) found that 38% of farmworkers report significant stress. MSFWs identify themselves as highly stressed even though they rate their physical health as good or excellent (Kim-Godwin and Bechtel, 2004). Weigel and colleagues (2007) found that 41% of farmworkers along the United States–Mexico border reported *nervios* (a term used by some Western Hemisphere Hispanics to refer to increased susceptibility to mental stress and symptoms of nervousness), 37% reported depression, and 17% reported heart palpitations that were attributed to anxiety. In North Carolina, 28% of farmworkers surveyed reported higher levels of depressive symptoms (Sandberg et al, 2012). Hovey and Magana (2002) found that migrant women reported significantly more anxiety than migrant men and were at greater risk for anxiety from working all day, cooking, cleaning, taking care of children, experiencing sexual harassment, and seldom receiving maternity leave and prenatal care. Farmworkers, especially males, are reluctant to seek mental health care.

Female farmworkers, especially the undocumented, are a vulnerable population suffering harassment and sexual abuse. According to a report by Human Rights Watch (2012), harassment and sexual abuse are so common that female farmworkers see no escape from its occurrence and believe it is part of the job. The report identified sexually charged language, unwanted

touching, stalking, and rape as common occurrences. Most victims do not report these abuses, often feeling powerless; however, many who have reported have not seen their perpetrators prosecuted (Yeung and Rubenstein, 2013). Recently, the U.S. Equal Employment Opportunity Commission filed lawsuits against employers in the Northwest as a means to address sexual harassment.

Drug and alcohol use in migrant communities also has been identified as a significant source of stress (Kim-Godwin and Bechtel, 2004), without a clear picture of the scope of the problem in migrant farmworker communities. One study in North Carolina showed variation in drinking pattern, with 26% of the farmworkers surveyed abstaining from drinking and 27% reporting heavy drinking (Grzywacz et al, 2007). Drinking alcohol poses safety hazards for farmworkers, such as accidents while driving and workplace injuries. Alcohol can also contribute to health problems, greater risk for HIV infection, violence in camps/home sites, domestic violence, and decreased funds for personal and family needs.

The incidence rate for tuberculosis is not known for migrant farmworkers; however, foreign-born immigrants had a rate of 15.8 per 100,000 in 2012, or 11.5 times higher than among native-born individuals (CDC, 2013a). Hispanics of any race had a 6.6 times higher incidence. The majority of migrant farmworkers are foreign-born and Hispanic. MSFWs are at increased risk for TB because of higher rates in their countries of origin (Latin America, Haiti, and Southeast Asia), crowded housing, and malnutrition (NCFH, 2013b). Indigenous farmworkers from southern Mexico and Central America are especially at higher risk (Lowther et al, 2011). Malnutrition and diabetes may affect tuberculosis status. Required long-term treatment is difficult to complete because of mobility, fear of deportation, language barriers, and lack of access to services. Incomplete treatment contributes to resistant TB. The MCN's Health Net TB tracking program fosters continuity and monitoring of TB treatment as migrant farmworkers move to different work and home sites.

Accurate HIV data for migrant farmworkers is difficult to obtain; however, results from relevant studies show that HIV is a health concern for migrant farmworkers. HIV rates increased by almost 8% along the United States–Mexico border from 2003 to 2006 (Espinoza et al, 2009). According to the NCFH report on data from Health Center Programs (2014), migrant/seasonal farmworkers had a slightly lower diagnosis rate of HIV than did nonagricultural workers. Risk factors for this population include lack of accurate knowledge, barriers to health care services, limited education, poverty, sharing needles for common medications such as vitamins and antibiotics, unprotected sexual activity, isolation and separation from families, available prostitution, migration across borders that results in the spread of HIV (NCFH, 2011), and needle-sharing through amateur tattooing (Smith et al, 2009). Beliefs regarding AIDS/HIV also play a role in lack of preventive behaviors. Sanchez and colleagues (2004) found that misconceptions existed, such as HIV no longer being a serious problem in the United States, that it only affects homosexuals, that one does not need to be tested if the person looks healthy, and that HIV is curable. Farmworkers

reported that sexual issues are taboo and not discussed and that married men can have multiple partners (Washington Association of Community and Migrant Health Centers, 2003). Apostolopoulos and colleagues (2006) stated that successful prevention efforts should include reducing migrants' social isolation and using their social networks while educating on condom use and increasing HIV awareness and testing.

Although there is no clear picture on the health status of the migrant farmworker population, available data indicate that this population suffers from challenging health problems that are difficult to address. Nurses can play a vital role in changing this situation.

CHILDREN AND YOUTH

Migrant farmworker parents want a better future for their children. In fact, this strong desire was the catalyst for many farmworkers to leave their country of origin. These children often appear to the outsider as happy, outgoing, and inquisitive. However, these children suffer from health problems including malnutrition (vitamin A and iron deficiencies), infectious diseases (upper respiratory tract infection, gastroenteritis), dental caries (from prolonged bottle-feeding, bottle-propping, and limited access to fluoride and dental care), inadequate immunization status, pesticide exposure, injuries, overcrowding and poor housing conditions, and disruption of their social and school life, which, not surprisingly, lead to anxiety-related problems. A study of migrant farmworker children in Georgia from 2003 to 2011 found elevated prevalences of obesity, high blood pressure, stunting, and anemia in older children (Nichols et al, 2014). Children living with at least one undocumented parent experience worse health and less access to care and use of public assistance programs (Yoshikawa and Kalil, 2011). See Figure 34-2.

Children may be separated from their farmworker parents for periods of time when parents leave for work away from the home site. Children experiencing their parents' stress with work, housing, and income when they accompany their parents can result in physical, behavioral, and emotional problems. A clear understanding of these children's health and social status is lacking because of their absence in research and epidemiologic studies.

Ziol-Guest and Kalil (2012) found that being uninsured is more likely in families that are undocumented and permanent resident immigrants. Because of this limited health insurance, it is no surprise that many farmworker children have unmet health needs, those children who sought health care did not have a consistent provider, and children were not on a well-child schedule (Gentry et al, 2007). Moving between states and/or being undocumented can affect migrant children's eligibility for Medicaid and the state Children's Health Insurance Program (CHIP).

Migrant adolescents who work in agriculture warrant attention. Although the exact number of youth who work in the fields is not known, the Centers for Disease Control and Prevention estimated that 230,000 youth were employed on U.S. farms in 2008. It is estimated that about 6% of all farmworkers are

FIG 34-2 Children of migrant farmworkers experience many hardships. They may have to help with the agricultural work while trying to maintain their schoolwork and to fit into two different cultures. These can be difficult efforts, especially if the children have to move a lot or are frequently sick.

between the ages of 14 and 17 years and that many of those children work “off the books” and cannot be documented as workers (NCFH, 2012c). Some adolescents accompany their parents to work or come with others such as an uncle; however, many adolescents come alone. These youth are the most vulnerable to low wages, lack of health insurance or disability insurance, lack of education, social isolation, occupational hazards, and substance abuse and HIV exposure. Cooper and colleagues (2005) found that migrant youth were more likely to have been injured while working. Migrant adolescents have reported increasing substance use (Cooper et al, 2005). Salazar and colleagues (2004) found that migrant adolescents believe that “weak” individuals were the most vulnerable to health problems and that being sick is an inevitable outcome of migrant lifestyle. Health care providers may believe that they are prohibited from caring for minor unaccompanied youth; however, they should be aware of their state’s laws on minors’ consent to care that could increase access to care for these youth. The 1938 Child Labor Act does not protect farmworker children. Children as young as 12 can work in the fields if they have parental permission. Children ages 16 and older may work in any farm job at any time, including performing hazardous work.

Children of migrant farmworkers may need to work for the family’s economic survival. The number of migrant farmworker children under age 14 is unknown. According to the Fair Labor Standards Act, the minimum age at which a child can work in agriculture is 14 years, whereas the age is 16 in other industries. Children 12 to 13 years of age can work on a farm with the parents’ consent or if the parent works on the same farm. Children younger than 12 years can work on a farm with fewer than seven full-time workers. Some additional protection is provided to children by the majority of states, such as limiting the number of hours per day and week a child can work.

Federal law does not protect children from overworking or from the time of day they work outside of school. Therefore, children may work until late in the evenings or very early in the mornings every day of the week if not protected by state law or if inadequately monitored. Personal communication with Marie Napolitano and adolescent farmworkers in Oregon revealed that they were frequently too tired after working to do homework and to attend classes. They leave school before the term ends to travel with their families and they arrive late to start school in the fall. Child farmworkers often attend three to five different schools each year as they migrate from one farm to another farm, and these frequent changes in schools and constant fatigue set these children up for failure.

Some children of migrant farmworkers stay home to care for younger children. Girls 8 to 10 years old may remain at the camp site to care for their siblings and other children. The Migrant Head Start Program is a safe, healthy, and educative option for children 6 weeks to 5 years old. However, inadequate funding means there are not enough services for all migrant children. The Migrant Education Program is a state and nationally sponsored summer school program for farmworkers’ children more than 5 years of age. However, this program is not available to all eligible migrant youth, especially those living in isolated rural areas.

Nurses can play an important role in the lives of migrant children, as portrayed by migrant children in southern Georgia. During focus groups, these children talked about the importance of nurses in their health and health care (Wilson et al, 2000). For example, one child said, “The nurses teach you how to stay healthy, like good things to eat, how to stay safe, and how to learn in school” (Wilson et al, 2000, p. 143). Another child said, “The nurse also told us how to stay safe in our neighborhood, like staying away from people who drink and take drugs” (Wilson et al, 2000, p. 143).

CULTURAL CONSIDERATIONS IN MIGRANT HEALTH CARE

To provide culturally effective care to migrant farmworkers, nurses need to be knowledgeable about the cultural backgrounds of these individuals. Because the majority of migrant farmworkers are of Mexican descent, this section focuses on Mexican culture. Although certain health beliefs and practices have been identified with the Mexican culture, the nurse must remember that beliefs and practices differ between regions and localities of a country, and among individuals. Mexico is a

multicultural country; therefore, the cultural backgrounds of Mexican immigrants vary depending on their place of origin. There are many indigenous groups in Mexico that speak their own group dialect. Mexican immigrants may or may not understand or speak Spanish. Mexican immigrants who are less educated, have fewer economic resources, and are from rural areas tend to possess more **traditional beliefs and practices**.

Nurse-Client Relationship

The nurse is considered an authority figure who should respect (*respeto*) the individual, be able to relate to the individual (*personalismo*), and maintain the individual's dignity (*dignidad*). Mexican individuals prefer polite, nonconfrontational relationships with others (*simpatia*). At times, because of *simpatia*, individuals and families may appear to understand what is being said to them (by nodding their heads) when in actuality they do not understand. The nurse should take measures to validate the understanding of these individuals. The Mexican individual expects to converse about personal matters (*chitchat*) for the first few minutes of an encounter. They expect the nurse not to appear rushed and to be a good listener. Humor is appreciated and touching as a caring gesture is seen as a positive behavior.

Mexican clients may not seek care with health professionals first. Instead they may consult with knowledgeable individuals in their family or community (the popular arena of care) or with folk healers (the traditional arena of care). Examples of the members of the popular arena include the “senora,” or wise, older woman living in the community; one’s grandmother (*la abuela*); and the local parish priest. If you work with Latino migrant workers, you may relate better with them if you learn some key Spanish words and phrases.

Health Values

Family, in general, is a significant component of a Mexican individual's health care and social support system. The female in the household is considered to be the caretaker whereas the male is considered to be the major decision-maker. However, Mexican females in certain families have significant influence over most matters including health decisions. Grandmothers and sisters are highly significant to the wife (female) in the immediate family. They provide advice, care, and support. Not all Mexican immigrants have extended families in the United States. If not present, communication may be maintained with family in Mexico, but a support system for these individuals may be lacking.

Love of their children, rather than concern for their own health, may encourage migrant parents to adopt healthier lifestyles. One example is when the parents of a child with asthma choose to stop smoking. In Oregon, when asked if they protected themselves from pesticide exposure, Mexican migrant parents responded negatively in general. However, they were willing to change their behaviors if, as a result, their children would be protected from pesticides (Napolitano et al, 2002).

The Mexican client may be more willing to follow the advice of another Mexican individual with a similar health problem rather than the advice of the health professional. I found that Mexican women with type 2 diabetes were more willing to ask

and adopt the practices of others with diabetes than follow the nonmeaningful, redundant advice of physicians to take their medications, watch their diet, and exercise. One woman, who was unable to differentiate the symptoms of hyperglycemia and hypoglycemia, would drink a bottle of grape juice when she felt her “sugar high,” as was recommended by her neighbor.

Although the majority of Mexican immigrants may identify themselves as Catholics, many Mexican individuals belong to other religious groups. The individual's religion may influence his or her health practices such as birth control; however, the nurse cannot assume that a Catholic, for example, will not use some method of birth control. The **Quality and Safety in Nursing Education box** provides ways to provide client-centered care.

QSEN FOCUS ON QUALITY AND SAFETY EDUCATION FOR NURSES

Targeted Competency: Client-Centered Care

Recognize the client or designee as the source of control and full partner in providing compassionate and coordinated care (interventions) based on respect for the client's preferences, values, and needs.

Important aspects of client-centered interventions include the following:

Knowledge: Discuss principles of effective communication.

Skills: Assess own level of communication skill in encounters with clients and families.

Attitudes: Value continuous improvement of own communication and conflict resolution skills.

Client-Centered Care Question

To provide client-centered care, it is important not only to be able to communicate with the person(s) but also to understand their cultural perspectives that influence their health care practices. If you are caring for clients who live in migrant farmworker camps and you observe that they are allowing their children to work several hours both before and after they go to school, how would you approach the situation?

- Would you begin by speaking with the parents?
- Would you speak with the person who owns or manages the farm?
- What would your approach be to those with whom you speak?
- At what point would you consider involving community resources? If you choose this route, what resources would you consider?

Prepared by Gail Armstrong, PhD(c), DNP, ACNS-BC, CNE, Associate Professor, University of Colorado Denver College of Nursing.

Health Beliefs and Practices

In the Mexican culture, health may be considered a gift from God. Another common perception of health is that a healthy person is one who can continue to work and maintain one's daily activities independent of symptoms or diagnosed diseases. The nurse should understand that a Mexican individual may not return for a clinic appointment because the client was capable of working that day. Mexican immigrants may think illness is a punishment from God and may cite this belief as a rationale for why therapies have not cured them. This more commonly occurs with chronic illnesses. There are four more common folk illnesses that a nurse may encounter with the Mexican client. These are *mal de ojo* (evil eye), *susto* (fright), *empacho* (indigestion), and *caida de mollera* (fallen fontanelle).

Symptoms and treatments may vary depending on the individual's or family's origin in Mexico. Other cultural beliefs related to hot-cold balance, pregnancy, and postpartum behaviors (*cuarentena*) have been documented. When experiencing a folk illness, the traditional Mexican individual would prefer to seek care with a folk healer. The more common healers are the *curanderos*, *herbalistas*, and *espiritualistas*. The most commonly used herbs are chamomile (*manzanilla*), peppermint (*yerba buena*), aloe vera, cactus (*nopales*), and epazote.

EVIDENCE-BASED PRACTICE

Guidelines recommend that human papillomavirus (HPV) vaccination be routinely administered to girls aged 11 to 12 years old, with catch-up vaccinations being administered between the ages of 13 and 26 years. There are few studies that have included Latina women, especially those from rural areas in low-income families, which includes migrant farmworkers and their children. [Luque and colleagues \(2012\)](#) conducted a study with Latina farmworkers in Central Florida to identify the barriers and benefits to HPV vaccination for this population. Study results showed barriers included lack of transportation and health insurance, language and cultural practices accessing health care, and lack of knowledge regarding the vaccine's purpose. Misperceptions were identified. The perceived benefits included the worthiness of vaccines in general, improving the health of their children, and enhancing communication with their children.

Nurse Use

Nurses have the opportunity to provide education regarding the HPV vaccine to migrant farmworkers as individuals in a health care setting or to groups in community settings. Nurses can design their educational programs to include the farmworkers' beliefs about the benefits of vaccine and the prevention of illness in their children's future lives.

HEALTH PROMOTION AND ILLNESS PREVENTION

The same principles of health promotion and illness prevention apply to migrant farmworkers as to other U.S. populations. However, health promotion and disease prevention may be difficult concepts for migrant workers to embrace because of their beliefs regarding disease causality, their irregular and episodic contact with the health care system, and their lower educational level.

Health promotion begins by asking farmworker families which health topics would be of interest to them and whether they are familiar with the available resources to improve their health. Several migrant health programs have recruited migrant workers to serve as outreach workers and lay camp aides to assist in outreach and health education of the workers. Nurses can be part of the planning and education of health workers for outreach educational programs. Evaluation to determine successful outreach educational methods can be undertaken by nurses. These activities demonstrate the core competencies related to the domain of community dimensions of practice skills for public health nursing ([Quad Council, 2011](#)). The skills include recognizing community relationships affecting health, collaborating with community partners to promote the health of the population, using group processes to advance community involvement, identifying community assets and resources, and promoting public health programs.

ROLE OF THE NURSE

As described next, nurses can use primary, secondary, and tertiary prevention actions to help improve the health of migrant farmworkers. Primary prevention activities include education for the prevention of infectious diseases such as HIV, measures to reduce pesticide exposure, and immunizations in childhood and adulthood. Secondary prevention activities include screening for pesticide exposure, TB skin testing, diabetes screening and monitoring activities, and diagnostic testing done for prenatal care. Tertiary prevention includes rehabilitation for musculoskeletal injury, especially low back pain, and treatments for lead poisoning and anemia.

LEVELS OF PREVENTION

Migrant and Farmworker Health Issues

Primary Prevention

Teach migrant workers how to reduce exposure to pesticides.

Secondary Prevention

Conduct screening for diabetes in adult farmworkers and for anemia in children in camps.

Tertiary Prevention

Educate migrant families regarding appropriate nutrition for an adult with diabetes or a child with anemia.

The health status of all people is a function of their ecology, or all that “touches” them. The nurse keeps a finger on the pulse of the community by remaining active with political and social issues that involve the client. The nurse can be a catalyst for change to assess farmworker needs continually, to direct efforts to obtain needed health care services, and to evaluate the success of those efforts. Acting as a community educator knowledgeable about how to obtain the latest information and resources, the nurse can work to assess the infrastructure and needs of the community. Follow-up on assessments by the nurse is critical. For example, the needs assessment might indicate inadequate child and adult immunizations in the migrant population, which may best be provided in the fields, camps, and schools. The nurse may instigate and lead in the creation of an immunization tracking system to share information with other counties and states as the farmworkers migrate.

Nurses can screen and monitor migrant farmworkers' health. Diseases such as TB, diabetes, and hypertension are often missed in a mobile population without regular access to care. Nurses can create screening programs in migrant camps and other farmworker housing. When problems are identified and treated, nurses can monitor the success of medication regimens, preventive measures, and follow-up with the health care system. The nurse can provide culturally specific health promotion and disease prevention programs and materials, as well as information about any further referral sources. The nurse can teach health promotion strategies to lay health promoters who then will educate the migrant community. [Box 34-3](#) lists selected resources for the nurse working with migrant farmworkers. The Clinical Decision-Making Activities at the end of the chapter explore nurses' roles in various health care delivery settings.

LINKING CONTENT TO PRACTICE

In this chapter, an overview of the lifestyle and health status of the migrant farmworker population is presented. The public health nurse plays an important role in improving the health of this population. Core competencies within five of the Quad Council Domains of Public Health Nursing guide the nurse in working with migrant farmworkers. These domains are as follows: (1) Analytic/Assessment Skills, which include identifying, describing and using data obtained from working with migrant individuals, families and groups; (2) Policy Development/Program Planning Skills, which are directed toward knowing and applying policies, laws, and regulations toward the delivery of health programs and the protection of the migrant population; (3) Communication Skills, which

are used to identify health literacy of the migrant farmworker and to communicate in a linguistic and culturally appropriate style; (4) Cultural Competency Skills, which allow the nurse to function in a culturally appropriate manner and to assist the public health organization to become more culturally competent when serving migrant farmworker families; and (5) Community Dimension of Practice Skills, which include use of community resources, establishing linkages between community partners to eliminate redundancy and better serve the migrant population, and maintaining partnerships with migrant leaders and agencies serving this population (Quad Council, 2011).

The effectiveness of many existing programs dedicated to all levels of prevention and treatment for farmworkers has not been evaluated (Arcury and Quandt, 2007); therefore, opportunities exist for nurses to lead or participate in evaluation of these programs.

Nurses can be social and **political advocates** for the migrant population. Educating communities about these individuals, collecting necessary data on their lives and health, and communicating with legislators and other policy makers at local, state, and national levels are needed actions that nurses are prepared to undertake.

The health of the MSFW population warrants a variety of actions by nurses. Working with this population can be challenging. Insufficient resources, short-term stays in a community, barriers placed by growers, discrimination, and nonenforced legislation are just some of the obstacles that confront the nurse. However, nurses can make a difference in the health of migrant farmworkers and their families.

HEALTHY PEOPLE 2020

Selected Objectives for Migrant Farmworker Populations

This box lists selected *Healthy People 2020* objectives that relate to health promotion and disease prevention in migrant farmworkers. They were selected on the basis of occupational, lifestyle, and socioeconomic factors that place migrant farmworkers and their families at unique risk for suboptimal health.

Environmental Health

- EH-10: Reduce pesticide exposures that result in visits to a health care facility.
- EH-19: Reduce the proportion of occupied housing units that have moderate or severe physical problems.

Immunization and Infectious Diseases

- IID-29: Reduce tuberculosis.
- IID-30: Increase treatment completion rate for all tuberculosis patients who are eligible to complete therapy.

Maternal, Infant, and Child Health

- MICH-10: Increase the proportion of pregnant women who receive early and adequate prenatal care.

Occupational Safety and Health

- OSH-2: Reduce nonfatal work-related injuries.
- OSH-8: Reduce occupational skin diseases or disorders among full-time workers.

PRACTICE APPLICATION

Maricela is 15 years old and has accompanied her uncle and male cousin to the camp to cook and clean the cabin for them. She also works in the fields picking crops in season. Maricela traveled the East Coast for 6 months with her uncle and cousin. Maricela is originally from Mexico, and Florida is her home base. One evening after finishing her work, Maricela asks to speak with Joan Lewis, the nurse practitioner whose medical van is parked outside the migrant camp where Maricela lives. She tells the nurse that her stomach has been hurting for a while and asks Ms. Lewis for something to stop the pain. While assessing the complaint, Ms. Lewis asks Maricela what she believes has caused the pain. Maricela is very quiet and barely responds to the nurse. She does not make eye contact with Ms. Lewis. Maricela states that she probably ate something hot that upset

her stomach. She seems to be in a great hurry and says she does not want her uncle to know she stopped by the van because he would be angry. Ms. Lewis, who speaks fluent Spanish, completes her history but Maricela does not permit the nurse to examine her abdomen. Maricela also would not talk about her last menstrual period. She asks for medicine again and gets up to leave.

- A. What do you see as the important points regarding Maricela's situation?
- B. What are cultural considerations that may impact the assessment of Maricela's complaint?
- C. What could be the possible causes for Maricela's stomach pain? What is your rationale for each cause?

Answers can be found on the Evolve website.

KEY POINTS

- A migrant farmworker is a laborer whose principal employment involves moving from a home base to another location to plant or harvest agricultural products and lives in temporary housing.
- An estimated 1 to 3 million migrant farmworkers are in the United States. These numbers are controversial because of the inconsistency in defining farmworkers and limitations in obtaining data.
- Migrant farmworkers are considered a vulnerable population because of their lifestyle and lack of resources.
- Health problems of migrant farmworkers are linked to their work and housing environments, limited access to health services and education, and lack of economic opportunities.
- Migrant farmworkers are faced with uncertainty regarding work and housing, inadequate wages, unsafe working conditions, and lack of enforcement regarding legislation for field sanitation and safety regulations.
- Farmworkers are exposed not only to the immediate effects in the fields (foggy or wet with pesticides), but also to unknown long-term effects of chronic exposure to pesticides.
- When harvesting is completed, the farmworker becomes simultaneously homeless and unemployed. Forced migration to find employment leaves little time or energy to seek out and improve living standards.
- Children of migrant farmworkers may need to work for the family's economic survival. They are most affected by the disruptive and challenging lifestyle.

CLINICAL DECISION-MAKING ACTIVITIES

1. Interview rural community leaders regarding migrant farmworkers in your area. What do business owners, teachers, clergy, politicians, and other health professionals say about this population? Can you identify misinformation or lack of information on their parts?
2. Outreach workers are personnel generally hired by an agency, such as a health department, to provide services such as education to migrant persons. Lay health promoters, often past migrants themselves, also provide community-based education. Find out if these roles exist in your community. Interview these individuals or accompany them in their work. Compare and contrast their roles. How are they complementary? How do they overlap? How can they work together to maximize health? How are their approaches to education different (e.g., does one use a protocol or template, whereas the other uses popular education techniques)? How does the outreach worker role and the lay health promoter role compare with the nursing role? How can the nurse work with the outreach worker and the lay health promoter?
3. Find an agency that visits migrant farmworkers in their housing. Ask to accompany them on subsequent visits. What is the condition of the housing? Are there deficits that could impact the health of the inhabitants?
4. Determine eligibility for Medicaid and Aid to Families with Dependent Children services in your state. You may consult the county health department and the state health department. Do migrant workers in your state qualify?
5. Design a temporary clinic to provide health care to migrant workers in your area during crop season. What services would you provide? What hours would you operate? How would you staff the clinic? Where would you get funds?
6. Below are a few settings and RN-delivered services for migrant clients. Can you propose others?
 - a. Health department (generally state and county funded)—Nurses monitor communicable diseases and provide treatments for communicable outbreaks such as TB and pertussis.

CLINICAL DECISION-MAKING ACTIVITIES—cont'd

- b. Migrant camps (generally funded through migrant clinics or health departments)—**Nurses assess and triage, screen for disease, dispense medications under protocol, provide education, interview families, and coordinate care in conjunction with health department nurses.
- c. Migrant clinics (federally funded)—**Nurses work with clinics' primary care providers, lead prenatal (both classes and home visits) and diabetes programs, educate regarding illnesses, and visit migrant camps to provide services or follow-up on clinic care.

Teen Pregnancy

Dyan A. Aretakis, RN, FNP, MSN

Dyan A. Aretakis earned her BSN from the University of Connecticut and the MSN, PNP, and FNP from the University of Virginia. She began her nursing practice in pediatrics at the University of Connecticut and at a regional residential facility for individuals with intellectual developmental disorders. She went on to co-develop a model teen health center at the University of Virginia Health System in 1990 and currently practices in and directs its daily and long-term programs. This unique program provides a range of adolescent and young adult primary health care services as well as community and professional outreach programs.

OBJECTIVES

After reading this chapter, the student should be able to do the following:

1. Discuss approaches that could be used in providing care to the adolescent client.
2. Identify trends in adolescent pregnancy, births, abortions, and adoption in the United States.
3. Discuss reasons that may affect whether a teenager becomes pregnant.
4. Explain some of the deterrents to the establishment of paternity among young fathers.
5. Develop nursing interventions for the prevention of pregnancy problems that adolescents are at risk for experiencing.
6. Identify nursing activities that may contribute to the prevention of adolescent pregnancy.

KEY TERMS

abortion services, p. 768

adoption, p. 771

birth control, p. 767

coercive sex, p. 771

dual protection, p. 770

CHAPTER OUTLINE

Adolescent Health Care in the United States

The Adolescent Client

Trends in Adolescent Sexual Behavior, Pregnancy, and Childbearing

Background Factors

Sexual Activity and Use of Birth Control

Peer Pressure and Partner Pressure

Other Factors

Young Men and Paternity

Early Identification of the Pregnant Teen

Special Issues in Caring for the Pregnant Teen

Violence

CHAPTER OUTLINE — cont'd

Initiation of Prenatal Care
Low-Birth-Weight Infants and Preterm Delivery
Nutrition
Infant Care
Repeat Pregnancy
Schooling and Educational Needs

Teen Pregnancy and the Nurse
Home-Based Interventions
Community-Based Interventions

Teen pregnancy is an area of public concern because of its significant effect on communities. Resources to support the special needs of pregnant teenagers are decreasing, and the costs of sustaining young families are prohibitive. Many teenagers who become pregnant are caught in a cycle of poverty, school failure, and limited life options. Even under the ideal circumstances of adequate finances, loving and supportive families, and good birth outcomes, a teen mother must circumvent her own necessary developmental tasks to raise her child.

There is neither a uniform reason that teens become pregnant nor a universally acceptable solution. The causes of teen pregnancy are diverse and affected by changing moral attitudes, sexual codes, and economic circumstances. Teen pregnancy places an enormous strain on the health care and social service systems. Social concern is also raised about the lost potential for young parents when pregnancy occurs, and the academic and economic disadvantages that their children will experience. Nurses are in a key position to understand how teen pregnancy affects both the individual and the community. This chapter presents a variety of issues associated with teen pregnancy and proposes nursing interventions to promote healthy outcomes for individuals and communities.

ADOLESCENT HEALTH CARE IN THE UNITED STATES

Adolescents are generally healthy, and when they seek health care it is for reasons different from those of adults or young children. The main causes of teen mortality are high-risk behaviors: motor vehicle accidents (usually including alcohol), homicide, suicide, and accidental injuries (such as falls, fires, or drowning). Teens often engage in behaviors that put them at risk for life-threatening diseases. For example, each year, one fourth of both new human immunodeficiency virus (HIV) infections and newly identified sexually transmitted diseases (STDs) occur among adolescents. During the teen years, other behaviors are initiated (e.g., smoking, decreased activity, and poor nutrition) that can ultimately lead to poor health as well as influence behavior change that can significantly alter a young person's life.

National surveys highlight the health issues facing adolescents. There have been some improvements in risk behaviors as well as a worsening of others. Among ninth to twelfth graders participating in the 2013 Youth Risk Behavior Surveillance System, fewer teens reported binge drinking or riding in a car with a driver who had been drinking (Kann et al, 2014).

However, these and other significant risk behaviors continued at high rates. Of ninth to twelfth graders, 38.7% reported current alcohol use (20.8% reported binge drinking); 22.4% of teens were current cigarette smokers; and 40.7% had tried marijuana (23.4% were current users). Mental health issues are also strongly associated with the adolescent years: 29.9% of students reported feeling sad or hopeless for more than 2 weeks; 39.1% of females and 20.8% of males reported these symptoms. Suicidal thoughts with a plan existed for 13.6% of students nationwide, and 10.6% of girls and 5.4% of boys attempted suicide. In addition, 30.3% of students were either obese or overweight, 21% had been told they had asthma, and 10.1% used sunscreen when they were in the sun for more than an hour. It is the collective impact of these behaviors that not only put adolescents at risk during the teenage years but set the stage for adult morbidity and mortality from heart disease, cancer, and diabetes (Centers for Disease Control and Prevention [CDC], 2014).

Adolescents may not seek care for these problems for the following reasons: (1) access to health care may be hindered due to a limited number of professionals with expertise in dealing with teenagers; (2) costs of care or availability of insurance may limit services; (3) adolescents need to believe that their visits are confidential before they will honestly reveal information; and (4) health care professionals must be able to discuss sensitive topics in a nonjudgmental and supportive manner and demonstrate a desire to work with youths. Nurses who want to promote the health of adolescents by providing anticipatory guidance about peer pressure, assertiveness, and future planning need to understand adolescent behaviors, health risks, and the social context in which they live. Involvement and education of the parents about youth culture and development can promote positive and supportive parenting of teens.

THE ADOLESCENT CLIENT

Adolescents have limited experience in independently seeking health care. When they do seek care, it is often to discuss concerns about a possible pregnancy or to find a **birth control** method. These teens may also need assistance negotiating complex health care systems. Special approaches in both client interview and subsequent client education are often warranted. The behavior of adolescents toward the nurse can range from mature and competent during one visit to hostile, rude, or distant at other times because behavior often reflects intense anxiety over what the teen is experiencing.

Because client interviews usually begin with evaluation of a chief complaint, teens need to know that their concerns are heard. Health care providers may have their own opinions about what teenagers need and may fail to take the chief complaint seriously. For example, when a teen expresses ambivalence about or a desire to become pregnant, this should be discussed in depth even though the nurse may feel uncomfortable when asked to provide information to a teen about how to conceive. During this interview, the nurse can provide preconception counseling and emphasize the need to achieve good health and to establish a health-promoting lifestyle before pregnancy. Health risks to the mother, as well as to fetal development, can be discussed. The nurse can encourage a young person to consider lifetime goals and discuss how parenthood might affect them. Not only does information presented this way demonstrate that the nurse has heard what the teen is saying, but it also allows the nurse to provide useful health information that may encourage the teen to examine her plans carefully, seriously, and maturely.

It is also important to pay attention to what the teen *fails* to verbalize. Knowledge of adolescent health care issues is valuable so that the nurse can anticipate other health concerns and provide an environment in which the adolescent feels safe about discussing other issues. By creating a caring and understanding atmosphere, the nurse can encourage the young person to discuss concerns about family violence, drugs, alcohol, or dating.

Discussing reproductive health care is a sensitive matter for both teens and many adults. Teens may have difficulty expressing themselves because of a limited sexual vocabulary or embarrassment resulting from their lack of knowledge. The nurse must recognize this potential deficit and embarrassment and assist teens by anticipating concerns. It is also important to allow teens to express themselves in their own language, which may include crude or offensive words. Nurses must learn about common slang expressions and common misconceptions so they do not miss important concerns that a teenager might have. The nurse can offer more appropriate terms once trust is established.

Teens may have difficulty discussing topics that provoke a judgmental reaction, such as discussing STDs (See [Box 35-1](#)). The nurse can choose neutral words to evaluate symptoms (e.g., “Has there been a change in your typical vaginal discharge?”). This approach also gives the nurse a chance to educate the young client about normal anatomy and physiology.

Considerable debate exists over whether adolescents should make reproductive health care decisions without their parents’ knowledge. As seen in [Box 35-2](#), federal law establishes the adolescent’s right for access to contraceptive treatment. Obstacles to services do exist, however, and this may result in a teen not receiving contraceptive information and treatment. Obstacles can include lack of transportation to a health care facility, insufficient money to pay for services, or permission to leave school early to attend an appointment.

Although most minor teens can consent to birth control services in the United States, there is great variability in who may access and release their medical records. In recognition of the importance of confidentiality in reproductive health care, federal

BOX 35-1 Sexually Transmitted Diseases and Teen Pregnancy

Sexually transmitted diseases (STDs) affect 25% of sexually experienced teenagers each year. STDs are more easily transmitted to women than men. STD infections among women can contribute to infertility, cancer, and ectopic pregnancy. When a young woman is pregnant, these infections can cause premature rupture of membranes, premature labor, and postpartum infection. Also, the baby can be affected by all STDs in several ways: prematurity and low birth weight, febrile infection after delivery, long-term infection, and even death (e.g., exposure to viral infections such as human papillomavirus and herpes simplex virus).

The pregnant adolescent is at high risk for acquiring an STD because she may not be using barrier protection (e.g., condoms). During the pregnancy, she will require periodic STD screening. STD education and counseling should accompany this screening. Information given should include ways to reduce risk, such as maintaining a mutually monogamous relationship and using latex condoms.

BOX 35-2 Reproductive Health Care and Adolescents’ Rights

No federal regulation requires a young person to have parents involved in decisions on contraception services provided by federal programs. States cannot prohibit an adolescent access to contraception. Several Supreme Court decisions protect this access:

- 1965: *Griswold v. Connecticut*—the right to prevent pregnancy through the use of contraceptives is protected by the right to privacy.
- 1972: *Eisenstadt v. Baird*—the right to privacy in contraceptive use is extended to unmarried individuals.
- 1977: *Carey v. Population Services International*—the right to privacy is specifically extended to minors.

Data from [National Abortion and Reproductive Rights Action League Foundation \(NARAL\)](#): *U.S. Supreme Court Decisions concerning Reproductive Rights: 1927–2012*. Washington, DC, 2014a, NARAL. Retrieved February 2015 from <http://www.prochoiceamerica.org/media/fact-sheets/government-federal-courts-scotus-choice-cases.pdf>

privacy rules were established in 2002 as follow-up to the Health Insurance Portability and Accountability Act of 1996 (HIPAA). This rule, the HIPAA Privacy Rule (or more correctly, the Standards for Privacy of Individually Identifiable Health Information), established that if a minor consented to care, then only that individual could access and release those medical records. However, the Privacy Rule also deferred to existing state law. In many states the laws specify that parents can legally access all the medical records of their minor children ([English and Kenney, 2010](#)), which limits the confidentiality assurances offered to a teen seeking reproductive health care. It is incumbent on nurses working with teens to be knowledgeable about state and federal laws so they can accurately inform teenagers of their rights and limitations in seeking reproductive health care.

Abortion services for adolescents are not clearly defined. No federal protection is extended to adolescents requesting abortion services, and the adolescent’s right to privacy and ability to give consent varies by state (See [Box 35-3](#), which describes abortion and adolescent rights). Confidential care to teenagers may mean the difference in preventing an unwanted pregnancy, an

BOX 35-3 Abortion and Adolescent Rights

- **Parental consent laws:** One or both parents of a young woman who is under 18 years of age seeking an abortion must give permission to the abortion provider before the abortion is performed. These 25 states have enforceable mandatory consent and notice laws: Alabama, Arkansas, Arizona, California, Idaho, Indiana, Kansas, Kentucky, Louisiana, Maine, Massachusetts, Michigan, Mississippi, Missouri, Montana, Nebraska, New Mexico, North Carolina, North Dakota, Ohio, Pennsylvania, Rhode Island, South Carolina, Tennessee, and Wisconsin.
- **Parental notification laws:** One or both parents of a young woman seeking an abortion must be notified by the abortion provider before the abortion is performed. These laws are in 14 states: Alaska, Colorado, Delaware, Florida, Georgia, Illinois, Iowa, Maryland, Minnesota, Nevada, New Hampshire, New Jersey, South Dakota, and West Virginia.
- **Parental notification and consent laws:** One or both parents of a young woman seeking an abortion must be notified and provide consent before the abortion is performed. These laws are enforced in five states: Oklahoma, Texas, Utah, Virginia, and Wyoming.
- **The following states (11) with parental notification or consent laws permit other trusted adults to stand in for a parent:** Arizona, Colorado, Delaware, Illinois, Iowa, Maine, North Carolina, Pennsylvania, South Carolina, Virginia, and Wisconsin.
- **The following states (four) have laws that have been found unconstitutional and unenforceable:** California, Nevada, New Jersey, and New Mexico.
- **Judicial bypass:** In a 1979 Supreme Court decision, it was ruled that any mandatory parental consent law must allow the young woman an opportunity to be granted an exception or waiver to the law. A young woman could appeal directly to a judge, who would decide either that she was mature enough to make this decision or that the abortion would be in her best interest.

Data from [National Abortion and Reproductive Rights Action League Foundation \(NARAL\): Who Decides? The Status of Women's Reproductive Rights in the United States](http://www.prochoiceamerica.org/government-and-you/who-decides/), ed 23. Washington, DC, 2014b, NARAL. Retrieved February 2015 from <http://www.prochoiceamerica.org/government-and-you/who-decides/>

abortion, and a birth. This care can influence whether prenatal visits begin in the first trimester or in the second or third trimester. Teens have various reasons for pursuing confidential care, including seeking independence as well as serious and well-founded concerns about a parent's potential reaction (e.g., abuse of the teen). Once nurses recognize the reason for confidential care, they can work with teens to discuss reproductive health care needs with the family. To do so, first clarify family values about sexuality and family communication styles with the teen. In a nonhealthy family, referral to community agencies (e.g., child protective services, Al-Anon) may be necessary. However, the nurse may need to honor the adolescent's need for confidentiality for an unknown period and proceed with the usual interventions, such as pregnancy testing, options counseling, and referral for clinical care.

TRENDS IN ADOLESCENT SEXUAL BEHAVIOR, PREGNANCY, AND CHILDBEARING

In 2012, there were 305,388 births to women under age 20. There was an overall 7% decline from 2011 (8% decline in teens ages 15 to 17; 5% decline in 18- to 19-year-olds). These were

the lowest rates since 1945. Of these births, 18.3% were a repeat birth (CDC, 2013). The birth rate in the United States still remains higher than in any other developed nation (Ikramullah et al, 2011). The numbers of teens who become pregnant are generally identified in the following way: by age group (e.g., younger than 15, ages 15-17, ages 18-19, and under age 20), by states, by marital status, by rates (e.g., number of pregnancies, births, and abortions per 1000 young women), and by race/ethnicity (e.g., African American, white, Hispanic/Latino). Births to teenagers make up 11% of all births in the United States (Ikramullah et al, 2011). Teen birth rates increase by age, with the highest rates occurring among 19-year-olds. Pregnancy and birthrates increased steadily among teens of all ages from 1986 to 1991 and declined among teens of all ages and ethnicities from 1991 to 2005. Decreases from 25% to 17% were also noted in the teen repeat birth rate from 1991 to 2012 (CDC, 2013; Ikramullah et al, 2011). Decreases in pregnancy among teens ages 15 to 17 have been attributed to reduced sexual activity (one fourth of the reduction) and the rest result from improved contraceptive use. For teens ages 18 to 19 the reduction is entirely attributed to increased contraceptive use, with evidence showing that the use of long-acting reversible contraceptives tripled among this age group from 2007 to 2009 (Kost and Henshaw, 2014).

Decline in the teen birth rate varies by race, with the highest birth rates among Hispanic teens (46.3 births per 1000), then black teens (43.9 births per 1000) and white teens (20.5 births per 1000) (Office of Adolescent Health, U.S. Department of Health and Human Services [USDHHS], 2015).

In 2010, there were 615,000 pregnancies to American teens between the ages of 15 and 19 years. In this same age group, there were 157,450 abortions. About 5% of all abortions are obtained by minors (Guttmacher Institute, 2014). The reasons most teens give for having an abortion is that they are concerned about how a baby would change their lives. They also say that they do not think they could afford to care for a baby, and they do not feel that they are mature enough to raise a child. A sexually active teen who does not use contraceptives has a 90% chance of becoming pregnant within one year (Guttmacher Institute 2015). Elective abortion rates for teenagers increased from the time of legalization in 1973 until 1988 and then began to decline. This decrease was caused in part by decreases in the pregnancy rate, but may also have resulted from laws that required parental notification or consent for minors requesting abortion services in some states. As of May 2014, laws in 38 states required that minors seeking abortions must have parental involvement in the decision (Guttmacher Institute, 2014).

BACKGROUND FACTORS

Many adults have difficulty understanding why young people would jeopardize their careers and personal potential by becoming pregnant during the teen years. Adolescents, however, do not view the world in the same way as adults. Teens often feel invincible and therefore do not recognize any risk related to their behaviors or anticipate the consequences. That is, they

HEALTHY PEOPLE 2020

Selected Objectives Related to Adolescent Reproductive Health

Objectives Related to Adolescent Health

- HIV-13: Increase the percentage of adolescents who have been tested for HIV.

Objectives Related to Family Planning

- FP-12: Increase the proportion of adolescents who received formal instruction on reproductive health topics before they are 18 years old.
- FP-13: Increase the proportion of adolescents who talked to a parent or guardian about reproductive health topics before they are 18 years old.

Objectives Related to Maternal, Infant, and Child Health

- MICH-8.1: Reduce low birth weight (LBW) and very low birth weight (VLBW)
- MICH-10: Increase the proportion of pregnant women who receive early and adequate prenatal care.

From U.S. Department of Health and Human Services: Healthy People 2020. Available at <http://www.healthypeople.gov/HP2020/>. Accessed March 29, 2010.

may not think that sexual activity will lead to pregnancy. When teens become pregnant, they do not believe that the negative outcomes they are advised of could come true. Many teens believe that they are unique and different and that everything will work out fine. The developmental circumstances of adolescence, coupled with potential background disadvantages, can magnify the problems facing the pregnant and parenting teen. Pregnant teens often express the unrealistic attitude that they can do it all: school, work, parenting, and socializing.

Babies born to teenage mothers in the United States are at risk for many of the same problems as their young mothers. These risks include school failure, poverty, and physical or mental illness (*American Academy of Child and Adolescent Psychiatry, 2012*). Specifically, a disproportionate number of teens who give birth are poor (more than 75%), have limited educational achievements, and see few advantages in delaying pregnancy because they do not expect that their circumstances will improve at a later time (*Heavey, 2010*). Most teens report that their pregnancy was unplanned. They typically think that a pregnancy should be delayed until people are older, have completed their education, and are employed and married. Their behaviors, however, do not support the opinions they express. In fact, a desire to become pregnant has been noted to be as high as 40% among some groups of teens who usually live in multifactorial disadvantaged circumstances (*Heavey, 2010*). Several factors that often contribute to pregnancy are discussed next.

Sexual Activity and Use of Birth Control

The **sexual debut**, or first experience with intercourse, for a teen has a significant impact on pregnancy risk. Although the percentage of sexually active teens today is much greater than it was in the 1970s, there were decreases between 1991 and 2013. A reported 5.6% of students first have sex before the age of 13 (males, 8.3%; females, 3.1%); in the ninth grade, approximately 30% of students are sexually active, 41.4% by tenth grade, 54.4.1% by the eleventh grade, and 63% by the twelfth grade.

These numbers have not changed substantially since 2001. For each grade the percentage of males is greater than females in each racial group. Over 15% of students have had sexual intercourse with four or more persons during their life. Male students and African American students were more likely than white, Hispanic/Latino, or female students to initiate sexual activity before age 13. African American students are more likely to report a history of sexual activity, followed by Hispanic/Latino and white students (*CDC, 2014*). The *Healthy People 2020* goal is to increase the proportion of adolescents who have never engaged in sexual intercourse by age 17 (*USDHHS, 2010*).

Although more teens have begun using birth control in the past 10 years, there is still progress to be made. *Healthy People 2020* addresses this with goals to increase the proportion of 15- to 19-year-olds who use condoms and a hormonal contraceptive and increase the proportion of teens who receive reproductive health information through formal instruction as well as from their parents or guardians (*USDHHS, 2010*). Condoms are the most commonly used method of birth control, with 68% of adolescent females and 80% of adolescent males reporting their use at first voluntary coitus. Great improvement in overall contraceptive use has occurred, with 86% and 93% of females and males, respectively, reporting that a method of contraception was used at last sex. The current recommendation for greatest protection against pregnancy and sexually transmitted infection (STI) is the use of a hormonal contraceptive, preferably **long-acting reversible contraception** (LARC), and a condom, referred to as **dual protection**. At this time only 20% of females and 34% of males reported using dual protection the last time they had sex (*Guttmacher Institute, 2014*). Male teens use condoms with more frequency than female teens, and African American males use condoms more often than any other group, male or female. Overall, 59.1% of sexually active teen couples reported that the male partner used condoms the last time they had intercourse, with the greatest use at last intercourse reported by African American male teens (73%) and the lowest use reported by Hispanic/Latino female teens (50.7%). Overall these rates have not significantly changed in many years (*CDC, 2014*).

In 2012 the American College of Obstetricians and Gynecologists made a strong recommendation to encourage adolescents to use LARC methods—intrauterine devices and contraceptive implants. These methods are reversible and have the highest rates of continuation and prevention of pregnancy, rapid repeat pregnancy, and abortion in young women. Although gaining in popularity the data do not yet reflect high numbers at this time (*American College of Obstetricians and Gynecologists, 2012*). *Table 35-1* describes hormonal birth control methods and their effectiveness.

As noted earlier, the use of alcohol and other substances is common among adolescents and can contribute to unplanned pregnancy. Mood-altering effects may reduce inhibitions about engaging in intercourse and interfere with the proper use of a chosen birth control method.

Peer Pressure and Partner Pressure

Peer pressure among teens is not a new phenomenon, but many of the influences have become more serious. Influence has

TABLE 35-1 Hormonal Birth Control Methods Recommended for Teenagers

Method	Failure Rate with Typical Use (%/year)	Pattern of Use	Noncontraceptive Benefits
Mirena IUD	0.2	Placed in the uterus; effective continuously for 5 years (Mirena); 10 years (ParaGard)	Less menstrual bleeding, often with amenorrhea after initial few months
ParaGard IUD	0.8		
Nexplanon implant	0.05	Placed subdermally in the upper arm; effective continuously for 3 years	Less menstrual bleeding
Depo-Provera	6	IM injection into either the deltoid or the gluteal muscle every 3 months	<ul style="list-style-type: none"> Decreases sickle cell crisis Decreases the seizure threshold May become amenorrheic
NuvaRing	9	Vaginal ring inserted for 21 to 32 days; contains estrogen and progestin	For all estrogen/progestin combinations: <ul style="list-style-type: none"> Risk of ovarian and endometrial cancer is reduced May use an extended regimen to reduce menses (except Ortho Evra patch) May improve acne Light regular menses (except POP)
Ortho Evra transdermal patch	9	A transdermal patch that is applied to specific skin sites weekly for 3 weeks, and removed for 7 days; contains estrogen and progestin	See above
Birth control pills	9	Take pill daily. COC—estrogen and progestin; POP—progestin only (“mini pill”)	See above

COC, combined oral contraceptive pill; IM, intramuscular; IUD, intrauterine device; POP, progestin-only pill.

Data from Hatcher RA, Trussell J, Nelson A, et al: *Contraceptive Technology*, ed 20. New York, 2011, Ardent Media.

expanded from fashion and language to cigarettes, substance abuse, sexuality, and pregnancy. Teens are more likely to be sexually active if their friends are sexually active (Wisniewski et al, 2013). Peers reinforce teen parenting by exaggerating birth control risks, discouraging abortion and adoption, and glamorizing the impending birth of the child.

Both young men and young women may think that allowing a pregnancy to happen verifies one's love and commitment for the other. In addition, young men from socioeconomically disadvantaged backgrounds may be more likely to say that fathering a child would make them feel more manly, and they are less likely to use an effective contraceptive (Heavey et al, 2008).

Other Factors

Other factors influencing teen pregnancy are a history of sexual victimization, family structure, and parental influences. Pregnant teenagers have a greater likelihood of having been sexually abused during their lifetime, with rates recorded as high as 60% to 70% (Finer and Philbin, 2013). Adolescent girls with a history of sexual abuse are at risk for earlier initiation of voluntary sexual intercourse, are less likely to use birth control, are more likely to use drugs and alcohol at first intercourse, and are more likely to have older sexual partners (Noll et al, 2009). The youngest women are more likely to experience coercive sex or statutory rape (65% of females who had intercourse before age 14 reported that it was involuntary) (Child Trends Data Bank, 2013). Young women may also become pregnant as a result of forced sexual intercourse. A history of sexual victimization will influence a young woman's ability to exert control over future sexual experiences, which will affect the use of birth control and rejection of unwanted sexual experiences. All these factors

contribute to an increased risk for becoming pregnant (Miller et al, 2010). In addition, young women who have experienced a lifetime of economic, social, and psychological deprivation may think that a baby will bring joy into an otherwise bleak existence. Some mistakenly believe that a baby can provide the love and attention that her family has not provided.

Family structure can influence adolescent sexual behavior and pregnancy. Adolescents raised in single-parent families are more likely to report having sexual experience as well as initiating sex at a younger age than those raised in two-parent families. This difference is striking: only 55% of youth living in one-parent families reported never having had intercourse compared with 70% of youth living in two-parent families. Other factors, such as parental higher education, family communication, and good family health practices, were also associated with decreased sexual risk behaviors (Oman et al, 2005).

Parenting styles can influence a young woman's risk for early sexual experiences and pregnancy. Parents who are extremely demanding and controlling or neglectful and who have low expectations are least successful in instilling parental values in their children. Parents who have high demands for their children to act maturely and who offer warmth and understanding with parental rules have children more likely to exhibit appropriate social behavior and to delay early sexual experiences and pregnancy. Children of parents who are neglectful are the most sexually experienced, followed by children of parents who are very strict. Furthermore, parents who discuss birth control, sexuality, and pregnancy with their children can positively influence delay of sexual initiation and effective birth control use. Parents who do not communicate about sexuality with

their teens may find them more at risk for sexual permissiveness and pregnancy (Bersamin et al, 2008).

YOUNG MEN AND PATERNITY

Although declines among pregnant female teenagers have been seen over the past 23 years, there are no published data showing the same decline among teen males. About 9% have become fathers before the age of 20. Of this group, two thirds were ages 18 or 19 when they fathered their first child and one third were less than 18 years old. These are conservative numbers because not all teen males are aware that a partner became pregnant nor are they always aware of the outcome of the pregnancy. A review of birth certificate information may not be helpful as many unmarried couples fail to complete the steps required for a father's name to appear. Adolescent males who become fathers are often reported to be second-generation teen parents. Studies demonstrate that they came from poor families, did poorly in school, and engaged in many high-risk behaviors such as gang membership, drugs, and early sexual involvement. These young fathers face special challenges because of concomitant social problems and limited future plans or ability to provide support. There may also be an overlap between young fatherhood and delinquency. Adolescent males who demonstrate law-breaking behaviors, alcohol or substance use, school problems, and aggressive behaviors may have difficulty developing a positive fathering role, yet they are the highest-risk group to become young fathers. Almost half of these teen fathers will go on to father at least one additional child by the age of 22 to 24, sometimes with another mother (9% of the time) (Paschal et al, 2011; Savio Beers and Hollo, 2009).

Paternity, or fatherhood, is legally established at the time of the birth for a teen who is married. However, it is more difficult to establish paternity among nonmarried couples. Some of the difficulty lies in the complexity of the specific state system for young men to acknowledge paternity. In some states, a young man may have to work with the judicial system outside of the hospital after the birth; if he is under age 18, he may need to involve his parents.

Some young couples do not attempt to establish paternity and prefer a verbal promise of assistance for the teen mother and child. Although a verbal commitment may be acceptable when the child is born, the mother may become more inclined to pursue the establishment of paternity later when the relationship ends or for reasons related to financial, social, or emotional needs of the child. Young women who receive state or federal assistance (e.g., Temporary Assistance for Needy Families [TANF], Medicaid) may be asked to name the child's father so the judicial process can be used to establish paternity.

Young men react differently when they learn that their partner is pregnant. The reaction often depends on the nature of the relationship before the pregnancy. Many young men will accompany the young woman to a health care center for pregnancy diagnosis and counseling. A large percentage of young men will continue to accompany the young woman to some prenatal visits and may even attend the delivery. These young men may also want, and need, to be involved with their children

FIG 35-1 It is important to include both the teen mother and the father in teaching about child development.

regardless of changes in their relationships with the teen mother. It is not unusual for a young man to be excluded or even rejected by the young woman's family (usually her mother). He may then begin to act as though he is disinterested when he may really feel that he cannot provide resources for his child or know how to take care of him or her (Savio Beers and Hollo, 2009) (See Figure 35-1).

Nurses can acknowledge and support the young man as he develops in the role of father. His involvement can positively affect his child's development and provide greater personal satisfaction for him and greater role satisfaction for the young mother. Young mothers who report less social support from their baby's father are more apt to be unhappy and distressed in the parenting role and consequently more at risk for abuse of their child (Savio Beers and Hollo, 2009). The immediate concerns revolve around his financial responsibility, living arrangements, relationship issues, school, and work. Establishing an opportunity to meet with the young man and both families is helpful to clarify these issues and identify roles and responsibilities.

Life experiences for a young man will influence behaviors that can lead to a teen pregnancy or prevent a teen pregnancy. Adverse childhood experiences including a history of abuse (especially physical and sexual abuse and domestic violence), mental illness and/or substance abuse in the childhood home, criminal behaviors in the home, and separated parents have been linked to negative behaviors such as early sexual intercourse, multiple partners, and substance use. These behaviors are possible antecedents to male involvement in teen pregnancy (Sipsma et al, 2010).

Age discrepancy between the pregnant teen and her male partner is an important consideration, even when it is 2 years. It raises concern about coercion, potential or actual violence, increased risk for STI, and exposure to greater substance and

alcohol use (Volpe et al, 2013). The greatest age discrepancies are seen with the youngest pregnant teens. Although these numbers have decreased, the risk is present with more than half of all females ages 15 and younger reporting first sexual intercourse with a male partner who is more than 3 years older. Protective factors that can reduce the risk of a young teen becoming sexually involved with an older partner include living with both biological parents, greater parental education, and not being born to a teen mother (Child Trends Data Bank, 2013).

EARLY IDENTIFICATION OF THE PREGNANT TEEN

Some teens delay seeking pregnancy services because they fail to recognize signs such as breast tenderness and a late period, because they are experiencing a variety of other pubertal changes. Most young women, however, suspect pregnancy as soon as a period is late. These young women may still delay seeking care because they falsely hope that the pregnancy will just go away. A teen may also delay seeking care to keep the pregnancy a secret from family members, fearing either an angry or disappointed response or expecting to be forced into a decision that may not be hers.

Nurses must be sensitive to subtle cues that a teenager may offer about sexuality and pregnancy concerns. Such cues include questions about one's fertile period or requests for confirmation that one need not miss a period to be pregnant. Once the nurse identifies the specific concern, information can be provided about how and when to obtain pregnancy testing. The nurse should determine how a teenager would react to the possible pregnancy before completing the test. If the test is negative, the nurse should take the opportunity to assess whether the young woman would consider counseling to prevent pregnancy. A follow-up visit is important after a negative test to determine if retesting is necessary or if another problem exists.

In looking at teen pregnancy from the perspective of levels of prevention, several steps could be taken. These are shown in the Levels of Prevention box.

LEVELS OF PREVENTION

Teen Pregnancy

Primary Prevention

Teach young people about sexual practices that will prevent untimely pregnancy.

Secondary Prevention

Provide services for early detection of teen pregnancy.

Tertiary Prevention

Counsel the young person or young couple about available options, including keeping the baby (and making appropriate plans to care for the child), abortion, and adoption.

A young woman with a positive pregnancy test requires a physical examination and pregnancy counseling. It is advantageous to offer these at the same time so that the counseling is

consistent with the findings of the examination. The purpose of the examination is to assess the duration and well-being of the pregnancy, as well as to test for sexually transmitted infection. The pregnancy counseling should include the following: information on adoption, abortion, and child-rearing; an opportunity for assessment of support systems for the young woman; and identification of the immediate concerns she might have (Aruda et al, 2010).

The availability of affordable abortion services up to 13 weeks of gestation varies from community to community. Similarly, second-trimester services may be available locally or involve extensive travel and cost. The nurse should know about abortion services and provide information or refer the pregnant teenager to a pregnancy counseling service that can assist.

The pregnant teenager needs information about adoption, such as current policies among agencies that allow continued contact with the adopting family. Also, church organizations, private attorneys, and social service agencies provide a variety of adoption services with which the nurse should be familiar.

Box 35-4 lists guidelines for adoption counseling.

Pregnancy counseling requires that the nurse and young woman explore strengths and weaknesses for personal care and responsibility during pregnancy and parenting. Young women vary in their interest in including the partner or their parents in this discussion. Issues to discuss include education and career plans, family finances and qualifications for outside assistance, and personal values about pregnancy and parenting at this time

BOX 35-4 Guidelines for Adoption Counseling

1. Assess your own thoughts and feelings on adoption. Do not impose your opinion on the decision-making process of teen mothers.
2. Know about state laws, local resources, and various types of adoption services.
3. Choose language sensitively. Examples follow:
 - a. Avoid saying "giving away a child" or "putting up for adoption." It is more appropriate and positive to say "releasing a child for adoption," "placing for adoption," or "making an adoption plan."
 - b. Avoid saying "unwanted child" or "unwanted pregnancy." A more appropriate term may be *unplanned pregnancy*.
 - c. Avoid saying "natural parents" or "natural child," because the adopted parents would then seem to be "unnatural." The terms *biological parents* and *adoptive parents* are more appropriate.
4. Assess when a discussion of adoption is appropriate. It can be helpful to begin with information on adoption and then explore feelings and concerns over time. Individuals will vary in how much they may have already considered adoption, and this will influence the counseling session.
5. Assess the relationship between the pregnant teen and her partner and what role she expects him to play. Discuss the reality of this.
6. It may be helpful for a pregnant teen to talk with other teens who have been pregnant, are raising a child, have released a child for adoption, or have been adopted themselves.
7. A young woman can be encouraged to begin writing letters to her baby. These can be saved or given to the child when released to the adoptive family.

Modified from Brandsen CK: *A case for adoption*, Grand Rapids, MI, 1991, Bethany.

in their life. Often it is difficult to focus on counseling in any depth at the time of the initial pregnancy testing results. A follow-up visit is usually more productive and should be arranged as soon as possible.

As decisions are made about the course of the pregnancy, the nurse can make referrals to appropriate programs such as WIC (a supplemental food program for women, infants, and children), Medicaid, and prenatal services. The young woman and her family also need to know about expected costs of care and, if there is a family insurance policy, whether it will cover the pregnancy-related expenses of a dependent child. For those without insurance, the family can apply for Medicaid or determine whether local facilities offer indigent care programs (e.g., Hill-Burton programs for assistance with hospital expenses). The nurse can also begin prenatal education and counseling on nutrition, substance abuse and use, exercise, and special medical concerns.

SPECIAL ISSUES IN CARING FOR THE PREGNANT TEEN

Pregnant teenagers are considered high-risk obstetric clients. Many of the complications of their pregnancy result from poverty, late entry into [prenatal care](#), and limited knowledge about self-care during pregnancy. Nursing interventions through education and early identification of problems may dramatically alter the course of the pregnancy and the birth outcome.

Violence

Teens are more likely to experience violence during their pregnancies than adult women. Age may be a factor in their greater vulnerability to potential perpetrators that include partners, family members, and other acquaintances. Violence in pregnancy has been associated with an increased risk for substance abuse, poor compliance with prenatal care, and poor birth outcome. In the case of partner violence, young women may be protective of their partners because of fear or helplessness. Eliciting this history from an adolescent is not easy. Be sure to inquire about violence at every visit. Frequent routine assessments are more revealing than a single inquiry at the first prenatal visit. Research has demonstrated that 6% to 55% of pregnant or parenting adolescents reported violence, a rate greater than that reported by adult women ([Herrman, 2013](#)). Violence that began during the pregnancy may continue for several years after, with increasing severity. Variations by ethnicity have also been observed during this postpartum period; [intimate partner violence](#) may peak at 3 months postpartum among African American and Hispanic/Latino new mothers and at 18 months for white mothers ([Harrykissoon et al, 2002](#)). The nurse must observe for physical signs of abuse, as well as for controlling or intrusive partner behavior ([Giullery et al, 2012](#)).

Initiation of Prenatal Care

Pregnant adolescents differ remarkably from pregnant adults in initiation and compliance with prenatal care. Inadequate prenatal care has been associated with increased health risks to

both the mother and the fetus. In 2003, 6.4% of pregnant 15- to 19-year-olds received late or no prenatal care ([Neinstein, 2008](#)). Teens report that the greatest barrier to care is real or perceived cost. Other barriers include denial of the pregnancy, fear of telling parents, transportation, dislike of providers' care, and offensive attitudes among clinic staff toward pregnant teens ([Neinstein, 2008](#); [Aruda et al, 2010](#)).

Once a teen is enrolled in prenatal care, the nurse becomes an important liaison between personnel at the clinical site and the young woman. Confusion and misunderstandings occur easily when teens do not understand what a health care provider says to them. Often these misunderstandings are based on lack of knowledge about basic anatomy and physiology. For example, a teen may be told as she gets close to term that the head of the baby is down and it can be felt. This is an alarming piece of information for a young woman who imagines the entire baby could just pop out at any time!

Cooperation between the nurse and the clinical staff can also maximize the client's compliance with special health or nutritional needs. For example, a teen who has premature contractions may be restricted to bed rest and instructed to increase fluids. The nurse who makes home visits can provide additional assessment of the teen's condition and can solve problems about self-care, hygiene, meals, and schooling.

Low-Birth-Weight Infants and Preterm Delivery

Teens are more likely than adult women to deliver infants weighing less than 5.5 lb or to deliver before 37 weeks of gestation. These low-birth-weight and premature infants are at greater risk for death in the first year of life and are at increased risk for long-term physical, emotional, and cognitive problems ([Neinstein, 2008](#)). For example, low-birth-weight and premature infants can be more difficult to feed and soothe. This challenges the limited skills of the young mother and can further strain relations with other members of the household, who may not know how to offer support or assistance.

The risk for low-birth-weight infants and premature births can be averted by the teen's early initiation into prenatal care. Although such births still occur, it is important to work closely with the teen mother as soon as she is identified as pregnant to try to promote compliance with prenatal care visits and self-care during the pregnancy. After the pregnancy, these infants and their mothers will benefit from frequent nursing supervision to ensure that their care is appropriate and that everyone in the home is coping adequately with the strain of a small infant.

Nutrition

The nutritional needs of a pregnant teenager are especially important. First, the teen lifestyle does not lend itself to overall good nutrition. Fast foods, frequent snacking, and hectic social schedules limit nutritious food choices. Snacks, which account for approximately one third of a teen's daily caloric intake, tend to be high in fat, sugar, and sodium and limited in essential vitamins and minerals. Second, the nutritive needs of both pregnancy and the concurrent adolescent growth spurt require the adolescent to change her diet substantially. The growing teen must increase caloric nutrients to meet individual growth needs as well as to

TABLE 35-2 Adolescent Nutritional Needs during Pregnancy

Nutrient	Daily Requirement during Pregnancy*	Food Source
Calcium	1300 mg (decrease to 1000 mg for 19-year-olds)	Macaroni and cheese; pizza; puddings, milk, yogurt; also fortified juices, water, breakfast bars and fast foods, including Taco Bell's chili cheese burrito, McDonald's Big Mac
Iron	30 mg (recommendation is for 30 mg of elemental iron as daily supplement)	Meats; dried beans; peas; dark green, leafy vegetables; whole grains; fortified cereal; absorption of iron from plant foods improved by vitamin C sources taken simultaneously
Zinc	15 mg	Seafood, meats, eggs, legumes, whole grains
Folate (folic acid)	0.6 mg (prenatal vitamins contain 0.4-1.0 mg of folic acid)	Green, leafy vegetables; fruits
Vitamin A	800 µg	Dark yellow and green vegetables, fruits
Vitamin B ₆	2.2 mg	Chicken, fish, liver, pork, eggs
Vitamin D	5 µg	Fortified milk products and cereals

*Higher ranges are especially important for the younger pregnant teen.

allow for adequate fetal growth. Third, poor eating patterns of the teen and her current growth requirement may leave her with limited reserves of essential vitamins and minerals when the pregnancy begins. The nurse can assess the pregnant teenager's current eating pattern and provide creative guidance. Identifying good choices that a teen can consume "on the run" might include snacks of drinkable yogurt, leftover pizza, string cheese, or energy/granola bars. The teen who often eats out can boost her protein intake at fast-food establishments by ordering milkshakes instead of soft drinks and cheeseburgers or broiled chicken sandwiches instead of hamburgers (Stang and Story, 2005).

The recommended nutritional needs of the adolescent may depend on the **gynecological age** of the teen—that is, the number of years between her chronological age and her age at menarche, as well as her chronological age. Young women with a gynecological age of 2 years or less or under the age of 16 years may have increased nutrient requirements because of their own growth. Furthermore, the younger and still-growing teen may compete nutritionally with the fetus. Fetuses may show evidence of slower growth in young women ages 10 to 16 years (Stang and Story, 2005). The nurse, in collaboration with the WIC nutritionist, can determine the nutritional needs of the pregnant teenager to tailor education appropriately. Table 35-2 describes adolescent nutritional needs in pregnancy.

Weight gain during pregnancy is one of the strongest predictors of infant birth weight. Although precise weight gain goals in adolescence are controversial, pregnant adolescents who gain 25 to 35 lb have the lowest incidence of low-birth-weight babies. Babies born to teenagers may be at risk for being small for gestational age despite adequate weight gain if there is very slow gain in the first 24 weeks. Teenagers who begin the pregnancy at a normal weight should be counseled to begin weight gain in the first trimester and to average gains of 1 lb per week for the second and third trimesters (Stang and Story, 2005). Younger teen mothers (ages 13 to 16), because of their own growth demands, may need to gain more weight than older teen mothers (ages 17 and older) to have the same-birth-weight baby. Table 35-3 shows the recommendations established by the Institute of Medicine for adolescent gestational weight gain by pre-pregnant weight categories.

TABLE 35-3 Gestational Weight Gain Recommendations for Adolescents*

Prepregnant Weight Category†	RECOMMENDED TOTAL GAIN			
	kg	lb	Trimester 1 (lb)	Trimesters 2 and 3 (lb/wk)
Underweight (BMI 19.8)	12.5-18	28-40	5	1.0
Normal weight (BMI 19.9-26)	11.5-16	25-35	3	1.0
Overweight (BMI 26-29)	7.0-11.5	15-25	2	0.66
Very overweight (BMI ≥ 29)	7.0-9.1	15-20	1.5	0.5

*Very young adolescents (14 years of age or younger, or less than 2 years postmenarche) should strive for gains at the upper end of the range.

†BMI (body mass index) is calculated as weight (in kilograms) divided by height (in meters) squared.

From Story M, Stang J, editors: *Nutrition and the Pregnant Adolescent: A Practical Reference Guide*. Minneapolis, MN, 2000, University of Minnesota, Center for Leadership, Education, and Training in Maternal and Child Nutrition. Retrieved February 2015 from <http://www.epi.umn.edu/let/pubs/nmpa.shtml>

It is important for the nurse to assess the attitudes of the pregnant teen about weight gain and to monitor her progress, providing feedback on adequate weight gain and counseling if weight gain is excessive. Gaining weight beyond the recommendations raises the risk for infants to be hypoglycemic, to be large-for-gestational age, and to have a low Apgar score, seizures, and polycythemia (American Dietetic Association, 2008). Family support of the pregnant teen can be a strong influence in adequate weight gain and good nutrition during the pregnancy. Nutrition education should emphasize what accounts for weight gain and how fetal growth will benefit.

Iron deficiency anemia is the most common nutritional problem among both pregnant and nonpregnant adolescent females (Stang and Story, 2005). Up to 11% of adolescents may begin a pregnancy with low or absent iron stores because of heavy menstrual periods, a previous pregnancy, growth demands, poor iron intake, or substance abuse. By the second

trimester, at least 16% of pregnant adolescents will have iron deficiency anemia and even higher rates among lower income teenagers (American Dietetic Association, 2008). The increased maternal plasma volume and increased fetal demands for iron (especially in the third trimester) can further compromise the adolescent. Iron deficiency in pregnancy may contribute to increased prematurity, low birth weight, maternal cardiovascular stress, increased risk of maternal urinary tract infection, decreased maternal well-being, postpartum hemorrhage, and slower wound healing (Stang and Story, 2005). The nurse can reinforce the need for the teen to take prenatal vitamins during pregnancy and after the baby's birth. Vitamins should contain 30 to 60 mg of elemental iron daily. The nurse should educate about iron-rich foods and foods that promote iron absorption, such as those containing vitamin C.

Infant Care

Many adolescents have cared for babies and small children and feel confident and competent. Few teens are ever prepared, however, for the reality of 24-hour care of an infant. The nurse can help prepare the teen for the transition to motherhood while she is still pregnant. The trend toward early discharge from the hospital has made prenatal preparation even more important. The nurse can enlist the support of the teen's parents in education about infant care and stimulation. Young fathers-to-be would benefit from this education as well. Family values, practices, and beliefs about child care may be deeply embedded and require the nurse to work gently and persuasively to challenge any that may be detrimental to an infant (Savio Beers and Hollo, 2009). For example, a family may believe that corporal punishment is a necessary component of child-rearing.

Adolescents often lack the self-confidence and knowledge required to positively interact with their infants. They may also have unrealistic expectations about their children's development (Ryan-Krause et al, 2009). For example, they may expect their children to feed themselves at an early age or think that their children's behavior is more difficult than an adult mother might think. Teen parents often lack knowledge about infant growth and development, as seen in their limited verbal communication with their children, limited eye contact, and the tendency to display frustration and ambivalence as mothers. Over time, adolescents can improve their ability to foster their children's emotional and social growth. Children of adolescent mothers have also been found to be at risk for academic and behavior problems as they enter school (Terry-Humen et al, 2005; Cornelius et al, 2010). These risks can be reduced when the teen mother receives professional intervention and supervision in the area of infant social and cognitive development (Ryan-Krause et al, 2009).

Abusive parenting is more likely to occur when the parents have limited knowledge about normal child development. It may also be more likely to occur among parents who cannot adequately empathize with a child's needs. Younger teens are particularly at risk for being unable to understand what their infant or child needs. This frustration may be exhibited as abusive behavior toward the child. Nurses should continually assess for child abuse risk when dealing with teens who exhibit greater psychological distress or lack social supports (Lee, 2009).

After the birth of the baby, the nurse should observe how the mother responds to infant cues for basic needs and distress. Specific techniques that the new mother can be instructed to use in early child care are listed in the How To box. Begin parenting education as early as possible. Adolescents who feel competent as parents have enhanced self-esteem, which in turn positively influences their relationship with their child. Recognizing these good parenting skills and providing positive feedback help a young mother gain confidence in her role (Ryan-Krause et al, 2009).

HOW TO Promote Interactions between the Teen Mother and Her Baby

The nurse can make the following suggestions to the teen mother:

1. Make eye contact with your baby. Position your face 8 to 10 inches from your baby's face and smile.
 2. Talk to your baby often. Use simple sentences, but try to avoid baby talk. Allow time for your baby to "answer." This will help your baby to acquire language and communication skills.
 3. Babies often enjoy when you sing to them, and this may help soothe them during a difficult time or help them fall asleep. Experiment with different songs and melodies to see which your baby seems to like.
 4. Babies at this age cannot be spoiled. Instead, when babies are held and cuddled, they feel secure and loved.
 5. Babies cry for many reasons and for no reason at all. If your baby has a clean diaper, has recently been fed, and is safe and secure, he or she may just need to cry for a few minutes. What works to calm your baby may be different from other babies you have known. You can try rocking, gentle reassuring words, soft music, or remaining quiet.
 6. Make feeding times pleasant for both of you. Do not prop the bottle in your baby's mouth. Instead, sit comfortably, hold your baby in your arms, and offer the bottle or breast.
 7. When babies are awake, they love to play. They enjoy taking walks and looking at brightly colored objects or pictures and toys that make noises, such as rattles and musical toys.
-

Repeat Pregnancy

Teen mothers who have a closely spaced second pregnancy, or a repeat pregnancy, have poorer birth, educational, and economic outcomes than teens who do not. In 2009, 19% of teen births were a repeat birth (Ikramullah et al, 2011). Some studies have shown that the younger the teen at first birth, the more likely she will have a second teen birth within 24 months (Savio Beers and Hollo, 2009). A Healthy People 2020 objective is to reduce the proportion of pregnancies conceived within 18 months of a previous birth. Nurses should recognize which teens are at risk for a second teen pregnancy, such as lower educational and cognitive ability, mental health issues, physical trauma, losses (such as death of a loved one), and substance use. Also, some teens who report a planned first pregnancy are more likely to have an intentional second pregnancy within 24 months to complete their family (Savio Beers and Hollo, 2009; Patchen et al, 2009).

Discussions about family planning should begin during the third trimester of the current pregnancy. Nurses should review contraceptive options and help the young woman identify the

methods she is most likely to use. It is helpful to determine at this time the methods she has used in the past, her satisfaction or dissatisfaction, and reasons for use or nonuse. Many teens express unrealistic goals, such as “I am never going to have sex again” or “I need a break from guys,” and they may erroneously believe that they are unable to conceive for some time after the delivery. After delivery, the nurse should follow-up on the young woman’s plan. Obstacles to obtaining contraceptives may exist, and the nurse can identify these and help problem-solve with the new mother.

Schooling and Educational Needs

Adolescents who become parents may have had limited school success before the pregnancy. However, coping with the demands of child-rearing coupled with the immaturity of the young mother may make school even less of a priority. As noted previously, the potential for a closely spaced second birth may be lessened by a return to school. Fifty-one percent of teen mothers earn a high school diploma compared with 89% of women who did not give birth during the teen years. Federal legislation passed in 1975 prohibits schools from excluding students because they are pregnant. Greater emphasis is placed on keeping the pregnant adolescent in school during the pregnancy and having her return as soon as possible after the birth. Several factors may positively influence a young woman’s return to school. These include her parents’ level of education and their marital stability, small family size, whether there were reading materials at home, whether her mother is employed, and whether the young woman is African American.

A practical challenge for young parents is locating and affording quality child care; difficulties with this may prevent the highly motivated teenager from returning to high school. In the past 30 years, the percentage of parenting teens who return to high school and graduate has improved significantly. Attendance in college, now becoming the career requisite, is still less attainable for women who had children as teenagers than for those who delayed childbearing, and less than 2% attain that college degree by the age of 30 (Ng and Kaye, 2012).

Young women who have pregnancy complications may seek home instruction. This decision is made according to regulations issued by the state boards of education. Some young women have difficulty attending school because of the normal discomforts of pregnancy or because of social and emotional conflicts associated with the pregnancy. Teens who leave school without parental or medical excuses may face legal problems because of truancy. This increases the potential for them to become school dropouts. The nurse can determine whether this has happened and try to coordinate with the school personnel (and school nurse, if one exists) to tailor efforts for a particular pregnant teen to keep her in school. Specific needs to be addressed include the following: (1) using the bathroom frequently, (2) carrying and consuming more fluids or snacks to relieve nausea, (3) climbing stairs and carrying heavy book bags, and (4) fitting comfortably behind stationary desks. Schools that are committed to keeping students enrolled are generally helpful and will assist in accommodating special needs.

TEEN PREGNANCY AND THE NURSE

Nurses can influence teen pregnancy through appropriate interventions at home and in the community.

Home-Based Interventions

Nurses can identify young women at risk for pregnancy in families currently receiving services. Younger sisters of pregnant teens are at a twofold increased risk for becoming pregnant themselves (Savio Beers and Hollo, 2009). Nurses can offer anticipatory guidance addressing sexuality issues to the parents of all preteens and teens during home visits to increase their knowledge and awareness.

Visiting the pregnant teen in her home allows the nurse to assess the facilities available at home for management of her pregnancy needs and the suitability of the environment for her child. Some specific areas to assess are adequacy of heating and cooling, a source of water, cleanliness of the home, cooking facilities, and food storage. The nurse may find it more convenient for parents and other family members to participate in education and counseling sessions in their own home. Also, the need for financial assistance and other social service support may be more easily identified. Home visiting by nurses during a young woman’s pregnancy can be critical in achieving compliance with antepartum goals concerning weight gain, good nutrition, and prenatal medical concerns (Figure 35-2).

A teen pregnancy can shift the family dynamics. Families may go through stages of reactions. First, a crisis stage may occur, characterized by many emotions and conflict. By the third trimester, a honeymoon stage may occur, with greater acceptance and understanding of the teen and the impending birth. Finally, after the infant’s birth, reorganization may occur, during which conflict may emerge again over issues of child care and the young woman’s role. The nurse can facilitate family coping and resolution of these stages by treating the family as client and assessing each person’s role and strengths. Ultimately,

FIG 35-2 Both the teen mother and the teen’s own mother can be included in health teaching.

family support for a teen parent can positively influence both mother and infant (Savio Beers and Hollo, 2009). A balance of moderate family guidance or supplementary care supports young mothers in their parenting role rather than replacing it.

QSEN FOCUS ON QUALITY AND SAFETY EDUCATION FOR NURSES

Teen Pregnancy

Targeted Competency: Evidence-Based Practice—Integrate best current evidence with clinical expertise and client/family preferences and values for delivery of optimal health care.

Important aspects of EBP include:

- Knowledge: Describe evidence-based practice (EBP) to include the components of research evidence, clinical expertise, and client/family values
- Skills: Locate evidence reports related to clinical practice topics and guidelines
- Attitudes: Value the need for continuous improvement in clinical practice based on new knowledge

Evidence-Based Practice Question

You are an RN in a community-based health clinic, conducting sports physicals for high-school aged students. You conduct a physical assessment on a female 18-year-old student, Gloria, who has been accompanied to this appointment by her mother. During the physical exam, Gloria confides in you that she is sexually active and is not currently using any form of contraception because her mother is not supportive. You ask Gloria if she would like to be using birth control and she says that she is not sure. You provide Gloria some educational materials on various contraceptive methods.

After the exam, Gloria's mother asks to speak with you privately. Gloria's mother is moderately emotional, worried that her daughter has been sexually active and might be pregnant.

- What are your legal limits around sharing information with Gloria's mother?
- Based on these limits, what information do you share with Gloria's mother?
- What might be your next step in facilitating a mother-daughter dialogue in this situation?
- Find a nursing research article about family communication with pregnant teens. Are there guidelines or outcomes from research that might be applied to this clinical scenario?
- What other patient outcome might you identify that could lead to a successful intervention in this scenario?

Prepared by Gail Armstrong, PhD®, DNP, ACNS-BC, CNE, Associate Professor, College of Nursing, University of Colorado.

Community-Based Interventions

Many communities have broad-based coalitions and planning councils that facilitate a comprehensive approach to teen pregnancy. These groups usually include health care professionals, social workers, clergy, school personnel, businessmen, legislators, and members of other youth-serving agencies. Nurses play a significant role on this team by participating in or organizing community assessments, public awareness campaigns, group education (for professionals, parents, and youths), and inter-professional programs for high-risk youths. Community acceptance is more likely when there is a broad base of support for activities directed at the reduction of teen pregnancy or reduction of consequences.

Research has evaluated years of pregnancy prevention programs. As less funding is available, programs must stand out to

LINKING CONTENT TO PRACTICE

Just as providing care to pregnant teens includes many of the *Healthy People 2020* objectives; this care is also consistent with the standards and competencies for public health professionals including nurses. Specifically, the nurse assesses the teen population, determines priorities for nursing actions based on the assessment, develops a plan and implements the plan by coordinating care with many appropriate agencies. In dealing with pregnant teenagers, it is essential to work with schools and many social service agencies in order to provide age-appropriate care and health education for both the teen and the baby. Skills in the core competencies such as assessment, planning, cultural competency, and communication are essential when providing care to this population.

From American Nurses Association: Scope & standards of practice: public health nursing, Silver Spring, Maryland, 2007, ANA; Public Health Foundation Council on Linkages: Core competencies for public health professionals, Washington, DC, June 11, 2009 adopted, PHF.

receive financial support. Research summaries that can be used by communities for strategic planning are available from the National Campaign to Prevent Teen and Unplanned Pregnancy (<http://thenationalcampaign.org/>), based in Washington, DC. Programs that have been evaluated fall into one of three categories: programs that focus on sexual factors (this includes educational programs addressing sexual behavior and STD/HIV), programs that focus on nonsexual behaviors (service learning that matches volunteerism with a didactic component), and programs that focus on both sexual and nonsexual factors (may bring other risk behaviors and/or protective factors into the curriculum). Because there is diversity available in the programs, communities can match their characteristics and needs with a program (Kirby, 2007).

The nurse can also be a valuable asset to schools. There are curriculum-based sex and STD/HIV education programs that have been evaluated and found to have positive effects on teens' sexual behavior (Kirby, 2007). Health teachers may ask nurses to provide educational materials or assistance with classroom instruction, especially in the areas of family planning, STDs, and pregnancy. Schools that do not have nurses may arrange to have a nurse from the health department available for health consultations with students during school hours. Schools may also request that nurses participate on their health advisory boards.

School-based health care clinics are operating in more than 1500 elementary, middle, and high schools in the United States. They are found primarily in urban areas (61%) but increasingly in rural (27%) and suburban (12%) regions. The services offered may include counseling, referrals, and primary care services. Some programs offer reproductive health counseling and services that can be vital in efforts to delay the onset of intercourse and increase the use of contraception. The nurse can assist school systems to design these programs as well as refer young women in need of reproductive health care services.

Nurses bring their knowledge about youth and reproductive behavior to any organization or group that has teens, their parents, or other professionals working with teens. Churches are becoming increasingly interested in addressing the needs of their youth, especially because teen sexual activity, pregnancy, and parenting are affecting more of their members.

EVIDENCE-BASED PRACTICE

When adolescents become parents they face challenges that set them apart from adult parents. Outcomes for teen parents and their children have been generously studied and clearly stated. What has been lacking in nursing research is a better understanding of the elements of nursing intervention that can improve these outcomes.

Previous studies have identified that pregnant and parenting adolescents can benefit from visiting nursing care on many fronts. This includes decreasing hospitalizations, ER visits, repeat pregnancies, spacing between births, less domestic violence and more. These studies focused more on the improved outcomes rather than informing nursing on the process by which this happens.

This study adds to the data that helps us understand how to help teenagers become parents. It focuses on information gathered from 30 Public Health Nurses (PHN) visiting pregnant and parenting teenagers. These PHN's submitted

stories about their young clients and those were analyzed to understand the basic social psychological problems experienced as well as the basic social psychological process used by the PHN to help the adolescent attain stronger parenting skills.

Nurse Use

The data that emerged from this study confirmed that adolescents begin parenting with negative life circumstances, poor knowledge base and lack of awareness of how to attain the knowledge. The elements of the PHN interventions that improved the adolescents' role as parents were wide ranging and included case management, health education, counseling and referral. This greater understanding about the process in which PHN home visiting works is essential for targeted and effective nursing interventions

Atkinson LD, Peden-McAlpine CJ: Advancing adolescent maternal development: a grounded theory. *J Pediatr Nurs* 29:168–176, 2014.

PRACTICE APPLICATION

A local youth-serving agency requested the assistance of a nurse, Kristen Brown, in the implementation of a new high school–based program for pregnant and parenting teen girls. The primary goal of the program is to keep these teens in school through graduation. The secondary goal is to provide knowledge and skills about healthy pregnancy, labor and delivery, and parenting. After delivery, students enrolled in this program were paid for school attendance and this money could be used to defray the costs of child care.

A nurse from the health department was the ideal choice to conduct the educational sessions. The group met weekly during the lunch hour. The curriculum that was developed included topics from early pregnancy through the toddler years. Occasionally, Ms. Brown recruited outside speakers such as a labor and delivery nurse or an early intervention specialist.

She also met individually with each enrolled student to provide case management services. Ideally, she would ensure that each student had a health care provider for prenatal care, that each was visited at home by a nurse, that each had enrolled in WIC and Medicaid if eligible, and that both the pregnant teen and her partner knew about other parenting and support groups.

One educational session that was particularly interesting was the discussion about the postpartum course—the 6 weeks after delivery. There were many lively discussions about labor experiences as well as some emotional discussions about the reality of coming home with a baby and changes in the relationship with their male partner. Accurate contraception information was provided, which helped to clarify the many myths the girls had heard from friends and older women. Many girls benefited from understanding the normalcy of postpartum blues, but one young woman recognized that she had a more serious and persistent depression and privately approached the nurse for assistance.

At the end of the first school year, the dropout rate for pregnant and parenting teens was reduced by half, and preterm labor rates had also declined. The local school board and a local youth-serving agency joined together to provide financial support to continue this program for an additional 2 years. Ms. Brown was asked to expand the educational programs and interventions she had developed.

What are some directions in which Ms. Brown might expand the program? List four.

Answers can be found on the Evolve site.

KEY POINTS

- The provision of reproductive health care services to adolescents requires sensitivity to the special needs of this age group. This includes knowing about state laws regarding confidentiality and services for birth control, pregnancy, abortion, and adoption.
- Pregnant teenagers have a substantial percentage of the first births in the United States. They are more likely to deliver prematurely and have a low-birth-weight baby. This risk can be reduced by early initiation of prenatal care and good nutrition.
- Factors that can influence whether a young woman becomes pregnant include a history of sexual victimization, family dysfunction, substance use, and failure to use birth control. Several factors may overlap.
- Nutritional needs during pregnancy can be challenged if the teenager has unhealthy eating habits and begins the pregnancy with limited reserves of vitamins and minerals. With education, the adolescent can make good food choices while still snacking or eating fast foods. Weight gain during pregnancy is a significant marker for a normal-weight baby.
- Young men need special attention and preparation as they become fathers. The interventions include information about pregnancy and delivery, declaration of paternity, care of infants and children, and psychosocial support in this role.

KEY POINTS—cont'd

- The pregnant teen will need support during her pregnancy and in child-rearing. Families may provide most of this support. However, many communities have a variety of services available for adolescents. These services include financial assistance for medical care, nutritional programs, and school-based support groups.
- Adolescent parents often have unrealistic expectations about their children and may not know how to stimulate emotional, social, and cognitive development. The children born to adolescents are at risk for academic and behavioral problems as they become older. Teens who receive education on normal development and child care are more likely to avert these problems with their children.
- During a pregnancy, teenagers are expected to attend school. Homebound instruction is reserved for those with medical complications. Teen mothers who return to school and complete their education after the birth of their child are less likely to have a repeat pregnancy. Problems finding child care and the need to have an income can create an obstacle to school return.
- Community coalitions, which include nurses, can have a significant impact on teen pregnancy. These coalitions generally have diverse representation from the community, and therefore their activities meet with more community support.

CLINICAL DECISION-MAKING ACTIVITIES

1. Become familiar with statistics on teen pregnancy, births, miscarriages, and abortions in your area, and collect information on use of prenatal care, low-birth-weight and premature deliveries, high school completion, and repeat pregnancies. Compare the trends in statistics to the impact and costs to the individual, her family, and the community.
2. Call or visit local schools and interview the school nurse or guidance counselors about teen pregnancy. Determine what resources are available through the schools for pregnancy prevention. Assess the family life education curriculum, and identify a teaching project for nursing students. Can pregnancy prevention and parenting education be incorporated into the learning objectives in the existing school curriculum?
3. Design and offer a childbirth preparation class for pregnant teens and their support persons. Include a plan for identifying potential participants, select a site that is accessible, and develop an evaluation method. Develop teaching tools that acknowledge adolescent development.
4. Assess reproductive health care services for young men in your community. Design an awareness campaign targeting young men on paternity issues and the prevention of pregnancy. Be specific about ways to incorporate male role models and mentors.

Mental Health Issues

Anita Thompson-Heisterman, MSN, PMHCNS-BC, PMHNP-BC

Anita Thompson-Heisterman earned the BSN, MSN, FNP, and PMHNP degrees and certificates from the University of Virginia. She began practicing community mental health nursing in 1983 as a psychiatric nurse in a community mental health center. Her community practice has included clinical and management activities in a psychiatric home care service, a nurse-managed primary care center in public housing, and an outreach program for rural older adults. Currently she is an assistant professor in the Division of Family, Community and Mental Health Systems at the University of Virginia School of Nursing, and her faculty practice is with the Memory and Aging Care Clinic at the University of Virginia Department of Neurology.

OBJECTIVES

After reading this chapter, the student should be able to do the following:

1. Describe the history of community mental health and make predictions about the future.
2. Discuss the prevalence of mental illness in the United States and the world.
3. Describe essential mental health services and corresponding national objectives for improving mental health.
4. Evaluate standards, models, concepts, strategies, and research findings for use in community mental health nursing practice to improve community mental health.
5. Describe the role of the community mental health nurse with individuals and with groups at risk for psychiatric mental health problems.
6. Apply the nursing process in community work with clients diagnosed with psychiatric disorders, families at risk for mental health problems, and vulnerable populations.

- Adults
- Adults with Serious Mental Illness
- Older Adults
- Cultural Diversity

Because providing community services and nursing care to people suffering from mental illness or emotional distress is complex and influenced by many individual and community factors, it requires a variety of approaches. Complicating factors include (1) the scope of emotional and mental disorders; (2) uncertainty about the specific cause, cure, and treatment for the most severe mental disorders; (3) the severe chronic disabling nature of some mental disorders; and (4) the complexity of the community mental health services sector. The scarcity of resources compounds the problems and presents challenges in community mental health work.

Cultural beliefs and economics influence the amount and types of services and treatment available in various countries. However, two universal truths exist: services for people with mental disorders are inadequate in all countries, and mental illness has a significant effect on families, communities, and nations. Therefore, specialized knowledge and skills about severe mental illness and mental health problems are necessary for effective nursing practice in the community. It is helpful to understand both the organization of mental health services from a historical perspective and the trends in current health care demands and delivery. Knowledge about populations at risk for psychiatric mental health problems and understanding illness outcomes in terms of biopsychosocial consequences are even more important. Finally, it is necessary to refine and broaden nursing process skills in treatment planning to include the impact of mental illness on families and communities.

This chapter focuses on the scope of mental disorders, the development of community mental health services, the current health objectives for mental health and mental disorders, and the role of the nurse in community settings. Conceptual frameworks useful in community mental health nursing practice are also presented. Because other chapters in this book are devoted to high-risk groups such as the homeless population and those with substance abuse problems, this chapter's focus is on the variety of **mental health problems** encountered in communities, with an emphasis on populations that have long-term, **severe mental disorders** and groups that are most vulnerable to mental health problems.

SCOPE OF MENTAL ILLNESS IN THE UNITED STATES

Mental health is defined in *Healthy People 2020* (U.S. Department of Health and Human Services [USDHHS], 2010) as

encompassing the ability to engage in productive activities and fulfilling relationships with other people, to adapt to change, and to cope with adversity. The World Health Organization (WHO) expands the definition, describing mental health as a state of well-being in which a person can realize his or her potential, and notes that mental health is essential if a person is to have health (WHO, 2008a). Mental health is an integral part of personal well-being, family and other interpersonal relationships, and contributions to community or society. Mental disorders are conditions that are characterized by alterations in thinking, mood, or behavior that are associated with distress and/or impaired functioning. Mental illness refers collectively to all diagnosable mental disorders. Severe mental disorders are determined by diagnoses and criteria that include degree of functional disability (American Psychiatric Association [APA], 2013).

Mental disorders are indiscriminate. They occur across the life span and affect persons of all races, cultures, genders, and educational and socioeconomic groups. They are the leading cause of disability in North America (WHO, 2008b). In the United States nearly 18% of adults (age 18 years and older) have a mental health condition severe enough to impair daily function, and 3.9% of these suffer from a serious mental illness such as schizophrenia (Substance Abuse and Mental Health Services Administration [SAMHSA], 2013). Nearly half of those with any mental disorder (8.1%) meet criteria for two disorders, mental health and substance abuse (National Institute of Mental Health [NIMH], 2013; SAMHSA, 2013). Fourteen percent of females and 7% of males between 12 and 17 years of age suffer from a major depressive disorder, and 11% of 13- to 18-year-old adolescents meet criteria for a lifetime substance abuse disorder (SAMHSA, 2013). By the 8th grade 24% of adolescents have ingested alcohol and by the 12th grade, 64% are drinking (SAMHSA, 2013). Adolescent mental health is a global concern as well (WHO, 2014). Nearly 17% of people over age 55 have a mood or anxiety disorder (Byers et al, 2010), and these rates will rise as the number of older Americans increases over the next two decades. Alzheimer's disease, the primary cause of dementia, is increasing. In 2014 an estimated 5.2 million Americans had Alzheimer's disease. This number includes 5 million people who were 65 years or older and approximately 200,000 individuals under age 65 who had younger-onset Alzheimer's disease (Alzheimer's Association, 2014, p. 16). The number of cases in the population doubles every 5 years of age after age 60

and is becoming a public health crisis as the “baby boomer” generation ages. Affective disorders include major depression and manic-depressive or bipolar illness. Although bipolar illness may affect only a small proportion of the population, major depression is pervasive and is the leading cause of disability among adults ages 15 to 44. Anxiety disorders, including panic disorder, obsessive-compulsive disorder, post-traumatic stress disorder (PTSD), and phobias, are prevalent, affecting 18% of American adults each year. Mental disorders can also be a secondary problem among people with other disabilities. Depression and anxiety, for example, occur more frequently among people with disabilities (NIMH, 2014).

The impact of mental illness on overall health and productivity in the United States and throughout the world is often underrecognized. In the United States, mental illness causes about the same amount of disability as heart disease and cancer. Depression is a leading cause of years of productivity loss because of disability in the United States and globally (Raviola et al, 2011; WHO, 2008b, 2012). Despite the prevalence of mental illness, only one third of persons with a mental disorder obtain help for their illness in any part of the health care system, and the majority of persons with mental disorders do not receive any specialty mental health care. Although 65% of persons with the most serious mental illnesses received treatment in 2011, 35% did not (SAMHSA, 2013). Of young people ages 4 to 17 years who have a mental disorder, 60% received help through private or community-based providers and 40% through schools (USDHHS, 2009). The World Health Organization (2008b) reports the global burden of mental health, substance abuse, and neurological diseases at 14% and noted that depression is the main cause of illness and disability in adolescents worldwide (WHO, 2014). In recognition of the lack of resources, the WHO launched a mental health global action program (mhGAP) to begin to address these needs (WHO, 2008a). Their poster “No Health Without Mental Health” effectively describes the need to integrate physical and mental health services. Given this information, it is critical that nurses recognize and provide health services for those with mental disorders in a variety of nontraditional community settings.

In addition to diagnosable mental conditions, there is growing awareness and concern about the public health burden of stress, especially after terrorist attacks at home and around the world; natural disasters such as hurricanes, tsunamis, tornados, and earthquakes; and human-made disasters. Strengthening the public health sector to respond to these events involves developing community mental health responses as well as addressing physical health concerns. Community mental health nurses (CMHNs) play an important role in identifying stressful events, assessing stress responses, educating communities, and intervening to prevent or alleviate disability and disease resulting from stress.

Although all of us are vulnerable to stressful life events and may develop mental health problems, persons with chronic and persistent mental illness have numerous problems. Mental illness is misunderstood, and those who suffer from it often experience stigma and lack of social support, which is so critical to health. Persons with mental illness are often identified by the

illness as a schizophrenic instead of a person with the disease of schizophrenia. The disruptive symptoms of this illness often occur just as young persons are attempting to finish schooling and develop a career, shattering lives and driving many into a lifetime of underemployment, poverty, and lack of access to adequate health services, housing, and social supports. Many accessible and coordinated services are needed to enable that people with chronic mental illness live in the community, yet these often are not available. Despite the inadequacy of resources, advances have been made in the treatment of mental illness. Two major movements have influenced these advances: consumer advocacy and better understanding of the neurobiology of mental illness (May, 2011; Pandya and Jän Myrick, 2013; Parry, 2010). Naturally, the financing of mental health services affects access to care and influences treatment. The system known as managed care has significantly affected service delivery for the past 25 years, and passage of mental health parity and national health care reform through the Patient Protection and Affordable Health Care Act will undoubtedly influence mental health care during the next decade (Mechanic, 2012; Pearlman, 2013).

Consumer Advocacy

Consumer advocacy movements for people with mental illness, like those for other illnesses, came about to fulfill unmet needs and to attempt to decrease the stigma associated with mental illness. Specifically, the National Alliance for the Mentally Ill (NAMI) was the first consumer group to advocate for better services. This consumer advocacy group worked to establish education and self-help services for individuals and families with mental illness. Efforts of the NAMI gained momentum in the early 1980s. Subsequently, political groups and legislative bodies responded with direct support. One example of direct support was funding for the Community Support Program (CSP) by the National Institute of Mental Health (NIMH). The CSP provided grant monies to states to develop comprehensive services for persons discharged from psychiatric institutions and invited consumers to participate. These and similar efforts have helped bring consumers, families, and professionals together to work toward improvement in the treatment and care of persons with mental illness.

Neurobiology of Mental Illness

Mental illnesses are complex biopsychosocial disorders. Considerable emphasis in the past 20 years has focused on the biological basis of mental illness. The 1990s were declared the “decade of the brain” as advances in research in neurology, microbiology, and genetics led to understanding the structural and chemical complexity of the brain. Consequently, more is now known about the functions of the brain than at any time in history. We have learned that the brain is not a static organ. The concept of brain plasticity demonstrates that new learning actually changes brain structure. For example, traumatic experiences change brain biochemistry, as do significant positive experiences (May, 2011). This information supports the thought that both experience and psychosocial factors have effects on the etiology and on the treatment of mental illnesses. Both somatic and

psychosocial interventions need to be used to treat mental illness. In addition to research, neuroradiological techniques aid diagnosis and treatment of people with psychiatric disorders. Angiography is used to screen for abnormalities of the vascular system, such as atherosclerosis and brain tumors, that can lead to behavior changes. The use of noninvasive scanning of the brain can help in making diagnoses. Computed axial tomography (CAT) scans provide a cross-sectional view of the brain, whereas nuclear magnetic resonance (NMR) imaging offers the advantage of imaging the brain from different planes. Still other techniques, such as positron emission tomography (PET) and single-photon emission computed tomography (SPECT), provide information about cerebral blood flow and brain metabolism. The information gained from these advanced technologies can lead to better understanding about mental illness and treatment and help scientists study the effects of psychotherapeutic interventions on the brain. Discoveries in psychopharmacology have also revolutionized the treatment of mental illness. New, atypical antipsychotic drugs used in the treatment of schizophrenia can improve the quality of life for many, primarily because of fewer side effects. For example, side effects of antipsychotic drugs include central and peripheral nervous system manifestations. Newer second-generation antipsychotics have reduced some of these side effects but new adverse effects, including weight gain, insulin resistance, and dangerously high blood glucose levels, collectively known as metabolic syndrome, have created fresh concerns for consumers and providers (Pramyothin and Kaodihiar, 2010). Although psychopharmacology has dramatically improved the lives of people with severe mental illness, controversies exist about the costs of monitoring treatment. Newer antidepressant medications known as selective serotonin reuptake inhibitors (SSRIs) are now considered the first choice in the treatment of depression as well as for many anxiety disorders because they lead to good responses with fewer side effects. They are now widely prescribed by primary care physicians as well as psychiatrists and are some of the most prescribed medications in the United States. Although considered safer than older agents, evidence suggests that the SSRIs may accelerate bone loss, leading to osteoporosis, and they may not be more effective than nonpharmacological interventions, such as exercise, in treating depression (Eom et al, 2012). Future directions suggest the science of pharmacogenetics will enable more individualized treatment of mental illness based on specific, genetically based responses to pharmaceuticals (Preskorn, 2010).

SYSTEMS OF COMMUNITY MENTAL HEALTH CARE

Managed Care

Managed care is a system of managing health care to ensure access to appropriate and cost-effective services. Managed mental health care grew rapidly during the 1990s, and by 1999 nearly 80% of Americans were enrolled in a managed health care plan. Initially a method to control costs and access to mental health care in the private insurance sector, managed care became a significant factor in public mental health, and by the

turn of the century more than half of all Medicaid recipients were enrolled in a managed mental health care plan (Mechanic, 2008). Consumer outcomes such as health status, quality of life, functioning, and satisfaction are considerations in deciding whether services are effective.

Because one purpose of managed care was to control costs, often by substituting less costly services for more costly ones, the findings about consumer outcomes become critical. The provision of quality comprehensive services needed by persons with serious and persistent mental illness in the community is not inexpensive, but it is generally less costly than hospital care and frequent admissions. Services must fit the needs of the consumer, and outcomes research and consumer satisfaction can help guide care and policy decisions.

Changes continue to take place in mental health funding, and changes in one sector can have far-reaching consequences in many others. Although legislation was passed in 1996 ensuring **parity** for mental illness coverage in insurance plans, the implementation at the state level and the effects on insurance plans had been rather negligible for a variety of reasons, and further legislation passed in 2008 was needed to improve service access (Mental Health America, 2009).

The seemingly constant changes in mental health funding present challenges for nurses, who need to make judgments about the positive and negative outcomes of these changes on the people they care for before research findings that can be generalized to the population are readily available.

Patient Protection and Affordable Health Care Act

The **Patient Protection and Affordable Health Care Act** (ACA, passed in 2010) affects both access to and funding of mental health services and will increase the need for community mental health nurses at the general and advanced practice levels (Mechanic, 2012; Pearlman, 2013). The ACA will ensure access to mental health services for 27 million more Americans who had no coverage and an additional 35.5 million who will have new or improved mental health services added to existing coverage (Pearlman, 2013). Preventive mental health services, such as depression and behavioral screening, are now required to be offered free of charge, and integration of mental health services into primary care is mandated (USDHHS, 2014). The ACA removes economic and geographic barriers and helps remove the stigma of mental illness through routine screening and treatment within a primary care visit. It is expected that earlier detection and treatment of mental health and substance abuse conditions will occur, thus improving the mental health of the population (Busch et al, 2013). Such a major change in the manner in which services are provided along with the expected increase in the number of people seeking mental health care will lead to new challenges and opportunities in the delivery of care.

Mental Health Services

Mental health problems and mental disorders are treated by a variety of caregivers who work in diverse and loosely connected facilities. The landmark surgeon general's report on mental health, in an attempt to delineate where Americans receive

mental health services, defined four major ways through which people receive assistance: (1) the specialty mental health system, both public and private, (2) the general medical or primary care sector, (3) the human service sector, and (4) the voluntary support network, including advocacy groups (USDHHS, 1999). Nurses need to understand that delivery of mental health services may occur in any of these systems. In fact, most older adults receive mental health services through the primary care sector, whereas most children and adolescents are served through human services that include schools. Those with resources, less severe mental health problems, and access to primary care are more likely to have their mental health needs addressed within the context of a visit to their primary care provider. Because of the influence of managed care, access to a specialist, if indicated for psychiatric treatment, has occurred via this route as well. The Patient Protection and Affordable Health Care Act passed in 2010 now mandates mental health screening and initiation of treatment in primary care and may have a significant effect on where mental health services are received (Mechanic, 2012; Pearlman, 2013).

The **community mental health model** is the primary method of care for people with serious and persistent mental illness. Components of this model include team care, case management, outreach, and a variety of rehabilitative and recovery approaches to help prevent exacerbations of illness. In most states, services are provided through comprehensive **community mental health centers** (CMHCs). There is great variance in how each state and locality implements mental health service delivery and each version continues to evolve in this era of health care reform, as the CMHCs react to societal, political, and fiscal pressures. As resources diminish, the focus narrows and many CMHCs are unable to provide services to populations other than those with serious and persistent mental illness. It is unclear how the growing focus on integration of mental health into primary care, parity in insurance coverage, and the passage of national health care reform might impact the community mental health system of care, but it is hoped that it will lead to more comprehensive, integrated, and less fragmented services (Garfield et al, 2011; Mechanic, 2012).

EVOLUTION OF COMMUNITY MENTAL HEALTH CARE

Historical Perspectives

How the community has perceived the etiology of mental and emotional illness across the ages has influenced the care and treatment of persons suffering from these disorders. These patterns were often cyclical. In ancient times, mental illness was viewed as resulting from supernatural forces, and those afflicted were sometimes shunned. During the Greco-Roman era, mental and physical illnesses were seen as interrelated and resulting from physical conditions. Treatment was aimed at curing the disease by restoring balance. A return to a belief in supernatural etiologies occurred during the Middle Ages in Europe and continued in the years in which the United States was being formed into a country. These beliefs led to poor treatment of the mentally ill, including incarceration, starvation, and torture. Near

the end of the eighteenth century, the revolution in mental health care known as Humanitarian Reform took place. This reform movement, influenced by Philippe Pinel (1759-1820) in France and Benjamin Rush (1745-1813) in North America, led to hospital expansion, medical treatment, and the community mental health movements (Boyd, 2011).

Before the Humanitarian Reform, persons with mental illness were often housed in jails because health and social services had not been developed. Even later, after the development of hospitals as a site of treatment, persons with mental disorders were neglected and mistreated. Although the first psychiatric hospital in the United States was built in Williamsburg, Virginia, in 1773, approximately 50 years passed before widespread construction of facilities in other states took place. One person in particular, Dorothea Dix, led reform efforts to correct inhumane practices (Boyd, 2011).

Dorothea Lynde Dix (1802-1887) focused attention on criminals, those with mental disorders, and victims of the Civil War. She believed that people with mental disorders needed health and social services, and her efforts influenced the improved organization of mental health services. Her work led to the development of hospitals as the primary site of care, and she influenced standards for hospital administration and nursing care. Because of her lifetime efforts, often through political action, treatment for mentally infirm persons was altered in both North America and Europe (Boyd, 2011).

Hospital Expansion, Institutionalization, and the Mental Hygiene Movement

Psychiatric hospitals constructed during the expansion era were located in rural areas and were intended for small numbers of clients. However, they soon became overcrowded with people who had severe mental disorders, with older adults, and with immigrants who were poor and unable to speak English. Clients were essentially separated from the community and isolated from their families. Many were institutionalized for the rest of their lives, in response to both a continued fear of persons with mental disorders and a lack of community resources. **Institutionalization** of large numbers of people, combined with minimal information about cause, cure, and care, resulted in overcrowded conditions and exploitation of clients.

At the beginning of the twentieth century, institutional conditions were reported publicly in the United States by Clifford Beers, who had been hospitalized both in private and in public mental hospitals (Parry, 2010). Beers urged reform and influenced the founding of the National Committee for Mental Hygiene. During the mental hygiene movement, attention shifted to ideas about prevention, early intervention, and the influence of social and environmental factors on mental illness. These ideas about treatment also influenced the development of multidisciplinary approaches to treatment. The mental hygiene and community mental health movements increased understanding about mental illness.

Further understanding about the scope of mental illness was gained during the conscription process for the armed services in World War II. Many of the persons screened for military service during World War II were found to have neurological

and psychiatric mental health disorders. Even more military personnel required treatment for mental health problems associated with social and environmental stress during and after the war, not only in the United States but also in Europe, Russia, and Pacific Rim countries (Boyd, 2011). At the same time, the community mental health model continued to expand slowly while populations consisting of individuals with severe mental disorders and older adult persons with dementia grew larger in the state hospitals. Demands for mental health services in communities, combined with concerns about conditions of state psychiatric hospitals, prompted federal legislation that influenced development of the community mental health concept.

Federal Legislation for Mental Health Services

The first major piece of legislation to influence mental health services in the United States was the Social Security Act in 1935. This act, created in response to economic and social problems of the era, shifted the responsibility of care for ill people from the state to the federal government. The federal government's role expanded when the demand for mental health services increased during and after World War II. Key points of legislation that influenced the development of community mental health services are summarized in Table 36-1.

In 1946 the National Mental Health Act was passed and the **National Institute of Mental Health** (NIMH) administered its programs. Objectives included development of education and research programs for community mental health treatment approaches. The act also included financial incentives for training grants to increase the number of professional workers, including nurses, in mental health services. Education and research programs materialized readily, along with advances in

science and technology and the development of psychotropic medications. In 1955 the Mental Health Study Act was passed, and the Joint Commission on Mental Illness and Health was established by the NIMH. Members of the commission studied national mental health needs and submitted to Congress a report entitled *Action for Mental Health*. Recommendations of the report included continued development of research and education programs, early and intensive treatment for acute mental illness, and shifting the care of severely mentally ill persons away from the large hospitals to psychiatric wards in general hospitals and to community mental health clinics. Along with prevention and intervention, community services were to include aftercare services following hospitalization for individuals with major mental illness (Boyd, 2011). The shift in the locus of care from state hospitals to community systems was begun.

The Community Mental Health Centers Act was passed in 1963, and the CMHC concept was formalized. Federal funds were designated to match state funds to construct CMHCs and start-up programs. CMHCs were mandated to have five basic services: inpatient, outpatient, partial hospitalization, 24-hour emergency services, and consultation/education services for community agencies and professionals. In addition, regulations encouraged states to offer diagnostic and rehabilitative precare and aftercare services (Boyd, 2011). However, many CMHCs, especially those in poor and rural areas, were unable to generate adequate money for continuing their start-up programs. Funding did not follow the client to the community. The deinstitutionalization of persons with severe mental disorders was well underway before some of these shortcomings were recognized.

TABLE 36-1 Legislation That Influenced Community Mental Health Services

Year	Legislation	Focus
1946	National Mental Health Act	Education and research for mental health treatment approaches began (NIMH)
1955	Mental Health Study Act	Resulted in Joint Commission on Mental Illness and Health, which recommended transformation of state hospital systems and establishment of community mental health clinics
1963	Community Mental Health Centers Act	Marked beginning of community mental health centers' concept and led to deinstitutionalization of large psychiatric hospitals
1975	Developmentally Disabled Assistance and Bill of Rights Act	Addressed the rights and treatment of people with developmental disabilities and provided foundation for similar action for individuals with mental disorders
1977	President's Commission on Mental Health	Reinforced importance of community-based services, protection of human rights, and national health insurance for mentally ill persons
1981	Omnibus Budget Reconciliation Act	Rescinded much of the 1977 commission's provisions and shifted funds for all health programs from federal to state resources
1986	Protection and Advocacy for Individuals with Mental Illness Act	Legislated advocacy programs for mentally ill persons
1990	Americans with Disabilities Act	Prohibited discrimination and promoted opportunities for persons with mental disorders
1996	Mental Health Parity Act	Attempted to address discrepancy between mental health and medical-surgical benefits in employer-sponsored health plans
2008	Mental Health and Addiction Equity Act	Prohibits discrepancy in coverage between mental health and physical health benefits in employer-sponsored and private insurance plans and added substance abuse as a covered mental health condition
2010	Patient Protection and Affordable Health Care Act	Prohibits discrimination in coverage for preexisting conditions. Prohibits discontinuation of coverage because of illness

DEINSTITUTIONALIZATION

Deinstitutionalization involved transitioning large numbers of people from state psychiatric hospitals to communities. The cost of institutional care was perhaps the main reason for the movement; other influences included the discovery of psychotropic medications and civil rights activism (Boyd, 2011). The goal of deinstitutionalization was to improve the quality of life for people with mental disorders by providing services in the communities where they lived rather than in large institutions. To change the locus of care, large hospital wards were closed and persons with severe mental disorders were returned to the community to live. Many were discharged to the care of family members; others went to nursing homes. Still others were placed in apartments or other types of adult housing; some of these were supervised settings, and others were not.

Not surprisingly, as with any abrupt, dramatic change, problems related to unexpected service gaps between the hospitals and the CMHCs led to continuity-of-care problems. Although deinstitutionalization was a noble idea, there were not adequate resources to support the implementation. For example, families were not prepared for the treatment responsibilities they had to assume, and yet few mental health systems offered them education and support programs. Although many older adult clients were admitted to nursing homes and personal care settings, education programs were seldom available for staff members, who often lacked the skills necessary to treat persons with mental disorders. And finally, some clients found themselves in independent settings such as rooming houses and single-room occupancy hotels with little or no supervision and few skills to manage living in the community. Clients, families, communities, and the nation suffered as poor living and social conditions were associated with mental disorders. Homelessness and placement of the mentally ill in jails and prisons also occurred. These conditions may have increased the stigma associated with persons with mental illness. The placement of persons with mental illness in nursing homes, assisted living facilities, and jails was often referred to as “**reinstitutionalization**,” because it only shifted people from one institution to another. These issues prompted additional legislation and advocacy efforts.

Civil Rights Legislation for Persons with Mental Disorders

The development of CMHCs was based partially on the principle that persons with mental disorders had a right to treatment in the least restrictive environment (Boyd, 2011). Although CMHCs were less restrictive than institutions, they lacked necessary services. For example, people with severe mental disorders require daily monitoring or hospitalization during acute episodes of illness. Even though hospital services were available, many individuals expressed their rights to refuse treatment and resisted admission. Also, transitional care after discharge for those persons who were admitted to hospitals was not available in most communities. In addition to the right to refuse treatment, advocates for mentally ill individuals focused on such civil rights issues as segregated services, inhumane practices in psychiatric hospitals, and failure to include clients in treatment

planning. Activism for minorities and handicapped persons also influenced civil rights legislation for persons with mental disorders. In particular, during the 1970s institutional conditions of persons with developmental handicaps prompted passage of the Developmentally Disabled Assistance and Bill of Rights Act. Other legislation shifted funding from the federal to the state level. The Mental Health Systems Act, was passed in 1980 to improve mental health services. However, in 1981 when Ronald Reagan took office, the Act was repealed in 1981 and replaced with a block grant program reducing the involvement of the federal government (Mechanic, 2007). This action limited the federal leadership role, shifted more costs back to the states from the federal government, and further impeded the implementation and provision of community mental health services.

State systems of mental health services developed in unique and diverse ways and were often inadequate. In general, individuals with severe mental disorders were vulnerable and neglected and either lacked or were unable to access health and social services. In an effort to offset these problems, in 1986 the federal Protection and Advocacy for Individuals with Mental Illness Act and the State Comprehensive Mental Health Services Plan Act of 1986 were passed. Advocacy programs for mentally ill persons became part of the same state advocacy systems developed earlier under the Developmental Disabled Assistance and Bill of Rights Act, and consumer involvement in CMHCs was mandated (Boyd, 2011). In spite of advocacy efforts and legislation, the CMHCs were unable to meet the increased and diverse demands for mental health services in their communities. The lack of services, combined with concerns about discrimination against all people with disabilities, led to additional legislation.

The **Americans with Disabilities Act** (ADA) was passed in 1990. The ADA mandated that individuals with mental and physical disabilities must not be discriminated against and must be brought into the mainstream of American life through access to employment and public services (Boyd, 2011). History reveals that past legislation promoted the rights of persons with mental disorders, but litigation was also responsible for the lack of growth, if not the decline, in community mental health services. In 1996 the Mental Health Parity Act was passed to address discrimination in insurance coverage and in 2008 the Mental Health Parity and Addiction Equity Act (MHPAEA) was passed, prohibiting differential coverage for mental health disorders (Mental Health America, 2009). The community mental health nurse can advocate for clients to ensure equality in access to health services, housing, and employment.

Advocacy Efforts

Consumers or survivors, defined as persons who are current or former recipients of mental health services, along with their families have had a significant impact on mental health services. As in all areas of health care, the rights and wishes of consumers are important in planning and delivering services. However, consumers of mental health services have traditionally had difficulty advocating for themselves. In the past, treatment programs often fostered passivity in clients and excluded them from the treatment planning process. In addition, family

BOX 36-1 Advocacy and Self-Help Organizations

- *Community Support Program (CSP)*: A program of the U.S. Department of Health and Human Services (USDHHS), Substance Abuse and Mental Health Services Administration (SAMHSA), and the Center for Mental Health Services (CMHS), that developed plans for a model continuum of care, offers grants for demonstration programs including community rehabilitation projects, and provides money to states for development of consumer and family services and advocacy efforts
- *Consumer/Survivor Mental Health Research and Policy Work Group*: An endeavor sponsored by the Mental Health Statistics Improvement Program of the CMHS to initiate consumer representation in activities of the National Association of State Mental Health Program Directors (NASMHPD)
- *Mental Health America (MHA)*: An organization aimed at improving mental health in the population at large, emphasizing prevention
- *National Alliance for the Mentally Ill (NAMI)*: A family organization that promotes family support groups, education programs, public campaigns to reduce stigma, and advocacy for mental health policy and services at local and national levels
- *NAMI Consumers' Council*: A consumer advocacy group that advocates for improved and effective psychiatric services and consumer empowerment
- *National Mental Health Consumers' Association (NMHCA)*: A consumer organization that advocates for improvements in the mental health system

members were responsible for care in the home, but they lacked resources and even information about treatment (Riesser and Schorske, 2013). Like consumers, family members suffered from the stigma of mental illness and public attitudes that contributed to self-advocacy problems. In contrast, self-advocacy and involvement in treatment planning fosters self-confidence, promotes participation in services, and may have a significant influence on policy decisions (Marchinko and Clark, 2011; Tierney and Kane, 2011). Consumer and family groups fostered these objectives.

Family members led self-advocacy efforts in the 1970s, when small groups organized to challenge and change mental health services. These early efforts resulted in the formation of the **National Alliance for the Mentally Ill** (NAMI), which today has both state and local affiliates. Soon, consumer groups formed to advocate for better services, changes in mental health policy, self-help programs in treatment, and empowerment. Several advocacy groups that support these consumer efforts are summarized in **Box 36-1**. In their assessment of resources, nurses can identify community advocacy and support groups.

CONCEPTUAL FRAMEWORKS FOR COMMUNITY MENTAL HEALTH

The community mental health principles that are the underpinnings of practice include the right to mental health services delivered in the least restrictive environment, consumer involvement in treatment, advocacy, and rehabilitative and recovery services. Biopsychosocial theories are useful to understand the multidimensional aspects of community mental health nursing. These include theories and models that explain biological processes, systems, personality, life span development, family dynamics, and

stress and coping. Focusing on wellness or recovery, relapse prevention, or relapse management and helping the client reach a maximal level of function are useful for nursing practice.

Another helpful framework for community mental health practice is **systems theory**, which emphasizes the relationship between the elements of a unit and the whole. An understanding of the whole occurs through the examination of interactions and relationships that exist between the parts. A holistic view of system and subsystems can be applied in a variety of ways in community mental health practice. One example of a subsystem in a community is its cultural groups. Subsystems of the cultural groups are families; subsystems of the families are individuals. Using systems theory to explore the background, conditions, and context of situations will disclose information about the positive and negative forces that either promote or undermine the well-being of any unit in the system.

The diathesis-stress model is also useful in CMHN practice. This theory integrates the effects of biology and environment, or nature and nurture, on the development of mental illness. Certain genes or genetic combinations produce a predisposition to a disorder. When an environmental stressor challenges a predisposition to a disorder, the mental disorder may be expressed (Edmondson et al, 2014; Liu and Alloy, 2010). The integration of psychosocial and neurobiological paradigms is critical to the practice of psychiatric nursing. Nurses must recognize the effects of environment and biology on people and actively work to mitigate psychosocial as well as biological stressors through teaching strategies to promote mental health and reduce stress.

Levels of Prevention

Health promotion and illness prevention are fundamental to community mental health practice as well as to national objectives for mental health (USDHHS, 2010). Therefore, the concepts of primary, secondary, and tertiary levels of prevention are useful in community mental health practice (see **Levels of Prevention** box).

Primary prevention refers to the reduction of health risks. It involves both health promotion and disease prevention. Health promotion strategies aim to enhance the well-being of healthy populations, whereas disease prevention strategies focus on the identification of populations at risk and conditions that may cause stress and illness. Providing education about stress reduction techniques to adults in the workplace is a form of mental health promotion. An example of disease prevention is to provide mental health information about depression and eating disorders to adolescents in schools.

Secondary prevention activities are aimed at reducing the prevalence or pathological nature of a condition. They involve early diagnosis, prompt treatment, and limitation of disability. Many functions of the practitioner role are aimed at secondary prevention for individuals. These include providing individual and group psychotherapy, case management, and referral. Screening members of a community for depression during National Depression Screening Day is an example of population-based secondary prevention. Counseling, referral, and treatment interventions after traumatic incidents, such as terrorist attacks or natural disasters, are other important community interventions.

Tertiary prevention efforts attempt to restore and enhance functioning. On a community level, tertiary prevention activities might include support of affordable housing, promotion of psychosocial rehabilitation and recovery programs, and involvement in advocacy and consumer groups for persons with mental illness. Many nursing role activities in community mental health are aimed at tertiary prevention with individuals. They include working with individuals to monitor illness symptoms and treatment responses, coordinating transition from the hospital to the community, and identifying respite care options for caregivers.

Relapse management with a focus on recovery is central to many of the programs and activities that enhance coping skills and competence. The nurse may participate in **assertive community treatment** (ACT) programs, psychosocial rehabilitation (clubhouses), and intensive case management. ACT programs differ from intensive case management approaches in that they are based more on a medical model and team approach and provide crisis and case management services 24 hours a day, 7 days a week. They are sometimes referred to as hospitals without walls (Salyers and Tsemberis, 2008). **Intensive case management models** vary across programs but generally include contact with clients several times a week by an individual case manager. Nurses have critical roles in both treatment programs, as they have the knowledge and skills to provide comprehensive biopsychosocial care.

For example, the nurse visits the client at home, checks medication, assesses physical and emotional functioning, and may take the client shopping for nutritional food. The nurse may accompany the consumer to the physician's office and serve as an advocate for the client in this setting.

As case managers, nurses work with consumers, family members, and other caregivers to foster coping and competency aimed at managing illness symptoms. The goal of managing illness symptoms is to offset relapse and promote recovery. **Relapse management** and promotion of **recovery** are major goals of intervention in community mental health nursing. Assessment of the frequency, intensity, and duration of symptoms for the purpose of identifying biological, environmental, and behavioral triggers that may lead to illness relapse helps the consumer manage the illness and promotes recovery. Examples of triggers are poor nutrition, poor social skills, hopelessness, and poor symptom management. Once triggers are identified, interventions aimed at fostering effective coping skills can be introduced to offset relapse of symptoms. For example, an intervention that may promote effective coping to offset social isolation is to guide the client to organized consumer group activities available in the community. Another is to promote consumer and family efforts at job training through community vocational agencies. Still another is to promote competency in family members by coordinating services that enhance their understanding of the illness, provide social support, and include respite care when needed. Finally, an alliance with the client to manage medication and side effects is an important component of relapse prevention and recovery promotion (Baker et al, 2013).

As previously discussed, scientific advances that led to the use of medications to treat mental illness revolutionized mental health care and services. Atypical antipsychotics and new

antidepressants with fewer side effects have further influenced mental health care in the community. Although these new drugs have dramatically improved the lives of many people with mental disorders, they are not without problems and are not a cure. The nurse has a critical role in monitoring side effects, detecting related health problems such as diabetes, and providing education and intervention. The most effective tertiary prevention is to combine medications with other relapse management approaches including culturally sensitive social, behavioral, and psychotherapeutic interventions (Segal et al, 2010; Sterling et al, 2010).

LEVELS OF PREVENTION

In Community Mental Health

Primary Prevention

- Educate populations about mental health issues.
- Teach stress reduction techniques.
- Support and provide prenatal education.
- Provide parenting classes.
- Provide support to caregivers.
- Provide bereavement support.

Secondary Prevention

- Conduct screenings to detect mental health disorders.
- Provide mental health interventions after stressful events.

Tertiary Prevention

- Provide health promotion activities to persons with serious and persistent mental illness.
- Promote support group participation for those with mental health disabilities.
- Advocate for rehabilitation and recovery services.

ROLE OF THE NURSE IN COMMUNITY MENTAL HEALTH

The role of the nurse in community mental health was shaped both by the evolution of services and by the work of nursing pioneers. Development of a knowledge base for the nursing discipline and the further expansion of mental health care services to nontraditional community sites called for more advanced community-based practitioners (American Academy of Nursing, 2012). Nursing practice standards reflect the values of the profession, describe the responsibilities of nurses, and provide direction for the delivery and evaluation of nursing care. These standards also describe the roles of nurses in both advanced and basic practice.

Advanced practice psychiatric nurses have graduate-level education. The psychiatric nurse practitioner title and role have been expanded to encompass primary care and specialty knowledge and skills. They provide primary, secondary, and tertiary care to individuals, groups, families, adults, children, and adolescents. Depending on state laws, some prescribe medications and have hospital admission privileges. For example, the advanced practice nurse may see clients individually to provide psychotherapy, may prescribe medications, and may conduct physical examinations or coordinate this care with

other providers in primary care settings. The blended nurse practitioner role has been a response to a shift in the health care system away from specialization and toward comprehensive services that address both physical and mental health problems.

Nurses prepared at the undergraduate level provide basic primary, secondary, and tertiary services that are equally valuable. Specific roles and functions of both mental health and community nurses at the basic level (**Box 36-2**) are based on clinical nursing practice and standards ([American Nurses Association \[ANA\], 2013, 2014](#)). The functions suggest the overlapping roles of clinician, educator, and coordinator.

Clinician

Objectives of the practitioner role are to help the client maintain or regain coping abilities that promote functioning. This involves using the nursing process to guide the diagnosis and treatment of human responses to actual or potential mental health problems ([ANA, 2014](#)). Role functions at the basic practitioner level include case management, counseling, milieu therapy, and psychobiological interventions with individuals and with groups. Clinician skills are used with individual clients in a variety of settings, including the home, and often with large groups of people in specific neighborhoods, schools, and public health districts. For example, many clients who have schizophrenia live in personal care homes. These clients require biopsychosocial interventions related to medication management, milieu management for improved social interaction, and

assistance with self-care activities for community living such as use of public transportation. Also, the practitioner increasingly coordinates these activities with both the consumer and other staff members in community settings. Therefore, coordination of care is often the means for promoting recovery plan outcomes and enhancing quality of life for clients. These activities can support positive outcomes for others in the community at large.

For example, family members are a primary support system for individuals with schizophrenia. Whether the client lives in a personal care home, a family residence, or another setting, counseling family members and the client about the illness may offset the stressors of caregiving. Moreover, educating the public may reduce the stigma and decrease social isolation for both clients and families, lead to public support for needed services, and decrease the costs of health care because of fewer hospitalizations. As suggested in these examples, clinician and educator roles overlap.

Educator

The educator role uses teaching/learning principles to increase understanding about mental illness and mental health. The educator role is foundational to health maintenance, health promotion, and community action. Teaching clients about illness symptoms and the benefits of medications promotes health maintenance and may reduce the risk for illness relapse. Research supports similar education programs for family members to increase their ability to monitor illness symptoms and to identify events that lead to relapse ([Sveinbjarnardottir et al, 2013](#)). The nurse may facilitate a combined support and education group for parents of children with schizophrenia or for consumers with major mental illness in weekly sessions at the community mental health center. As seen in [Figure 36-1](#) the CMHN, both at the basic and at the advanced level, may participate in developing educational groups and programs for consumers, families, and other providers either alone or in collaboration with other organizations such as the local affiliate of Mental Health America or the National Alliance for the Mentally Ill. The nurse may also teach clients primary prevention skills such as parenting as shown in [Figure 36-2](#).

At the community level, both formal and informal teaching is important. One important objective for mental health

BOX 36-2 Roles and Functions in Psychiatric/Mental Health Nursing Community Practice

Roles

- Clinician
- Educator
- Coordinator

Functions

- Advocacy
- Case finding and referral
- Case management
- Community action and involvement
- Complementary interventions
- Counseling
- Crisis intervention
- Health maintenance
- Health promotion
- Health teaching
- Home visits
- Intake screening and evaluation
- Milieu therapy
- Promotion of self-care activities
- Psychiatric rehabilitation and recovery
- Psychobiological interventions

Modified from American Nurses Association, American Psychiatric Nurses Association, and International Society of Psychiatric Mental Health Nurses: Scope and standards of psychiatric-mental health nursing, Washington, DC, 2007, American Nurses Publishing.

promotion is to teach positive coping skills. Overmedicating is an example of an ineffective individual coping skill. Even when medications are properly used in treatment, the nurse requires specialized knowledge about drug interactions, pharmacokinetics, and pharmacodynamics. Factors that influence pharmacokinetics include anatomical and physiological changes that occur with aging or with coexisting mental and physical conditions. Use of nonprescription medications such as herbal remedies and over-the-counter drugs can influence pharmacokinetics. Because over one third of Americans use nontraditional remedies and many of these are specific for psychiatric conditions, nurses need to assess the use of these substances, be aware of interactions, and share this information with clients (Barnes et al, 2008). For example, people may use herbal remedies such as ginkgo biloba to improve memory, valerian to improve sleep, and St. John's wort to treat depression.

Coordinator

Coordination of care is a basic principle of the multidisciplinary team approach in community mental health services. Yet there is often a lack of coordination as well as limited services in many communities. Therefore, at a minimum, the role of coordinator must include case finding, referral, and follow-up to evaluate system breakdown and deficits. Because of current system deficits, nurses in community mental health function as coordinators who carry out intake screening, crisis intervention, and home visits. The nurse coordinator also tries to improve the client's health and well-being by promoting independence and self-care in the least restrictive environment. For example, the nurse may teach the client how to fill a medication box or how to use relaxation techniques to reduce stress. Health teaching related to nutrition, smoking cessation, and sleep promotion is essential for consumers with mental illness. These functions are consistent with descriptions of clinical case management that emphasize continuity of care for individuals who need complex services and with providing information for recovery (Caldwell et al, 2010).

To achieve these objectives and improve services, nurses work with a variety of professionals, including advanced practice nurses, social workers, physicians, psychologists, occupational and vocational therapists, and rehabilitation counselors

FIG 36-3 Interdisciplinary mental health planning team meeting. (Digital Vision, #200297936-001, Photodisc, Thinkstock)

(Figure 36-3). The nurse is often the advocate for the consumer who needs assistance making his or her needs clear and accessing both health and social services. Because nonlicensed paraprofessionals are frequently involved in direct care activities, their services must be directed, coordinated, and evaluated within the context of treatment planning. Finally, coordination also involves work with individuals who may not have formal preparation but who are essential for positive treatment outcomes. These individuals include family members, shelter volunteers, consumer support groups, and community leaders who can influence development of services. For example, the nurse can teach others about mental illness and effective interventions for times when symptoms become apparent and behaviors become difficult to manage. In the coordinator role, nurses can identify and influence health system effectiveness and ineffectiveness. To assist clients in accessing community resources and services, it is as important to develop positive relationships with other community providers as it is with clients.

CURRENT AND FUTURE PERSPECTIVES IN MENTAL HEALTH CARE

Both nationally and internationally, too few mental health care services exist, and the available services are fragmented and often difficult to access. In the United States, large segments of the population do not have basic health care services or insurance to cover both expected and unexpected illnesses. The Patient Protection and Affordable Health Care Act passed in 2010 aims to close some of the gaps in coverage and as of March 31, 2014, an additional 8 million people had enrolled in an insurance plan. Because health insurance coverage for most Americans is linked to employment, in an economic recession when jobs are lost, insurance is often lost as well, and people are no longer able to afford health care. Also, consumers, family members, and health care providers are concerned about issues of basic treatment, continuity of care, housing, and costs for acute and long-term mental health services for persons with

mental illness. As large numbers of baby boomers reach retirement age and Medicare eligibility, there is concern about whether Social Security and Medicare resources will continue to exist for older Americans. Declining state budgets and possible cuts in Medicaid funding may place community mental health services in peril. Therefore, implementation of health care reform continues to be a major political, social, and economic issue. Significant alterations in the current health care delivery system are occurring. Nurses working in communities must understand the models of care, the scope of mental illness, and the national health objectives designed to promote the health and welfare of persons with mental health problems.

Managed care and the Patient Protection and Affordable Health Care Act, as described previously, will continue to influence the delivery of mental health services. There will be a continued focus on providing services in primary care settings, attempts to reduce inpatient stays, and a more systematic evaluation of the outcomes of the care provided. The massive growth in managed care plans dramatically reduced hospital stays but also limited access to care. It is unclear how passage of national health care reform will affect the care of those with long-term care needs. Because the public mental health system is the only remaining state and federally supported treatment system for persons with serious and persistent mental disorders and Medicaid funds more than half of public mental health services, use of managed care approaches did not always provide for adequate services. The expansion of Medicaid through the ACA may improve access to mental health care for more people and improve delivery of services but could also strain systems not prepared for higher volumes of people. Differences in federal and state managed plans and services could create further barriers to care, leading to gaps in service and large holes in the safety net for vulnerable consumers suffering from mental illness.

Nurses can be important providers in community mental health because of their emphasis on wellness and health promotion, skills at teaching and case management, and lower cost for service. In communities, nurses practice primary, secondary, and tertiary prevention activities by conducting comprehensive client histories to determine health problems and interventions that improve quality of care and cost-effectiveness. In home health settings, nurses screen for ineffective coping techniques such as use of alcohol or other substances to offset the stress of traumatic life events, thereby preventing further problems and costly care. They also screen for signs of psychiatric disorders in primary care and community health care settings. Community mental health services must include access to work and school settings for families and children. These types of nursing assessments and subsequent interventions may offset costly treatment in hospital settings.

Providing the range of community services necessary to handle persistent mental illness is difficult without sufficient funds for health and social services. It is important for nurses and others working in CMHCs to recognize the impact of changes in funding, target populations, restructuring, and disagreements between professions, agencies, and levels of government. Such information enables nurses to advocate for adequate services to meet the needs of individuals with severe and persistent mental

illness. The nurse can build relationships with other providers, network with other agencies, and foster interagency collaboration to improve the quality of care for clients and their families.

NATIONAL OBJECTIVES FOR MENTAL HEALTH SERVICES

The goals of the community mental health movement are consistent with the health promotion and disease prevention objectives outlined in *Healthy People 2020* (USDHHS, 2010). The *Healthy People 2020* box illustrates the primary objectives of the national health agenda for mental health promotion and illness prevention. The objectives of *Healthy People 2020* address both settings where people receive care (e.g., primary care, juvenile justice systems) and populations at risk (e.g., children, adults with mental illness, and older adults). Increasing cultural competency and consumer satisfaction with mental health services are further objectives of the national agenda for mental health.

The new millennium brought recognition of the importance of addressing mental health and mental illness as part of disease prevention. Recognition of the burden of mental illness and the status of mental health in the United States was clarified by a landmark report from the surgeon general's office, *Mental Health: A Report of the Surgeon General* (USDHHS, 1999), followed by a report from the Surgeon General's Conference on Children's Mental Health in 2000 (USDHHS, 2000). A national agenda for action described in *Healthy People 2010* and continued in *Healthy People 2020* (USDHHS, 2010) made mental health one of the 10 leading health indicators, which are chosen on the basis of relevance as a broad public health issue. The *President's New Freedom Commission on Mental Health* (2003) further highlighted the need to transform and heal system fragmentation to ensure access to quality mental health services. The goals of a transformed mental health system are found in Box 36-3.

Overall, the national goals of *Healthy People 2020* are to improve mental health and ensure access to quality and appropriate mental health services. Approaches emphasize prevention, maintenance, and restoration of mental health and independent functioning. The standards address mental health conditions of concern across the life span and with specific populations. Nurses can (1) promote the standards in the

BOX 36-3 New Freedom Commission's Six Goals of a Transformed Mental Health System

1. Americans will understand that mental health is essential to overall health.
2. Mental health care will be consumer and family driven.
3. Disparities in mental health care will be eliminated.
4. Early mental health screening, assessment, and referral will be common practice.
5. Excellent mental health care will be delivered and research will be accelerated.
6. Technology will be used to access mental health care and information.

From President's New Freedom Commission on Mental Health: Achieving the promise: transforming mental health care in America, USDHHS Pub No SMA-03-3832, Rockville, MD, 2003, USDHHS.

agencies where they are employed, (2) use the standards in community assessment activities, and (3) introduce information about the standards to other groups and agencies, including local consumer and family organizations, to help prioritize mental health concerns. The following box lists selected objectives that pertain to mental health and mental disorders.

HEALTHY PEOPLE 2020

Examples of Targeted National Health Objectives for Mental Health and Mental Disorders

Goal: Improve mental health and ensure access to appropriate, quality mental health services.

- MHMD-1: Reduce the suicide rate.
- MHMD-4: Reduce the proportion of persons who experience major depressive episode (MDE).
- MHMD-6: Increase the proportion of children with mental health problems who receive treatment.
- MHMD-9: Increase the proportion of adults with mental disorders who receive treatment.
- MHMD-10: Increase the proportion of persons with co-occurring substance abuse and mental disorders who receive treatment for both disorders.

From U.S. Department of Health and Human Services: Healthy People 2020 Objectives, Office of Disease Prevention and Health Promotion, Washington, DC, 2010, USDHHS

As indicated in the definitions at the beginning of this chapter, mental health is a dynamic process, influenced by both internal and external factors, that enables and promotes the individual's physical, cognitive, affective, and social functioning. In contrast, threats to mental health create stress that undermines relationships and diminishes the individual's ability to pursue and achieve life's goals. Values and beliefs influence the allocation of resources for neighborhoods and schools and can contribute to or undermine the mental health of people in communities.

Mental health problems are manifested in many ways. Untoward incidents or even anticipated life events can diminish physical, cognitive, affective, and social functioning. For example, in most situations, an anticipated or unexpected death of a family member results in grief that may temporarily interrupt the functioning of surviving family members and produce mental distress. Given adequate support and adaptation, most persons resume their lifestyles after the death of a loved one in spite of the sadness that they are likely to experience. When people do not have adequate resources, or when bereavement is complicated because of the conditions of the situation, there is an increased risk for threats to the mental health of surviving family members. Important interventions with individuals experiencing sorrow and grief are to encourage roles and activities that promote comfort and reduce isolation. Death of a family member can affect survivors of different ages in various ways. Infants and youths may be deprived of significant nurturing and care that will result in long-term emotional deficits, whereas adults are at increased risk for stress related to role changes, and older adults are vulnerable to social isolation as relatives and friends die. In any of these situations, individual or group therapy may be indicated not only for the immediate situation, but also for prevention of longer-term problems.

However, bereavement is not the only cause of diminished mental health. Other causes include, but are not limited to, physical health problems, disabilities resulting from trauma, exposure to violence in the neighborhood, job loss and unstable employment, and unanticipated environmental disasters that result in loss. Because multiple threats to mental health exist across the life span, it is useful to organize the study of problems according to life stages along life's continuum. The box that follows provides suggestions for how nurses can intervene following a community disaster.

HOW TO Provide Interventions after Community Disasters

Community mental health nurses can intervene immediately after a mass trauma by using interventions that promote:

- A sense of safety
- Calming
- A sense of self and community efficacy
- Connectedness
- Hope

From *Hobfoll SE, Watson P, Bell CC, et al: Five essential elements of immediate and mid-term mass trauma intervention: empirical evidence. Psychiatry 70:283–315, 2007.*

Children and Adolescents

Healthy People 2020 objectives aim to increase the number of children screened and treated for mental health problems. Children are at risk for disruption of normal development by biological, environmental, and psychosocial factors that impair their mental health, interfere with education and social interactions, and keep them from realizing their full potential as adults. For example, children may develop depression after a loss or behavior problems from abuse or neglect. Examples of environmental factors include crowded living conditions, violence, separation from parents, and lack of consistent caregivers. Exposure to community violence can be related to significant stress and depression in children ([McClosky et al, 2008](#)). Types of mental health problems typically diagnosed during childhood are depression, anxiety, and attention-deficit disorders. Examples of chronic disorders commonly seen are Down syndrome and autism. These problems affect growth and development and influence mental health during adolescence.

Suicide is the third leading killer of young persons between ages 15 and 24, and the second-leading cause of death in young adults, and in most cases there was a mental or substance abuse disorder ([CDC, 2009, 2013](#)). The second objective of *Healthy People 2020* is to reduce the rate of suicide attempts by adolescents. Some of the risk factors for both adolescents and adults include prior suicide attempts, stressful life events, and access to lethal methods. Increasing the number of adolescents screened for depression in primary health care settings is a new objective of *Healthy People 2020*. Early detection and treatment of depression can help prevent suicide. In addition to depression and substance abuse, adolescent problems include conduct disorders and eating disorders.

Another objective of *Healthy People 2020* is to reduce the proportion of adolescents with eating disorders. Many CMHNS

do not directly work with persons with a primary eating disorder; eating disturbances often are a symptom accompanying other conditions. Because most children are not seen in the mental health system, an important role of the CMHN is to educate other community providers, teachers, parents, and children. School nurses are in an ideal position to provide primary, secondary, and tertiary interventions for children with eating disorders. Nutrition education and early recognition, intervention, referral, and follow-up can help prevent eating disorders from becoming severe and can prevent relapses. Nurses can advocate in and beyond their communities for the provision of a nurse in all schools. This can increase the chances of early recognition of and treatment for persons with eating disorders.

Effective service expansion for children, particularly for those with serious emotional disturbances, depends on promoting collaboration across critical areas of support including schools, families, social services, health, mental health, and juvenile justice. Better services and collaboration for children with serious emotional disturbance and their families will result in greater school retention, decreased contact with the juvenile justice system, increased stability of living arrangements, and improved educational, emotional, and behavioral development. One of the objectives of *Healthy People 2020* is to ensure that children in the juvenile justice system receive access to mental health assessment and treatment (USDHHS, 2010). Children and adolescents require a variety of mental health services, including crisis intervention and both short- and long-term counseling. Nurses working in community settings, well-child clinics, and home health can help to offset this problem through prevention, education, and inclusion of parents in program planning. Because many children and adolescents lack services or access to services, community mental health assessment activities are essential. Assessment activities include identifying types of programs available or lacking in places where children and adolescents spend time. Assessments should be performed in schools and in the homes of clients served, and also in day care centers, churches, and organizations that plan and guide age-specific play and entertainment programs. Assessment data are essential for planning and developing programs that address mental health problems prevalent from the prenatal period through adolescence. Preventing problems during these developmental periods can reduce mental health problems in adulthood.

Adults

Adults suffer from varied sources of stress that contribute to their mental health status. Sources of stress include multiple role responsibilities, job insecurity, and unstable relationships. These and other conditions can undermine mental health and contribute to serious mental illness, depression, anxiety disorders, and substance abuse. *Healthy People 2020* objectives seek to help adults access treatment in order to decrease associated human and economic costs and to reduce suicide rates (USDHHS, 2010).

At some point, virtually all adults will experience a tragic or unexpected loss, a serious setback, or a time of profound

sadness, grief, or distress. Major depressive disorder, however, differs both in intensity and in duration from normal sadness or grief. Depression disrupts relationships and the ability to function and can be fatal. In 2009 death by suicide surpassed that caused by motor vehicle accidents, and there has been a substantial increase in suicide rates among adults aged 35 to 64 years in the decade between 1999 and 2010 (CDC, 2013). The majority of those who kill themselves have a mental or substance abuse disorder. Other risk factors include prior suicide attempts, stressful life events, and access to lethal methods. Women are twice as likely to experience depression, and women who are poor, unemployed, or victims of domestic violence are even more at risk (USDHHS, 2008). Available medications and psychological treatment can help 80% of those with depression, yet only a few seek help. Those with depression are more likely to visit a physician for some other reason, and the mental health condition may not be noted. Therefore, it is imperative that nurses in all settings recognize and screen for depression. Community health nurses may provide treatment interventions. The Evidence-Based Practice box describes an intervention that nurses used with mothers of infants and toddlers to examine their effect on symptoms of depression.

EVIDENCE-BASED PRACTICE

The purpose of this randomized controlled in-home interventional study was to compare interpersonal psychotherapy combined with parenting enhancement provided by advanced practice psychiatric mental health nurses with a parenting enhancement-only intervention provided by generalist nurses to determine the effect of the intervention on depressive symptoms and parenting behaviors.

Two hundred and twenty-six mothers of Early Head Start infants and toddlers from the northeastern and southeastern areas of the United States were randomized into the intervention or the control group. Depression assessments and videotaped, coded mother-child interactions were used at baseline and at 14- to 22-week and at 26-week postintervention intervals.

Mothers in both the control and intervention groups had reduction in depressive symptoms measured by the Hamilton Depression Rating Scale, but only mothers in the intervention group had significant positive interaction changes with their children. The study suggested that a combination of generalist and specialist nurses could be very effective in the treatment of maternal depression.

Nurses can provide mental health screening, support, and education for low-income mothers. Community health nurses at both the generalist and advanced practice levels can be instrumental in designing and developing programs to detect and reduce depression in mothers living in low-resourced communities. These interventions may be critical to ensuring improved mental health of both mothers and their children, as maternal depression is associated with negative emotional outcomes of their children.

Beeber LS, Schwartz TA, Holditch-Davis D, et al: Parenting enhancement, interpersonal psychotherapy to reduce depression in infants and toddlers: a randomized trial. *Nurs Res* 62:82–90, 2013.

Anxiety disorders are common both in the United States and in other countries. An alarming 18% of the adult population will experience an anxiety disorder, many with overlapping substance abuse disorders (NIMH, 2013). Anxiety disorders may have an early onset and are characterized by recurrent episodes of illness and periods of disability. Panic disorder and

agoraphobia along with depression are associated with increased risks of attempted and completed suicide.

The lifetime rates of co-occurrence of mental disorders and addictive disorders are strikingly high. About one in four persons in the United States experiences a mental disorder in the course of a year, and nearly one in three adults who have a mental disorder in their lifetime also experiences a co-occurring substance (alcohol or other drugs) abuse disorder (NIMH, 2013). Individuals with co-occurring disorders are more likely to experience a chronic course and to use services than are those with either type of disorder alone; however, the services are often fragmented and treatment occurs in different segments of the system.

How can nurses intervene? The general medical sector, including primary care clinics, hospitals, and nursing homes, is typically the initial point of contact for many adults with mental disorders; for some, these providers may be the only source of mental health services. Early detection and intervention for mental health problems can be increased if persons presenting in primary care are assessed for mental health problems. Nurses who work in the general medical sector and in other community settings are in an ideal position to assess and detect mental health problems. Nurses conduct comprehensive biopsychosocial assessments and are often the professional most trusted with sensitive information by clients in these settings. The use of screening tools for depression, anxiety, substance abuse, and cognitive impairment can assist the nurse in early detection and intervention for mental health problems. Suicide can be prevented in many cases by early recognition and treatment of mental disorders, and by preventive interventions that focus on risk factors. Thus, reduction in access to lethal methods and recognition and treatment of mental and substance abuse disorders are among the most promising approaches to suicide prevention. Nurses, long respected as important population-centered providers, can work with legislators for measures to limit access to weapons such as handguns.

LINKING CONTENT TO PRACTICE

This chapter describes the role of the nurse who works with persons with mental illness in the community. The role is diverse and complex and relies on basic nursing knowledge as well as specific knowledge about mental illness. Applying this role in the community draws on many of the recommendations of nursing and public health groups. For example, the core competencies adopted by the [Council on Linkages between Academia and Public Health Practice \(2010\)](#) include those related to assessment, policy development and program planning skills, communication and cultural competency skills, and involvement with the community in order to provide services effectively. The [Quad Council of Public Health Nursing Organizations \(2011\)](#) further develops these skills and makes clear application to nursing practice. The American Nurses Association develops and publishes scope and standards of practice documents that identify specific nursing competencies by specialty area (ANA, 2013, 2014).

Adults with Serious Mental Illness

Objectives of *Healthy People 2020* that address tertiary prevention and are targeted to persons with serious mental illness are

to reduce the proportion of homeless adults who have serious mental illness, to increase their employment, and to decrease the number of adults with mental disorders who are incarcerated. Brief hospital stays and inadequate community resources have resulted in an increased number of persons with serious mental illness living on the streets or in jail. It is estimated that 14% of males and one third of females in jail suffer from a mental illness (Steadman et al, 2009). Some people arrested for nonviolent crimes could be better served if diverted from the jail system to a community-based mental health treatment program with linkage to mental health services. Approximately half of the homeless persons in the United States have a serious mental illness or a substance abuse problem and on any given night an astonishing 60,000 are veterans (National Coalition for Homeless Veterans, 2014). Most do not have any form of employment. At present, many people with severe mental disorders live in poverty because they lack the ability to earn or maintain a suitable standard of living. Even people who live with family caregivers or in supervised housing are at risk for inadequate services because the long-term care they need often depletes human and fiscal resources. An effective approach for helping persons with serious mental illness is to partner with consumers to facilitate recovery through intensive case management. Persistent client outreach and engagement strategies are effective in helping persons with serious mental illness (Cook et al, 2009).

CMHNs are engaged in all forms of case management activities with persons with serious and persistent mental illness. They provide important case management services, coordinate resources for consumers, and function as important members of ACT programs, which provide continuous assistance to persons with mental illness. Nurses by philosophy and training promote independent living and provide support and encouragement for persons to achieve a maximal level of wellness and function. Nurses recognize the importance of the mental health benefits of meaningful work that improves self-esteem and independence. Nurses can support development of [wellness recovery action plans](#) both at the individual and agency levels. Nursing health promotion interventions can be provided in shelters, soup kitchens, and other places where homeless persons receive food and protection.

Older Adults

In the United States, the population older than 65 years has steadily increased since the year 2000. As the life expectancy of individuals continues to grow, the number experiencing mental disorders of late life will increase. This trend will present society with unprecedented challenges in organizing, financing, and delivering effective preventive and treatment services for mental health in this population. Although many older people maintain highly functional lives, others have mental health deficits associated with normal sensory losses related to aging, failing physical health, difficulty performing activities of daily living, and social deprivation or isolation. Life changes related to work roles and retirement often result in reduced social contacts and support. Other previously described losses are associated with the death of a spouse, other family members, or friends. Reduced

social networks and contacts triggered by these life events can influence mood and contribute to serious states of depression. However, depression is not a normal part of aging.

The depression rate among older adults is half that of younger people, but the presence of a physical or chronic illness increases rates of depression. Depression rates for older adults in nursing homes range from 15% to 25% (Blazer, 2003). In the United States men between the ages of 65 and 74 are in the highest risk category for suicide; men account for 80% of all suicides of those older than age 65 (NIMH, 2013). Alzheimer's disease and vascular conditions can cause a severe loss of mental abilities with behavioral manifestations. Nearly half of those older than age 85 have symptoms of cognitive impairment severe enough to impair function. All these conditions affect the mental health status of individuals and their family caregivers.

Older adults, because they may be dependent on others for care, are at risk for abuse and neglect. Healthy aging activities such as physical activity and establishing social networks improve the mental health of older adults. Older adults underutilize the community mental health system and are more likely to be seen in primary care or to be recipients of care in institutions. The nurse can reach them by organizing health promotion programs through senior centers or other community-based settings. Home health care nurses can assess and intervene to protect those at risk for abuse and neglect, and mental health nurses can provide stress management education for nursing home staff. Stress management for caregivers and respite daycare programs for an older adult family member can increase coping and prevent abuse. Mental health outreach services for older adults have been very effective in reducing depressive symptoms (Tampi and Tampi, 2013). Nurses can advocate with health authorities and localities to increase awareness of the importance of meeting the mental health needs of this growing population.

Most family caregivers are women who care for a spouse, an aging parent, or a child with a long-term disabling illness. These caregivers are also at risk for health disruption. The risk is particularly great for caregivers of persons with a chronic illness. Caregivers of persons with severely disabling mental disorders often have their mental health threatened by lack of social support, the stigma of the disease, and chronic strain. During stressful life events such as these, it is important for caregivers to know how to manage the many competing demands in their lives.

Activities to improve the mental health status of adults include public education programs, prevention approaches, and provision of mental health services in primary care. Specific approaches to reduce stress include use of community support groups, education about lifestyle management, and worksite programs. Nevertheless, most programs currently available for adults, families, and caregivers with health problems primarily monitor or restore health rather than prevent problems. Therefore, the nurse can refer family caregivers and others to organizations such as the local National Alliance for the Mentally Ill for group support services. In addition, many national organizations designed for groups with specific problems (Box 36-4)

BOX 36-4 Examples of Sources of Information and Help for People with Mental Illness and Mental Health Problems

- Alcoholics Anonymous
- Al-Anon
- Alzheimer's Association
- American Anorexia/Bulimia Association
- American Association of Suicidology
- Anxiety Disorders Association of America
- Attention Deficit Information Network
- Children and Adults with Attention Deficit Disorder
- Depressive/Manic Depressive Association
- Gamblers Anonymous
- National Center for Post-Traumatic Stress Disorder
- National Center for Learning Disabilities
- Obsessive-Compulsive Foundation Overeaters Anonymous
- Schizophrenics Anonymous

See the Evolve website at <http://evolve.elsevier.com/Stanhope> for more information about these organizations.

QSEN FOCUS ON QUALITY AND SAFETY EDUCATION FOR NURSES

Quality and Safety Focus

Targeted Competency: Safety—Minimizes risk of harm to clients and providers through both system effectiveness and individual performance.

Important aspects of safety include:

- Knowledge: Examine human factors and other basic safety design principles as well as commonly used unsafe practices (such as, workarounds and dangerous abbreviations)
- Skills: Use national client safety resources for own professional development and to focus attention on safety in care settings
- Attitudes: Value the contributions of standardization/reliability to safety

Safety Question

Nurses engage in patient-specific interventions to keep patients safe. Nurses also regularly contribute to the development of safety approaches at the systems level. System level approaches to safety ensure standardization of processes and a consistent methodology to addressing recurring safety concerns.

You are working as an RN in home care. Your home care agency has had three patients admit to suicidal ideation and intention in the last 3 months. In all three situations, the home care nurses handled the situations very differently, with varied success. Your manager asks you to participate in a task force to develop a standard operating procedure that all home care nurses can employ to respond to a suicidal patient in the home.

- What health care team members would be helpful in addressing the development of this standardized operating procedure?
- What evidence might you look to in developing this standardized procedure?
- How might you envision most effectively training home care nurses in this standardized approach?

Prepared by Gail Armstrong, PhD©, DNP, ACNS-BC, CNE, Associate Professor, University of Colorado Denver College of Nursing.

have local chapters or information that can be accessed on the Internet. Some state activities expand mental health services to older adults, and *Healthy People 2020* has objectives designed to increase services to older adults and cultural competence within the mental health system.

Cultural Diversity

To work effectively, health care providers need to understand the differences in how various populations in the United States perceive mental health and mental illness and treatment services. These factors affect whether people seek mental health care, how they describe their symptoms, the duration of care, and the outcomes of the care received. Various populations use mental health services in different ways. People may not seek mental health services in the formal system, they may drop out of care, or they may seek care at much later stages of illness, which typically costs more. This pattern of use may be the result of a community-based mental health service system that is not culturally relevant, responsive, or accessible to select populations. Although all socioeconomic and cultural groups have mental health problems, low-income groups are at greater risk because they often lack minimal resources for meeting basic physical and mental health needs.

In an effort to describe and remedy mental health disparities based on culture, a supplemental report was published to the landmark surgeon general's report on mental health (USDHHS, 2001). Caution is needed, however, when discussing differences among racial and ethnic groups in the rates of mental illness. Studies of the number of cases of mental health problems among racial and ethnic populations, while increasing in number, remain limited and often inconclusive. Discussion of the rates of existing cases must consider differences in how persons of different cultures and racial and ethnic groups perceive mental illness. Behavioral problems, often viewed in Western medicine as signs of mental illness, may be assessed differently by individuals in various racial and ethnic groups. The manner in which people of different cultures describe emotional distress may affect the detection and treatment of mental illness. With this caution in mind, along with the recognition that sample sizes for racial and ethnic groups may be limited, examination of existing large-scale studies for mental health trends and disparities among racial and ethnic groups remains important (Akincigil et al, 2012).

According to the surgeon general's landmark report on culture, race, and ethnicity, the predominant minority populations in the United States are African Americans, Hispanics, Asian and Pacific Islander Americans, and Native Americans including Native Alaskans (USDHHS, 2001). A notable omission from this federal report is Middle Eastern Americans, and little information could be found either in the literature or through national websites, although there is a significant and growing population, particularly in the upper Midwest. Great diversity exists among people from the Middle East, although they may share some cultural traditions with Asians, Africans, or Europeans and in some cases have been included in those classifications. However, within each of the groups identified in the federal report, there is also much diversity, as each group consists of subgroups with unique cultural differences. Therefore, it is important to avoid simplification and overgeneralization in discussions about the characteristics and problems of minorities and to examine both individual and national bias. It is critical to conduct community assessments to determine

unique characteristics and factors that contribute to mental health needs within specific aggregates of the population. The information presented here is intended to stimulate thinking and awareness for developing nursing activities in individual communities. Community assessments that include data about specific populations from organized agencies such as the [Indian Health Service \(2014\)](#) are important because assessment data can help guide role activities during all steps of the nursing process.

Nurses provide a variety of primary, secondary, and tertiary prevention interventions with populations at risk that help meet the objectives for improving mental health. Consumers have historically influenced mental health services, and the health care industry increasingly is using consumer opinion to gain information on service needs and changes. Objectives of *Healthy People 2020* are to increase state tracking of consumer satisfaction with mental health services and to increase the number of states who incorporate plans addressing cultural competence. Nurses working within broad-based coalitions of consumers, families, other providers, and community leaders can help to achieve the goals of accessible, culturally sensitive, quality mental health services for all people.

African Americans

African Americans are the second largest minority population in the United States. In 2012, 28.1 percent of African Americans compared to 11.0 percent of non-Hispanic whites were living at the poverty level (Office of Minority Health, USDHHS, 2012). Ethnic and racial minorities in the United States may live in an environment of social and economic discrimination and inequality, which takes a toll on mental health and places them at risk for associated mental problems. African Americans are more likely to be exposed to, or to become victims of, violence, placing them at risk for the development of post-traumatic stress disorder (PTSD). They are overrepresented both in the homeless and correctional system populations, further increasing the risk of developing mental health problems. Although they were less likely to commit suicide, the suicide rate of young African American men is now equal to that of whites (CDC, 2009). Despite these issues, African Americans are less likely to use mental health services and may have significant negative expectations about mental health services. Nurses can promote the mental health of African Americans by integrating mental health care into primary care settings, providing services in community centers, collaborating with African American faith communities, providing education to decrease the stigma, working toward the provision of safer communities, and recruiting African Americans to work as community mental health providers.

Latino Americans

Latino Americans are the second largest minority group in America, and by 2050 they are projected to comprise 25% of the population (Office of Minority Health, USDHHS, 2012). Although they live primarily in the southwestern regions of the country, many have migrated to states in the Southeast and Midwest. Migrant farmworkers are also an important

subpopulation among Latinos. As discussed in [Chapter 34](#), migratory living patterns that are marked by low income, poor education, and lack of health services contribute to stressful living conditions. Nurses and nurse practitioners may be primary health care providers for migrant laborers and new immigrants. Their roles expand beyond traditional practice to encompass case management and interagency collaboration. Collaboration includes networking and referral to community mental health agencies and to advanced practice psychiatric nurses when either drug or alcohol abuse or mental illness is the primary health problem.

Latino Americans living in low-income urban areas are subject to many of the conditions described for low-income and disadvantaged African American families. Initially, it was reported that recent Latino immigrants had lower rates of depression than those born in the United States, but evidence from the [CDC \(2009\)](#) found suicide to be the eighth-leading cause of death among Latino males and even higher rates of attempts among young Latina women. There are significant relationships between suicide and having a family history of suicide, physical or sexual abuse, and environmental stress. These findings suggest serious stressful living conditions for both individuals and families. Nurses working with Latino families need knowledge and skill in both the language and cross-cultural therapies, and they also need to include consumers in planning and evaluating mental health service delivery. Focus groups can be held to involve community members in the planning and implementation of culturally relevant mental health services.

Asian and Pacific Islander Americans

Asian and Pacific Islander Americans are a diverse and rapidly increasing population ([USDHHS, 2001](#)). This group includes both settled citizens and new refugees. The largest segment of this population lives in California. Whereas Asian and Pacific Islander Americans, like other minority groups, are represented in all socioeconomic strata, the lower-income groups include refugees and recent immigrants who are dealing with the displacement issues of loss, adjustment, and adaptation. Losses often involve forfeiture of family, traditions, and lifestyles for cultures that may seem alien. Adjustments and adaptations include those basic to daily living: learning new languages, laws,

and monetary systems and locating support systems. Finding support systems includes becoming acquainted with the health care delivery system. Our knowledge of the mental health needs of this population is limited, because they have the lowest utilization rates of mental health services of any cultural group ([USDHHS, 2001](#)). This avoidance of mental health care is associated with the stigma and shame related to having a mental disorder as well as to perceived discrimination by mental health providers ([Wu et al, 2009](#); [Spencer et al, 2010](#)). Assessment, planning, and interventions with members of this diverse group must include information about their health beliefs, a key component in any program.

Population-focused mental health nurses need to understand existing cultural barriers and help to design culturally sensitive approaches for vulnerable populations. Nurses can work to decrease the stigma of mental illness by educating minorities about the biological basis of many mental disorders. Recruitment of a culturally diverse nursing workforce may increase use of mental health services.

Native Americans

Native Americans represent 1.5% of the U.S. population. Although this is a small group, it is also diverse, with more than 551 tribes and more than 200 languages. Native Americans also appear to have significant rates of substance abuse, depression, and suicide (1.5 times the national rate), along with unintentional injury and homicide. They are exposed to violence at more than twice the national rate, which results in significant rates of PTSD ([CDC, 2009](#); Indian Health Service, 2014). Use of mental health services has been difficult to determine, because only a small percentage of Native Americans use those provided by the Indian Health Service.

A promising intervention to address the needs of this diverse group is to build on the traditions of the specific tribe culture to foster identity and integration and enhance protective factors. A return to traditional values of community and group support has been shown to be effective in reducing rates of substance abuse ([CDC, 2009](#); [Indian Health Service, 2014](#)). Nurses working with Native Americans, as with all population groups, need to learn the culture of the specific group and to mutually plan culturally sensitive mental health interventions at levels of primary, secondary, and tertiary prevention.

PRACTICE APPLICATION

Mr. B. is an 81-year-old white widowed man living in a rural area 20 miles from a small city. The nurse practitioner who had treated Mr. B. for sinusitis referred him to the outreach nurse for an evaluation. The nurse practitioner was concerned when she noted that Mr. B. had lost weight and had started to cry when talking about his wife who had died several years before. During the initial visit, the nurse noted that Mr. B. weighed only 110 lb, was not sleeping, had stopped going to church, and was quite anxious and sad about his finances, his limitations from arthritis, his relationship with his 27-year-old stepson, Bart, and the possibility of nursing home placement.

The nurse conducted a suicide assessment, knowing that Mr. B. was at high risk because of his age, his mood, and the presence of guns in the home. Mr. B. stated that he had considered shooting himself, but he was reluctant to have the rifles removed at the nurse's suggestion because Bart used the guns for hunting. Mr. B. agreed to a family meeting with his stepson, and Bart agreed to remove the guns from the house. Both Mr. B. and Bart needed significant education about the biological basis of depression and the efficacy of using a new antidepressant, along with support to treat his condition. Mr. B., like many older adults, did not wish to see a psychiatrist or use the community

PRACTICE APPLICATION—cont'd

mental health system. He did agree to a trial of antidepressants, however.

The nurse, through the primary care nurse practitioner, arranged for a prescription of an antidepressant (a selective serotonin reuptake inhibitor) that is safe for use with older adults, and Mr. B. started the medication within 2 weeks of the initial visit. In addition to medication and counseling, Mr. B. needed help with nutrition. Because Bart was away 10 hours a day, at work in the city, Mr. B. was alone all day. Mr. B. was not able to prepare meals because of his arthritis. The nurse arranged with the local board for aging to provide home-delivered meals. This not only helped with nutrition, but also gave Mr. B. a visit from the volunteer twice a week.

Mr. B. and Bart needed help with financial planning, as they did not want to lose the farm should Mr. B. need more assistance or nursing home placement in the future. The nurse arranged for them to talk with a social worker regarding long-term care planning.

In addition to addressing the immediate concerns, the nurse continued to provide weekly visits to Mr. B. for support and counseling, medication monitoring, and case management

activities. Family meetings with Bart and Mr. B. to discuss mutual concerns were arranged every 2 months and as needed. The significant improvement of depressive symptoms (that is, sleep, appetite, weight, and mood) in Mr. B. was monitored both clinically and through use of a depression rating scale.

Psychological, physical, and social problems of older adults are closely intertwined and are best evaluated and treated by a multidisciplinary team. Psychiatric illness often presents first with physical symptoms, and physical limitations create further psychological distress. Older adults often prefer not to use formal mental health services, so careful assessment in primary care settings is critical to detect their mental health problems.

- A. In addition to his stepson and the nurse, who else might notice if Mr. B.'s condition began to deteriorate?
- B. What nursing measures are important in monitoring Mr. B.'s response to the antidepressant?
- C. What secondary prevention measures did the nurse use?
- D. What resources might be available for Bart should he need more information about depression?

Answers can be found on the Evolve site.

KEY POINTS

- Reform movements and subsequent federal legislation influenced the development of the current community mental health model that includes team care, case management, prevention, and rehabilitation and recovery components of service.
- During the past two decades, federal legislation in the United States focused on mainstreaming persons with mental disabilities into American life by legislating access to employment, services, and housing.
- Prevalence rates for mental health problems are very high, and people are at risk for threats to mental health at all ages across the life span. Low-income and minority groups are often at increased risk because they lack access to services and because programs may lack cultural sensitivity.
- National health objectives to promote health and services for persons who have mental health problems and severe mental disorders illustrate the scope of mental illness and provide direction for community mental health practice.
- Guidelines for attaining national health objectives were designed to help individuals at regional and local levels establish health priorities that include those for mental illness.
- The American Nurses Association standards provide a framework for the roles and functions of community mental health nurses.
- Frameworks that are useful in community mental health nursing include primary, secondary, and tertiary levels of prevention; biological theories including the effects of psychosocial factors on the brain, growth, and development; and rehabilitation and recovery models.

CLINICAL DECISION-MAKING ACTIVITIES

1. For 1 week, keep a list of incidents related to mental health problems that you learn about in the local media. Categorize the incidents according to age, sex, and socioeconomic, ethnic, or minority status. Which populations seem to have the most mental health problems?
2. Visit a local shelter or organization that offers temporary protection for persons with mental disorders. Determine services that are available or lacking for children, women, and men. Describe a nursing intervention that would improve services.
3. Visit with representatives of your local self-help organizations for consumers to determine their needs and the adequacy of resources for people with severe mental disorders and their caregivers; determine gaps in services. Develop a list of the agencies in your community that provide direct or indirect services for those with mental illness and their families.
4. Interview a school nurse, an occupational health nurse, an emergency department nurse, or a hospice nurse in your community to discuss types of mental health problems

CLINICAL DECISION-MAKING ACTIVITIES—cont'd

- they see with clients in their practice settings. Determine resources that are available or lacking for primary, secondary, and tertiary prevention. Design a primary prevention intervention.
- Interview a nurse working in a local community mental health agency to discuss roles, functions, programs, and resources available or lacking for primary, secondary, and tertiary prevention. Compare findings about prevention programs with information obtained from the preceding interview.
 - Visit a consumer-operated program or a psychosocial rehabilitation program. Interview members to learn how they view services and resources available or lacking in this setting. Describe how your attitudes about persons in recovery from mental illness changed after your visit.
 - Accompany a community mental health nurse on home visits to clients enrolled in an assertive community outreach program, and then accompany a psychiatric nurse in a home care agency. Compare and contrast how the services, funding, populations served, and philosophies of treatment differ.
 - As a class activity, arrange for a panel of speakers representing the minority populations described in this chapter. Discuss their views about the way culture shapes thinking about mental illness, and determine types of culturally sensitive services that are available or lacking in your community.
 - Review articles in at least four research journals to determine current research findings about mental disorders and mental health problems, and compare nursing care in the United States with that of other countries. Discuss the differences in mental health care between countries.

Alcohol, Tobacco, and Other Drug Problems

Mary Lynn Mathre, RN, MSN, CARN

Mary Lynn Mathre earned the BSN from the College of St. Teresa in Winona, MN, and the MSN from the Frances Payne Bolton School of Nursing at Case Western Reserve University. She has 39 years of experience as an acute care nurse and has worked in the field of alcohol, tobacco, and other drugs for the past 25 years. From 1991 to 2003 she worked as the addictions consult nurse for the University of Virginia Health System and interacted with many community resources to provide appropriate referrals and aftercare for clients. From 2004 to 2007 she worked in an outpatient opioid treatment program as the executive director. Currently she works as an independent consultant on substance abuse prevention and brief interventions. She is an active member of the International Nurses Society on Addictions and serves on the editorial board for the *Journal of Addictions Nursing*.

OBJECTIVES

After reading this chapter, the student should be able to do the following:

1. Analyze personal attitudes toward alcohol, tobacco, and other drug problems.
2. Differentiate among these terms: *substance use*, *abuse*, *dependence*, and *addiction*.
3. Discuss the differences among the major psychoactive drug categories of depressants, stimulants, marijuana, hallucinogens, and inhalants.
4. Explain the role of the nurse in primary, secondary, and tertiary prevention of alcohol, tobacco, and other drug problems as it relates to individual clients, their families, and special populations.
5. Evaluate the role of the nurse in primary, secondary, and tertiary prevention of alcohol, tobacco, and other drug problems as it relates to the community and national policies on drug control.

- Addiction Treatment
- Smoking Cessation Programs
- Support Groups
- Nurse's Role

Outcomes

Substance abuse is the number one national health problem, causing more deaths, illnesses, and disabilities than any other health condition. The substance abuser is not only at risk for personal health problems, but may also be a threat to the health and safety of family members, coworkers, and other members of the community.

Substance abuse and addiction affect all ages, races, sexes, and segments of society. As seen in *Healthy People 2020* (USDHHS, 2010), tobacco use and substance abuse are two major topic areas, with many objectives and subobjectives, as well as related objectives in other priority areas. The newer phrase of *alcohol, tobacco, and other drug (ATOD) problems* rather than *substance abuse* reminds us that alcohol and tobacco represent the major drugs of abuse when discussing substance abuse, drug addiction, or chemical dependency.

This chapter begins by providing a broad perspective of ATOD problems to clarify the relevant issues. A historical overview of ATOD problems and attitudes toward ATOD users and addicts is examined. Relevant terms are defined to decrease the confusion caused by frequent misuse of terms. The major drug categories are described, including information on commonly used substances and current ATOD use trends. The remainder of the chapter examines the role of the nurse in primary, secondary, and tertiary prevention and describes how the nurse can improve the outcomes for individuals, families, and various populations with ATOD problems when using a harm reduction model. It is important to apply nursing strategies to the *Healthy People 2020* objectives for ATOD problems.

ALCOHOL, TOBACCO, AND OTHER DRUG PROBLEMS IN PERSPECTIVE

ATOD abuse and addiction can cause multiple health problems for individuals. Heavy ATOD use has been associated with many problems, including neonates with low birth weight and congenital abnormalities; accidents, homicides, and suicides; chronic diseases, such as cardiovascular diseases, cancer, lung

disease, hepatitis, HIV/AIDS, and mental illness; violence; and family disruption. Factors that contribute to the substance abuse problem include lack of knowledge about the use of drugs; the war on drugs' emphasis on illicit drugs and law enforcement rather than the prevention and treatment of abuse and addiction of ATODs; lack of quality control of illegal drugs; and drug laws that label certain drug users as criminals, which encourages the negative attitudes and stigma toward these persons.

Historical Overview

Psychoactive drug use has been part of most cultures since the beginning of humanity. Often a culture encourages use of some drugs while discouraging the use of others. Caffeine, alcohol, and tobacco are socially acceptable drugs in the United States and Canada, whereas other cultures prohibit their use. Conversely, marijuana, cocaine, and opium use are not accepted in mainstream U.S. society, although these substances are considered sacred or beneficial and their use is accepted in various other cultures.

The United States' primary solution to various "drug problems" has been **prohibition**. During alcohol prohibition from 1920 to 1933, the United States experienced a sharp increase in violent crime and corruption among law officials as a result of the illicit marketing of alcohol. Use of distilled beverages was encouraged because of the higher profit margin per bottle of liquor than for beer or wine. The high alcohol content in illicit moonshine caused severe health problems. The alcohol prohibition was eventually recognized as a failure and repealed (Rose, 1996).

Similar problems are occurring with the current war on drugs and the newer prohibition on marijuana, cocaine, and other drugs. An increase in both violent crime and reports of corruption among law officials as a result of the illicit market has become a major national problem (*Common Sense for Drug Policy*, 2014). Stronger drugs are pushed because of their greater profits. Some would say that drug prohibition laws have

created mandatory sentences for drug offenders, violated civil liberties, and put more resources into law enforcement than into drug education and treatment ([Common Sense for Drug Policy, 2014](#)). As the drug war budget grows each year, most of that budget goes to law enforcement and punishment, leaving only a third for prevention and treatment. However, the 2014 budget is increasing its efforts in demand reduction. President Obama has requested more than \$25 billion for drug control programs. Of that, 42% is designated for demand reduction: treatment, education and prevention. The remaining 58% is for supply reduction: law enforcement, interdiction, and international programs (<http://www.whitehouse.gov/blog/2013/04/10/president-s-fy-2014-budget-supporting-21st-century-drug-policy>).

A 3-year study by the National Center on Addiction and Substance Abuse (CASA) closely examined the 2005 federal, state, and local government budgets to measure the financial impact of ATOD problems on their health, social service, criminal justice, education, mental health, developmentally disabled, and other programs. The CASA study found that the government spent at least \$467.7 billion (\$238.2 billion, federal; \$135.8 billion, state; and \$93.8 billion, local) in 2005 on substance abuse and addiction, which amounted to 10.7% of the entire combined \$4.4 trillion budgets. Of every dollar the federal and state governments spent on substance abuse and addiction, 95.6 cents was used to deal with the ATOD problems, while only 1.9 cents went to prevention and treatment, 0.4% to research, 1.4% to taxation or regulation, and 0.7% to interdiction. Almost half of this spending cannot be disaggregated by specific substance. However, of the \$248 billion in ATOD-related spending, 92.3% was linked to alcohol and tobacco ([National Center on Addiction and Substance Abuse, 2009](#)). This was a landmark study to show the societal costs of drug problems, but that the funding went to dealing with the consequences rather than prevention.

Attitudes and Myths

Attitudes are developed through cultural learning and personal experiences. Attitudes toward ATOD problems are influenced by the way society inappropriately categorizes drugs as either “good” or “bad.” In the United States, good drugs are typically over-the-counter (OTC) drugs or those prescribed by a health care provider as *medicine*, but this makes them no less problematic or addictive. Bad drugs are the illegal drugs, and persons who use these drugs are considered criminals regardless of whether the drug has caused any problems.

Americans rely heavily on prescription and OTC drugs to relieve (or mask) anxiety, tension, fatigue, and physical or emotional pain. Rather than learning nonmedicinal methods of coping, many people rely on the “quick fix” and take pills to deal with their problems or negative feelings.

Addicts are often viewed as immoral, weak-willed, or irresponsible persons who should try harder to help themselves. Although alcoholism was recognized as a disease by the American Medical Association in 1954 and drug addiction was recognized as a disease some years later, much of the public and many health care professionals have failed to change their attitudes and accept alcoholics and addicts as ill persons in need of health care.

It is important for nurses to examine their attitudes toward ATOD use, abuse, and addiction before working with this health problem. To be therapeutic, the nurse must develop a trusting, nonjudgmental relationship with the client. Systematic assessment for ATOD problems is based on awareness that there may be problems with both legal and illegal drugs. If the nurse’s attitude toward a client with a drug abuse problem is negative or punitive, the issue may never be directly addressed or the client may be avoided. If the client senses the negative attitude of the health care provider, either by words or from tone of voice, communication may cease and information may be withheld. To develop a therapeutic attitude, the nurse must realize that any drug can be abused, that anyone may develop drug dependence, and that drug addiction can be successfully treated.

Myths develop over years, and if myths are not questioned, many attitudes may be formed solely on the basis of fiction rather than fact. Some common myths are as follows:

- “An alcoholic is a skid row bum”—but less than 5% of persons with addictions fit this description.
- “If you teach people about drugs, they will abuse them”—although it is true that people may choose to use drugs if they have knowledge about them, it is more likely that people without knowledge about them will abuse them.
- “Addiction is a sin or moral failing”—addiction is recognized as a health problem involving biopsychosocial factors, and persons who use drugs do not do so with the intent to become addicted.

Paradigm Shift

We can hope to see a major shift in how the United States conceptualizes ATOD problems. The old criminal justice model is based on stereotypes, misinformation, and punishment, and it uses war tactics to fight the drug users, addicts, and suppliers. Campaigns have been launched using the slogans “zero tolerance” for drug users, “just say no” to drugs, and striving for a “drug-free America”—all of which vilify the drug user or drug addict. The Obama administration’s approach to the nation’s drug problem is to approach it as a public health problem and not just a criminal justice problem, and the administration has put more funding into prevention and treatment (\$10.7 billion) than into domestic law enforcement (\$9.6 billion) (<http://www.whitehouse.gov/blog/2013/04/10/president-s-fy-2014-budget-supporting-21st-century-drug-policy>). Also, on the international level, experts are suggesting that national drug policies need to be more comprehensive rather than focusing on law enforcement strategies. ([Box 37-1](#) lists Federal drug control spending by function).

The [harm reduction](#) model is a public health approach to ATOD problems initially used in Great Britain, The Netherlands, Germany, Switzerland, and Australia, and interest in it is spreading throughout Europe and in Canada. This new public health model recognizes the following:

- Addiction is a health problem.
- Any psychoactive drug can be abused.
- Accurate information can help people make responsible decisions about drug use.
- People who have ATOD problems can be helped.

BOX 37-1 High-Level Principles for an Effective Drug Policy

We propose that national drug strategies should always be based on five core principles:

1. Drug policies should be developed through a structured and objective assessment of priorities and evidence.
2. All activities should be undertaken in full compliance with international human rights law.
3. Drug policies should focus on reducing the harmful consequences rather than the scale of drug use and markets.
4. Policy and activities should seek to promote the social inclusion of marginalized groups.
5. Governments should build open and constructive relationships with civil society in the discussion and delivery of their strategies.

Adapted from the Suggested principles for an effective drug policy proposed by the International Drug Policy Consortium (IDPC), published in March 2012. Available at <http://idpc.net/publications/2012/03/idpc-drug-policy-guide-2nd-edition>. Each chapter of the guide fully integrates the above five core principles.

This approach accepts the reality that psychoactive drug use is endemic, and it focuses on pragmatic interventions, especially education, to reduce the adverse consequences of drug abuse and get treatment for addicts. The United States has already taken a harm reduction approach with tobacco and alcohol. Educational campaigns are used to inform the public about the health risks of tobacco use. Warnings have appeared on tobacco product labels since 1967 as a result of the surgeon general's 1966 report on the dangers of smoking. In 1971 a ban on television and radio cigarette advertising was imposed. Cigarette smoking has declined from 42% in 1965 to 18% in 2012, which is about 43 million Americans who still smoke (USDHHS, 2014). Smoking is on the decline among eighth and twelfth graders. According to the 2012 *National Survey on Drug Use and Health: Summary of National Findings*, past month use of any tobacco product among persons aged 12 or older decreased from 30.4% on 2002 to 26.7% in 2012 and past month tobacco use among 12- to 17-year-olds fell from 15.2% to 8.6% in that same period (SAMHSA, 2013). Education is continuing to address the dangers of alcohol abuse and to establish guidelines for safe alcohol use.

Nurses need to seek the underlying roots of various health problems and plan action that is realistic, nonjudgmental, holistic, and positive. A harm reduction model for ATOD problems facilitates such an approach.

Definitions

The terms *drug use* and *drug abuse* have virtually lost their usefulness because the public and government have narrowed the term *drug* to include only illegal drugs rather than including prescription, OTC, and legal recreational drugs. The current phrase *alcohol, tobacco, and other drugs* (ATODs) is a reminder that the leading drug problems involve alcohol and tobacco. The term *substance* broadens the scope to include alcohol, tobacco, legal drugs, and even foods. **Substance abuse** is the use of any substance that threatens a person's health or impairs social or economic functioning. This definition is more objective and

universal than the government's definition of drug abuse, which is the use of a drug without a prescription or any use of an illegal drug. Although any drug or food can be abused, this chapter focuses on **psychoactive drugs**—drugs that affect mood, perception, and thought.

Drug dependence and drug addiction are often used interchangeably, but they are not synonymous. **Drug dependence** is a state of neuroadaptation (a physiologic change in the central nervous system [CNS]) caused by the chronic, regular administration of a drug; in drug dependence, continued use of the drug becomes necessary to prevent withdrawal symptoms. For example, when a person is given an opiate such as morphine on a regular basis for pain, management, the morphine needs to be gradually tapered rather than abruptly stopped to prevent symptoms of **withdrawal**.

Drug addiction is a pattern of abuse characterized by an overwhelming preoccupation with the use (compulsive use) of a drug, securing its supply, and a high tendency to relapse if the drug is removed. Frequently, addicts are physically dependent on a drug, but there also appears to be an added psychological component that causes the intense cravings and subsequent relapse. In general, anyone can develop drug dependence as a result of regular administration of drugs that alter the CNS; however, only 7% to 15% of the drug-using population will develop a drug addiction. The process of becoming addicted is complex and related to several factors, including the addictive properties of the substance, family and peer influences, personality, age of first use, cultural and social factors, existing psychiatric disorders, and genetics.

Alcoholism is addiction to the drug called alcohol. Alcoholism and drug addiction are recognized as illnesses under a **biopsychosocial model**. Simply stated, the disease concept of addiction and alcoholism identifies them as chronic and progressive diseases in which a person's use of a drug or drugs continues despite problems it causes in any area of life—physical, emotional, social, economic, or spiritual.

With the 2013 updated *Diagnostic and Statistical Manual of Mental Disorders* (DSM-5), the substance-related and addictive disorders classification has been replaced with a single disorder (substance use disorder) that is measured on a continuum from mild to severe and identified by the substance, such as “alcohol use disorder—moderate.” The severity of the disorder is determined by the number of diagnostic criteria that are met (American Psychiatric Association, 2013).

PSYCHOACTIVE DRUGS

Although any drug can be abused, ATOD abuse and addiction problems generally involve the psychoactive drugs. These drugs, which can alter emotions, are used for enjoyment in social and recreational settings and for personal use to self-medicate physical or emotional discomfort. Psychoactive drugs are divided into categories according to their effect on the CNS and the general feelings or experiences the drugs may induce. The Internet or a pharmacology text can provide detailed information on these drug categories (e.g., **depressants**, **stimulants** [as shown in Box 37-2], **hallucinogens**, inhalants [as shown in

BOX 37-2 Cocaine and Amphetamines: Common Illicit Stimulants

The most commonly used illicit stimulants include cocaine and amphetamines (not prescribed). Cocaine comes from the coca shrub cultivated by South American Indians in the Andes Mountains for thousands of years. Purified cocaine can be snorted, smoked, or injected. Crack is a cheap form of smokable cocaine that produces an intense high, but it lasts for a short period. Street cocaine ranges in purity from 50% to 60% and may be cut with other drugs, such as procaine or amphetamine, or any white powder, such as sugar or baby powder. High doses can cause extreme agitation, paranoid delusions, hyperthermia, hallucinations, cardiac dysrhythmias, pulmonary complications, convulsions, and possibly death (Cocaine, *Merck Manual*, 2008).

Amphetamines are a class of stimulants similar to cocaine, but the effects last longer and the drugs are cheaper. Amphetamines have a chemical structure similar to adrenaline and noradrenaline and are generally used to decrease fatigue, increase mental alertness, suppress appetite, and create a sense of well-being. Historically, amphetamines have been issued to American soldiers and pilots to decrease fatigue and increase mental alertness. They are popular among people who need to stay awake for long hours to work or study. They can be taken as pills, injected, snorted, or smoked. "Ice," the smokable form of crystal methamphetamine, first appeared in Hawaii and the western states, but the market has moved across the United States. Methamphetamine is easy to manufacture on the illicit market and its effects can last up to 24 hours (Amphetamines, *Merck Manual*, 2008).

Chronic administration of these stimulants can lead to a neurotransmitter depletion (especially of dopamine), which results in an extreme dysphoria characterized by apathy, sadness, and anhedonia (lack of joy). Thus, these users can get caught up in a dangerous cycle of gaining an extreme high followed by an extreme low. To avoid that low, the person consumes more of the stimulant. Addicts who use these drugs soon are overwhelmed by their cravings and may engage in criminal activities such as theft or prostitution to get drug money.

BOX 37-3 Inhalants

Inhalants are often among the first drugs that young children use. The primary abusers of most inhalants are adolescents who are 12 to 17 years of age. The 2012 National Survey on Drug Use and Health found that 584,000 persons aged 12 or older had used inhalants for the first time within the past 12 months and 62.5% of them were under the age of 18 (SAMHSA, 2013). Use often ends in late adolescence.

Inhalants are breathable chemicals, which include gases and solvents, and they do not fit neatly into other categories. The four categories of inhalants are volatile organic solvents, aerosols, volatile nitrites, and gases. These substances are inhaled ("huffed") from bottles, aerosol cans, or soaked cloth or put into bags or balloons to increase the concentration of the inhaled fumes and decrease the inhalation of other substances in the vapor (e.g., paint particles). (See www.inhalants.org for examples of products in these categories and specific drug information.) Inhalant users can get high several times in a short period since the inhalants are short acting and have a rapid onset. Users are predominately white. Experimental use is about equal for males and females, but males are more likely to engage in chronic use.

Depending on the dose, the user may feel a slight stimulation, less inhibition, or even lose consciousness. Other signs include paint or stains on clothes or the body; spots or sores around the mouth; red or runny eyes or nose; chemical breath odor; a drunk, dazed, or dizzy appearance; nausea and loss of appetite; and finally anxiety, excitability, and irritability. Users can die from "sudden sniffing death" syndrome, and this can occur from the first to the 100th time he or she uses the inhalant. This death appears to be related to acute cardiac dysrhythmia. Dangers with administration of gases increase when inhaling directly from pressurized tanks because the gas is very cold and can cause frostbite to the nose, lips, and vocal cords. Also, if a gas such as nitrous oxide is not mixed with oxygen, the user may die from asphyxiation (National Institute on Drug Abuse, 2012).

Box 37-3], and marijuana), and a drug chart of commonly abused drugs is provided on the Evolve site for this book. This chapter focuses on alcohol, tobacco, and marijuana since alcohol and tobacco cause the greatest harm and marijuana is the most commonly used illicit drug. (Resource Tool 37.B on the Evolve website lists useful web resources with more information on handling substance abuse and addiction.) Information on prescription drug misuse will be discussed because there has been an increase in overdose deaths from illicit use of prescription medications.

Alcohol

Alcohol (ethyl alcohol or ethanol) is the oldest and most widely used psychoactive drug in the world. In 2012 a national survey found that young people between the ages of 12 and 20 are more likely to use alcohol than to use tobacco or illicit drugs, including marijuana. Youth tend to drink less often than adults, but they consume more alcohol per occasion. On average, youth report consuming five drinks per occasion, and they increasingly binge drink. Alcohol abuse contributes to illness in each of the top three causes of death in the United States: heart disease, cancer, and stroke. In 2012, an estimated 22.2 million persons (8.5% of the population aged 12 or older) were classified with substance dependence or abuse in the past year based

on criteria specified in the *Diagnostic and Statistical Manual of Mental Disorders*, 4th edition (DSM-IV). Of these, 2.8 million were classified with dependence on or abuse of both alcohol and illicit drugs, 4.5 million were dependent on or abused illicit drugs but not alcohol, and 14.9 million were dependent on or abused alcohol but not illicit drugs (SAMHSA, 2013).

Alcohol abuse costs billions of dollars in lost productivity, property damage, medical expenses from alcohol-related illnesses and accidents, family disruptions, alcohol-related violence, and neglect and abuse of children. Chronic alcohol abuse leads to profound metabolic and physiologic effects on all organ systems. Gastrointestinal (GI) disturbances include inflammation of the GI tract, malabsorption, ulcers, liver problems, and cancers. Cardiovascular disturbances include cardiac dysrhythmias, cardiomyopathy, hypertension, atherosclerosis, and blood dyscrasias. CNS problems include depression, sleep disturbances, memory loss, organic brain syndrome, Wernicke-Korsakoff syndrome, and alcohol withdrawal syndrome. Neuromuscular problems include myopathy and peripheral neuropathy. Males may experience testicular atrophy, sterility, impotence, or gynecomastia, and females who consume alcohol during pregnancy may reproduce neonates with **fetal alcohol syndrome** (FAS) or fetal alcohol effects (FAE). Some of the metabolic disturbances include hypokalemia, hypomagnesemia, and ketoacidosis. Also, endocrine disturbances may result

FIG 37-1 Blood alcohol level and related central nervous system effects of a normal drinker (160-lb man) according to the number of drinks consumed in 1 hour. (From Kinney J: *Loosening the Grip: A Handbook of Alcohol Information*, ed 10, New York, 2011, McGraw-Hill.)

in pancreatitis or diabetes (*Drug and Substance Use and Abuse in Adolescents*, Merck Manual, 2009).

The concentration of alcohol in the blood is determined by the concentration of alcohol in the drink, the rate of drinking, the rate of absorption (slower in the presence of food), the rate of metabolism, and a person's weight and sex. The amount of alcohol the liver can metabolize per hour is equal to about $\frac{3}{4}$ oz of whiskey, 4 oz of wine, or 12 oz of beer. Figure 37-1 shows the effects on the CNS as the **blood alcohol concentration** (BAC) increases. However, with chronic consumption, tolerance will develop, and a person can reach a high BAC with minimal CNS effects.

Alcohol use in moderation may provide health benefits by providing mild relaxation and lowering the serum cholesterol level. Controlled drinking organizations such as Moderation Management (<http://www.moderation.org>) provide guidelines for persons who want to have alcohol in their lives. See Box 37-4 for safe limits of alcohol consumption and Table 37-1 for standard drink equivalents.

BOX 37-4 What Are the Recommended Safe Limits for Alcohol Consumption?

For healthy men up to age 65:

- No more than 4 drinks in a day AND
- No more than 14 drinks in a week

For healthy women (and healthy men over age 65):

- No more than 3 drinks in a day AND
- No more than 7 drinks in a week

From: National Institute on Alcohol Abuse and Alcoholism: *Helping Patients Who Drink Too Much: A Clinician's Guide (Update)*. NIH Pub No 07-3769. Rockville, MD, 2005, USDHHS.

Tobacco

Smoking is the foremost preventable cause of death and disease in the United States, with one in five deaths attributed to cigarettes. For every person who dies from tobacco use, another 30 will suffer from at least one serious tobacco-related illness (USDHHS, 2014). Table 37-2 shows cigarette smoking-related mortality in the United States. It is estimated that more than 480,000 deaths per year are caused by complications of cigarette smoking (USDHHS, 2014). In 2012, an estimated 69.5 million Americans aged 12 or older were current (past month) users of a tobacco product. This represents 26.7% of the population in that age range. In addition, 57.5 million persons (22.1% of the population) were current cigarette smokers; 13.4 million (5.2%) smoked cigars; 9 million (3.5%) used smokeless tobacco; and 2.5 million (1.0%) smoked tobacco in pipes. Young adults ages 18 to 25 reported the highest rate of current tobacco use at 38.1% (SAMHSA, 2013). Tobacco Control State Highlights 2010 is a call-to-action report that looks at six high-impact strategies to reduce tobacco use and provides key indicators for assessing progress in every state. The World Health Organization introduced a framework to describe these strategies using the acronym MPOWER. The strategies include (1) Monitor tobacco use and prevention policies, (2) Protect people from tobacco smoke, (3) Offer help to quit tobacco use, (4) Warn about the dangers of tobacco use, (5) Enforce bans on tobacco advertising, promotion, and sponsorship, and (6) Raise taxes on tobacco (WHO, 2008).

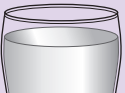

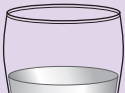

The economic toll from tobacco use in the United States is enormous. Cigarette smoking was responsible for approximately \$289 billion in annual health-related losses, with \$133 billion in direct medical costs and \$156 billion in lost productivity (USDHHS, 2014).

Nicotine, the active ingredient in the tobacco plant, is a particularly toxic drug. To protect itself, the body quickly develops tolerance to the nicotine. If a person smokes regularly, **tolerance** to nicotine develops within hours, compared with days for heroin or months for alcohol. Pipes and cigars are less hazardous than cigarettes because the harsher smoke discourages deep inhalation. However, pipes and cigars increase the risk of cancer of the lips, mouth, and throat.

Smoke can be inhaled directly by the smoker (**mainstream smoke**), or it can enter the atmosphere from the lighted end of the cigarette and be inhaled by others in the vicinity (sidestream smoke). **Sidestream smoke** or secondhand smoke contains higher concentrations of toxic and carcinogenic compounds than mainstream smoke. Exposure to sidestream tobacco smoke

TABLE 37-1 What Is a Standard Drink?

A standard drink in the United States is any drink that contains about 14 g of pure alcohol (about 0.6 fluid oz or 1.2 tbsp). The U.S. standard drink equivalents shown here are approximate, since different brands and types of beverages vary in their actual alcohol content.

12 oz of beer or cooler	8-9 oz of malt liquor 8.5 oz shown in a 12-oz glass that, if full, would hold about 1.5 standard drinks of malt liquor	5 oz of table wine	3-4 oz of fortified wine (such as sherry or port) 3.5 oz shown	2-3 oz of cordial, liqueur, or aperitif 2.5 oz shown	1.5 oz of brandy (a single jigger)	1.5 oz of spirits (a single jigger of 80-proof gin, vodka, whiskey, etc.) Shown straight and in a highball glass with ice to show level before adding mixer*
						
12 oz	8.5 oz	5 oz	3.5 oz	2.5 oz	1.5 oz	1.5 oz

Many people do not know what counts as a standard drink and so they do not realize how many standard drinks are in the containers in which these drinks are often sold. Some examples:

For beer, the approximate number of standard drinks in

 $12.07 = 1$
$$16 \text{ oz} = 1.3$$

For malt liquor, the approximate number of standard drinks in

$$12 \text{ oz} = 1.5$$
$$16 \text{ oz} = 2$$

For table wine, the approximate number of standard drinks in

a standard 750 mL (25 oz) bottle = 5

For 80-proof spirits, or “hard liquor,” the approximate number of standard drinks in

a mixed drink = 1 or more*

a pint (16 oz) = 11

 $22 \ 07 = 2$
$$40 \text{ oz} = 3.3$$
$$22.07 = 2.5$$
$$40 \text{ oz} = 4.5$$

a fifth (25 oz) = 17

$$1.75 \text{ L (59 oz)} = 39$$

.....

**Note:* It can be difficult to estimate the number of standard drinks in a single mixed drink made with hard liquor. Depending on factors such as the type of spirits and the recipe, a mixed drink can contain from one to three or more standard drinks.

TABLE 37-2 Cigarette Smoking–Related Mortality

Disease	Men	Women	Overall
CANCERS			
Lung	74,300	53,400	127,700
Other	26,000	10,000	36,000
Subtotal	100,300	63,400	163,700
CARDIOVASCULAR DISEASES AND METABOLIC DISEASES			
Coronary heart disease	61,800	37,500	99,300
Other heart disease	13,400	12,100	25,500
Cerebrovascular disease	8,200	7,100	15,300
Other vascular disease	6,000	5,500	11,500
Diabetes mellitus	6,200	2,800	9,000
Subtotal	95,600	65,000	160,000
RESPIRATORY DISEASES			
Pneumonia/influenza	7,800	4,700	12,500
COPD	50,400	50,200	100,600
Subtotal	58,200	54,900	113,100
Total	254,100	183,300	437,400

Modified from Centers for Disease Control and Prevention: *Annual Cigarette Smoking-Related Mortality in the United States*. Available at http://www.cdc.gov/tobacco/data_statistics/fact_sheets/health_effects/tobacco_related_mortality/index.htm. Accessed June 2, 2014.

has been causally linked to cancer, respiratory and cardiovascular diseases, and to adverse effects on the health of infants and children (USDHHS, 2014). Sidestream smoke is only about 20% less dangerous than actually smoking, and most of the toxic effects occur within the first 5 minutes of exposure (Barnoya and Glanz, 2005). Smoking bans are being adopted to reduce the discomfort and health hazards among nonsmokers.

Nicotine is also used as chewing tobacco or snuff. Marketed as “smokeless tobacco,” a wad is put in the mouth and the nicotine is absorbed sublingually. Higher doses of nicotine are delivered in the smokeless forms because the nicotine is not destroyed by heat. Nevertheless, this form is less addictive because nicotine enters the bloodstream less directly. Smokeless tobacco users are 20% more likely to die of heart disease than non-users, and they are at a higher risk for cancers of the mouth, pharynx, esophagus, stomach, and pancreas (Barry, 2007).

Caffeine is one of the most widely used psychoactive drugs in the world, with a U.S. daily per capita consumption of 211 mg. As seen in [Table 37-3](#) caffeine is found in coffee, tea, chocolate, soft drinks, and various medications ([Table 37-3](#)). Moderate doses of caffeine from 100 to 300 mg per day increase mental alertness and probably have little negative effect on health. Higher doses can lead to insomnia, irritability, tremulousness, anxiety, cardiac dysrhythmias, GI disturbances, and headaches. Regular use of high doses can lead to physical

TABLE 37-3 Caffeine Content in Commonly Consumed Substances

Drink/Food/Supplement	Amount Of Drink/Food	Amount of Caffeine
Jolt cola	12 oz	71.2 mg
Mountain Dew	12 oz	55 mg
Coca-Cola	12 oz	34 mg
Diet Coke	12 oz	45 mg
Pepsi	12 oz	38 mg

dependence, and the withdrawal symptoms may include headaches, slowness, and occasional depression (Mayo Clinic Staff, 2009). Treating afternoon headaches with analgesics containing caffeine may in reality be preventing a withdrawal symptom from heavy morning coffee consumption.

Marijuana

Marijuana (*Cannabis sativa* or *C. indica*) is the most widely used illicit drug in the United States. Compared with the other psychoactive drugs, marijuana has little toxicity and is one of the safest therapeutic agents known (Marijuana, Merck Manual, 2013). Psychological dependence can occur with chronic use, but little is known about any potential physical dependence. However, because of its illegal status, there is no quality control, and a user may consume contaminated marijuana. Users enjoy a mild euphoria, a relaxed feeling, and an intensity of sensory perceptions. Some call the effect a dreamy state of consciousness in which ideas seem disconnected, unanticipated, and free flowing. Time, color, and spatial perceptions may be altered (Marijuana, Merck Manual, 2013). Side effects include dry and reddened eyes, increased appetite, dry mouth, drowsiness, and mild tachycardia. Adverse reactions include anxiety, disorientation, and paranoia.

The greatest physical concern for chronic users is possible damage to the respiratory tract from smoking the drug. For chronic users tolerance can develop, as well as physical dependence; however, the withdrawal symptoms are benign. Addiction can occur for some chronic users and is difficult to treat because the progression tends to be subtle.

Despite its therapeutic effects, especially in treating pain, the only legal access to marijuana was through the U.S. Food and Drug Administration's (FDA's) Compassionate Investigational New Drug Program. This program was closed in 1992. In response to this complete prohibition, some health care organizations supported access to this medication through formal resolutions, including several state nurses' associations, the American Nurses Association, and the American Public Health Association. Twenty-two states and Washington, DC, have passed laws allowing clients to use marijuana as medicine under the recommendation of their physician, but the federal government continues its total prohibition efforts. See www.medicalcannabis.com for a full list of supporting organizations.

In the late 1980s to early 1990s scientists discovered a complex molecular signaling system within the human body that is involved in most physiologic processes and its purpose is to protect us from stressors and help maintain balance. This system is called the endocannabinoid system (ECS) and consists of receptors primarily in our brain (CB1 receptors) and immune system (CB2 receptors). We now know that all animals have an ECS and that we make cannabinoids (endogenous cannabinoids) that are similar in structure to the phytocannabinoids found in the cannabis plant. This new science is shedding light on human physiology and helps explain how and why cannabis has such a wide margin of safety and is helpful for such a wide array of health problems (Pacher et al, 2006; Werner, 2011).

Illicit Prescription Drugs

Prescription drug abuse is an emerging area of concern, as drug overdose death rates have more than tripled in the United States since 1990. In 2012 drug overdose was the leading cause of injury death. The drug overdose rate more than doubled between 1999 and 2013 leading to 43,982 drug overdose deaths in 2013 (CDC, 2014). In 2010, approximately 2 million persons reported using prescription painkillers nonmedically for the first time within the last year—nearly 5,500 per day. More than 3 out of 4 people who misuse prescription opioids use drugs prescribed to someone else, and the users were either given them for free, bought them, or stole them (SAMHSA, 2011). In 2013, 22,767 (51.8%) of the 43,982 drug overdose deaths in the United States were related to pharmaceuticals (CDC, 2014). Commonly abused classes of prescription drugs include opioids (prescribed to treat pain), CNS depressants (prescribed to treat anxiety and sleep disorders), and stimulants (prescribed to treat narcolepsy, attention-deficit/hyperactivity disorder [ADHD], and obesity). These drugs can be fairly safe when used as directed; however, some people with prescriptions begin using more than prescribed, mislead their primary care provider to get early refills, or do some “doctor shopping” to get more prescriptions.

PREDISPOSING/CONTRIBUTING FACTORS

In addition to the specific drug being used, two other major variables influence the particular drug experience: set and setting. To understand various patterns of drug use and abuse

by individuals, all three factors (drug, set, and setting) should be considered.

Set

Set refers to the individual using the drug, as well as that person's expectations, including unconscious expectations, about the drug being used. A person's current health may alter a drug's effects from one day to the next. Some people are genetically predisposed to alcoholism or other drug addiction, and their chemical makeup is such that simply consuming the drug triggers the disease process. Persons with underlying mood disorders or other mental illness may try to self-medicate with psychoactive drugs. Sometimes the choice of drug exacerbates symptoms; for example, a depressed person might consume alcohol and become more depressed.

Setting

Setting is the influence of the physical, social, and cultural environment within which the use occurs. Social conditions influence the use of drugs. The fast pace of life, competition at school or in the workplace, and the pressure to accumulate material possessions are daily stressors. Pharmaceutical, alcohol, and tobacco companies are continuously bombarding the public with enticing advertisements pushing their products as a means of feeling better, sleeping better, having more energy, or just as a "treat." People grow up believing that most of life's problems can be solved quickly and easily through the use of a drug. For persons of a lower socioeconomic background and with minimal education or employment possibilities, many of life's opportunities may seem out of reach. Rather than seeking relief through medical care, the use of psychoactive drugs may offer a way to numb the pain or escape from a hopeless reality. They may also rely on alcohol or illicit drugs, which are more readily available. For some, dealing in illicit drugs may appear to be the only way to avoid a future of poverty and unemployment.

Biopsychosocial Model of Addiction

Many theories have been proposed to explain the etiological factors of addiction, and no consensus exists on specific causes. The underlying etiological factors include the belief that addiction is a disease, a moral failing, a psychological disturbance, a personality disorder, a social problem, a dysbehaviorism, or a maladaptive coping mechanism. Different people develop addiction in different ways. For example, some alcoholics say, "I knew I was an alcoholic from my first drink; I drank differently than others." Others have no family history of addiction, but when stressed (such as from chronic pain, significant losses, abusive relationships that lead to low self-esteem, or trauma resulting in post-traumatic stress disorder), they find that drugs may temporarily relieve their stress. Over time, heavy use of one or more drugs to cope with the stress may lead to a substance use disorder. Current research focuses on the neurochemistry of addiction, which shows actual brain chemistry changes among addicts. The biopsychosocial model provides a framework for understanding addiction as being the result of the interaction of multiple factors.

PRIMARY PREVENTION AND THE ROLE OF THE NURSE

The harm reduction approach to substance use disorders focuses on health promotion and disease prevention. Primary prevention for ATOD problems includes (1) the promotion of healthy lifestyles and resiliency factors and (2) education about drugs and guidelines for their use. Nurses are ideally prepared to use health promotion strategies such as promoting and facilitating healthy alternatives to indiscriminate, careless, and often dangerous drug use practices and providing education about drugs to decrease harm from irresponsible or unsafe drug use practices.

Promotion of Healthy Lifestyles and Resiliency Factors

It is possible to teach clients to be assertive in their relationships with others and how to make more beneficial decisions by looking carefully at the pros and cons of each option and the related consequences. People may turn to medications, especially psychoactive drugs, when they have persistent health problems such as difficulty sleeping, muscle tension, lack of energy, chronic stress, and mood swings. Nurses can help clients understand that medications may mask problems rather than solve them. Stress reduction and relaxation techniques along with a balanced lifestyle may be more effective than medications. Lack of sleep, improper diet, and lack of exercise contribute to many health complaints. Assisting clients to balance their need for rest, nutrition, and exercise on a daily basis can reduce these complaints. Nurses can provide useful information to groups, assisting in the development of community recreational resources or facilitating stress reduction, relaxation, or exercise groups. Nurses can help people learn about drug-free community activities. The [How To box](#) lists community activities in which the nurse may become involved.

HOW TO Set Up Community-Based Activities Aimed at Substance Abuse Prevention

- Increase involvement and pride in school activities.
- Organize student assistant programs (students helping students).
- Organize a Students Against Drunk Driving (SADD) chapter.
- Mobilize parental awareness and action groups (e.g., Mothers Against Drunk Driving [MADD]).
- Increase availability of recreational facilities.
- Encourage parental commitment to nondrinking parties.
- Encourage religious institutions to convey nonuse messages, and provide activities associated with nonuse.
- Curtail media messages that glamorize drug and alcohol use.
- Support and reinforce antidrug use peer-pressure skills.
- Provide general health screenings, including ATOD use.
- Collaborate with community leaders to solve problems related to crime, housing, jobs, and access to health care.

Lack of educational opportunities, job training, or both can contribute to socioeconomic stress and poor self-esteem, which can lead to drug use to escape the situation. Nurses can help

clients identify community resources and solve problems to meet basic needs rather than avoid them.

In addition to decreasing risk factors associated with ATOD problems, it is important to increase protective or resiliency factors. Prevention guidelines to teach parents and teachers how to increase resiliency in youths include the following strategies:

- Help them develop an increased sense of responsibility for their own success.
- Help them identify their talents.
- Encourage them to dedicate their lives to helping society rather than believing that their only purpose in life is to be consumers.
- Provide realistic appraisals and feedback; stress multicultural competence; encourage and value education and skills training.
- Increase cooperative solutions to problems rather than competitive or aggressive solutions.

Drug Education

ATOD problems include more than abuse of psychoactive drugs. Today more than 450,000 different drugs and drug combinations are available by prescription or over the counter, and in 2010 pharmaceutical drugs were involved in almost 60% of all drug-related deaths. Opioid drugs, such as oxycodone and methadone, were involved in about 3 of every 4 pharmaceutical overdose deaths. In addition, since 2007 deaths from opioids have outnumbered those for heroin and cocaine combined (<http://www.pdmpexcellence.org/content/prescription-drug-abuse-epidemic-revised-1>). Nurses know about medication administration, the possible dangers of indiscriminant drug use, and the inability of drugs to cure all problems. Nurses can influence the health of clients by destroying the myth of good drugs versus bad drugs. This means (1) teaching clients that no drug is completely safe and that any drug can be abused, (2) helping persons learn how to make informed decisions about their drug use to minimize potential harm, and (3) teaching them to always tell their health care provider what supplements they are taking.

Drug technology is growing, yet the public receives little information about how to safely use this technology. Harm reduction as a goal recognizes that people consume drugs and that they need to know about the use of drugs and risks involved to make decisions about their drug use. Drug education should begin on an individual basis by reviewing the client's prescription medications. Because a physician or nurse practitioner has prescribed the medication, clients often presume little risk is involved.

Is the client aware of any untoward interactions this drug may have with other drugs being used or with food? A common occurrence with drug users is taking drugs from different categories together or at different times to regulate how they feel, known as **polysubstance use or abuse**. For example, a person may drink alcohol when snorting cocaine to “take the edge off”; or some intravenous drug users combine cocaine with heroin (speedball) for similar reasons. Polysubstance use can cause drug interactions that can have additive, synergistic, or

antagonistic effects. Indiscriminant polysubstance abuse may lead to serious physiologic consequences and can be complicated for the health care professional to assess and treat. It is important to encourage clients to ask questions about their drug use. The **How To box** lists key information that clients should obtain before taking a drug or medication to decrease the possible harm from unsafe medication consumption.

HOW TO Determine the Relative Safety of a Drug for Personal or Client Use

Before using a drug/medication, always determine the following:

- The chemical being taken
- How and where the drug works in the body (main effects, side effects, and adverse reactions)
- The correct dosage and route of administration
- Whether there will be drug interactions, including interactions with herbal remedies or foods
- Awareness of the symptoms of a potential allergic reaction and know when to seek help
- If there will be drug tolerance
- If the drug will produce physical dependence

From Mothers Against Misuse and Abuse: Drug consumer safety rules. Mosier, OR. Available at <http://www.mamas.org/drugSafety.htm>. Accessed July 9, 2010.

Nurses can identify references and community resources available to provide the necessary information, and they can clarify the information. User-friendly reference texts and online resources are available that describe drug interactions among medications, other drugs (including alcohol, tobacco, marijuana, and cocaine), and other substances (food and beverages); they serve as excellent guides for nurses and their clients. (See <http://www.drugs.com/drug-interactions/cannabis.html> for more information.) Clients should learn about and ask questions about their prescription medications, self-administered over-the-counter drugs, including supplements and herbal remedies, and recreational drugs. This does not mean that nurses should encourage other drug use but, rather, that the potential harm from self-medication can be reduced if clients have the necessary information to make more informed decisions.

Parents should seek information about their use of medications so they can act as role models for their children. It can be confusing for children and adolescents to be told to “just say no” to drugs when they see their parents trying drugs or they see drug advertisements offering to “quick fix” every health complaint, feeling of stress, anxiety, or depression with a medication. The simple “just say no” approach does not help young people for several reasons. First, children are naturally curious, and drug experimentation is often a part of normal development. Second, children from dysfunctional homes may use drugs to get attention or to escape an intolerable environment. And finally, the “just say no” approach does not address the powerful influence of peer pressure (*Marijuana, Merck Manual, 2013*).

Drug education has moved into the school curriculum with Project DARE (Drug Abuse Resistance Education), the most widely used school-based drug-use prevention program in the United States. This program uses law enforcement officers to teach the material, but recent studies find that it is less effective

than other interactive prevention programs and may even result in increased drug use (Pan and Bai, 2009). Basic ATOD prevention programs for young people should combine efforts to increase resiliency factors with drug education. Nurses can serve as educators or as advisors to the school systems or community groups to ensure that all of these areas are addressed. Role-playing is useful in teaching many of these skills.

SECONDARY PREVENTION AND THE ROLE OF THE NURSE

Screening for health problems has long been a basic tool used by public health nurses when working with various populations. There are numerous screening tools for ATOD problems that can be used independently or integrated with broader health screening tools. When drug abuse, dependence, or addiction is identified, nurses must assist clients to understand the connection between their drug use patterns and the negative consequences on their health, their families, and the community. Brief interventions include effective strategies nurses can initiate for early intervention before a person needs more extensive or specialized treatment.

One such intervention is called Screening, Brief Intervention, and Referral to Treatment (SBIRT). SBIRT is an evidence-based practice used to identify, reduce, and prevent problematic use, abuse, and dependence on alcohol, tobacco, and other drugs. The SBIRT model was incited by an Institute of Medicine recommendation that called for community-based screening for health risk behaviors, including substance use. Primary care centers, hospital emergency rooms, trauma centers, and other community settings provide opportunities for early intervention with at-risk substance users before more severe consequences occur.

- Screening quickly assesses the severity of substance use and identifies the appropriate level of treatment.
- Brief intervention focuses on increasing insight and awareness regarding substance use and motivation toward behavioral change.
- Referral to treatment provides those identified as needing more extensive treatment with access to specialty care.

A key aspect of SBIRT is the integration and coordination of screening and treatment components into a system of services. This system links a community's specialized treatment programs with a network of early intervention and referral activities that are conducted in medical and social service settings (<http://www.integration.samhsa.gov/clinical-practice/SBIRT>—accessed June 16, 2014).

Assessing for Alcohol, Tobacco, and Other Drug Problems

The National Institute on Alcohol Abuse and Alcoholism (NIAAA) has published a clinician's guide for assessing problem drinking. This free booklet (NIAAA, 2005) is available in English and Spanish and provides a step-by-step guide for clinicians to use with their clients (<http://www.niaaa.nih.gov/publications/clinical-guides-and-manuals/helping-patients-who-drink-too-much-clinicians-guide>—accessed June 16, 2014).

Self-assessment screening tools are available online at <http://www.alcoholscreening.org/Home.aspx> and www.drugscreening.org. These screening tools are based on the Alcohol, Smoking, and Substance Involvement Screening Test (ASSIST) developed by the World Health Organization and allow for immediate feedback. People can participate in this screening anonymously.

During health assessment, the nurse should assess for substance abuse problems including both self-medication practices and recreational drug use when taking a medication history. Thus, all relevant drug-use history is collected and aids in the assessment of drug-use patterns. Note any changes in drug-use patterns over time. After obtaining a medication history, follow-up questions can determine if problems exist. The following are examples:

- If using a prescription drug, is the client following the directions correctly?
- Has the client increased the dosage or frequency above the prescription level?
- Is the person using any prescribed psychoactive drugs?
- If so, for how long and what is the dosage?

One useful assessment tool is to ask about the 5 As when screening for ATOD problems: (1) Ask about use; (2) Assess amount and pattern of use; (3) Advise about safe use as appropriate; (4) Assist with identifying help or resources; (5) Arrange for follow-up as needed. Also, the **Levels of Prevention** box shows the levels of prevention related to substance abuse that can be used by nurses.

LEVELS OF PREVENTION

Substance Use Disorders

Primary Prevention

Provide community education to teach healthy lifestyles; focus on how to resist getting involved in substance abuse.

Secondary Prevention

Institute early detection programs in schools, the workplace, and other areas in which people gather to determine the presence of substance abuse.

Tertiary Prevention

Develop programs to help people reduce or end substance abuse.

When assessing self-medication and recreational or social drug-use patterns, determine the reason the person uses the drug. Some underlying health problems (e.g., pain, stress, weight, insomnia) may be relieved by nonpharmaceutical interventions. The amount, frequency, and duration of use and the route of administration of each drug should be determined. To establish the presence of a substance abuse problem, it is necessary to determine if the drug use is causing any negative health consequences or problems with relationships, employment, finances, or the legal system. The **How To** box lists examples of questions to ask to determine the presence of socioeconomic problems that are often a result of substance abuse. If a pattern

of chronic, regular, and frequent use of a drug exists, nurses should assess for a history of withdrawal symptoms to determine if there is physical dependence on the drug. A progression in drug-use patterns and related problems warns about the possibility of addiction. **Denial** is a primary symptom of addiction. Methods of denial include the following:

- Lying about use
- Minimizing use patterns
- Blaming or rationalizing
- Intellectualizing
- Changing the subject
- Using anger or humor
- “Going with the flow” (agreeing that a problem exists, stating the behavior will change, but not demonstrating any behavior changes)

HOW TO Assess Socioeconomic Problems Resulting from Substance Abuse

If the client admits to use of alcohol, tobacco, or other drugs, ask the following questions:

1. Do your parents, spouse, or friends worry or complain about your drinking or using drugs?
 2. Has a family member sought help about your drinking or using drugs?
 3. Have you neglected family obligations as a result of drinking or using drugs?
 4. Have you missed work because of your drinking or using drugs?
 5. Does your boss complain about your drinking or using drugs?
 6. Do you drink or use drugs before or during work?
 7. Have you ever been fired or quit because of drinking or using drugs?
 8. Have you ever been charged with driving under the influence (DUI) or being drunk in public (DIP)?
 9. Have you ever had any other legal problems related to drinking and using drugs, such as assault and battery, breaking and entering, or theft?
 10. Have you had any accidents while intoxicated, such as falls, burns, or motor vehicle accidents?
 11. Have you spent your money on alcohol or other drugs instead of paying your bills (e.g., telephone, electricity, rent)?
-

A problem should be suspected if the client becomes defensive or exhibits other behavior indicating denial when asked about alcohol or other drug use.

Drug Testing

During the 1980s, pre-employment or random drug testing in the workplace gained popularity. A person’s urine, blood, saliva or hair can be examined to test for the use of drugs. The breath can be tested for alcohol. Urine testing is the most common method of drug screening. Urine testing indicates only past use of certain drugs, not intoxication. Thus, persons can be identified as having used a certain drug in the recent past, but the degree of intoxication and extent of performance impairment cannot be determined with urine testing. Also, most drug-related problems in the workplace are related to

alcohol, and alcohol is not always included in a urine drug screen. When is drug testing appropriate? Drug testing that follows documented impairment may help substantiate the cause of the impairment, and thus it serves as a backup rather than the primary screening method. It is also useful for recovering addicts. Part of their treatment is to abstain from psychoactive drug use; therefore, a urine test yielding positive results for a drug indicates a relapse.

Blood, breath, and saliva drug tests can indicate current use and amount. Any of these tests can help determine alcohol intoxication, and they are often used to substantiate suspected impairment. A serum drug screen can be useful to determine the specific drug ingested when overdose is suspected. The testing of hair is gaining attention because the results can provide a long history of drug-use patterns.

Alcohol and other drug testing should be used as a clinical and public health tool but not for harassment and punishment. For example, approximately 40% to 50% of people who are seen in trauma centers were drinking at the time of their injuries. Hence, it is recommended that breath alcohol testing should be routinely done for clients admitted to the emergency department for traumatic injuries ([Physicians and Lawyers for National Drug Policy, 2008](#)).

Employee assistance programs (EAPs) are a beneficial service in many work settings. Often a sizable number of EAP clients have substance use problems since most adults with these problems are employed. The 2012 national survey of drug use found that of the 20.7 million adults classified with dependence or abuse, 51.9% were employed full time ([SAMHSA, 2013](#)). EAP programs can identify health problems among employees and offer counseling or referral to other health care providers as necessary. Such programs provide early identification of and intervention for substance abuse problems; they also offer services to employees to reduce stress and provide health care or counseling so that they may prevent substance abuse problems from developing. Nurses frequently develop and run these programs.

High-Risk Groups

Identifying high-risk groups helps nurses design programs to meet specific needs and to mobilize community resources.

Adolescents

The younger a person is when beginning intensive experimentation with drugs, the more likely dependence will develop. Underage drinking is seen as the most serious drug problem for youth in the United States. Findings from the 2012 National Survey on Drug Use and Health note these drug use patterns among 12- to 17-year-olds: among 12- or 13-year-olds, 1.7% used psychotherapeutic drugs nonmedically (with 1.5% using pain relievers), 1.2% used marijuana, and 0.9% used inhalants; among 14- or 15-year-olds, 6.1% used marijuana, 2.5% used psychotherapeutic drugs nonmedically (with 2.2% using pain relievers), 0.7% used inhalants, and 0.5% used hallucinogens; among 16- or 17-year-olds, 14.0% used marijuana, 4.0% used psychotherapeutic drugs nonmedically (with 3.1% using pain relievers), 1.2% used hallucinogens, 0.7 used inhalants, and 0.2% used cocaine ([SAMHSA, 2013](#)).

People who use illicit prescription drugs are at risk of abuse and addiction as well as overdose deaths. Many teens and college youth steal them from their family members, and others buy them off the Internet. The most commonly abused opioids among teens are hydrocodone (Vicodin) and oxycodone (OxyContin), and these are sometimes crushed and snorted or injected. Friends in school share their dextroamphetamine (Adderall) or methylphenidate (Ritalin) with other students, who often use them to help them study. Benzodiazepines such as diazepam (Valium) and alprazolam (Xanax) are the depressants of choice.

A new trend called “pharming” is where young people bring prescription medications to a party to share with friends and they may take them alone, in combinations, or mixed with alcohol. Students say that prescription drugs are often cheaper and easier to obtain, and some believe that they are “cleaner” or safer than illicit drugs such as marijuana or cocaine. They generally have no idea of the toxic effects when these drugs are taken in high doses or combined.

Heavy drug use during adolescence can interfere with normal development. Note that *Healthy People 2020* objectives SA-2 and TU-3 reduce the initiation of the use of tobacco, alcohol, and other drugs (see *Healthy People 2020* box) (U.S. Department of Health and Human Services, 2010). Family-related factors (genetics, family stress, parenting styles, child victimization) appear to be the greatest variable that influences substance abuse among adolescents. The co-occurrence with psychiatric disorders (especially mood disorders) and behavioral problems is also associated with substance abuse among adolescents, leaving peer pressure as a less-influential factor. Research suggests that successful social influence-based prevention programs may be driven by their ability to foster social norms that reduce an adolescent’s social motivation to begin using ATODs. One particularly effective treatment approach for adolescents is the use of family-oriented therapy (SAMHSA, 2008). The Quality and Safety in Nursing Education box provides information about using information management tools to develop ATOD prevention programs in a school.

HEALTHY PEOPLE 2020

Objectives Related to Substance Abuse

- SA-2: Increase the proportion of adolescents never using substances.
- SA-8: Increase the proportion of persons who need alcohol and/or illicit drug treatment and received specialty treatment for abuse or dependence in the past year.
- SA-17: Decrease the rate of alcohol-impaired driving (0.08+ blood alcohol content [BAC]) fatalities.

Objectives Related to Tobacco Use

- TU-3: Reduce initiation of tobacco use among children, adolescents, and young adults.
- TU-11: Reduce the proportion of nonsmokers exposed to second-hand smoke.
- TU-14: Increase the proportion of smoke-free homes.

From U.S. Department of Health and Human Services: *Healthy People 2020: National Health Promotion and Disease Prevention Objectives*. Washington, DC,

QSEN FOCUS ON QUALITY AND SAFETY EDUCATION FOR NURSES

Targeted Competency: Informatics

Use information and technology to communicate, manage knowledge, mitigate error, and support decision making.

Important aspects of informatics to include:

- **Knowledge:** Identify essential information that must be available in a common database to support client care.
- **Skills:** Use information management tools to monitor outcomes of care processes.
- **Attitudes:** Value technologies that support clinical decision making, error prevention, and care coordination.

Informatics Question

You are taking over the role of school nurse at a large regional high school. There has been a recent tragedy involving a senior from this high school drinking and driving with friends in the car, resulting in one student death, and significant injury to the driver and another passenger. You have been asked to address use of alcohol, tobacco, and other drugs (ATOD) at this high school.

1. What data should you collect to assess the scope of the ATOD problem at this school?
2. Who are some key informants you want to interview? What information will you seek from them?
3. You decide that an alcohol and drug education program is needed in the school. What data will you want to track over time to assess the effectiveness of this intervention?

From U.S. Department of Health and Human Services, 2010.

Older Adults

Older adults (65 years of age and older) represent 13% of the U.S. population and are the fastest growing segment of U.S. society, expected to represent 21% by the year 2030. Older adults are prescribed approximately one third of all medications in the United States, and almost half of the people over 65 years of age take 3 or more prescription drugs (Basca, 2008).

Alcohol and prescription drug misuse affects as many as 17% of adults age 60 and older. Problems with alcohol consumption, including interactions with prescribed and OTC drugs, far outnumber any other substance abuse problem among older adults (SAMHSA, 2009). The free public education brochure, *As You Age ... A Guide to Aging, Medicines and Alcohol* is available at <http://store.samhsa.gov/product/As-You-Age-A-Guide-to-Aging-Medicines-and-Alcohol/SMA04-3940>.

The increased use of prescription drugs and alcohol by older adults may be related to coping problems. Problems of relocation, possible loss of independence, retirement, illness, death of friends, and lower levels of achievement contribute to feelings of sadness, boredom, anxiety, and loneliness. Factors such as slowed metabolic turnover of drugs, age-related organ changes, enhanced drug sensitivities, a tendency to use drugs over long periods, and a more frequent use of multiple drugs all contribute to greater negative consequences from drug use among older adults. Alcohol abuse may not be identified because its effects on cognitive abilities may mimic changes associated with normal aging or degenerative brain disease. Also, depression may simply be attributed to more frequent losses rather than

the depressant effects of alcohol, and the older adult may subsequently receive medical treatment for depression rather than alcoholism.

Injection Drug Users

In addition to the problem of addiction, **injection drug users** (IDUs) (those who self-administer intravenously or subcutaneously) are at risk for other health complications. Intravenous (IV) administration of drugs always carries a greater risk of overdose because the drug goes directly into the bloodstream. With illicit drugs, the danger is increased because the exact dosage is unknown. In addition, the drug may be contaminated with other chemicals, such as sugar, starch, or quinine, that can cause negative consequences. Often IDUs make their own solution for IV administration, and any particles present can result in complications from emboli.

Although heroin use was at a peak in the mid-1970s, there is a new concern due to the recent surge in its use, especially in New England, the Mid-Atlantic, and Great Lakes regions in the United States. The use of heroin is up about 75% from five years ago and much of it is fueled by the low-priced drug coming in from South America and Mexico and its availability via the Internet (Pilcher and Bernard-Kuhn, 2014).

Addicts often share needles. Human immunodeficiency virus (HIV), hepatitis C, and other blood-borne diseases can be transmitted through contaminated needles. Infections and abscesses may develop as a result of dirty needles or poor administration techniques. Since the peak of the HIV epidemic among IDUs in the late 1980s, HIV incidence among IDUs has decreased by almost 80%. Despite this overall decline, IDUs continue to represent a substantial proportion of persons with new HIV diagnoses, with the highest number among African Americans (CDC, 2011). Because of this trend, emphasis is being placed on reducing the transmission of this disease through contaminated needles. Abstinence is ideal but unrealistic for many addicts. Using the harm reduction model, the nurse should provide education on cleaning needles with bleach between uses and on needle exchange programs to decrease the spread of the virus. Studies indicate that needle exchange programs have not increased injection drug abuse but have, in fact, increased the number of people entering treatment programs (Knox, 2012).

Drug Use during Pregnancy

Most drugs can negatively affect a fetus. Thus, the use of any drug during pregnancy should be discouraged unless medically necessary. *Healthy People 2020* objectives address this issue under the Maternal, Infant and Child Health topic area with several objectives that describe recommendations to improve the health of infants, such as reducing the occurrence of fetal alcohol syndrome (FAS) (MICH-25), and increasing abstinence from alcohol, cigarettes, and illicit drugs among pregnant women (MICH-11). FAS is considered the leading preventable birth defect, causing mental and behavioral impairment. In 2011 to 2012 approximately 2.7% of pregnant women reported binge drinking and 0.3% reported heavy drinking. These low rates may be due to the extensive information available about

the effects of alcohol on the fetus. Estimates of illicit drug use during pregnancy for women aged 15 to 44 were 5.9%. Tobacco remains the most-used addictive substance during pregnancy, with about 15.9% of pregnant women smoking (SAMHSA, 2013). In some states, pregnant women who are using illicit drugs are reported to child protective services because of the potential harm to the fetus.

Despite the increased focus on drug abuse interventions, many pregnant women with drug problems do not receive the help they need. This may be a result of ignorance, poverty, lack of concern for the fetus, lack of available services, and fear of the consequences of revealing drug use. The fear of criminal prosecution may push addicted women further away from the health care system, cause them to conceal their drug use from medical providers, and cause them to avoid the critical treatment and medical care that they need (Brady and Ashley, 2005).

Persons Who Use Illicit Drugs

The strategy of “just say no” to drugs is both simplistic and misleading. Indiscriminant use of “good” drugs has caused more health problems from adverse reactions, drug interactions, dependence, addiction, and overdoses than use of “bad” drugs. However, the war on drugs focuses on illicit drugs and punishes illicit drug users. The black market associated with illicit drug use puts otherwise law-abiding citizens in close contact with criminals, prevents any quality control of the drugs, increases the risk of AIDS and hepatitis as a result of needle sharing, and hinders health care professionals’ accessibility to the abuser or addict. Lack of quality control (unknown strength and purity) can cause unexpected overdoses or secondary effects of the impurities; for example, a synthetic analog of fentanyl (3-methylfentanyl) marketed as “heroin” is 6000 times as potent as morphine. Unsafe administration (contaminated needles) leads to local and systemic infections. The high cost of drugs on the black market leads to crime to support the addiction. In 2012, the highest rate of current illicit drug use was among 18- to 20-year-olds at 23.9%, with the next highest rate occurring among the 21- to 25-year-olds at 19.7%. Illicit drugs include marijuana/hashish, cocaine (including crack), heroin, hallucinogens, inhalants, or prescription-type psychotherapeutics that are used nonmedically. Marijuana was the most frequently used illicit drug (SAMHSA, 2013). See Figure 37-2 for illicit drug use by race/ethnicity.

Codependency and Family Involvement

Drug addiction is often a family disease. One in four Americans experiences family problems related to alcohol abuse. People in a close relationship with the addict often develop unhealthy coping mechanisms to continue the relationship. This behavior is known as **codependency**—a stress-induced preoccupation with the addicted person’s life, leading to extreme dependence and excessive concern with the addict.

Strict rules typically develop in a codependent family to maintain the relationships: don’t talk, don’t feel, don’t trust, don’t lose control, and don’t seek help from outside the family. Codependents try to meet the addict’s needs at the expense of their own. Codependency may underlie many of the medical

FIG 37-2 Past month illicit drug use among persons aged 12 or older, by race/ethnicity, 2012. (From Substance Abuse and Mental Health Services Administration: *Results from the 2012 National Survey on Drug Use and Health: Summary of National Findings*, Office of Applied Studies, NSDUH Series H-46, USDHHS Pub No SMA 13-4795, Rockville, MD, 2013. See page 25 at: <http://www.samhsa.gov/data/NSDUH/2012SummNatFindDetTables/NationalFindings/NSDUHresults2012.pdf>)

complaints and emotional stress seen by health care providers, such as ulcers, skin disorders, migraine headaches, chronic colds, and backaches.

When the addicted person refuses to admit the problem, the family continues to adapt to emotionally survive the stress of the addict's irrational, inconsistent, and unpredictable behavior. Family members consequently develop various roles that tend to be gross exaggerations of normal family roles, and they cling irrationally to these roles, even when they are no longer functional.

One of the most significant roles a family member may assume is that of an enabler. **Enabling** is the act of shielding or preventing the addict from experiencing the consequences of the addiction. As a result, the addict does not always understand the cost of the addiction and thus is "enabled" to continue to use. Although codependency and enabling are closely related, a person does not have to be codependent to enable. Anyone can be an enabler: a police officer, a boss or coworker, and even a drug treatment counselor. Health care professionals who do not address the negative health consequences of the drug use with the addicted person are enablers.

The nurse can help families recognize the problem of addiction and help them confront the addicted member in a caring manner. Whether or not the addicted family member is agreeable to treatment, the family members should be given some guidance about the literature and services that are available to help them cope more effectively. The nurse can help identify treatment options, counseling assistance, financial assistance,

support services, and (if necessary) legal services for the family members. Children of ATOD abusers or addicts are themselves at a greater risk for developing addiction and must be targeted for primary prevention.

TERTIARY PREVENTION AND THE ROLE OF THE NURSE

The nurse is in a key position to help the addict and the addict's family. The nurse's knowledge of community resources and how to mobilize them can significantly influence the quality of care clients receive.

Detoxification

Detoxification is the clearing of one or more drugs from the person's body and managing the withdrawal symptoms. Depending on the particular drug and the degree of dependence, the time required may range from a few days to several weeks. Because withdrawal symptoms vary (depending on the drug used) and range from uncomfortable to life threatening, the setting for and management of withdrawal depend on the drug used.

Drugs such as stimulants or opiates may produce withdrawal symptoms that are uncomfortable but not life threatening. Detoxification from these drugs does not require direct medical supervision, but medical management of the withdrawal symptoms increases the comfort level. On the other hand, drugs such as alcohol, benzodiazepines, and barbiturates can produce

life-threatening withdrawal symptoms. These clients should be under close medical supervision during detoxification and should receive medical management of the withdrawal symptoms to ensure a safe withdrawal. Of those who develop delirium tremens from alcohol withdrawal, 15% may not survive despite medical management; therefore, close medical management is initiated as the blood alcohol level begins to fall.

A general rule in detoxification management is to wean the person off the drug by gradually reducing the dosage and frequency of administration. Thus, a person with chronic alcoholism could be safely detoxified by a gradual reduction in alcohol consumption. In practice, however, the switch to another drug, usually a benzodiazepine, often offers a safer withdrawal from alcohol as well as an abrupt end to the intoxication from the drug of choice. For example, chlordiazepoxide (Librium) is commonly used for alcohol detoxification. Outpatient or home detoxification for persons requiring medical detoxification for alcohol withdrawal can be a cost-effective treatment. Nurses can monitor and evaluate the client's health status in the home environment to reduce the risk of medical complications related to alcohol withdrawal, and to provide encouragement and support for the client to complete the detoxification.

Addiction Treatment

Addiction treatment differs from the management of negative health consequences of chronic drug abuse, overdose, and detoxification. **Addiction treatment** focuses on the addiction process. The goal is to help clients view addiction as a chronic disease and assist them to make lifestyle changes to halt the progression of the disease. According to the disease theory, addicts are not responsible for the symptoms of their disease; they are, however, responsible for treating their disease. In 2012, 22.2 million persons aged 12 or older needed treatment for an illicit drug or alcohol use problem (8.5% of the persons aged 12 or older). Of these, 4.0 million persons age 12 or older received treatment for alcohol or illicit substance use problems (SAMHSA, 2013). **Figure 37-3** shows the common reasons persons do not receive treatment. Of the 2.3 million persons aged 12 or older who received substance use treatment in 2011, 898,000 were in treatment for an alcohol use disorder, 780,000 for an illicit drug use disorder, and 574,000 received treatment for both alcohol and illicit drug problems (SAMHSA, 2013).

Most treatment facilities are multidisciplinary because the intervention strategies require a wide range of approaches. Their programs involve interactions between the addict, family, culture, and community. Strategies include medical management, education, counseling, vocational rehabilitation, stress management, and support services. In addition, specific programs address the needs of various populations such as adolescents, pregnant women, specific ethnic groups, gays and lesbians, as well as health care professionals. The key to effective treatment is to match individual clients with the interventions most appropriate for them. **Box 37-5** lists 13 fundamental principles for effective addiction treatment.

Total abstinence is the most recommended treatment goal for ATOD addiction. People who are addicted to a particular drug (e.g., cocaine) are advised to abstain from the use of all

FIG 37-3 Reasons for not receiving substance use treatment among persons aged 12 or older who needed and made an effort to get treatment but did not receive treatment and felt they needed treatment, 2009-2012 combined. (See bottom of page 88 at: <http://www.samhsa.gov/data/NSDUH/2012SummNatFindDetTables/NationalFindings/NSDUHresults2012.pdf>) (From Substance Abuse and Mental Health Services Administration: *Results from the 2012 national survey on drug use and health: summary of national findings*, Office of Applied Studies, NSDUH Series H-46, HHS Pub No SMA 13-4795, 2013, Rockville, MD.)

psychoactive substances. The use of another drug may simply reinforce the craving for the original drug and cause relapse. More commonly, the addiction merely transfers to the replacement substance.

Treatment may be on an inpatient or outpatient basis. In general, the more advanced the disease is, the greater the need for inpatient treatment. Inpatient treatment programs usually may range from less than 1 week to as long as 90 days. Once a person has completed detoxification (considered the first phase of the treatment process), the programs use counseling and group interaction to help the client stay clean long enough for the body chemistry to rebalance. This is often a difficult time for persons recovering from addictions because they may experience mood swings and difficulty sleeping and dealing with emotions.

The goal of the educational part of the programs is to provide information about the disease and how drugs affect a person physically and psychologically. Clients are informed of the various lifestyle changes that are recommended, and they learn about tools to assist them in making these changes. Discharge planning continues throughout treatment as clients build the support systems that they will need when they leave the controlled environment of a treatment center and face pressures and temptations (triggers) that may lead to relapse.

Long-term residential programs, also called halfway houses, have been developed to ease the person recovering from an addiction back into society. These facilities provide continued support and counseling in a structured environment for persons

BOX 37-5 Principles of Drug Addiction Treatment

More than three decades of scientific research have yielded 13 fundamental principles that characterize effective drug abuse treatment. These principles are detailed in NIDA's *Principles of Drug Addiction Treatment: A Research-Based Guide* (April, 2009).

1. No single treatment is appropriate for all individuals. Matching treatment settings, interventions, and services to each client's problems and needs is critical.
2. Treatment needs to be readily available. Treatment applicants can be lost if treatment is not immediately available or readily accessible.
3. Effective treatment attends to multiple needs of the individual, not just his or her drug use. Treatment must address the individual's drug use and associated medical, psychological, social, vocational, and legal problems.
4. At different times during treatment, a client may develop a need for medical services, family therapy, vocational rehabilitation, and social and legal services.
5. Remaining in treatment for an adequate period of time is critical for treatment effectiveness. The time depends on an individual's needs. For most clients, the threshold of significant improvement is reached at about 3 months in treatment. Additional treatment can produce further progress. Programs should include strategies to prevent clients from leaving treatment prematurely.
6. Individual and/or group counseling and other behavioral therapies are critical components of effective treatment for addiction. In therapy, clients address motivation, build skills to resist drug use, replace drug-using activities with constructive and rewarding non-drug-using activities, and improve problem-solving abilities. Behavioral therapy also facilitates interpersonal relationships.
7. Medications are an important element of treatment for many clients, especially when combined with counseling and other behavioral therapies.
8. Addicted or drug-abusing individuals with coexisting mental disorders should have both disorders treated in an integrated way.
9. Medical detoxification is only the first stage of addiction treatment and by itself does little to change long-term drug use. Medical detoxification manages the acute physical symptoms of withdrawal. For some individuals it is a precursor to effective drug addiction treatment.
10. Treatment does not need to be voluntary to be effective. Sanctions or enticements in the family, employment setting, or criminal justice system can significantly increase treatment entry, retention, and success.
11. Possible drug use during treatment must be monitored continuously. Monitoring a client's drug and alcohol use during treatment, such as through urinalysis, can help the client withstand urges to use drugs. Such monitoring can also provide early evidence of drug use so that treatment can be adjusted.
12. Treatment programs should provide assessment for HIV/AIDS, hepatitis B and C, tuberculosis and other infectious diseases, and counseling to help clients modify or change behaviors that place them or others at risk of infection. Counseling can help clients avoid high-risk behavior and help people who are already infected manage their illness.
13. Recovery from drug addiction can be a long-term process and frequently requires multiple episodes of treatment. As with other chronic illnesses, relapses to drug use can occur during or after successful treatment episodes. Participation in self-help support programs during and following treatment often helps maintain abstinence.

needing long-term assistance in adjusting to a drug-free lifestyle. The residents are expected to secure employment and take responsibility in managing their financial obligations.

Outpatient programs are similar in the education and counseling offered, but they allow the clients to live at home and continue to work while undergoing treatment. This method is effective for persons in the earlier stages of addiction who feel confident that they can abstain from drug use and have established a strong support network. The **How To box** provides resources to help locate treatment programs throughout the United States.

HOW TO Find an Appropriate Treatment Program

1. Look it up in the National Directory of Drug and Alcohol Abuse Treatment Programs (updated annually). This directory provides information on more than 11,000 alcohol and drug treatment programs in all 50 states, the District of Columbia, Puerto Rico, and 4 U.S. territories. Free copies are available by calling SAMHSA's Clearinghouse at 1-877-726-4727.
2. Look it up on the Substance Abuse and Mental Health Services Administration's (SAMHSA) website. Their Substance Abuse Treatment Facility Locator Internet-based service provides an easy-to-use directory to help you locate (including road maps to each facility) and contact public and private treatment programs (<http://www.findtreatment.samhsa.gov>).

For those addicted individuals unwilling or unable to completely abstain from psychoactive drugs, other medications can assist them in abstaining from their drug of choice. Currently there are three types of medication-assisted therapies (MAT) for treating opioid addiction: methadone, buprenorphine, and naltrexone. Methadone, when administered in moderate or high daily doses, produces a **cross-tolerance** to other opioids, thereby blocking their effects and decreasing the craving for the drug of choice. The advantages of methadone are that it is long acting, does not produce a "high," and is inexpensive. The oral use of methadone eliminates the danger of the spread of AIDS and other blood-borne infections that commonly occur among needle-sharing addicts. Although not recognized as a cure for heroin (or other opioid) addiction, methadone maintenance is a harm reduction intervention because it reduces deviant behavior and introduces addicted persons to the health care system (Volkow et al, 2014).

Recovery from addiction involves a lifetime commitment and may include periods of relapse. The addicted person must realize that modern medicine has not found a cure for addiction; therefore, returning to drug use may ultimately reactivate the disease process.

Smoking Cessation Programs

Nearly 35 million Americans try to quit smoking each year. Fewer than 10% of those who try to quit on their own are able

EVIDENCE-BASED PRACTICE

Scavone et al (2013) examined the use of cannabis prior to and during methadone maintenance treatment (MMT) for opioid dependence via a chart review of 91 patients undergoing MMT in Pennsylvania. They found that those opioid addicts with a history of cannabis use reported “significantly less daily expenditure on acquisition of opiates.” In addition they found that those who used cannabis during induction had lower ratings of opiate withdrawal symptoms. The researchers concluded that these findings point to novel interventions for the treatment of opioid dependence that specifically target cannabinoid-opioid system interactions. This study supports earlier work by Reiman (2009), who found that many patients in a California cannabis dispensary reported using cannabis to help them get off and stay off of problematic drug use with alcohol, opioids, and other drugs of abuse.

Nurse Use

With the emerging understanding of the endocannabinoid system and its overall role of maintaining homeostasis, this study supports the healing properties of cannabis as it reduces withdrawal symptoms from addictive drugs and helps addicts reach stabilization. This is not to say that a person may not have a problem with cannabis, but rather it is important to assess the reasons for drug use and the consequences of that use to determine whether or not the person has a drug use disorder.

Scavone JL, Sterling RC, Weinstein SP, et al: Impact of cannabis use during stabilization on methadone maintenance treatment. *Am J Addict* 22(4):344–351, 2013.

to stop for a year; those who use an intervention are more likely to be successful. Interventions that involve medications and behavioral treatments appear most promising (USDHHS, 2014). For example, nicotine replacement therapy can be used to help smokers withdraw from nicotine while focusing their efforts on breaking the psychological craving or habit. Four types of nicotine replacement products are available: nicotine gum and skin patches are available over the counter, and nicotine nasal spray and inhalers are available by prescription. These products are about equally effective and can almost double the chances of successfully quitting. Other treatments include smoking cessation clinics, hypnosis, and acupuncture. The most effective way to get people to stop smoking and prevent relapse involves multiple interventions and continuous reinforcement, and most smokers require several attempts at cessation before they are successful. Many resources are available on smoking cessation programs and support groups, including those listed in Box 37-6. There is a website developed specifically for nurses to help nurses quit smoking: <http://www.tobaccofreenurses.org>.

Support Groups

The founding of **Alcoholics Anonymous (AA)** in 1935 began a strong movement of peer support to treat a chronic illness. AA groups have developed around the world. Their success has led to the development of other support groups such as the following:

- Narcotics Anonymous (NA) for persons with narcotic addiction
- Pills Anonymous for persons with polydrug addictions
- Overeaters Anonymous
- Gamblers Anonymous

AA and NA help addicted people develop a daily program of recovery and reinforce the recovery process. The fellowship, support, and encouragement among members provide a vital social network for the person recovering from an addiction.

Al-Anon and Alateen are similar self-help programs for spouses, parents, children, or others involved in a painful relationship with an alcoholic. Nar-Anon is a support group for those in relationships with persons with narcotic addictions. Al-Anon family groups are available to anyone who has been affected by their involvement with an alcoholic person. The purposes of Alateen include providing a forum for adolescents to discuss family stressors, learn coping skills from one another, and gain support and encouragement from knowledgeable

LINKING CONTENT TO PRACTICE

Using the tools of primary, secondary, and tertiary prevention with individuals, families, and communities in whom alcohol and other drug use is an issue incorporates both public health and public health nursing guidelines and competencies. Specifically, the core competencies of the [Council on Linkages Between Academia and Public Health Practice \(2010\)](#) begin by identifying the analytic and assessment skills needed by public health professionals. The 12 skills in this competency category are used in providing services to the population described in this chapter. For example, you begin by assessing the “health status of populations and their related determinants of health and stress.” You next move to skill #2, which is describing the “characteristics of a population-based health problem.” These competencies are described through a set of eight domains. Each domain can be used with populations dealing with alcohol and other drug problems.

Similarly, the Intervention Wheel, which is the subject of [Chapter 9](#), has many applications with this population. The Intervention Wheel specifies that “interventions are actions that PHNs take on behalf of individuals, families, and systems, and communities to improve or protect health status ([Council on Linkages, 2010](#), p. 1). This tool outlines 17 public health interventions. All 17 of these interventions have application with the populations described in this chapter. For example, case finding, referral and follow-up, health teaching, counseling, and policy development and enforcement are selected examples of ways in which public health nurses intervene in serving a vulnerable population with alcohol- and drug-related problems.

peers. Adult Children of Alcoholics (ACOA) groups are also available in most areas to address the recovery of adults who grew up in alcoholic homes and are still carrying the scars and retaining dysfunctional behaviors.

For some persons, the AA program places too much emphasis on a higher power or focuses too much on the negative consequences of past drinking. Women for Sobriety focuses on rebuilding self-esteem, and this is often a core issue for many women with alcoholic problems. (See www.womenforsobriety.org for additional information.) Rational Recovery has a cognitive orientation and is based on the assumption that ATOD addiction is caused by irrational beliefs that can be understood and overcome. See www.rational.org for additional information on this approach.

Nurse's Role

Many people with alcoholism and drug addiction become lost in the health care system. If satisfactory care is not provided in one agency or the waiting list is months long, the person may give up rather than seek alternative sources of care. The nurse who knows the client's history, environment, support systems, and the local treatment programs can offer guidance to the most effective treatment modality. Brief interventions by health care professionals who are not treatment experts can be effective in helping ATOD abusers and addicts change their risky behavior. [Brief interventions](#) may convince the ATOD abuser or addict to reduce substance consumption or follow through with a treatment referral ([SAMHSA, 2011](#)). [Box 37-7](#) describes six elements commonly included in brief interventions, using the acronym FRAMES. Strategies used with clients can vary depending on their readiness for change. Understanding the stages of change listed in [Box 37-8](#) and recognizing which stage

BOX 37-7 Brief Interventions Using the FRAMES Acronym

Feedback. Provide the client direct feedback about the potential or actual personal risk or impairment related to drug use.
Responsibility. Emphasize personal responsibility for change.
Advice. Provide clear advice to change risky behavior.
Menu. Provide a menu of options or choices for changing behavior.
Empathy. Provide a warm, reflective, empathetic, and understanding approach.
Self-efficacy. Provide encouragement and belief in the client's ability to change.

BOX 37-8 Stages of Change

Pre-Contemplation

At this stage, the person does not intend to change in the foreseeable future. The person is often unaware of any problem. Resistance to recognizing or modifying a problem is the hallmark of pre-contemplation.

Contemplation

At this stage, the individual is aware that a problem exists and is seriously thinking about overcoming it but has not yet made a commitment to take action. The nurse can encourage the individual to weigh the pros and cons of both the problem and the solution to the problem.

Preparation

Preparation was originally referred to as *decision making*. At this stage, the individual is prepared for action and may reduce the problem behavior but has not yet taken effective action (e.g., reduces amount of smoking but does not abstain).

Action

At this stage, the individual modifies the behavior, experiences, or environment to overcome the problem. The action requires considerable time and energy. Modification of the target behavior to an acceptable criterion and significant overt efforts to change are the hallmarks of action.

Maintenance

In this stage, the individual works to prevent relapse and consolidate the gains attained during action. Stabilizing behavior change and avoiding relapse are the hallmarks of maintenance.

Modified from DiClemente CC, Schlundt D, Gemmell L: Readiness and stages of change in addiction treatment. *Am J Addict* 13(2):103-119, 2004.

a client is in are important factors for determining which interventions and programs may be most helpful to the client.

After the client has received treatment, the nurse can coordinate aftercare referrals and follow up on the client's progress. The nurse can provide additional support in the home as the client and family adjust to changing roles and the stress involved with such changes. The nurse can support addicted persons who have relapsed by reminding them that relapses may well occur, but that they and their families can continue to work toward recovery and an improved quality of life.

OUTCOMES

Health promotion and risk reduction are basic concepts in nursing. Promoting a healthy environment in the home and local community provides individuals and families a nurturing environment in which to achieve optimal health. Individuals with high self-esteem and access to health care and information about the health risks related to drug use can be responsible for their personal health and make informed decisions about drug use. Nurses can assess the health of the community and its citizens, prioritize the needs, and identify local resources to collaborate with others to develop strategies that will improve the underlying health of the community.

Early identification and intervention for persons with ATOD problems can prevent many of the harmful physical, emotional, and social consequences that may occur if abuse continues and may also prevent abuse patterns from developing into addiction. The nurse needs to assess individual and community

ATOD problems and target at-risk groups to develop strategies to increase assessment and provide appropriate interventions. Review the national health objectives (refer back to the *Healthy People 2020* box) for the tobacco and substance abuse areas and note how many can be achieved with secondary prevention strategies.

Besides saving taxpayers' money, treatment helps addicted individuals and their families recover from the devastating effects of addiction. Addicts and their families often become hopeless and helpless while actively addicted. The nurse can offer hope in affirming the addict's self-worth and can be the bridge to community resources to assist in treatment and recovery.

Many of these expected outcomes for ATOD problems have been lessened because a lack of funding has resulted from federal strategies that focus on law enforcement and punishment rather than on education and treatment. The greatest challenge for nurses is to influence policy makers to put the emphasis on health care for this major health problem.

PRACTICE APPLICATION

Ms. Jane Doe, RN, is a home health case manager in a large, low-income housing area in her community. She designs care plans and coordinates health care services for clients who need health care at home. She makes the initial visits to determine the level and frequency of care needed and then acts as supervisor of the volunteers and nurses' aides who perform most of the day-to-day care. Single-parent families are the norm, and drug dealing is commonplace in this housing area.

Ms. Doe made a home visit to Ann Greene, a 26-year-old mother of three. She takes care of her 62-year-old maternal grandfather, Mr. Jones, who is recovering from cardiac bypass surgery. He has a smoking history of two packs per day for almost 40 years. Since his surgery, he has reduced his smoking to one pack per day, but he refuses to quit. He has a history of alcohol dependence, reportedly consuming up to a fifth of liquor a day, and a history of withdrawal seizures. Four years ago he went through alcohol detoxification, but he refused to stay at the facility for continued treatment, stating he could stay sober on his own. Since that time he has had several binge episodes, but Ann says that he has not been drinking since the surgery. A widower for 5 years, Mr. Jones now lives with his granddaughter and her three children.

Ms. Greene is a widow and has two sons, ages 3 and 9, and a daughter, age 5. The oldest son's father is an alcoholic who is currently incarcerated for manslaughter while driving under the influence of alcohol, and the father of her two youngest

children was killed by a stray bullet in a cocaine bust 3 years ago. She and her husband had smoked crack cocaine for several months but both stopped when she became pregnant with their youngest child and remained cocaine free. She is angry at the system and frightened of police officers ever since the drug raid in which her husband was killed. Other residents were also hurt, and less than \$500 worth of cocaine was found three apartments away from hers.

Ms. Greene does not consume alcohol, but she smokes one to two packs of cigarettes per day. She quit smoking during her pregnancies but restarted soon after each birth.

- A. What type of interventions can the nurse provide for Mr. Jones regarding his smoking?
- B. How can the nurse help Ms. Greene cope with the potential risk of Mr. Jones' drinking when he progresses to more independence?
- C. How can the nurse help Ms. Greene with her cigarette smoking?
- D. Knowing that there is a genetic link to alcoholism and being aware of the high rate of drug problems in the housing area, how can Nurse Doe help prevent this mother and her children from developing substance abuse problems?
- E. What problems seem greater because of the drug laws, and what can Ms. Greene do to help make the environment safer and more nurturing?

Answers can be found on the Evolve site.

KEY POINTS

- Substance abuse is the number one national health problem, linked to numerous forms of morbidity and mortality.
- Harm reduction is an approach to ATOD problems that deals with substance abuse primarily as a health problem rather than as a criminal problem.
- All persons have ideas, opinions, and attitudes about the use of drugs that influence their actions.
- Social conditions such as a fast-paced life, excessive stress, and the availability of drugs influence the incidence of substance use disorders.

KEY POINTS—cont'd

- Important terms to understand when working with individuals, groups, or communities for whom substance abuse is prevalent are *drug dependence*, *drug addiction*, *alcoholism*, *psychoactive drugs*, *depressants*, *stimulants*, *marijuana*, *hallucinogens*, and *inhalants*.
- Primary prevention for substance use disorders includes education about drugs and guidelines for use, as well as the promotion of healthy alternatives to drug use either for recreation or to relieve stress.
- Nurses can help develop community prevention programs.
- Secondary prevention depends heavily on careful assessment of the client's use of drugs. Such assessment should be part of all basic health assessments.
- High-risk groups include pregnant women, young people, older adults, intravenous drug users, and illicit drug users.
- Drug addiction is often a family, not merely an individual, problem.
- Codependency describes a companion illness to the addiction of one person in which the codependent member is addicted to the addicted person.
- Brief interventions by a nurse can be as effective as treatment.
- Nurses are in ideal roles to assist with tertiary prevention for both the addicted person and the family.

CLINICAL DECISION-MAKING ACTIVITIES

1. Read your local newspaper or online news for 4 days and select stories that illustrate the effects of substance abuse on individuals, families, and the community. What interventions would you use? Who would you involve in your work? Are the interventions primary, secondary, or tertiary in nature? How would you evaluate your work?
2. For each of the stories in the news related to substance abuse, describe preventive strategies that a nurse might have tried before the problem reached such a dire state.
3. Looking at your local community resources directory, the telephone book, or the Internet, identify agencies that might serve as referral sources for individuals or families for whom substance abuse is a problem.
4. Review popular magazine and television advertisements for alcohol, tobacco, and other medicines (e.g., sleep aids, analgesics, laxatives, stimulants). In small groups, discuss the messages conveyed in the advertisements, and discuss the implications of client education to reduce possible harm from misuse and abuse of these substances.
5. Attend an open AA or NA meeting and an Al-Anon meeting. Go alone if possible or with an alcoholic or a drug-addicted friend. As the members introduce themselves, give your first name and state, "I am a visitor." Plan to listen and do not attempt to take notes. Respect the anonymity of the persons present. Discuss your experiences later in a group.
6. In groups of four or five, review the national health objectives in *Healthy People 2020* (see www.healthypeople.gov) under Tobacco Use and under Substance Abuse. Pick an objective from each section, and brainstorm about possible community efforts a nurse could initiate to reach that objective.

Violence and Human Abuse

Jeanne L. Alhusen, PhD, CRNP, RN

Jeanne L. Alhusen is an assistant professor at the Johns Hopkins University School of Nursing. Her BSN, MSN, and PhD are from Villanova University, Duke University, and Johns Hopkins University. Dr. Alhusen works as a family nurse practitioner, and her research interests are in maternal mental health and early childhood outcomes, particularly among families living in poverty. She has received funding from NIH to conduct research on the impact of domestic violence on early childhood outcomes.

Tina Bloom, PhD, MPH, RN

Tina Bloom is an Assistant Professor and Robert Wood Johnson Foundation Nurse Faculty Scholar at the Sinclair School of Nursing, University of Missouri-Columbia. She received a BSN from the University of Kansas in Kansas City, Kansas, and an MPH and PhD from Oregon Health and Science University in Portland, Oregon. Dr. Bloom specializes in research on intimate partner violence interventions, with a particular interest in maternal-child health and the issues of marginalized and underserved abuse survivors, and eliminating disparities in access to resources for underserved survivors.

Rosa M. Gonzalez-Guarda, PhD, MPH, RN, CPH

Rosa M. Gonzalez-Guarda is an assistant professor at the University of Miami School of Nursing and Health Studies. Dr. Gonzalez-Guarda received a bachelor of science in nursing (BSN) from Georgetown University, a master of science in nursing (MSN) and public health (MPH) from Johns Hopkins University, and an interdisciplinary PhD from the University of Miami. She has worked on community-based prevention programs and research targeting Hispanics and other health disparity populations in the areas of intimate partner violence, human immunodeficiency virus (HIV) and other sexually transmitted infections (STIs) and co-occurring health conditions. She is currently funded by the Robert Wood Johnson Foundation Nurse Faculty Scholars Program to develop and pilot test a culturally tailored teen dating violence prevention program for Hispanic youth.

Jacquelyn C. Campbell, PhD, RN, FAAN

Jacquelyn C. Campbell is the Anna D. Wolf Chair and Professor at the Johns Hopkins University School of Nursing with a joint appointment in the Bloomberg School of Public Health. Her BSN, MSN, and PhD are from Duke University, Wright State University, and the University of Rochester schools of nursing. Dr. Campbell has been the principle investigator on ten major National Institutes of Health, National Institute of Justice, and Centers for Disease Control and Prevention research grants and has published more than 220 articles and seven books on this subject. She is an elected member of the Institute of Medicine and the American Academy of Nursing, is Chair of the Board of Directors Family Violence Defense Fund, and was a member of the congressionally appointed U.S. Department of Defense Task Force on Domestic Violence.

OBJECTIVES

After reading this chapter, the student should be able to do the following:

1. Discuss the scope of the problem of violence in American communities.
2. Examine at least three factors existing in most communities that influence violence and human abuse.
3. Define the four general types of child abuse: neglect, physical, emotional, and sexual.

OBJECTIVES — cont'd

4. Discuss elder abuse as a crucial community health problem.
5. Discuss the principles of nursing intervention with violent families.
6. Describe specific nursing interventions with battered women.

KEY TERMS

assault, p. 830

child abuse, p. 835

child neglect, p. 835

elder abuse, p. 838

emotional abuse, p. 835

emotional neglect, p. 835

forensic, p. 831

homicide, p. 829

incest, p. 836

intimate partner violence, p. 827

passive neglect, p. 835

physical abuse, p. 833

physical neglect, p. 835

post-traumatic stress disorder, p. 831

rape, p. 830

sexual abuse, p. 833

Development of Abusive Patterns

Types of Intimate Partner and Family Violence

Nursing Interventions

Primary Prevention

Secondary Prevention

Tertiary Prevention: Therapeutic Intervention with Abusive Families

An estimated 55,000 individuals die each year in the United States as a result of violence-related injuries. While homicide rates have decreased over the last 20 years, homicide remains the second leading cause of death for individuals 15 to 24 years of age, and the third leading cause of death for individuals 1 to 4 and 25 to 34 years of age ([Centers for Disease Control and Prevention \[CDC\], 2013](#)). Homicides committed by intimate partners account for 14% of all U.S. homicides, and 70% of those victims were female ([Smith et al, 2014](#)). Suicide is the third leading cause of death among adolescents. In 2010, rates of suicide among male teens were highest among American Indians (24.3 per 100,000) and whites (14.2), followed by Hispanics (8.1), blacks (6.8), and Asian or Pacific Islanders at 6.3 per 100,000 ([CDC, 2013](#)). These statistics do not account for the significant morbidity associated with interpersonal violence. For every person who dies as a result of violence, many more are injured and suffer lasting physical, sexual, and mental

health sequelae. As the World Health Organization has reported, when interpersonal violence results in large numbers of deaths, the issue is a significant public health concern necessitating attention from researchers, policy makers, health care providers, and the public ([Krug et al, 2002](#)).

Violence is an important public health nursing issue. Violence leads to significant mortality and morbidity. Communities across the United States are concerned about crime and violence rates. Medical, nursing, psychology, and social service professionals have been slow to develop an integrated response to violence that is part of their daily professional lives. As a result, the estimated 3.5 million victims of violence annually may not receive the best care possible. Nurses are in a unique position to develop community responses to violence, to influence public policy regarding violence, and to provide individuals, families, and communities with the necessary resources to appropriately address violence. Nurses represent a large group

of health care providers who have an ethic of caring and value early intervention and health promotion. This can optimize individual, familial, community and societal health outcomes.

This chapter examines violence as a public health problem and discusses how nurses can help individuals, families, groups, and communities cope with and reduce violence and abuse. Nurses work with clients in a wide variety of settings, including the home. Because nurses are in key positions to detect and intervene in community and family violence, an understanding of how community-level influences can affect all types of violence is necessary. The *Healthy People 2020* box as follows lists five objectives for reducing violence in communities.

HEALTHY PEOPLE 2020

Objectives for Reducing Violence

- IVP-29: Reduce homicides.
- IVP-35: Reduce bullying among adolescents.
- IVP-37: Reduce child maltreatment deaths.
- IVP-39: Reduce violence by current or former intimate partners.
- IVP-40: Reduce sexual violence.

U.S. Department of Health and Human Services (USDHHS), 2010

SOCIAL AND COMMUNITY FACTORS INFLUENCING VIOLENCE

Many factors in a community can support or minimize violence. Changing social conditions, multiple demands on people, economic conditions, and available social resources are predictive of the level of violence and human abuse. The following discussion of selected current social conditions helps to explain factors that influence violent behavior. The *Linking Content to Practice* box discusses how public health nurses can collaborate in the community to prevent violence.

LINKING CONTENT TO PRACTICE

According to the Quad Council Domains of Public Health Nursing Practice (Swider et al, 2013) and the American Public Health Association (2010), public health nurses must collaborate in partnership with communities to assess and identify community needs; plan, implement, and evaluate community-based programs; and assist in the setting of policy that will contribute to the needs of the community in relationship to all types of interpersonal violence. The Quad Council competencies in the analytic assessment domain direct nurses to conduct thorough health assessments of individuals, families, communities, and populations and to develop diagnoses for the population being assessed (Swider et al, 2013). Public health nurses can help the community in many ways, as is described throughout this chapter.

Work

Productive and paid work is an expectation in mainstream American society. Work can be fulfilling and contribute to a sense of well-being; it can also be frustrating and unfulfilling, contributing to stress that may lead to aggression and violence. Unemployment and changing patterns of employment are also associated with violence both within and outside the home.

When jobs are repetitive, boring, and lacking in stimulation, frustration mounts. Some work environments discourage creativity and reward conformity and “following the rules.” In many work settings, people try to get ahead regardless of the cost to others. Workers may go home feeling physically and psychologically drained. They may have worked at a back-breaking pace all day only to be yelled at by the boss for what seemed like a trivial oversight. It is hard to separate feelings generated at work from those at home. For example, a father arrives home feeling tired, angry, and generally inadequate because of a series of reprimands from his boss. Soon after he sits down, his 4-year-old son runs through the house pretending to fly a wooden airplane. After about three loud trips past his father, who keeps shouting for the child to be quiet and go outside, the airplane hits the father in the head. The father may hit the boy out of frustration and anger.

Unemployment may precipitate aggressive outbursts. The inability to secure or keep a job may lead to feelings of inadequacy, guilt, boredom, dissatisfaction, and frustration. Unemployment does not fit the image of the ideal man in American society, and these men are more likely to be violent both within and outside the family (Ellison et al, 2007; Peralta et al, 2010). Women who experience *intimate partner violence* (IPV) may lose their jobs because of constant harassment and stalking from the abuser and their subsequent absenteeism. Women who are stalked at work often find their jobs in jeopardy because of work interruption, continual stress, and decreased job performance. Slowly, employers are beginning to understand the implications of IPV. More women are finding support from employers when they disclose possible or actual abuse (Logan et al, 2007; Swanberg et al, 2007).

Unemployment, often linked with poverty, remains a risk factor associated with IPV (Ellison et al, 2007). Statistics from the U.S. Department of Labor (2012) showed that young, minority men have the highest rates of unemployment in the United States, ranging upward to 50% even in times of prosperity. An important theory explaining the relation between poverty and IPV is that it is mediated through stress. Living in poverty is inherently stressful, and thus it has been posited that IPV may result from stress, and poorer men have fewer available resources to reduce stress. Most analyses conclude that the differential rates of violence between African Americans and whites in the United States have more to do with socioeconomic disparities, such as poverty, unemployment, and overcrowding, than with race (Ellison et al, 2007).

Education

In recent years, schools have assumed many responsibilities traditionally assigned to the family. Schools teach sexual development, discipline children, and often serve as a safe haven where children are fed and given the developmental support needed. Large classes often mean that teachers spend more time and energy monitoring and disciplining children than challenging and stimulating them to learn. As more and more social problems arise, it is often the expectation that the school system will teach children about these issues. One such issue is bullying. Bullying has become a major problem in U.S. schools.

According to the 2013 Youth Risk Behavior Surveillance System (CDC, 2013), 19.6% of youth were bullied on school grounds during the year, 14.8% were bullied electronically and 5.5% reported carrying a weapon on school grounds in the 30 days before the survey. Bullying can be physical and/or psychological abuse, intimidation, or verbal abuse; the exclusion of some children from group activities is another form of bullying. Bullying takes place across ethnic groups and developmental ages and is identified as an antecedent for perpetration of domestic violence (Corvo and deLara, 2010; Vervoort et al, 2010). Bullying can have devastating effects on a child's health and can lead to self-harm (Salmivalli, 2010).

Another form of aggression or bullying has emerged, labeled "cyberbullying," in which the aggression takes place via modern technological devices, and specifically mobile phones or the Internet. An issue unique to cyberbullying, which distinguishes it from most traditional forms of bullying, is the difficulty in getting away from it. Unlike traditional forms of school bullying, where the bullying can stop once the victim returns home, with cyberbullying the victim may continue to receive text messages or e-mails wherever they are located. Also, cyberbullying has the potential to reach particularly large audiences in a peer group. Cyberbullying often leads to depression, isolation, low self-esteem, and absenteeism. Many schools and parent groups are targeting bullying behavior on a larger scale by focusing on peer groups and population-based interventions (Berlan et al, 2010; Kiriakidis and Kavoura, 2010).

A substantial amount of socialization during adolescence occurs within the school setting, and thus school counselors, nurses, and other professionals play a central role in identifying and intervening in school-based violence.

Media

The media can be instrumental in campaigns against violence. Recent television programs, both documentaries and dramatizations, and print articles have heightened public awareness about family violence. Programs that raise the social awareness of IPV may play a role in reducing violence in interpersonal relationships (Regan, 2010). Social marketing techniques and public service announcements serve as mechanisms to inform the public of community resources supporting victims of interpersonal violence and serve as mechanisms to prevent IPV (Grier and Kumanyika, 2010). Abused women and rape victims have especially benefited from media attention, which tends to lessen the stigma of such victimization. The media are also useful in publicizing services.

Conversely, research on violent television and films, video games, and music demonstrates that media violence increases the likelihood of aggressive and violent behavior, both immediately and long-term (Anderson et al, 2003). The influence of mass media is thought to be one of the many potential factors that contribute to aggressive or violent behavior. It is important to remember that violent adolescents and adults often were highly aggressive and potentially violent as children. Thus, influences that may promote aggressive behavior in children could ultimately contribute to violent behavior into adulthood. This highlights the importance of identifying factors, including

media violence, that may contribute to violent behavior in childhood.

Parents and caregivers are critical in monitoring what reaches their children. Communities, including school settings, religious organizations, and parent-teacher organizations, should teach parents and children how to be more informed, healthier consumers of the media. As technology is a mainstay in most homes, parents need better tools to assist them in monitoring and modifying their children's media habits. From a policy perspective, violence prevention researchers should work with media researchers to create avenues for disseminating solutions to social and public health problems.

Organized Religion

Historically, a seemingly contradictory relationship has existed between abuse and religion. For example, many religious groups uphold the philosophy of "spare the rod, spoil the child." Also, although divorce is socially accepted, some faiths perpetuate the victimization of people with their disapproval of divorce. Family members may stay together, although they are at emotional or physical war with one another, because of religious convictions. Although women have claimed that their spirituality has helped them in times of despair and victimization, they maintain that religious doctrine and some clergy become barriers to women seeking help in dealing with, or ending, an abusive relationship (Beaulaurier et al, 2007; Potter, 2007).

Although churches have been slow to recognize domestic violence, some positive changes are taking place. Issues of male domination over women have become a major topic of discussion in some church groups, whereas in other groups women continue to be blamed for abuse that they sustain (Levitt and Ware, 2006). Religious affiliation and religious conservatism have been identified as risk factors for family violence, particularly child abuse (Hines and Malley-Morrison, 2005). Clergy need to be taught about the nature and dynamics of violence in the family, about religious messages and the potential for support, and about the need for collaboration between the church and advocates for the prevention of domestic violence. In religious groups where there is collaboration with advocates against abuse to children, women, and elders, there is a greater recognition of the harm of abuse and the clarity of the role of the clergy in dealing with abuse (Rodriguez and Henderson, 2010).

Population

A community's population can influence the potential for violence. Density, poverty, and diversity, particularly racial tension and overt racism, contribute to violence. In addition, one's perceptions of the safety in a community can be influenced by racism and perceptions of criminality (Lin et al, 2009; Howard et al, 2010).

High-population-density communities can positively or negatively influence violence. Those with a sense of cohesiveness may have a lower crime rate than areas of similar size that lack social and cultural groups to support unity among members. Bonds formed among church groups, clubs, and professional organizations may promote harmony among members.

Such groups provide members an opportunity to talk about stressors rather than to respond through violence. For example, residents of public housing often form neighborhood associations to deal with situations common to many or all residents. Tension can often be released in a productive way through projects carried out by the association.

Some high-population areas experience a community feeling of powerlessness and helplessness rather than one of cohesiveness. Lack of jobs and low-paying jobs may lead to feelings of inadequacy, despair, and social alienation. Social alienation and exclusion from opportunities can lead to decreased social cohesion and increased violence (Lee and Ousey, 2005; Rahn et al, 2009). Fear and apathy may cause community residents to withdraw from social contact. Withdrawal can foster crime because many residents assume someone else will report suspicious behavior, or they fear reprisals for such reports (Gracia and Herrero, 2007).

Youths often attempt to deal with feelings of powerlessness by forming gangs. Adolescents also join gangs for the safety they believe the gang provides. One of the strongest predictors of serious violence during adolescence is involvement with delinquent peers. Other significant risk factors for gang involvement include extreme poverty, disorganized neighborhoods, academic failure, high levels of family conflict, and favorable attitudes toward antisocial behavior. A number of these young adults have attempted to deal with their feelings by turning to crime against people and property to release frustration. In many cities, these gangs have been highly destructive. Through community mobilization efforts, primary prevention programs have been developed to deal with the disenfranchisement of youth and gang violence (Pitts, 2009).

Other high-population areas may be characterized by a sense of confusion, resulting in disintegration and disorganization. These areas may have transient populations with limited physical or emotional investment in the community. Lack of community concern allows crime and violence to go unchecked and may become a norm for the area. Also, as crime increases, residents who are able to move leave the area. This increases community disintegration because the residents who leave are often the most capable members of the population.

The potential for violence also tends to increase among highly diverse populations. Differences in age, socioeconomic status, ethnicity, religion, or other cultural characteristics may disrupt community stability. Highly divergent groups may not communicate effectively and neither accept nor understand one another. Many such groups become hostile and antagonistic toward one another. Each group may see the other as different and not belonging. The alienated group may become the focal point for the others' frustrations, anger, and fears. Racism, classism, and heterosexism are examples of major causes of community disintegration resulting in a vicious cycle of dishonesty, distrust, and hate.

Community Facilities

Communities differ in the resources and facilities they provide to residents. Some are more desirable places to live, work, and raise families and have facilities that can reduce the potential

for crime and violence. Recreational facilities such as playgrounds, parks, swimming pools, movie theaters, and tennis courts provide socially acceptable outlets for a variety of feelings, including aggression. Conversely, disadvantaged communities lack many of the social and economic resources for developing and maintaining secure organizations. Employers that provide employment and services are less likely to find it profitable to operate in poorer neighborhoods. Thus, basic institutions such as stores, banks, libraries, and recreational facilities, which provide both employment opportunities and social services, are less prevalent in disadvantaged communities.

Although the absence of such facilities can increase the likelihood of violence, their presence alone does not prevent violence or crime. These facilities are adjuncts and resources that residents can use for pleasure, personal enrichment, and group development. Familiarity with factors contributing to a community's violence or potential for violence enables nurses to recognize them and intervene accordingly. It is the nurse's responsibility to work with the citizens and agencies of the community to correct or improve deficits.

VIOLENCE AGAINST INDIVIDUALS OR ONESELF

The potential for violence against individuals (e.g., murder, robbery, rape, assault) or oneself (e.g., suicide) is directly related to the level of violence in the community. Persons living in areas with high rates of crime and violence are more likely to become victims than those in more peaceful areas. The major categories of violence addressed in this chapter are described in terms of the scope of the problem in the United States and underlying dynamics.

Homicide

Homicide is defined as a death resulting from the use of force against another person when a preponderance of evidence indicates that the use of force was intentional (Parks et al, 2014). Age-specific homicide rates are highest (11.7 deaths per 100,000 population) among those aged 20 to 24 years, followed by those aged 25 to 29 years (10.7 deaths per 100,000 population). Importantly, the homicide rate for males is nearly four times that of females (7.7 and 2.1 per 100,000, respectively). Non-Hispanic blacks account for nearly half (49.6%) of homicide deaths and have the highest rate (15.2 deaths per 100,000 population), followed by American Indians/Alaskan Natives (10.0) and Hispanics (5.1) (Parks et al, 2014). Rates of homicide for infants under the age of 1 year were highest among non-Hispanic blacks and American Indians/Alaska Natives (Parks et al, 2014). Parents perpetuate the majority of homicides of children. Strangers cause 15% of male and 9% of female homicides in the United States (Catalano, Smith, Snyder, and Rand, 2009). When strangers are involved, many of these homicides are related to the illegal substance abuse network. The majority of homicides are perpetrated by a friend, acquaintance, or family member. Therefore, prevention of homicide is at least as much an issue for the public health system as for the criminal justice system.

At least 16% of male homicides and 64% of female homicides in the United States occur in families, and half of these occur between spouses. These numbers, however, do not include unmarried couples who are living together or those who are either divorced or estranged, a group at higher risk. In total, approximately 14% of all homicides were committed by an intimate partner. Spouses or ex-spouses composed about 24% of the perpetrators in female spousal homicides. Twenty-one percent of boyfriends or girlfriends and 19% of family members were responsible for female intimate partner homicides. Female homicides are perpetrated primarily by someone whom the victim knows; only 10% of all female homicides are perpetrated by a stranger (Catalano et al, 2009).

An alarming aspect of family homicide is that small children often witness the murder or find the body of a family member (Lewandowski et al, 2004). In most communities no automatic follow-up or counseling of these children occurs through the criminal justice or mental health system. These children are at great risk for emotional turmoil and for becoming involved in violence themselves (Steeves and Parker, 2007).

The underlying dynamics of homicide within families vary greatly from those of other murders. Homicide within families is most often preceded by abuse of a family member, and homicides of intimate partners (male or female) are preceded by abuse of the female partner in 70% to 75% of cases (Campbell et al, 2000, 2003). Thus, prevention of family homicide involves working with abusive families. Homicide is the leading cause of death for pregnant and postpartum women (Nannini et al, 2008). In fact, in a study of intimate partner homicide of women, 75% of the women who were killed by their husband, boyfriend, or ex-partner had been seen in a health care setting within the year before their homicide (Woods et al, 2008). Nurses have a duty to warn family members of the possibility of homicide when severe abuse is present, just as they warn of the hazards of smoking. Other nursing care issues are further discussed in the section [Family Violence and Abuse](#) in this chapter.

Assault

The death toll from violence is staggering, yet the physical injuries and emotional costs of [assault](#) are equally important issues in terms of the acute health care system. Twenty-two percent of females compared with 7.4% of males reported injury related to physical assault. Age is the greatest risk factor for an individual's victimization through violence, and youths are at significantly higher risk. Although more males than females are victims of homicide and assault, women are more likely to be victimized by a relative, especially a male partner (Catalano et al, 2009). In some instances the response time of emergency services and the quality of treatment facilities determine whether an assault will end as a homicide. The same community measures used to address homicide are useful to combat assault. Also, nurses often care for the long-term health problems associated with assaults such as head injuries, spinal cord injuries, and stomas from abdominal gunshot wounds in a home health care setting. In addition to providing physical care, nurses must also address the emotional trauma resulting from

a violent attack by helping victims talk through their traumatic experience to try to make some sense of the violence, and by referring them for further counseling if anxiety, sleeping problems, or depression persists after the assault.

Rape

At present, [rape](#) is one of the most underreported forms of human abuse in the United States; only about half (47%) of rapes in the National Crime Victimization Survey (NCVS) are reported to the police (Catalano et al, 2009), although reporting rates have improved over the past 15 years. According to the NCVS (Rand, 2009), sexual assault rates fell by 52% from 1999 to 2008. The rates of completed and attempted rape are almost equivalent. The incidence of rape exceeds the prevalence of rape victims because some victims experience more than one rape in a 12-month period. In 2008, according to the NCVS, there were an estimated 182,000 rapes or sexual assaults against females 12 or older, whereas males experienced 40,000 rapes or sexual assaults. This is a rate per 1000 of approximately 1.4 and 0.3, respectively. African American females experienced higher rates of rape or sexual assault than white females and other women of color. Hispanic and non-Hispanic white females experienced comparable rates of sexual assault (Catalano et al, 2009). More than half the rapes or sexual assaults against females were committed by an offender whom they knew, and one in five was committed by an intimate partner. Strangers committed only about one third (31%) of all rapes/sexual assaults. Nearly half (47%) of the rapes and sexual assaults against females in 2009 were reported to the police. The rate of rape or sexual assault against females declined by 70% from 1993 to 2008 and by 36% during that period for males (Catalano et al, 2009).

Because the majority of violence against women is IPV and women are raped more often by someone they know than by strangers, health care providers must be alert for date and marital rape. In the National Violence Against Women Survey (Tjaden and Thoennes, 2000), 64% of rapes, physical assaults, and stalkings were committed against women by either current or former intimate partners. Official recognition of rape regardless of a victim's relationship to the perpetrator has led to an increased number of women reporting rape. Rape also happens to men, especially boys and young men, but the statistics on the incidence of male rape vary. In a survey of Air Force women, more than 50% had reported being a victim of rape at some time in their lifetime. Although the majority of rapes occurred before enlistment, 14% of women were raped for the first time in the military and 26% of women were victims of rape before and within the military (Bostock and Daley, 2007). It appears that the emotional trauma for a male rape victim is at least as serious as that for a woman.

College women are at particularly high risk for sexual victimization in the United States, with research estimating that approximately 25% of female college students will experience an attempted or completed rape at some point during their college experience (Fisher et al, 2000). Data from the Bureau of Justice Statistics demonstrate that despite arrest rates for sexual assault remaining stable, twice as many women reported a

sexual assault by an intimate partner in 2010 as compared with 1994 (Catalano, 2012). The health impact of sexual assault is highly significant. Health issues include high-risk sexual behavior, substance abuse, unintended pregnancy, depression, **post-traumatic stress disorder** (PTSD), suicidal ideation, and eating disorders (Silverman et al, 2001). Nurses are well positioned to provide victims with comprehensive care including mental health services. Nurses can identify and refer clients who have experienced sexual assault. Advanced practice nurses are often providers of primary health care on college campuses, placing them in a unique position to educate and support students on the issue of dating violence.

Another form of rape is forced sexual initiations, with as many as 21% of young women in the United States whose first sexual experience is below the age of 14 reporting that this initiation was physically forced, usually by a date or boyfriend (Stockman et al, 2010). These early sexual experiences are associated with unplanned, adolescent pregnancies as well as HIV/STD risk behaviors.

Prevention of rape, like that of other forms of human abuse, requires a broad-based community focus for educating both the community as a whole and key groups such as police, health providers, educators, and social workers. Rape rates and community-level variables such as community approval and legitimization of violence (e.g., violent network television viewing and permitting corporal punishment in schools) appear related and underscore the need for community-level intervention (Casey and Lindhorst, 2009).

Attitudes

The first priority is to change attitudes about rape and about victims or survivors. Rape is a crime of violence, not a crime of passion. The underlying issues are hostility, power, and control rather than sexual desire. The defining issue is lack of consent of the victim. When a woman or man refuses any sexual activity, that refusal means “no.” People have the right to change their mind, even when they seemed initially agreeable. Pressure from physical contact, threats, or deliberate inducement of drug or alcohol intoxication is a violation of the law. The myths that women say “no” to sex when they really mean “yes” and that the victims of rape are culpable because of the way they dress or act must end.

Pornography

Although there is evidence of a relationship between the viewing of pornographic material showing violence against women and aggressive sexual behavior, it is not clear if the relationship is causal. In other words, our current research does not yet show that viewing pornography occurs before sexual aggressiveness or that young men who are sexually violent tend to watch pornography. The current research tends to minimize the relationship between sexual assault and pornography (Ferguson and Hartley, 2009). However, there is some evidence that claims that early exposure to pornography as a child may be related to sexual offense in the future (Seto and Lalumière, 2010). Prevention programs, or more accurately labeled risk reduction or avoidance programs, also involve providing information to

women about self-protection, including using self-defense procedures, avoiding high-risk locations, and safeguarding one's home against unwanted entry. Most rape prevention programs have been oriented toward women. However, men are increasingly becoming involved in rape prevention education via anti-rape websites (Master's, 2010). Many of these websites are community-based programs that promote education about violence against women and promote a positive male role model of gender equity. They often depict examples of consensual and nonconsensual sexual behaviors.

Victim or Survivor?

During the act of rape, **survivors** are often hit, kicked, stabbed, and severely beaten. It is this violence that is most traumatic because of the survivors' fear for their lives, helplessness, lack of control, and vulnerability.

People react to rape differently, depending on their personality, past experiences, background, and support received after the trauma. Some cry, shout, or discuss the experience. Others withdraw and fear discussing the attack. During the immediate as well as the follow-up stages, victims tend to blame themselves for what happened. When working with rape victims, help them identify the issues behind self-blame. While not placing fault on survivors, teach them to take control, learn assertiveness, and therefore believe that they can take certain actions to prevent future rapes. Survivors need to talk about what happened and to express their feelings and fears in a non-judgmental atmosphere.

In any psychological trauma, victims should be given privacy, respect, and assurance of confidentiality. They should also be told about health care procedures conducted immediately after the rape and should be linked with proper resources for ease of reporting the crime. Nurses often provide continuous care once the victim enters the health care system. Because many victims deny the event once the initial crisis is past, a single-session debriefing should be completed during the initial examination. Specialty trainer providers should perform the physical assessment, examination, and debriefing.

As discussed in Chapter 44, in most states, nurses trained as **Sexual Assault Nurse Examiners** (SANEs), a subspecialty of **forensic** nursing, perform the physical examination in the emergency department to gather evidence (e.g., hair samples, skin fragments beneath the victim's fingernails, evidence from pelvic examinations obtained by colposcopy) for criminal prosecution of sexual assault (Sheridan, 2004). This is an important nursing intervention because physicians may not be able to take the time required for this procedure; nurses can take advantage of this opportunity to provide therapeutic communication and support. Nurses can be trained to conduct the examination either in SANE trainings or in forensic nursing programs in many schools of nursing, and their evidence is credible and effective in resultant court proceedings (Houmes et al, 2003; Campbell et al, 2006, 2007). Nurses can lobby for changes in hospital policies and state laws to make this strategy a reality in all states.

Rape is a situational crisis for which advance preparation is rarely possible. Therefore, nursing efforts are directed toward

helping victims cope with the stress and disruption of their lives caused by the attack. Counseling focuses on the crisis and the concomitant fears, feelings, and issues involved. Nurses can help survivors learn how to regroup personal strengths. If PTSD occurs, professional psychological or psychiatric treatment is indicated.

Many rape victims need follow-up mental health services to help them cope with the short- and long-term effects of the crisis. The time after a rape is one of disequilibrium, psychological breakdown, and reorganization of attitudes about the safety of the world. Common, everyday tasks often tax a person's resources, and they may forget or fail to keep appointments. Nurses can make referrals and obtain the victim's permission to remain in telephone contact in order to assess support, provide encouragement, and offer resources.

Suicide

According to the National Violent Death Reporting System (NVDRS), **suicide** accounted for the highest rate of violent death in 2007, taking the lives of 9245 people. Firearms accounted for 50.7%, hanging/strangulation/suffocation for 23.1%, and poisoning for 18.8% of suicides. Firearms (56%) or hanging/strangulation/suffocation (24.4%) were the most common form of suicide for men. Women used poisoning (40.8%) most frequently, followed by firearms (30.9%). Precipitating factors for suicide were mental health (45%), IPV (30%), and physical health problems (21.4%) (CDC, 2014a). The risk for death by suicide is greater than for death by homicide. Rates of completed suicide are higher for men, especially older adults, non-Hispanic whites, and Native Alaskans/American Indians (Karch et al, 2010). Affluent and educated people often have higher rates of suicide than do the economically and educationally disadvantaged except for Native Alaskan/American Indian populations, who are often poor and yet commit suicide in alarming numbers. The presence of a gun in the home is an important risk factor for both suicide and homicide (Campbell, 2007).

Suicide is the third-leading cause of death among young people ages 15 to 24. During 2005 to 2009, the highest suicide rates were among American Indian/Alaskan Native males, with 27.61 suicides per 100,000, and non-Hispanic white males, with 25.96 suicides per 100,000. Of all female race/ethnicity groups, the American Indian/Alaskan Natives and non-Hispanic whites had the highest rates with 7.87 and 6.71 suicides per 100,000, respectively. Boys and young men between the ages of 15 and 19 were five times more likely to commit suicide than females and four times more likely if between the ages of 20 and 24 (Karch et al, 2010). Attempted suicide was more prevalent for white, African American, and Hispanic females than for males of the same racial background. Leading risk factors for adolescent suicide are mental health, unintended pregnancy, and sexually transmitted disease (STD), especially HIV (Eaton et al, 2010). An important risk factor for actual and attempted suicide in adult women is IPV.

Nurses need to be involved in the reduction of suicide and the care for victims because suicide affects the community, the family, and individuals. On a community level, nurses can be

involved in a coordinated response to the prevention of suicide and the care of attempted suicides. Through their roles in public health and school nursing, they can help develop policies and protocols for suicide across the life span. Nursing care may focus on family members and friends of suicide victims. Survivors may feel angry at the dead person, and turn the anger inward. They may question their own liability for the death and have difficulty dealing with their feelings toward the dead person; survivors may limit their social activities because it is difficult for them and their friends to talk about the suicide. Nurses can help survivors cope with the trauma of the loss and make referrals to a counselor or support groups.

FAMILY VIOLENCE AND ABUSE

Family violence, including sexual, emotional, and physical abuse, causes significant injury and death. Although the rate of IPV has decreased for females and males over the last 15 years, the rate of homicides perpetrated by a known other has remained the same (Catalano et al, 2009). IPV tends to occur as part of a system of coercive control. In general, IPV is perpetrated by the most powerful against the least powerful.

The majority of IPV is directed at women, with the majority of IPV perpetrated by a male partner or ex-partner (Black et al, 2011). However, sexual minorities (LGBT; lesbian, gay, bisexuals, and transgender populations) experience violence from an intimate partner or ex-partner at similar rates as heterosexuals (Walters et al, 2013). LGBT IPV generally follows similar dynamics as heterosexual IPV (emotional, verbal, physical, and/or sexual violence, threats, isolation, and intimidation, in a context of one partner maintaining power and control over another) and results in similarly adverse health outcomes. As with heterosexual IPV, dynamics of power and control caused by race, gender expression, ability, immigration status, age, and class are methods of control in same-sex IPV (National Coalition of Anti-Violence Programs, 2012). Further, LGBT IPV survivors may face significant added barriers to help from law enforcement, health care, domestic violence agencies, and other service agencies, including a lack of appropriate services, provider stereotypes (e.g., women are not violent), discrimination, and even abuse based on their sexual minority status.

Recognizing the IPV survivor in the emergency department may be simple after the fact. It is unfortunate that, by the time medical care is sought, serious physical and emotional damage may have been done. Nurses are in a key position to predict and deal with abusive tendencies. By understanding factors contributing to the development of abusive behaviors, nurses can identify incidents of IPV.

Development of Abusive Patterns

Perpetrators of IPV often believe that violence within an interpersonal relationship is a normal behavior pattern (Stover et al, 2010). Factors that characterize people who become involved in IPV include upbringing, living conditions, and increased stress. Understanding how these factors influence the development of abusive behavior can help the nurse manage abusive families.

Upbringing

The most predictable factor in the background of an abuser is previous exposure to some form of violence (Whiting et al, 2009). As children, abusers were often beaten or witnessed the beating of siblings or a parent. These children learn that violence is a suitable way to manage conflict. For both men and women, witnessing abuse as a child was associated with abuse of their children. Having financial solvency and support tended to decrease the incidence of child abuse (Dixon et al, 2009; Whiting et al, 2009). Childhood physical punishment teaches children to use violent conflict resolution as an adult. A child may learn to associate love with violence because a parent is usually the first person to hit a child. Children may think that those who love them are also those who hit them. The moral rightness of hitting other family members thus may be established when physical punishment is used to train children, especially when it is used more than occasionally. These experiences predispose children ultimately to use violence with their own children.

As well as having a history of child abuse themselves, people who become abusers tend to have hostile personality styles and be verbally aggressive. They have often learned these characteristics from their own childhood experiences. Their parents may have set unrealistic goals, and when the children failed to perform accordingly, they were criticized, demeaned, punished, and denied affection. These children may have been told how to act, what to do, and how to feel, thereby discouraging the development of normal attachment, autonomy, problem-solving skills, and creativity (Dixon et al, 2005). Children raised in this way grow up feeling unloved and worthless. They may want a child of their own so that they will feel assured of someone's love.

Because of their experiences of trauma and to protect themselves from feelings of worthlessness and fear of rejection, abused children form a protective shell and grow increasingly hostile and distrustful of others. The behavior of potential abusers reflects a low tolerance for frustration, emotional instability, and the onset of aggressive feelings with minimal provocation. Because of their emotional insecurity, perpetrators of abuse often depend on a child or spouse to meet their needs of feeling valued and secure. When their needs are not met by others, they become overly critical. Critical, resentful behavior and unrealistic expectations of others lead to a vicious cycle. The more critical these people become, the more they are rejected and alienated from others. Abusive individuals tend to perceive that the target of their hostility is "out to get" them. These distorted perceptions can be detected when parents talk about an infant crying or keeping them up at night "on purpose" (Dixon et al, 2005).

Increased Stress

A perceived or actual crisis may precede an abusive incident. Because a crisis reinforces feelings of inadequacy and low self-esteem, a number of events often occur in a short time to precipitate abusive patterns. Unemployment, strains in the marriage, or an unplanned pregnancy may precipitate violence, especially in people with other risk factors such as a history of trauma themselves.

The daily hassles of raising young children, especially in an economically strained household, intensify an already stressed

atmosphere for which an unexpected and difficult event may provoke violence. Stressful life events, poverty, and cultural values and social isolation are often associated with family violence. Crowded living conditions may also precipitate abuse. The presence of several people in a small space heightens tensions and reduces privacy; tempers flare because of the constant stimulation from others.

Social isolation is associated with abuse in families (Hines and Malley-Morrison, 2005). Such isolation limits social support, decreasing a family's ability to deal with stressors. The problem may be intensified if a violent family member tries to keep the family isolated to avoid detection. Therefore, when a family chronically misses clinic or home visit appointments, nurses need to keep in mind that abuse may be present. Nurses can encourage involvement in community activities and can help neighbors reach out to neighbors to help prevent abuse.

Frequent moves disrupt social support systems, are associated with an overall increased stress level, and tend to isolate people, at least briefly. Mobility can have a serious negative effect on the abuse-prone family. These families do not readily initiate new relationships; they rely on the family for support. Resources may be unfamiliar or inaccessible to them. Because frequent moving may be both a risk factor for abuse and a sign of an abusive family trying to avoid detection, nurses should assess such families carefully for abuse.

Types of Intimate Partner and Family Violence

Because various forms of family violence and violence outside the home often occur together, nurses who detect child abuse should also suspect other forms of family violence. When older adult parents report that their (now adult) child was abused or has a history of violence toward others, the nurse should recognize the potential for elder abuse. **Physical abuse** of women is frequently accompanied by **sexual abuse** both inside and outside the marital relationship. Severe wife abusers may have a history of other acts of violence. Families who are verbally aggressive in conflict resolution (e.g., using name calling, belittling, screaming, and yelling) are more likely to be physically abusive. Although the various forms of family violence are discussed separately, they should not be thought of as totally separate phenomena.

No member of the family is guaranteed immunity from abuse and neglect. Spouse abuse, child abuse, abuse of older adults, serious violence among siblings, and mutual abuse by members all occur. Although these examples are not inclusive, they demonstrate the scope of family violence.

Child Abuse

A national survey estimated that in 2011, there were 742,000 unique reports of children and adolescents who were subjected to neglect, medical neglect, physical and sexual abuse, and emotional maltreatment. Of these children, 78% were victims of neglect, 18% were victims of physical abuse, 10% were sexually abused, and 8% were psychologically maltreated. The remaining 2% were medically neglected. This is probably a conservative figure, because only the most severe cases are reported. Except for sexual abuse, which is four times as high for girls as for boys, victims are equally distributed among sexually abused

male and female children (U.S. Department of Health and Human Services [USDHHS], 2013).

Children also witness domestic violence (Berman et al, 2010). When children witness domestic violence, they may experience many psychological and physical problems. Long-term developmental problems, including low self-esteem, depression, anxiety, and school failure, are also more common in children who witness IPV in their home (Lichter and McCloskey, 2004). Children living in homes with parental violence are more likely to feel guilt over the abuse and suffer from post-traumatic stress syndrome than children who are not exposed to violence (Scott, 2007; Kletter et al, 2009). Victims of child abuse are also 12 times more likely to abuse their children than individuals with no history of child abuse. Bower-Russa (2005) found that attitudes about discipline and severity of abuse as a child were factors that contributed to perpetration of child abuse. Community support and intervention programs that focus on positive child-rearing practices, especially discipline and positive recognition, assist parents in a positive, developmentally appropriate approach to child rearing (Daro and Dodge, 2009).

Children who experience abuse need to understand that the abuse experience is not their fault. From a practical sense, children need to understand safety issues and what they need to do when abuse occurs (Ernst et al, 2008). Risk factors for abused children include factors such as familial financial strain, lack of social support, abuse between parents, and problems with substance abuse. Some of the risk factors are identified in Box 38-1 (USDHHS, 2013; Zimmerman and Mercy, 2010). Children who witness abuse react differently according to their age, level of development, and sex; their reactions are influenced by the severity and frequency of the abuse witnessed (Kelly et al, 2010).

Children are often abused because they are small and relatively powerless. In many families only one child may be abused.

BOX 38-1 Determining Risk Factors for Child Abuse

Ask the following questions or observe the following behaviors to determine whether risk factors are present.

1. Are the parents unemployed?
2. Do the parents have the financial resources to care for a child?
3. Is there a support network that is willing to offer assistance?
4. Do one or both parents have a history of child abuse?
5. Is a parent a victim or perpetrator of intimate partner violence?
6. Do the parents have knowledge about child development?
7. Do one or both parents have problems with substance abuse?
8. Are the parents overly critical of the child?
9. Are the parents communicative with each other and the nurse?
10. Does the mother of the child seem frightened of her partner?
11. Does the child suffer from recurrent injuries or unexplained illnesses?

Data from Rodriguez CM: Personal contextual characteristics and cognitions: predicting child abuse potential and disciplinary style, *J Interpers Violence* 25(2):315-335, 2010; U.S. Department of Health and Human Services, Administration for Children and Families, Administration on Children, Youth and Families, Children's Bureau: *Child maltreatment*, 2008, 2010a. Available at http://www.acf.hhs.gov/programs/cb/stats_research/index.htm#can. Accessed August 20, 2010; Zimmerman F, Mercy JA: A better start: child maltreatment prevention as a public health priority, *Zero to Three* 30(5):4-10, 2010.

Parents may identify with this child and be especially critical of the child's behavior. Also, this child may have certain qualities, such as looking like a relative, being handicapped, or being particularly bright and capable, that provoke the parent.

Child abuse signifies ineffective family functioning. Abusive parents who recognize their problem are often reluctant to seek assistance because of the stigma attached to being considered a child abuser and the legal ramifications of abuse. Parents with a history of abuse as a child or who have minimal education, a lack of social support, a tendency toward depression, and multiple stress factors may be at risk for abusing their children (Whiting et al, 2009). Children are often used as leverage between parents when there is a history of violence between the parents. The abusive parent is often coercive and manipulative toward the child as a mechanism to control the nonabusive parent. Abusive parents often have unrealistic expectations of a child's developmental abilities. They often use avoidance strategies to deal with behavioral issues and overreact with abusive discipline in times of stress (Rodriguez, 2010). Abusive parents use physical discipline more frequently, often in the form of physical punishment and verbal abuse. Spanking can also be considered a form of child abuse (Hines and Malley-Morrison, 2005; Straus, 2005). The nurse must not only teach appropriate parenting behavior, but also address the underlying emotional needs of the parents. These parents often experience pain and poor emotional stability and need intervention as much as their children. Following are some of the behavioral indicators of potentially abusive parents (Zimmerman and Mercy, 2010). The box that follows lists ways to recognize actual or potential signs of child abuse.

HOW TO Identify Potentially Abusive Parents

The following characteristics in couples expecting a child constitute warning signs of actual or potential abuse:

- Denial of the reality of the pregnancy, as seen in a refusal to talk about the impending birth or to think of a name for the child
- An obvious concern or fear that the baby will not meet some predetermined standard: sex, hair color, temperament, or resemblance to family members
- Failure to follow through on the desire for an abortion
- An initial decision to place the child for adoption and a change of mind
- Rejection of the mother by the father of the baby
- Family experiencing stress and numerous crises so that the birth of a child may be the last straw
- Initial and unresolved negative feelings about having a child
- Lack of support for the new parents
- Isolation from friends, neighbors, or family
- Parental evidence of poor impulse control or fear of losing control
- Contradictory history
- Appearance of detachment
- Appearance of misusing drugs or alcohol
- Shopping for hospitals or health care providers
- Unrealistic expectations of the child
- Verbal, physical, or sexual abuse of mother by father, especially during pregnancy
- Child is not biological offspring of male stepfather or mother's current boyfriend
- Excessive talk of needing to "discipline" children and plans to use harsh physical punishment to enforce discipline

Foster Care. When child abuse is discovered, the child is often placed in a foster home. It is the legal responsibility of the nurse to report all cases of child abuse. Ideally, the initial report begins a process in which both the child and the family can receive the care needed. Although the focus of care should be on the best interests of the child and the parents, the primary attention should be on the health and safety of the child. While in foster care the abused child should receive continuous nursing care. The nurse is often the one consistent person abused children can relate to as they are transferred from their home to foster care and hopefully back to their home. Abused children generally want to return to their parents, and the goal of most agencies is to help natural families stay together as long as it is safe for the child. However, a family preservation approach may not always keep children safe (O'Reilly et al, 2010). Often the nurse's role is to help monitor a family in which a formerly abused child is returned from foster care. Keen judgment and close collaboration with social services are necessary in these situations. The nurse must ensure the safety of the child while working with the parents in an empathetic way. The nurse's goal is to enhance parenting skills through education on child care and development, communication, and principles of social learning theory. Parents must also be given positive support and reassurance about their ability to provide proper care to their child.

One of the most distressing outcomes of child abuse is depression and other mental health problems, especially suicide. Adolescents who have been placed in the social service system many times or who move from one foster home to another are at risk for delinquency, severe depression, alcohol and substance abuse, and suicide. Nurses need to understand the dynamics of adolescent suicide and substance abuse (Fletcher, 2010; Ford et al, 2010).

Indicators of Child Abuse. It is essential that nurses recognize the physical and behavioral indicators of abuse and neglect. **Child abuse** ranges from violent physical attacks to passive neglect. Violence such as beating, burning, kicking, or shaking may lead to severe physical injury. **Passive neglect** may result in insidious malnutrition or other problems. Abuse is not limited to physical maltreatment but includes **emotional abuse** such as yelling at or continually demeaning and criticizing the child. Children who come from a family where IPV occurs are at greater risk for physical and psychological abuse and child neglect (Hines and Malley-Morrison, 2005; Whiting et al, 2009; Fletcher, 2010).

Emotional abuse involves extreme debasement of feelings and may lead the child to feel inadequate, inept, uncared for, and worthless. These children learn to hide their feelings to avoid more scorn. They may act out by performing poorly in school, becoming truant, and being hostile and aggressive. Children who are abused or who witness domestic violence can suffer developmentally (Kletter et al, 2009; Rodriguez, 2010). Major responses of adolescents to physical and sexual abuse are substance abuse, severe depression, and running away from home (Fletcher, 2010; Ford et al, 2010).

Physical symptoms of physical, sexual, or emotional stress may include hyperactivity, withdrawal, overeating, dermatological

HOW TO Recognize Actual or Potential Child Abuse

Be alert to the following:

- An unexplained injury
- Skin: burns, old or recent scars, ecchymosis, soft tissue swelling, human bites
- Fractures: recent, or older ones that have healed
- Subdural hematomas
- Trauma to genitalia
- Whiplash (caused by shaking small children)
- Dehydration or malnourishment without obvious cause
- Provision of inappropriate food or drugs (alcohol, tobacco, medication prescribed for someone else, foods not appropriate for the child's age)
- Evidence of general poor care: poor hygiene, dirty clothes, unkempt hair, dirty nails
- Unusual fear of nurse and others
- Considered to be a "bad" child
- Inappropriate dress for the season or weather conditions
- Reports or shows evidence of sexual abuse
- Injuries not mentioned in history
- Seems to need to take care of the parent and speak for the parent
- Maternal depression
- Maladjustment of older siblings
- Current or history of intimate partner violence in the home

problems, vague physical complaints, stuttering, enuresis (bladder incontinence), and encopresis (bowel incontinence). Ironically, bedwetting is often a trigger for further abuse, thereby creating a vicious cycle. When a child displays physical symptoms without clear physiological origin, the nursing assessment should rule out the possibility of abuse.

Child Neglect. The four categories of **child neglect** include physical, emotional, medical, and educational neglect. **Physical neglect** is failure to provide adequate food, proper clothing, shelter, hygiene, or necessary medical care and is most often associated with extreme poverty. In contrast, **emotional neglect** is the lack of the basic nurturing, acceptance, and caring essential for healthy personal development. These children are largely ignored or treated as nonpersons, which affects the development of self-esteem. A neglected child has difficulty feeling self-worth because the parents have not shown that they value the child. Medical and educational neglect consist of the failure to provide for a child's basic medical and educational needs. Children with disabilities may be neglected because of inadequate resources. Medical neglect may be due to an inability to buy basic drugs needed for common diseases. All forms of neglect may be involved when a parent fails to teach children about risky behaviors such as smoking and substance abuse (Hines and Malley-Morrison, 2005). Astute observations of children, their homes, and the family can assist in a proper assessment of neglect and possible recommendations for care.

Sexual Abuse. Child abuse also includes sexual abuse. Approximately 1 in 4 female children and 1 in 10 males in the United States experiences some form of sexual abuse by the time he or she reaches 18 years of age. It is difficult to determine the exact prevalence because not all children have the cognitive

ability to describe these experiences. Rates based on reports to child protective services estimate that 50 in every 1000 children suffer from child abuse and/or neglect (USDHHS, 2013). This abuse ranges from unwanted sexual touching to intercourse. The child generally knows and trusts the person who perpetrates the sexual abuse. One third to one half of all sexual abuse involves a family member (Hines and Malley-Morrison, 2005; USDHHS, 2013). A child's risk for abuse is highest with parents, immediate family members, and nonrelated caregivers, although coaches, scout leaders, and even priests and other church workers have been reported as sexual abusers. The long-term effects of sexual abuse include depression, sexual disturbances, suicide, and substance abuse. Individuals with a history of both physical and sexual abuse tend to experience more severe symptoms than children who experience one form of abuse (Fletcher, 2010; Stevenson, 2009). Physically and sexually abusive parents share many of the same characteristics, including unhappiness, loneliness, and rigidity. However, sexually abused children have more gastrointestinal symptoms and post-traumatic stress disorders than physically abused children (Drossman, 2011).

Father–daughter incest is the type of incest most often reported; however, mothers do engage in child sexual abuse. In recent years more males have discussed their experiences of child sexual abuse. It is estimated that one in five children is a victim of child sexual abuse. Cases of father–daughter, father–son, mother–daughter, and mother–son incest have been reported (Hines and Malley-Morrison, 2005). Many cases of parental sexual abuse go unreported because victims fear punishment, abandonment, rejection, or family disruption if the problem is acknowledged. Although stepfathers are considered the most common perpetrator of father–daughter incest, we know little about female perpetrators. Incest occurs in all races, religious groups, and socioeconomic classes. Incest is receiving greater attention because of mandatory reporting laws, yet all too often its incidence remains a family secret.

Nurses must be aware of the incidence, signs and symptoms, and psychological and physical trauma of incest. Symptoms include low self-esteem, depression, anxiety, and somatic symptoms of headaches, eating and sleeping disorders, menstrual problems, and gastrointestinal distress (Drossman, 2011). Sexually abused children often exhibit premature sexual behavior, such as masturbation. Children often try to avoid or escape the abusive behavior. Avoidance can be through either behavioral or mental reactions, such as dressing to cover one's body or pretending that the abuse is not taking place. The child can escape either physically by running away or emotionally by withdrawing into other activities and thereby placing the sexual abuse in the background (Stevenson, 2009).

Adolescents may display inappropriate sexual activity or truancy or may run away from home. Running away is usually considered a sign of delinquency; however, an adolescent who runs away may be exhibiting a healthy response to a violent family situation. Therefore, the assessment should include questions about sexual and physical abuse at home and a plan for appropriate intervention.

The effects of childhood sexual abuse can be mitigated by continual professional support. At different developmental

stages, children may need assistance to overcome negative feelings about their own sexuality (Stevenson, 2009). Adult survivors of sexual abuse often are socially isolated and have significant health problems that need to be addressed in terms of the ongoing effects of their childhood and adult experiences (Mapp, 2006).

Abuse of Female Partners

Neither the term **wife abuse** nor the term **spouse abuse** takes into account violence in dating or cohabitating relationships or violence in same-sex relationships. IPV, a more inclusive term, refers to all kinds of violence between partners. IPV is not a rare event, with one in three women and one in four men reporting physical violence, rape, and/or stalking by a current or former intimate partner at some point in their life (Black et al, 2011). However, these figures do not include psychological forms of IPV, which also could have severe consequences. Recently, more attention has been given to female-perpetrated IPV and bidirectional violence (i.e., male-to-female violence concurrent with female-to-male violence), especially in the context of teen dating violence. Nevertheless, female victims of IPV are more likely to report severe IPV and experience more negative individual, family, and community consequences than their male counterparts, and a greater potential for intimate partner homicide (Black et al, 2011; Campbell, 2007).

IPV appears early in life. In fact, approximately 22% of victims of rape, physical abuse, and/or stalking by an intimate partner report their first experience when they were between the ages of 11 and 17. Nearly half (47%) report their first incident between the ages of 18 and 24 (Black et al, 2011). As in adulthood, IPV experienced by adolescents and young adults is associated with poor mental health outcomes such as depression and suicidality, are linked to risky behaviors such as substance abuse and risky sexual behaviors, and can set the stage for unhealthy relationships in adulthood (Coker et al, 2000; Fredland and Burton, 2011).

Signs of Abuse. Battered women often have bruises and lacerations of the face, head, and trunk of the body. Attacks are often carefully inflicted on parts of the body that are disguised by clothing. This pattern of proximal location of injuries (e.g., breasts, abdomen, upper thighs, and back) rather than distal and patterned injuries (in various stages of healing, in particular configurations matching the body part or object used as a weapon) is characteristic of abuse (Campbell and Sheridan, 2004; Sheridan and Nash, 2009). When a woman has a black eye or bruises about the mouth, the nurse should ask, "Who hit you?" rather than, "What happened to you?" The latter implies that the nurse is neither knowledgeable nor comfortable with violence, and this may prompt the woman to fabricate a more acceptable cause of her injury.

Once abused, women tend to exhibit low self-esteem and depression, and even PTSD (Humphreys and Campbell, 2010). They have more physical health problems than other women, such as chronic pain (back, head, abdominal), neurological problems, problems sleeping, gynecological symptoms, urinary tract infections, and chronic gastrointestinal problems (Campbell, 2002). Victims of IPV are also at greater risk for HIV and

other STIs, which appear to be both a risk factor and consequence of the abuse (Coker et al, 2009). In addition, female victims of IPV are more at risk for chronic diseases such as cardiovascular disease, atherosclerosis, and autonomic nervous system disorders (Symes et al, 2010). Although the focus tends to be on the victim of the abuse, it is important to note that there are health consequences to the perpetrator and children witnessing the abuse as well. These physical and mental health consequences incur health care costs that are preventable (Rivara et al, 2007).

Abuse as a Process. Nursing research by Ford-Gilboe and colleagues (2010) suggests that there is a process of response to battering over time wherein the woman's emotional and behavioral reactions change. At first there is a great need to minimize the seriousness of the situation. The violence usually starts with a slight shove in the middle of a heated argument. If there is any physical aggression, both the man and the woman tend to blame the incident on something external such as a stressful day at work or drinking too much. The male partner usually apologizes for the incident, and as with any problem in a relationship, the couple tries to improve the situation. Although marital counseling may be useful at this early stage, it is generally contraindicated at all other stages because of the risk to the woman's safety. Unfortunately, abuse tends to escalate in frequency and severity over time, often leading to severe physical injuries and even death (Piquero et al, 2006), and the man's remorse tends to lessen. Similar power and control dynamics and risks have been documented in same-sex relationships, yet these dynamics may be more difficult to assess because screening and services for IPV are often designed for heterosexual relationships (Alhusen et al, 2010).

Because women have often been taught to take responsibility for the success of a relationship, they usually go through a period in which they try to change their behavior to end the violence. They may even blame themselves for infuriating their partner. Women who blame themselves for provoking the abuse are more likely to have low self-esteem and be depressed than those who do not blame themselves. Some women experience a moral conflict between their need to leave an abusive relationship and their sense that it is their responsibility to maintain a relationship (Flinck et al, 2005). She is also typically concerned about her children, which may create barriers to a woman's ability to leave or to remain out of the relationship. The frequency of abuse, severity of power and control tactics used by the perpetrator, feelings of guilt, and social and financial responsibility are additional influences on a woman's decision about how she responds to the abuse and whether she stays or leaves the relationship (Sonis and Langer, 2008; Rhodes et al, 2010).

Although leaving the abusive partner may ultimately contribute to a decrease in the woman's risk for further victimization, the moment in which she leaves the relationship is the time in which there is the greatest risk for intimate partner homicide (Campbell, 2007). This creates a Catch-22 situation, in which the woman feels she will die whether she stays or leaves. Consequently, battered women often try several times to leave a relationship. The safety of the woman and her children is a nursing priority during these attempts.

EVIDENCE-BASED PRACTICE

Sharps and colleagues (2013) conducted a multistate longitudinal study testing the effectiveness of a structured intimate partner violence (IPV) intervention integrated into health department perinatal home visitation programs in rural and urban locations. All women ($n = 239$) enrolled in the randomized clinical trial were pregnant at the time of enrollment and reported a positive history of IPV in the perinatal period. The research partners included individuals from two schools of nursing, an urban East Coast health department, and 13 rural Midwestern health departments. The Domestic Violence Enhanced Home Visitation (DOVE) intervention, based on an empowerment model, combined two evidence-based interventions: a 10-minute brochure-based IPV intervention and perinatal nurse home visitation. Quantitative and qualitative data revealed that women in both the intervention group and control group demonstrated a significant decrease in IPV over time. However, women receiving the DOVE intervention had significantly lower levels of IPV than did control subjects at 24 months. Home visitors in both groups (e.g., intervention and control) were taught how to screen for IPV and how to coordinate appropriate referrals, ensuring that each woman received basic safety information.

Nurse Use

Nurses need to be able to work with survivors of IPV as well as providers within communities who work with abused women. Community-based partnerships are essential to most effectively develop and implement evidence-based IPV interventions such as DOVE. To best address IPV in a community, nurses must understand cultural differences among women who experience IPV as well as among community advocates who may also be assisting abused women. Public health nurses are well positioned to forge such partnerships and take an active role in planning, implementing, and evaluating programmatic change.

Partnering with the Community. Nurses need to be able to work to address IPV on various levels of intervention. Community-based partnerships are essential collaborative actions that will assist in the reduction of IPV. To do so, nurses must understand cultural differences related to IPV, as well as the needs and strengths of the communities with which they partner. Public health nurses can take an active role in leading groups and planning, implementing, and evaluating programmatic change. There are various examples of nurse-led community partnerships to prevent and address IPV. For example, both Belknap and VandeVusse (2010) and Gonzalez-Guarda and colleagues (2013) partnered with community agencies, schools, and community members to identify needs and preferences for IPV prevention and services for the Hispanic/Latino community. This work has led to the development, implementation, and evaluation of dating violence prevention programs for Hispanic/Latino youth.

The Centers for Disease Control and Prevention (CDC) has launched an initiative called Dating Matters. The purpose of this program is to teach parents and adolescents about healthy relationships and to give them tools to deal with unhealthy relationships such as teen dating violence (CDC, 2014b). Dating Matters focuses on 11- to 14-year-olds in high-risk, urban communities, and includes prevention strategies for individuals, peers, families, schools, and neighborhoods. The Migrant Clinicians Network, an organization to help migrant and other poor

transient workers, has developed a natural helper model for migrant workers, to work within their own community to identify and teach about IPV (Kugel et al, 2009). On the basis of models developed in the 1980s, communities are developing a coordinated response in which multiple agencies work together to assist with preventing IPV.

Screening. Given the high prevalence of IPV and the negative physical, psychological, social, and economic consequences associated with this public health problem, adolescents and adults should be screened for violence in their primary intimate relationship. The U.S. Preventive Services Task Force recommends screening women of childbearing age for IPV and referring or providing women who disclose abuse to intervention services (U.S. Preventive Services Task Force, 2013). The use of effective screening protocols, institutional support for implementing screening, initial and ongoing staff training, and access to services onsite or through a strong referral system are recommended as part of a comprehensive screening program (O'Campo et al, 2011).

Safety Planning. Victims of IPV are at high risk for severe injuries and homicide, especially at the moment they decide to leave an abusive relationship (Campbell, 2007). As such, nurses should work with women victims in creating a safety plan. This plan may include the following: (1) an order of protection (a legal document to keep the abuser away from her); (2) help in getting to a safe place, such as a domestic violence shelter in an anonymous location; (3) access to individual advocacy and support groups/or the criminal justice system (Harding and Helweg-Larsen, 2009); and (4) a carefully calculated plan for escape that includes keeping a bag with a copy of important documents and other resources (e.g., keys, phone, contact information) for emergencies. Although leaving an abusive relationship has been shown to be protective in the long term (Campbell, 2007), it is important to avoid pushing women into actions they are not ready to take. Cultural factors that influence responses to IPV are also important to consider in the development of interventions addressing the safety of victims (Ward and Wood, 2009; Belknap and VandeVusse, 2010).

Batterer's Interventions. The male partner may attend a program for batterers as an alternative to ending the relationship. These programs appear to be effective for some individuals. These programs are most effective if they are part of a coordinated community response, involve appropriate risk assessment and management practices, are of adequate structure (e.g., duration), are court-mandated and closely monitored, and involve training and close supervision of the staff implementing the program (Salcido Carter, 2009).

Intimate Partner Sexual Abuse

Battered women are often forced into sexual encounters. This sexual abuse is usually but not always accompanied by physical abuse. Women who are sexually abused are at risk for STDs (Coker et al, 2009). Sexual abuse increases the risk for mental health problems for all women who are involved in physically abusive relationships. Women who experience child abuse are at even greater risk for depression than those not exposed to abuse as a child (Fogarty et al, 2009).

The belief that men have a right to force their wives to have sex comes from traditional English law that said a woman gave irrevocable and perpetual consent to her husband on marriage to have sex whenever and however he wanted. Marital rape was not considered a crime in the United States until 1993 (Yllo, 1999). Marital rape leads to serious physical and emotional damage. Women who suffer from IPV may not consider forced sex a form of abuse. It is essential when women come to the emergency room with injuries that they are assessed for the presence of both physical and sexual abuse (Catallo, 2006).

To assess for sexual assault, the following question should be used in all nursing assessments to determine whether marital rape, date rape, or rape of a male has occurred: "Have you ever been forced into sex you did not wish to participate in?"

Abuse during Pregnancy

Battering during pregnancy has serious implications for the health of women and their children. As a conservative estimate, 3% to 8% of pregnant women in the United States are physically battered during pregnancy, with a larger proportion of women abused during the year before pregnancy. Even more (up to 20%) adolescents are abused during pregnancy than adult women (Bloom et al, 2010). Although abuse during pregnancy occurs across ethnic groups, Puerto Rican, white, and African American women experience a significantly higher severity of physical abuse than Hispanic women from Mexico and Central America (Bloom et al, 2010). Women abused during pregnancy are at risk for spontaneous abortion, premature delivery, low-birth-weight and small-for-gestational age infants, substance abuse during pregnancy, and depression (Alhusen et al, 2013; McFarlane and Parker, 2005). A man's control of contraception, a form of abusive controlling, may lead to unintended pregnancy and subsequent abuse. In addition, a man's refusal to use a condom places a woman at increased risk of STDs, including infection with HIV (Campbell et al, 2008).

Women who are abused during pregnancy are more likely to experience health problems and are at risk for alcohol and drug abuse (Blake et al, 2007). This group of infants could be anticipated to be at particularly high risk of child abuse after they are born. Clearly, all pregnant women should be assessed for abuse at each prenatal care visit, and postpartum home visits should include assessment for child abuse and partner abuse. There is a significant overlap in wife abuse and child abuse, and in more than half of families where there is severe wife abuse, there is also child abuse (Humphreys and Campbell, 2010).

Elder Abuse

The World Health Organization defines **elder abuse** broadly, as "a single or repeated act or lack of appropriate action, occurring within any relationship where there is an expectation of trust which causes harm or distress to an older person" (World Health Organization, 2002, p. 29). Research findings regarding the prevalence of elder abuse vary widely, depending on the population that is studied (e.g., community-dwelling elders versus those who are institutionalized), the study methods (e.g., review of service provider and protective service records versus population-based surveys of elders themselves), and the specific

definition of elder abuse that was used in the research (Acierno et al, 2010; Mysyuk et al, 2013). Even the definition of who may be considered an “elder” is not consistent across research studies (Acierno et al, 2010) or across cultures (Mysyuk et al, 2013). Large, longitudinal national studies that describe the prevalence of elder abuse, its risk and protective factors, and its consequences to health over time are needed (Dong and Simon, 2011).

Regardless, it is clear that elder abuse is common. In a recent random-digit dial survey of 5777 community-dwelling U.S. elders at least 60 years of age, 1 in 10 reported past-year emotional, physical, or sexual mistreatment or potential neglect (i.e., an identified need for assistance that no one was addressing) (Acierno et al, 2010). Elder abuse has significant implications for public health, as it is associated with significant consequences to mental and physical health; increasing risk of physical injury; gastrointestinal, gynecological, and musculoskeletal issues; delusions, dementia, anxiety, and depression; and mortality (Daly, 2011). Elder abuse is underreported across virtually all cultures, and constitutes a violation of elders’ basic human rights (World Health Organization, 2002).

Types of Elder Abuse. Specific types of elder abuse include the following (Daly, 2011):

- *Physical abuse:* The use of physical force, potentially resulting in injury, pain, or impairment
- *Sexual abuse:* Nonconsensual sexual contact of any kind
- *Emotional abuse:* Verbal or nonverbal acts that inflict psychological anguish, pain, or distress
- *Financial or material abuse:* Illegal or improper use of the elder’s money, property, or assets
- *Neglect:* Refusing or failing to fulfill one’s obligations or duties to an elder
- *Abandonment:* Desertion by a caregiver or custodian

Perpetrators of elder abuse may include family members, caregivers in home or institutional settings, and intimate partners. In addition, “resident-to-resident” verbal, sexual, and/or physical aggression within long-term care settings has been described (Daly, 2011). Although resident-to-resident aggression may not clearly fall under the World Health Organization definition of elder abuse (which implies a trusting or caregiver relationship), this type of violence also has obvious potential for harm to vulnerable elders.

Prevention of Elder Abuse. Effectively addressing elder abuse requires the involvement of multiple sectors and disciplines. Increasing awareness and recognition of elder abuse among professionals and the public, and training of service providers, are key areas for intervention (Daly, 2011; World Health Organization, 2002), as is improving education for health professionals on management and reporting guidelines for elder abuse (Dong and Simon, 2011).

Screening for Elder Abuse. The U.S. Preventive Services Task Force (USPSTF) has recommended that clinicians routinely screen all women of childbearing age for IPV. In the same report, the USPSTF concluded that there is insufficient evidence to support universal screening of elders for abuse. However, the Task Force also noted that elder abuse is both common and underreported, suggesting potential benefits for universal

screening, and that the existing evidence regarding the lack of harm resulting from IPV screening suggests that screening for elder abuse may also represent a small risk of harm (U.S. Preventive Services Task Force, 2013). More research is needed in this area. In the absence of support for universal screening, evidence-based guidelines for nurses published in 2010 indicate that certain groups of elders are particularly likely to benefit from assessment for abuse or risk for abuse (Daly, 2011). More recently, a systematic review of studies of community-dwelling elders by Johannesen and LoGiudice (2013) suggested that living with others (versus living alone) was correlated with overall abuse but not financial abuse; this may be another factor that warrants added attention to risk assessment.

For nurses, in-depth evidence-based guidelines for the prevention of elder abuse and numerous risk assessment tools for elder abuse are available from the University of Iowa College of Nursing’s Hartford/Csomay Center for Geriatric Nursing Excellence. See, www.nursing.uiowa.edu/hartford. If a nurse is working with an elder and abuse or risk of abuse is identified, the nurse should create an individualized plan of care and service, using such evidence-based practice guidelines. To be effective, these plans should focus on both the elder and their caregiver (Daly, 2011).

Nurses also can play a key role in facilitating primary and secondary prevention interventions. More research is needed regarding the effectiveness of such interventions, including evaluation of outcomes related to mandatory reporting laws. However, evidence to date suggests that there are a number of promising interventions, including educational programs (for elders, the general public, care providers including nursing assistants, or for mandatory reporters), home visitation, caregiver skill-building, counseling or social support interventions, respite care, and batterer intervention (for intimate partners who are violent) (U.S. Preventive Services Task Force, 2013; Daly, 2011). Nurses can also play a role in advocating for vulnerable elders with policy makers, working to ensure adequate funding of state and federal legislation that addresses elder abuse; in the United States these include the Older American Act, the Violence Against Women Act, and the Elder Justice Act (Dong and Simon, 2011).

NURSING INTERVENTIONS

Primary Prevention

A community approach is essential to prevent violence and human abuse. Public health nurses can help the community in the following areas.

First, the community can take a stand against violence and make sure their elected officials and the local media consider nonviolence a priority. Public education programs can educate communities about various forms of violence and ways to get help and intervene (Campbell and Manganello, 2006; Post et al, 2010). Nurses, as community advocates, should be integral in this process. In the legislative arena, laws are needed to outlaw physical punishment in schools and marital rape. Nurses can become involved with faith-based communities and schools to implement and evaluate prevention programs aimed at

decreasing violence. Policies for the various kinds of abuse should become standardized (Miller, 2005).

Strong community sanctions against violence in the home can reduce abuse levels (Sullivan et al, 2005). Neighbors can watch what is happening and work together to address problems in other families; this is not an invasion of privacy but a sign of community cohesiveness. Nurses can work with advocacy groups to make sure law enforcement personnel deal with assault within marriage as swiftly, surely, and severely as assault between strangers (Stover et al, 2010). Nurses can encourage others to intervene when they witness children beaten in a grocery store, notice that an older adult is not being properly cared for, see a neighborhood bully beat up his or her classmates, or hear a neighbor hitting his wife.

QSEN FOCUS ON QUALITY AND SAFETY EDUCATION FOR NURSES

Quality and Safety Focus

Targeted Competency: Teamwork and Collaboration—Function effectively within nursing and interprofessional teams, fostering open communication, mutual respect, and shared decision making to achieve quality client care.

Important aspects of teamwork and collaboration include:

- **Knowledge:** Recognize contributions of other individuals and groups in helping client/family achieve health goals
- **Skills:** Assume role of team member or leader, based on the situation
- **Attitudes:** Respect the unique attributes that members bring to a team, including variations in professional orientations and accountabilities

Teamwork and Collaboration Question

If you learned, after careful assessment of your community, that family violence is a significant community health problem, what plan of action could you take to intervene? Remember that the goal is to promote health. Are there other individuals in the community whose collaboration you could enlist? Might there be insights and assistance that could be offered by leaders in church organizations, educators in schools, primary care providers, or social workers? Outline a plan of action with objectives, timetables, implementation strategies, and evaluation plans for intervening in family violence in your community. Include the unique contributions of other team members.

Prepared by: Gail Armstrong, PhD®, DNP, ACNS-BC, CNE, Associate Professor, University of Colorado Denver College of Nursing.

Second, people can take measures to reduce their vulnerability to violence by improving the physical security of their homes and learning personal defense measures. Nurses can encourage people to keep windows and doors locked, trim shrubs around their homes, and keep lights on during high-crime periods. Many neighborhoods organize crime watch programs and post signs to that effect. One sign, often posted in a window, shows a hand and indicates that people in this home will assist children who need help. Also, many neighbors informally agree to monitor one another's property and safety, and many law enforcement agencies evaluate homes for security and teach individual or neighborhood safety programs.

Unfortunately, handguns are far more likely to kill family members than intruders (Hahn et al, 2005). Firearm accidents are a leading cause of death for young children, and handguns

kept in the home are easy to use when people are either depressed or very angry. A handgun is used in the majority of homicides between family members and in most suicides. Nursing assessments should include a question about guns kept in the home. The family should be made aware of the risk that a handgun holds for family members. If the family thinks that keeping a gun is necessary, safety measures should be taught, such as keeping the gun unloaded and in a locked compartment, keeping the ammunition separate from the gun and also locked away, and teaching children about the dangers of firearms. Lobbying for handgun control laws is a primary prevention effort that can significantly decrease the rate of death and serious injury caused by handguns in the United States.

Assessment for Risk Factors

Identification of risk factors is an important component of primary prevention. Although abuse cannot be predicted with certainty, several factors influence the onset and support the continuation of abusive patterns. Nurses can identify potential victims of abuse because they care for clients in a variety of settings. Factors to include in an assessment for individual or family violence, or the potential for family violence, are identified in Figure 38-1. Both individual and familial factors must be assessed within the context of the larger community (Straus et al, 2009). Factors that must be included are found in Box 38-2.

BOX 38-2 Assessing for Violence in a Community Context

Individual Factors

- Signs of physical abuse (e.g., abrasions, contusions, burns)
- Physical symptoms related to emotional distress
- Developmental and behavioral difficulties
- Presence of physical disability
- Social isolation
- Decreased role performance within the family, and in job- or school-related activities
- Mental health problems such as depression, low self-esteem, and anxiety
- Fear of intimate others
- Substance abuse

Familial Factors

- Economic stressors
- Presence of some form of family violence
- Poor communication
- Problems with child rearing
- Lack of family cohesion
- Recurrent familial conflict
- Lack of social support networks
- Poor social integration into the community
- Multiple changes of residence
- Access to guns
- Homelessness

Community Characteristics

- High crime rate
- High levels of unemployment
- Lack of neighborhood resources and support systems
- Lack of community cohesiveness

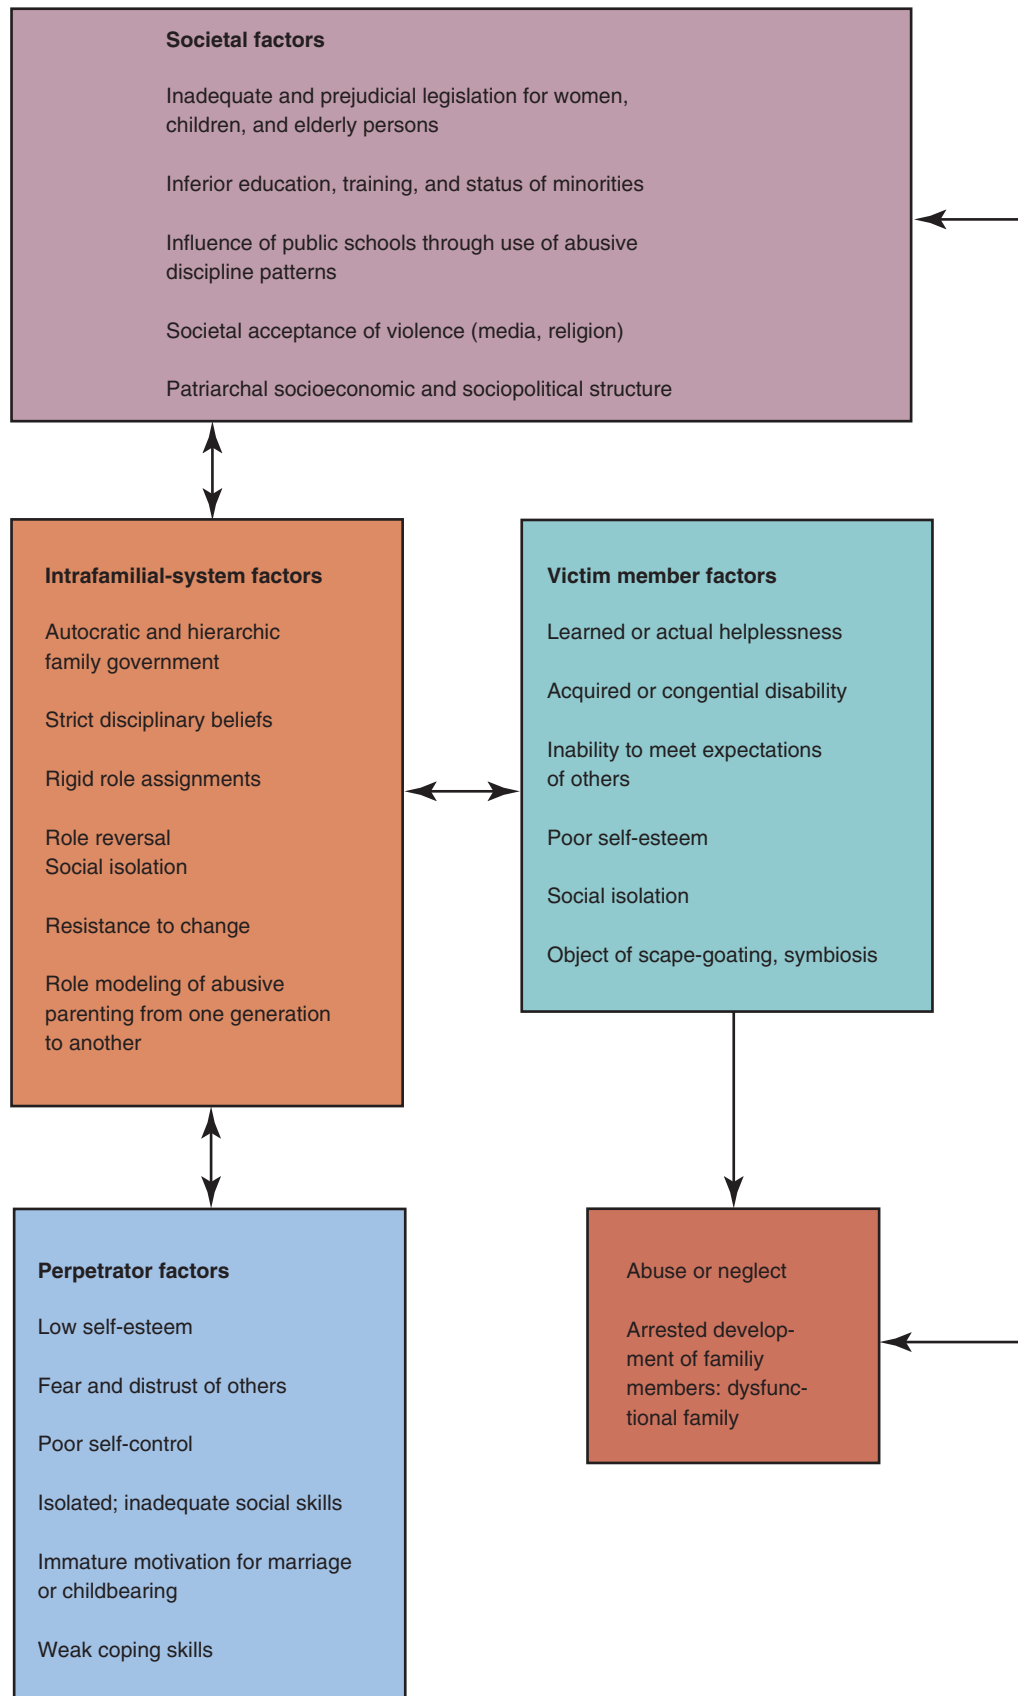

FIG 38-1 Factors to include when assessing an individual's or a family's potential for violence.

BOX 38-3 Prevention Strategies for Violence

Individual and Family Levels

- Provide education on developmental stages and needs of children (primary).
- Teach parenting techniques (primary).
- Teach stress-reduction techniques (primary).
- Provide assessment during routine examination (secondary).
- Assess for marital discord (secondary).
- Provide counseling for at-risk parents (secondary).
- Encourage assistance with controlling anger (secondary).
- Provide treatment for substance abuse (tertiary).

Community Level

- Develop policy.
- Conduct community resource mapping.
- Collaborate with community to develop systemic response to violence.
- Develop media campaign.
- Develop resources such as transition housing and shelters.

Individual and Family Strategies for Primary Prevention

Primary prevention of violence can take place through community, family, and individual interventions (Box 38-3). Nurses, in their work with schools, community groups, employee groups, daycare centers, and other community institutions, can foster healthy developmental patterns and identify signs of potential abuse. For example, nurses may take part in media campaigns that identify risk factors for abuse. Nurses can lead in developing after-school programs and late-night programs that support young people to work toward positive goals and to develop a constructive support network. These primary prevention efforts should be broad-based, to include vulnerable youth populations such as sexual minorities, that is, a group whose sexual orientation and practices are different from the majority in a given society (Walters et al, 2013). Nurses can identify community needs and resources by capacity mapping. The identification of strengths and weaknesses can assist in determining future goals and needed interventions for the good of the community.

Primary prevention of abuse includes strengthening individuals and families so they can cope more effectively with multiple life stressors and demands, and mitigating the risk factors in the community that increase the risk of violence. Providing support and psychological enrichment to at-risk individuals and families often prevents the onset of health disruption. For example, nurses can strengthen and teach parenting abilities. A class, clinic, or home visiting services can include basic skills such as diapering, feeding, quieting, and even holding and rocking. Parents also need to learn acceptable and effective ways to discipline children so that limits are maintained without causing the child emotional or physical harm. The Nurse–Family Partnership model of professional nurse home visitation for at-risk pregnant women has been shown to significantly reduce the risk of child abuse and is being adapted to work toward primary and secondary prevention of IPV (Niolon et al, 2009).

Mutual support groups are valuable for new parents, families of children with special needs, or abused people themselves. Such groups have variable formats and can provide information, support, and encouragement to facilitate positive outcomes. Nurses can help establish such groups, refer clients, or serve as group leaders. Chapter 16 describes the role of the nurse in working with community groups.

LEVELS OF PREVENTION

Violence

Primary Prevention

Strengthen individual and family by teaching parenting skills.

Secondary Prevention

Reduce or end abuse by early screening; teach families how to deal with stress and how to have fun and enjoy recreation.

Tertiary Prevention

When signs of abuse are evident, refer client to appropriate community organizations.

Secondary Prevention

When abuse occurs, nurses can initiate measures to reduce or end further abuse. Both developmental and situational crises present opportunities for abusive situations to develop. On a community level, nurses must form collaborative relationships to provide health services for battered women (McFarlane et al, 2005). There is a critical lack of appropriate services and resources available for many violence survivors, such as LGBT persons (Walters et al, 2013); nurses are key change agents in reaching vulnerable subpopulations. Researchers must work effectively with community agencies to use current research to screen for domestic violence and to use model treatments that have a positive effect on decreasing domestic violence (Humphreys and Campbell, 2010).

Nurses can be primary leaders in the development of screening practices in the health care arena (Higgins and Hawkins, 2005). The development of training programs for health care providers can be an effective step in identifying and treating victims of violence. Nurses can work closely with domestic violence shelters in identifying the needs of individuals who seek sanctuary from abusive situations.

On a family level, nursing intervention can help family members discuss problems and seek ways to deal with the tension that led to the abusive situations. Injured persons must be temporarily or permanently placed in a safe location. Secondary preventive measures are most useful when potential abusers recognize their tendency to be abusive and seek help. For children, there is often a need for 24-hour child protection services or caregivers who can take care of the child until the acute family or individual crisis is resolved. Respite care is extremely important in families with frail older adult family members. Telephone crisis lines can be used to provide immediate emergency assistance to families.

Effective communication with abusive families is important. Typically, these families do not want to discuss their problems and many are embarrassed to be involved in an abusive situation. Often a lot of guilt is involved. Effective communication must be preceded by an attitude of acceptance. It is often difficult for nurses to value the worth of an individual who willfully abuses another. The behavior, not the person, must be condemned.

In addition, families do not always know how to have fun. Nurses can assess how much recreation is integrated into the family's lifestyle. Through community assessment, nurses know what resources and facilities are available and how much they cost. Families may need counseling about the value of recreation and play in reducing tension and appropriately channeling aggressive impulses.

Tertiary Prevention: Therapeutic Intervention with Abusive Families

Although it may be difficult for abusive families to form trusting relationships with health care providers, nurses can act as a case manager, coordinating the other agencies and activities involved. Principles of giving care to families who are experiencing violence include the following:

- Intolerance for violence
- Respect and caring for all family members
- Safety as the first priority
- Absolute honesty
- Empowerment

Nurses must clearly indicate that any further violence, degradation, and exploitation of family members will not be tolerated, and that all family members are respected, valued human beings. However, everyone must understand that the safety of every family member is the first priority.

Abusers often fear they will be condemned for their actions, making it difficult to maintain contact with abusive families. Although nurses convey an attitude of caring and concern for them, families may doubt the sincerity of this concern. They may avoid being home at the scheduled visit time out of fear of the consequences of the visit or an inability to believe that anyone really wants to help them. If the victim is a child, parents may fear that the nurse will try to remove the child.

Nurses are mandatory reporters of child abuse, even when only suspected, in all states. They are also mandatory reporters of elder abuse and abuse of other physically and cognitively dependent adults as well as of felony assaults on anyone in most states. The mandatory reporting laws also protect reporters from legal action on cases that are never substantiated. Even so, physicians and nurses are sometimes reluctant to report abuse. They may be more willing to report abuse in a poor family than in a middle-class one, or they may think that an older adult or child is better off at home than in a nursing home or foster home. Referral to protective service agencies should be viewed as enlisting another source of help, rather than as an automatic step toward removal of the victim or criminal justice action. This same attitude can be communicated to families, so that reporting is done with families rather than without their knowledge and prior input. Absolute honesty about what will be

reported to officials, what the family can expect, what the nurse is entering into records, and what the nurse is feeling is essential.

To further empower the family, the nurse needs to recognize and capitalize on the violent family's strengths, as well as to assess and deal with its difficulties. The nurse must use a nurse-family partnership rather than a paternalistic or authoritarian approach. Families can often generate many of their own solutions, which tend to be more culturally appropriate and individualized than those the nurse generates. Victims of direct attack need information about their options and resources, and they need reassurance that abuse is unfortunately rather common and that they are not alone in their dilemma. They also need reassurance that their responses are normal and that they do not deserve to be abused. Continued support for their decisions must be coupled with nursing actions to ensure their safety.

Nursing Actions

The nurse can meet the family's therapeutic needs in a variety of ways. Besides referral to appropriate community agencies, nurses can act as role models for the family. During clinic and home visits, nurses can demonstrate constructive adult-child interactions. Nurses often teach mothers childcare skills such as proper feeding, calming a fretful child, effective discipline, and constructive communication.

Nurses can demonstrate good communication skills and discipline by teaching both parents and children in a calm, respectful, and informative manner. Caregivers, especially those caring for children, people with special needs, or older adults, may need to learn age-appropriate expectations. It is unreasonable to expect a 14-month-old infant to differentiate between right and wrong. Children at this age do not deliberately annoy caregivers by breaking delicate pieces of china. Likewise, a person with poor sphincter control does not willingly soil clothes or bedding.

Role modeling can be used with abuse victims of all ages. When providing nursing care to abused spouses or to older adults, nurses can demonstrate communication skills, conflict resolution, and skill training. For example, adult children often become abusive toward their older parents when they become frustrated in trying to care for them. During home visits, nurses can show how to physically and psychologically care for the relative. The nurse can work with caregivers to help them develop approaches that are acceptable to the individual older adult. Assessment, creativity, and critical thinking help the nurse, family, and client learn how to meet client and family needs without causing undue stress and frustration.

Working with abusers and victims of abuse can be emotionally intensive and physically draining. Abusers present difficult clinical challenges because they are often reluctant to seek help or to remain actively involved in the helping process.

Referral is an important part of tertiary prevention. Nurses should know about available community resources for abuse victims and perpetrators. Some of these resources are listed in [Box 38-4](#). If community attitudes and resources are inadequate, it is often helpful to work with local radio and television stations

BOX 38-4 Common Community Services

- Child protective services
- Child abuse prevention programs
- Adult protective services
- Parents Anonymous
- Domestic violence shelters
- Programs for children of battered women
- Community support groups
- 24-hour hotline
- Legal advocacy or information
- State/county coalition against domestic violence
- Batterer treatment
- Victim assistance programs
- Sexual assault programs
- Transition housing

and newspapers to provide information about the nature and extent of human abuse as a community health problem. This also helps to acquaint people with available services and resources. Frequently, people do not seek services early in an abusive situation because they simply do not know what is available to them. Ideally, a program or plan for abused people begins with a needs assessment to identify potential clients and to determine how to effectively serve this group. Nurses can help to get programs started and provide public education.

Nursing Interventions Specific to Female Partner Abuse

Women in abusive relationships may seek care for injuries in an emergency setting, a physician's office, or a prenatal clinic. These women may be seeking assistance for injuries sustained during physically abusive episodes (McFarlane et al, 2005), but more often they are in the health care system for other health problems. Despite the overall prevalence of battering and its resultant physical and emotional health problems for women, health professionals, even those working in emergency departments, often fail to identify abused women. Some health care professionals are perceived as paternalistic, judgmental, insensitive, and less effective and helpful than they could be (Alhusen et al, 2010).

Because of the stigma and unease involved, women and health care providers may hesitate to initiate discussion about abuse. However, the majority of battered women claim they would have liked to talk about the issue with a health care professional if they were asked (Higgins and Hawkins, 2005). Because abuse develops slowly, starting with minor psychological abuse and building to more severe physical incidents, victims and health care providers alike may not recognize the abuse until a severe episode occurs.

The quality of health care that a battered woman receives often determines whether she follows through with referrals to legal, social service, and health care agencies. The emergency department is the point of entry for many women in abusive relationships. Care in the emergency department is often fragmented and necessarily oriented toward addressing the most acute illness or injury. Therefore, women may not be adequately

assessed and often receive little or no support or referral to services to assist in dealing with the abuse. A cycle persists in which women seek care and receive either no interventions or ineffective interventions. This cycle perpetuates feelings of anger and inadequacy in health care providers, resulting in blame placed on women for their lack of compliance with remedies offered.

Managed care and clinic settings may be the best places to routinely screen for domestic violence. Ideally a clinical nurse specialist who is an expert in screening for IPV should be available to coordinate efforts in the different health care settings. If battered women can be identified, perhaps effective interventions can be provided that will prevent the kind of serious injury that later results in emergency department visits or even a homicide.

However, some battered women hesitate to identify themselves as victims of domestic violence for several reasons. They may fear that revelation will further jeopardize their safety by increasing the violence, and they may also think that it will increase their sense of shame and humiliation. In addition, the nature of the systems in which victims of violence introduce themselves can be barriers. Emergency departments, clinics, managed care settings, and health departments are busy places. Staff members work hard to maintain the functioning of these facilities. Sometimes it is difficult in such chaotic settings for staff members to realize their importance as the first or only health provider to recognize violence in their clients' lives, and that women need them to take the time to deal with this issue (Straus et al, 2009).

Studies have found that only a small percentage of battered women in emergency departments and other health care settings were identified as such and treated for the abuse, despite the significant prevalence (Furniss et al, 2007). Battered women present for treatment in a number of ways, including physical complaints (such as inability to sleep or chronic pain) related to the chronic stress of living in an abusive situation or to old injuries. They may be unaware of the relationship of their symptoms to the violence in their lives. Therefore, professional nursing organizations (American Nurses Association, Emergency Nurses Association, Association of Women's Health, Obstetric and Neonatal Nurses, American College of Nurse-Midwives) recommend that all women be routinely screened for domestic violence each time they come to a health care setting. For the battered woman and the staff to begin to make the connection between her life situation and the presenting complaints, the nurse needs to ask direct questions in a supportive, open, and concerned manner (Straus et al, 2009). Computerized inquiry is also effective in identifying abused women in health care settings (Trautman et al, 2007).

Assessment. Assessment for all forms of violence against women should therefore take place for all women entering the health care system. The assessment should be ongoing and confidential. A thorough assessment gathers information on physical, emotional, and sexual trauma from violence, risk for future abuse, cultural background and beliefs, perceptions of the woman's relationships with others, and stated needs. Conduct the assessment in private and direct other adults who are present

to the waiting area and tell them that it is policy that initially women are seen alone. Women should be asked directly if they were in an abusive relationship as a child or are currently in an abusive relationship as an adult. They should also be asked whether they have ever been forced into sex. Shame and fear often make disclosure difficult. Verbal acknowledgment of the situation and emotional and physical support assist women in talking about past or current circumstances (Humphreys and Campbell, 2010).

Women can be categorized into three groups: no, low, or moderate to high risk. Women with no signs of current or past abuse are considered at no risk. However, every future visit should include questioning a woman about whether there have been any changes in her life or whether she has additional information or questions about topics discussed at previous visits. If there is a new intimate partner in her life, she should again be screened for abuse. The Abuse Assessment Screen (AAS) is a four-question screen that has been successfully used in almost every kind of health care setting and can be downloaded from the Nursing Network on Violence Against Women International (NNVAWI) website (<http://www.nnvawi.org>).

Women at low risk show no evidence of recent or current abuse. Education that helps a woman gain perspective on her situation and her needs should be discussed. Resource materials including group and individual formats can be suggested. The risk level should be recorded and preventive measures and teaching should be documented.

Assessment of moderate to high risk includes evaluation of a woman's fear of both psychological and physical abuse. Lethality potential should be assessed (Campbell et al, 2009) and can be done with the Danger Assessment, also available at the NNVAWI website. Risk factors for lethality include behaviors such as stalking or frequent harassment, threats or an escalation of threats, use of weapons or threats with weapons, excessive control and jealousy, and forced sex. Statements from an abuser such as "If I can't have you, no one can" should be taken seriously. In all cases, a history of abuse and alcohol and drug use should be collected and carefully documented. The determined risk level should also be documented along with any past or present physical evidence of abuse from prior or current assault; this evidence should be photographed, shown on a body map, or described narratively. It is important that the assailant be identified in the record; this can take the form of either quotes from the woman or subjective information. These records can be very important for women in future assault or child custody cases, even if the woman is not ready to make a police report at the present time.

Immediate care for a woman in a potentially harmful or present abusive situation involves the development of a safety plan. A woman can be assisted to look at the options available to her (Dienemann et al, 2009). Discuss shelter information, access to counseling, and legal resources. If a woman wants to return to her partner, she can be helped in the development of plans that can be carried out if the abuse continues or becomes more serious. The Domestic Violence Abuse Survivor Assessment is an assessment tool that can help providers assist women in decision making and the identification of services to meet

needs. The assessment covers discussion about the relationship and assessment of psychosocial needs, safety and danger issues, speaking with children, and issues of substance abuse. The assessment can be found at the NNVAWI website.

Whenever there is evidence of sexual assault within the prior 24 to 48 hours, a rape kit examination should be performed. Lists of resources such as rape crisis clinics and support groups for survivors of physical and emotional abuse should be made available.

Prevention. Prevention, public policy, and social attitudes are intertwined. Our society has taken a major step toward the secondary prevention of abuse through the establishment of programs that encourage women and children to speak about their experiences. Nurses need to support these programs further by supporting individuals and families confronted with violence. In the development of laws that punish perpetrators of child and women abuse, society has given some support to the victims of abuse. Often, however, the victims are again victimized by disbelief of their experiences, a devaluing of the effects of these assaults, and a focus on assisting the perpetrators of the crimes. Primary prevention includes a social attitudinal change. Both girls and boys need to be taught human values of interdependence, respect for human life, and a commitment to empathy and strength in the development of the human species regardless of sex, race, or socioeconomic status. We must urge continued progress toward eliminating the feminization of poverty and ensuring gender parity in economic resources. In addition, local communities must make it clear that violence against women is not tolerated by eliminating pornography, mandating arrests of abusers, and creating a general climate of nonviolence.

Abused women need assistance in making decisions and taking control of their lives. Public health nurses, prenatal nurses, Planned Parenthood, primary care, and emergency department nurses are involved with women when they can be screened for the presence or absence of abuse. There are mechanisms for routinely asking women who are either abused or at risk for abuse (Higgins and Hawkins, 2005; Dienemann et al, 2009). To intervene effectively, nurses must understand abuse as a cumulative process that must be examined as a continuum within the context of a relationship. During this process, the abuse, the relationship, and a woman's view of changes within herself require time-specific interventions. Women are often blamed and held responsible for the abuse inflicted on them by their male partners (Weaver et al, 2007; Copel, 2008; Saito et al, 2009; Ting and Panchanadeswaran, 2009). When this happens, either they are assisted in a way that discounts their feelings and further devalues them, or the abuse is ignored.

Strategies for Addressing Education for Health Professionals.

Various strategies have been reported that address the knowledge deficit of health practitioners on abuse issues. The National March of Dimes Birth Defects Foundation has sponsored a variety of training sessions for health professionals and produced an excellent training manual that addresses violence against women and battering during pregnancy (McFarlane and Parker, 2005). The program covers the assessment and planning of interventions to assist pregnant women in abusive relationships.

More and more nursing programs are implementing courses on how to intervene with IPV. Wallace (2009) developed and implemented a two-credit elective course focusing on attitudes, knowledge, and interventions in a structured learning environment to help nursing students acquire the expertise needed to work with women in abusive relationships. An educational program for nurses was developed in order to initiate system-wide routine inquiry in an urban health care system (Schoening et al, 2004). The program consisted of a mandatory 1-hour program for all nurses with an optional 3-hour program for nurses working in obstetrics. The program focused on the dynamics of abuse, screening procedures, and nursing interventions. The program showed an increase in positive responses to battered women for nurses involved in the 3-hour program and for nurses in the 1-hour program only if they had previous

education on abuse. Short programs with skills education as well as discussion can be a benefit to both nurses and the clients they serve.

Nurses are also joining in community-based efforts to prevent and intervene with IPV and child abuse. Nurses work in public health collaborating with shelters for women, community mental health centers, criminal justice and advocacy institutions, and community-based health care. Bloom and colleagues (2009) developed a program to assist Latinas experiencing IPV. The program was developed specifically for the cultural and linguistic needs of the population. Emphasis was placed on assisting the Hispanic community in developing the knowledge and background to deal with the issue. At the same time, community efforts focused on expanding the knowledge base of the community at large about IPV.

PRACTICE APPLICATION

Mrs. Smith, a 75-year-old bedridden woman, became consistently rude and combative when her daughter Mary attempted to bathe her and change her clothes each morning. During a home visit, Mary told the nurse, Mrs. Jones, that she had become so frustrated with her mother on the previous morning that she had hit her. Mary felt terrible about her behavior. She stressed that her mother's incontinence made it essential that she be kept

clean; her clothes had to be changed every day for her own safety and physical well-being.

- A. How should Mrs. Jones respond to this disclosure?
- B. What specific nursing actions should be taken?
- C. What ongoing services does the nurse need to provide?

Answers can be found on the Evolve site.

KEY POINTS

- Violence and human abuse are not new phenomena, but they have increasingly become community health concerns.
- Communities throughout the United States are angry and frustrated about increasing levels of violence.
- Nurses can evaluate and intervene in incidents of community and family violence; to intervene effectively, the nurse must understand the dynamics of violence and human abuse.
- Factors influencing social and community violence include changing social conditions, economic conditions, population density, community facilities, and institutions within a community, such as organized religion, education, the mass communication media, and work.
- The potential for violence against individuals or against oneself is directly related to the level of violence in the community. Identification and correction of factors affecting the level of violence in the community constitute one way of reducing violence against family members and other individuals.
- Violence and abuse of family members can happen to any family member: spouse, older adult, child, or developmentally disabled person.
- People who abuse family members were often themselves abused and react poorly to real or perceived crises. Other factors that characterize the abuser are the way the person was raised and the unique character of that person.
- Child abuse can be physical, emotional, or sexual. Incest is a common and particularly destructive form of child abuse.
- Spouse abuse is usually wife abuse. It involves physical, emotional, and, frequently, sexual abuse within a context of coercive control. It usually increases in severity and frequency and can escalate to homicide of either partner.
- Nurses are in an excellent position to identify potential victims of family abuse because they see clients in a variety of settings, such as schools, businesses, homes, and clinics. Treatment of family abuse includes primary, secondary, and tertiary prevention and therapeutic intervention.

CLINICAL DECISION-MAKING ACTIVITIES

1. For 1 week, keep a log or diary related to violence.
 - A. Make a note of each time you feel as though you are losing your temper. Consider what it might take to cause you to react in a violent way.
 - B. Think back. When was the last time you had a violent outburst? What precipitated it? What were your thoughts? What were your feelings? How might you have handled

the situation or those feelings without reacting in a violent way?

- C. During this same week, make note of the episodes of violent behaviors you observe. For example, do parents hit children in the supermarket? What seems to precipitate such outbursts? What alternatives might exist for reacting in a less violent way?

CLINICAL DECISION-MAKING ACTIVITIES—cont'd

2. If you learned, after a careful assessment of your community, that family violence is a significant community health problem, what plan of action might you take to intervene? Remember that the goal is to promote health. Outline a plan of action with objectives, timetables, implementation strategies, and evaluation plans for intervening in family violence in your community.
3. Complete a partial community assessment to determine the actual incidence and types of violence in your community.
4. What resources are available in your community for victims of violence? Interview a person who works in an agency that seeks to aid victims of violence. What is the role of the agency? Do its services seem adequate? Who is eligible? Is there a waiting list? What is the fee scale?
5. Cut out all stories about violence that you find in your local newspaper every day for 2 weeks. Note the patterns. Is the majority of the violence perpetrated by strangers or family members? How are the victims portrayed? What kinds of families are involved? What kinds of stories and families get front-page treatment rather than a few lines in the back of the paper?

Nurses' Roles and Functions in the Community

At one time, the role of the public health nurse was primarily visiting clients at home and identifying cases of communicable disease. Over the decades, the role has become complex and now involves population-centered practice. The role of the community-based nurse focuses on improving the health of individuals and families through the delivery of personal health services, with an emphasis on primary prevention, health promotion, and health protection. Community-oriented, or population-focused, nursing practice emphasizes the delivery of services and interventions aimed at improving health and protecting entire populations from illness, disease, and injury. As the health care system has changed, the need for a comprehensive, population-focused public health system has become more evident. Nurses are able to provide care to individuals, families, and populations including aggregates and communities in a variety of settings and roles.

With increasing emphasis being placed on the community as the client, nurses recognize that to address community health issues, they must be able to meet the needs of the individuals, families, and groups that are the nucleus of the community. In recent decades, the primary practice setting for the nurse was the hospital, but now nurses are caring for clients in many settings. Regardless of the type of client, practice setting, specialty area of practice, or the functional role of the nurse, nurses act as advocates for clients in meeting their needs through the health care system.

This section discusses the roles of manager, consultant, clinical nurse specialist, and nurse practitioner, with particular emphasis on the development of the advocacy role in population-centered practice. Throughout the text, content is applicable to a variety of practice settings, including the more traditional public health practice areas such as the health department. A few other practice settings with close association to population-centered nursing have been highlighted, such as school health, occupational health, home health/hospice, and congregational settings. In the community setting, the field of forensics is receiving increasing attention as an area of practice for public health nurses. This area of practice is a highlight of this text.

The Advanced Practice Nurse in the Community

Kellie A. Smith, RN, EdD

Kellie A. Smith is an Assistant Professor at Thomas Jefferson University in Philadelphia, Pennsylvania, and is the coordinator of the graduate community health/public health nursing program entitled Community Systems Administration. She is a clinical nurse specialist in community health nursing. She has been involved in NIH/NIDDK (National Institute of Health/National Institute of Diabetes and Digestive and Kidney Diseases) research for type 2 diabetes prevention, the Diabetes Prevention Program. Dr. Smith was also involved with the trial's translational campaign, "Small Steps. Big Rewards," directed by The National Diabetes Education Program (NDEP). Dr. Smith has participated in health care professions' interprofessional education initiatives, including a chronic disease health mentor program. She has assisted students in community activism and philanthropy as the nursing student government faculty advisor.

OBJECTIVES

After reading this chapter, the student should be able to do the following:

1. Briefly discuss the historical development of the roles of the advanced public health nurse and the nurse practitioner.
2. Describe the educational requirements for population-focused advanced practice nurses.
3. Discuss certification/credentialing mechanisms in nursing as they relate to the role of the advanced practice nurse.
4. Compare and contrast the various role functions and practice arenas of population-focused advanced practice nurses.
5. Explore current issues and concerns related to practice.
6. Identify five stressors that may affect nurses in expanded roles.

Trends in Advanced Practice Nursing

This chapter explores the roles of the advanced practice nurse in the community. Why, one might ask, is this chapter in the text? For a few good reasons, because it is the intent to provide the bachelor of science in nursing (BSN) student with an understanding of the career opportunities that may be chosen for continuing one's education to the graduate level. For the nurse in a graduate program, this chapter provides an in-depth understanding of the role in the specialty area that has been chosen. The advanced practice nurse roles described in this chapter offer excellent choices for exciting careers, which will ensure satisfaction that a major contribution can be made to making a difference in health outcomes and improved health status of clients at all levels.

The advanced practice nurse is a licensed professional nurse prepared at the master's level or doctoral level to take leadership roles in applying the nursing process and public health sciences to achieve specific health outcomes for the community; this nurse is often referred to as an advanced public health nurse (APHN). Because both the American Nurses Association (ANA, 2013) and the Association of Community Health Nursing Educators (ACHNE, 2007) refer to this specialized role as APHN, this is the title that is used in this chapter. On the other hand, the advanced practice nurse in the community may be a **nurse practitioner** (NP). A nurse practitioner is generally a nurse with a master's or doctoral degree, who autonomously and in collaboration with health care professionals and other individuals provides a range of primary, acute, and specialty health care services (American Association of Nurse Practitioners [AANP], 2014b). The APHN and NP often work in similar settings. However, their client focuses differ. The NP's client is an individual or family, usually in a fixed setting, who has the opportunity to identify individual trends in their practices. The APHN's clients may be individuals, families, groups at risk, or communities, but the ultimate goal is the health of the community as a whole (ANA, 2013; Swider et al, 2014). The APHN always has a population focus and obtains knowledge from nursing, social, and public health sciences to achieve goals of

TABLE 39-1 How to Distinguish Similarities and Differences in Functions of Advanced Public Health Nurses and Nurse Practitioners

Function	NP Program	APHN Program
Comprehensive assessment	Always	Often
Physiology and pharmacology	Almost always	Often
Diagnosis and management	Always	Often
Systems	Individual/family focus	More systems focused
Leadership	Usually	Almost always
Program planning and evaluation	Less often	Always in community and public health
Research	Generally	Generally

Association of Community Health Nursing Educators (ACHNE): *Graduate Education for Advanced Practice in Community/Public Health Nursing: at the Crossroads*. Latham, NY, 2007, ACHNE.
 American Nurses Association (ANA): *Public Health Nursing: Scope and Standards of Practice*, ed 2. Washington, DC, 2013, ANA.

promoting and protecting the health of populations by creating conditions in which people can optimize their health (ACHNE, 2007; ANA, 2013). Table 39-1 compares the functions taught to the APHN and the NP in their educational programs.

This chapter provides a history of the educational preparation of the advanced practice nurse. Functions in advanced practice and arenas for practice are discussed. Issues and concerns, role negotiation, and areas of role stress relative to the APHN and the NP in the community are also discussed.

HISTORICAL PERSPECTIVE

Changes in the health care system and nursing have occurred in the past few decades because of a shift in societal demands

and needs. Trends that have influenced the roles of the APHN and NP include a shift from institution-based health care to population-focused health care, improvements in technology, self-care, cost-containment measures, accountability to the client, **third-party reimbursement**, and demands for making technology-related care more responsive to the client. It is anticipated that the 2010 Patient Protection and Affordable Care Act will significantly impact health care delivery to the previously uninsured and cause a need for more health care professionals and their roles (Japsen, 2013).

The **clinical nurse specialist** (CNS) role began in the early 1960s and grew out of a need to improve client care. In addition to providing direct patient care, CNSs influence care outcomes by providing expert consultation for nursing staffs and by implementing improvements in health care delivery systems (National Association of Clinical Nurse Specialists, 2014). Concurrently in the 1960s, a shortage of physicians occurred, and there was an increasing tendency among physicians to specialize. The number of physicians who might have provided medical care to communities and families across the nation was reduced. As this trend continued, a serious gap in **primary health care** services developed. Primary health care includes both public health and primary care services.

The NP movement began in 1965 at the University of Colorado, led by Dr. Loretta Ford, a nurse, and Dr. Henry Silver, a pediatrician. They determined that the morbidity among medically deprived children could be decreased by educating nurses to provide well-child care to children of all ages. Nursing practice for these pediatric nurse practitioners included the identification, assessment, and management of common acute and chronic health problems, with appropriate referral of more complex problems to physicians (Silver et al, 1967). The priorities of the nursing profession have traditionally been to care for and support the well, the worried well, and the ill, offering physical care services previously provided only by physicians. Preparing nurses as primary health care providers was responsive to society's critical need for primary health care services, including health promotion and illness prevention (Institute of Medicine, 2011).

In 1965, the physician assistant (PA) role was initiated at Duke University. This program was intended to attract former military corpsmen for training as medical extenders. Nurse practitioners are often combined into a single category with other nonphysician providers and are mistakenly portrayed as physician extenders. This misinterpretation of the intended role is addressed by one of the founders, Dr. Loretta Ford:

As conceptualized, the nurse practitioner was always intended to be a nursing model focused on the promotion of health in daily living, on growth and development of children in families, and on the prevention of disease and disability. Nursing as a discipline and a profession evolved not because there was a shortage of physicians but because of societal needs. The early plans did not include preparing nurses to assume medical functions. The interests were in health promotion and disease prevention for aggregate populations in community settings, including underserved

groups. These were the hallmarks of community-oriented nursing (Ford, 1986).

A report issued by the U.S. Department of Health, Education, and Welfare (now the U.S. Department of Health and Human Services [USDHHS]), *Extending the Scope of Nursing Practice* (1971), helped convince Congress of the value of NPs as primary health care providers. The Nurse Training Act of 1971 (PL 92-158) and the comprehensive Health Manpower Act of 1971 (PL 92-157) provided education monies for many NP and PA programs through the 1970s and into the 1980s. Similarly, in the 1970s the concept of an expanded practice role for nurses was garnering interest in Canada. The United Kingdom has increased their advanced practice nurse programs to educate and monitor the role, which has been in place for about 20 years. Graduate education for nursing is changing. In 2007 the American Association of Colleges of Nursing (AACN) called for the creation of a new nursing role, clinical nurse leader (CNL) (AACN, 2014a). The **clinical nurse leader** is defined as a nurse who is a master's degree-prepared generalist who functions at the microsystem level and assumes accountability for health care outcomes for a specific group of clients within a unit or area (Commission on Nurse Certification, 2012; Foster et al, 2011). The AACN has determined that the preferred preparation for specialty advanced practice nurses should be the doctor of nursing practice (DNP) (AACN, 2014a). In 2013, there were 241 DNP programs in the United States. A task force is in progress to uncover barriers and facilitators for schools transitioning their master's level advanced practice programs to the DNP (Kirschling, 2014).

COMPETENCIES

The Quad Council of Public Health Nursing Organizations, in 2003, developed a set of national public health competencies specific for public health nursing practice that are based on the *Core Competencies for Public Health Professionals* authored by the Council on Linkages between Academia and Public Health Practice. The core competencies were designed to serve as a starting point for academic and practice organizations to understand, assess, and meet training and workforce needs for health professionals practicing in public health; they were updated in 2011 (Quad Council, 2011). The Quad Council competencies are more specific to public health nursing and were developed to assist agencies that employ public health nurses, as well as academic settings that prepare public health nurses, to facilitate education, orientation, training, and lifelong learning (Quad Council, 2011) (see the [Linking Content to Practice box](#)). The ANA (2013) published *Public Health Nursing: Scope and Standards of Practice*, which includes population-focused standards of care in the following areas: assessment, population diagnosis and priorities, outcome identification, planning, implementation, evaluation, and standards for professional performance in ethics, education, evidence-based practice and research, quality of practice, communication, leadership, collaboration, professional practice evaluation, and resource utilization, environmental health, and advocacy. This

document is based on a collaboration between the ANA and the American Public Health Association (APHA)-Public Health Nursing Section (2013) definition and role of public health nursing practice. The second edition includes competencies that appear at the end of each of the standards of practice for the **advanced public health nurse**. For example, under Standard 1: Assessment, additional competencies for the advanced practice nurse include the following: gathers data from multiple interdisciplinary sources as well as synthesizes qualitative and quantitative data during data analysis for a comprehensive population assessment (ANA, 2013).

LINKING CONTENT TO PRACTICE

In this chapter, emphasis is placed on the role of the advanced public health nurse (APHN) in the community. The Quad Council Public Health Nursing Competencies (Quad Council, 2011) were developed by four organizations (Association of Community Health Nursing Educators, Association of State and Territorial Directors of Nursing, American Public Health Association Public Health Nursing Section, and American Nurses Association Congress on Nursing Practice and Economics). The competencies are categorized into eight domains and are applied to three tiers of public health nursing practice:

- Tier 1: Generalist public health nurses who carry out day-to-day functions in state and local public health organizations, including clinical, home visiting, and population-based services and who are not in management positions
- Tier 2: Public health nurses with an array of program implementation, management, and/or supervisory responsibilities, including responsibility for clinical services, home visiting, and community-based and population-focused programs
- Tier 3: Public health nurses at an executive/senior management level and leadership levels in public health organizations.

The domains are core areas of analytic and assessment skills, policy development/program planning, communication, cultural competency, community dimensions of practice, public health science, financial planning and management, and leadership and systems thinking skills (Quad Council, 2011). The latter tiers include a higher level mastery of skills and competencies. As an example, their fifth domain, Community Dimensions of Practice Skills, lists a tier 1 competency as: identifies community partners for PHN practice with individuals, families, and groups; a tier 2 competency as: identifies need for community involvement and partners to create community groups/coalitions; and a tier 3 competency as: establishes organizational relationships, processes, and system improvements to enhance collaboration and cooperation among stakeholders in population-focused health policies (Quad Council, 2011). The tier 2 and tier 3 competencies/skills are clearly consistent with the APHN role and are at an advanced mastery level. This is in contrast to the generalist/staff public health nurse, where the expected level of performance mastery for this domain is more at the knowledge/identification level. Thus, if an agency planned to conduct health education programs within a community, the APHN would take leadership roles in developing, implementing, and evaluating a needs assessment and interacting with community stakeholders to assist with conducting the health education programs that would be most relevant and accessible to the community.

EDUCATIONAL PREPARATION

Educational preparation for the APHN includes a minimum of a master's degree and is based on a synthesis of current knowledge and research in nursing, public health, and other scientific

disciplines. In addition to performing the functions of the generalist in population-focused nursing, the specialist possesses clinical experience in interprofessional planning, organizing, community empowerment, delivering and evaluating service, political and legislative activities, and assuming a leadership role in interventions that have a positive effect on the health of the community. ACHNE recommendations for graduate nursing education for the public health nurse specialty are guided by the report *Who Will Keep the Public Healthy?* (Institute of Medicine, 2003), the ANA's *Public Health Nursing: Scope and Standards of Practice* (2013), and the *AACN's Essentials of Doctoral Education for Advanced Practice Nursing* (2006).

The ACHNE identified five role characteristics of APHNs: (1) population-level health care focus; (2) ecological view; (3) responsibility for health outcomes for populations; (4) partnership/collaboration, using an interprofessional approach; and (5) leadership in practice. The curriculum areas for the APHN that were identified are population-centered nursing theory and practice, interprofessional practice, leadership, systems thinking, biostatistics, epidemiology, environmental health sciences, health policy and management, social and behavioral sciences, public health informatics, genomics, health communication, cultural competence, community-based participatory research, global health, policy, and law, and public health ethics. In addition to didactic content, graduate education for the APHN must include practicum experience that takes place at the population level, be grounded in the ecological perspective, and include the measurement of outcomes (ACHNE, 2007).

In contrast to the APHN, educational preparation of the NP has not always been at the graduate level. Early NP programs were continuing education certificate programs, and the baccalaureate degree was not always a requirement. At present, however, NPs are required to hold master's degrees and encouraged to obtain a practice doctorate (AACN, 2014a). The curriculum prepares NPs to perform a wide range of professional nursing functions including assessing and diagnosing, conducting physical examinations, ordering laboratory and other diagnostic tests, developing and implementing treatment plans for some acute and chronic illnesses, prescribing medications, monitoring client status, educating and counseling clients, and consulting and collaborating with and referring to other providers (American Nurses Credentialing Center [ANCC], 2014).

A 2006 AACN position statement calls for DNP education for advanced practice nurses and nurses seeking top systems/organizational roles. The eight foundational essentials for DNP programs are knowledge with a scientific underpinning, organizational and systems leadership, clinical scholarship, information systems, policy, collaboration, prevention and population health, and advanced nursing practice (AACN, 2006). Future recommendations of doctoral programs in nursing continue to be reviewed and discussed (Kirschling, 2014). The Academic Partnerships to Improve Health (APIH) is a collaborative between the AACN and the Centers for Disease Control and Prevention to help build capacity in the public health nursing workforce. This program supports faculty development in the area of population health and connects nursing students with

hands-on experiences at the community level to enhance their preparation for professional practice (AACN, 2014b).

CREDENTIALING

Certification examinations for advanced practice nurses are offered by the American Nurses Credentialing Center (ANCC). The purpose of professional certification is to confirm knowledge and expertise and provide recognition of professional achievement in a defined area of nursing. **Certification** is a means of assuring the public that nurses who claim to be competent at an advanced level have had their credentials verified through examination (ANCC, 2014). Although certification itself is not mandatory, many state boards of nursing require that nurses in advanced practice, particularly those in an NP role, be nationally certified to practice.

The American Nurses Association (ANA) began its certification program in 1973 and has offered NP certification examinations since 1976. The ANCC was opened in 1991 and offers certification in NP, advanced practice, and CNS specialty areas. Until 2009 a nurse could also be certified as a generalist or as a BSN-prepared specialist in community health. Since 1985, the basic qualifications for certification as an NP have been a baccalaureate degree in nursing and successful completion of a formal NP program. As of 1992, a master's or higher degree in nursing is required for NP certification through the ANCC. NPs are required to maintain certification by renewing every 5 years.

A number of nurse practitioner certifications are available at the ANCC. The examination topics vary, based on the specialty area (ANCC, 2014). The American Association of Nurse Practitioners (AANP) also has national competency-based certification examinations in three areas: family, adult, and adult-gerontology primary care nurse practitioners (AANP, 2014a).

The certification examination for CNS in public/community health nursing was first offered in October 1990 and required a master's or higher degree in nursing with a specialization in community/public health nursing practice. Effective in 1998, eligibility requirements included holding a master's or higher degree in nursing with a specialization in community/public health nursing or holding a baccalaureate or higher degree in nursing and a master's degree in public health with a specialization in community/public health nursing. In 2009, the ANCC Commission changed the certification examination from clinical nurse specialist in public/community health to either advanced public health nursing or public health clinical nurse specialist. However, as of December 31, 2013, these examinations are no longer available. If one already holds these certifications through examination, they may be renewed with professional development and practice hours. Effective January 1, 2014, an advanced public health nurse-board certified (APHN-BC) credential can be obtained by the "certification through portfolio assessment" method (ANCC, 2014).

To complete the portfolio assessment, one must hold a current, active RN license in a state or territory of the United States, have the equivalent of at least 2 years of full-time practice as a registered nurse, possess a graduate degree (master's, postgraduate, or doctorate) in nursing or hold a graduate degree in

public health and a bachelor's in nursing, have a minimum of 2000 practice hours in the specialty area of advanced public health nursing in the past 3 years, have completed 30 hours of continuing education in advanced public health nursing in the past 3 years, and fulfill two additional professional development categories (e.g., academic credits, presentations, publication or research, preceptor, or professional service) (ANCC, 2014).

ADVANCED PRACTICE ROLES

APNs holding a master's degree in nursing or DNP and specializing in public health nursing, in community health nursing, or as a nurse practitioner have many roles, some of which are described here. It should be noted that the "nursing role in APPHN [advanced practice public health nursing] is not distinguished by the sites at which nurses practice, but rather by the perspective, knowledge base, and principles that focus on care of populations" (ACHNE, 2007, p. 16). The APHN's role characteristics include a focus on population health such as population and community assessment; advocacy and policy setting at the organizational, community, and state levels; ecological view for large-scale program planning and project management; and leadership and partnership building. APHNs deliver population-focused services, programs, and research (ACHNE, 2007; APHA, 2013).

Clinician

Most of the differences between the roles of the APHN and the NP are seen in clinical practice. Although the APHN's practice includes nursing directed at individuals, families, and groups, the primary responsibility is to take a leadership role in the overall assessment, planning, development, coordination, and evaluation of innovative programs to meet identified community health needs. The APHN provides the direction for population-focused health care by identifying and documenting health needs and resources in a particular community and in collaborating with population-focused nurse generalists, other health professionals, and consumers (ACHNE, 2007; APHA, 2013). Practicing within the role of **clinician**, the APHN is involved in conducting community assessments; identifying needs of populations at risk; and planning, implementing, and evaluating population-focused programs to achieve health goals, including health promotion and disease prevention activities. The APHN ultimately works toward the goals of promoting and protecting the health of populations by creating conditions in which people can optimize their health (ANA, 2013; APHA, 2013).

The NP applies advanced practice nursing knowledge and physical, psychosocial, and environmental assessment skills to manage common health and illness problems of clients of all ages and both sexes. The NP's primary client is the individual and family. In the direct role of clinician, the NP assesses health risks and health and illness status, as well as the response to illness of individuals and families. The NP also diagnoses actual or potential health problems; decides on treatment plans jointly with clients; intervenes to promote health, to protect against disease, to treat illness, to manage chronic disease, and to limit

disability; and evaluates with the client and other primary care team members about how effective and comprehensive the nursing intervention may be in providing continuity of care (AACN, 2011). Despite the setting of the practice nurse practitioner, the practice can be population focused. These interventions often include community assessment and analysis, case finding, an emphasis on prevention, and participation in public policy. An advanced practice nurse in the community may work in an agency or setting where the caseload consists of individuals who present themselves for services. The APHN goal would be to identify others in the community who may be at risk and in need of the services. Outreach activities can accomplish this while also trying to accomplish the goals and objectives of *Healthy People 2020* (Box 39-1).

The ability of NPs to diagnose and treat has increased the provision of health care, teaching, and client compliance with treatment plans. The amount of physician involvement in the NP's practice is generally directed through state legislation (AANP, 2014b). Frequently, the NP will use protocols or algorithms that have been previously agreed on by the physician and the NP. These documents, required by some states, serve as standing orders for the management of certain illnesses. As of 2010, all states have passed legislation, either partial or full, granting NPs supervisory, collaborative, or independent authority to practice. Each state has differing regulatory and legislative mandates regarding NP areas of practice authority, reimbursement, and prescriptive authority (Phillips, 2014). The most up-to-date information on state nurse practitioner practices and laws is through the American Association of Nurse Practitioners (AANP) website (<http://www.aanp.org/>).

An important area for both APHNs and NPs to include in their advanced practice is health promotion/disease prevention. Within the past several decades, there has been a growing belief that the most effective way of dealing with major health problems is through prevention. This requires refocusing the health care system, identifying aggregates (populations) at risk, introducing risk reduction interventions, teaching people that they

control their own health, and encouraging health promotion and disease prevention behaviors. The goals of the Patient Protection and Affordable Care Act (PPACA, 2010), such as improvement of the individual health care experience, reduction of the cost of health, and improvement of the health of populations, create the potential for new public health nursing roles and responsibilities. Public health nurses in the community (through their assessment skills, primary care focus, and system-level perspectives) are vital to the interprofessional teams needed to ensure that all people have equitable access to high-quality care and healthy environments through health system reform (APHA, 2013). The USDHHS (2014a) develops national objectives for promoting health and preventing disease. Since 1997, this initiative, called *Healthy People*, has set and monitored national health objectives to meet a broad range of health needs, encourage collaboration across sectors, guide individuals toward making informed health decisions, as well as measure the impact of prevention activities. This campaign is essential for APHNs and NPs working toward the goal of a healthier nation. Nurses and advanced practice nurses may also use *The Guide to Clinical Preventive Services* to address health promotion and disease prevention (USDHHS/AHRQ/USPSTF, 2014). NPs and APHNs are especially involved in helping to meet the proposed objectives in the access to health services, educational and community-based programs, and public health infrastructure domains.

Population-Focused Intervention

The following example illustrates a population-focused intervention. An APHN was recently hired at a community hospital in the hospital's community health department. Traditionally, this department provided excellent health education and screening programs to individuals in the surrounding communities. However, outreach activities did not occur. After reviewing the data on attendance at community health events, the APHN developed and implemented a needs assessment in three neighboring communities not attending the events. In one neighborhood, consisting of 1800 apartments, 85% of the population was middle-income African Americans of all ages. The needs assessment revealed a strong interest in health promotion and disease prevention but nevertheless a lack of participation. The APHN developed a collaborative relationship with churches and community groups in the neighborhood. Health fairs and events were initiated (see the *Levels of Prevention* box).

Educator

Nurses in advanced practice function in several indirect nursing care roles, including that of educator. The role of the APHN and NP includes health education within a nursing framework (as opposed to health educators, who may not have a nursing background) and professional nurse educator (faculty) roles.

The APHN identifies groups at risk within a community and implements, for example, health education interventions. The APHN and NP increase wellness and contribute to maintaining and promoting health by teaching the importance of good nutrition, physical exercise, stress management, and a healthy lifestyle. They provide education about disease processes and

BOX 39-1 Example of a *Healthy People 2020* Objective and Selected Advanced Practice Nursing Activities

Objective

- Under Mental Health (objective MHMD-1): Reduce suicide rate to no more than 10.2 suicide deaths per 100,000 people.

Activities

- Review recent literature and epidemiology of suicide.
- Provide in-service education programs to groups of health professionals related to groups at risk for suicide and related assessment and screening tools for early detection and treatment of depression.
- Become active in legislation activities related to firearm access.
- Assess individual clients for depression and suicide risk.

U.S. Department of Health and Human Services (USDHHS): *Healthy People 2020*. Washington, DC, 2014a, U.S. Government Printing Office. Retrieved March 2015 from <http://www.healthypeople.gov/>

LEVELS OF PREVENTION

Population-Focused APHN Activities

Primary Prevention

- Flu immunizations at churches
- Classes on breast self-examination
- Education on the need for early detection of breast cancer

Secondary Prevention

- “Men’s Night Out” event with screenings for blood pressure and cholesterol (at neighborhood sites)
- Health fair at neighborhood sites with screenings

Tertiary Prevention

- Identified need and follow-up at clinics for groups with chronic diseases (diabetes, cancer, hypertension)

the importance of following treatment regimens. In addition, they provide anticipatory guidance and educate clients on the use of medications, diet, birth control methods, and other therapeutic procedures (ACHNE, 2007; ANA, 2013; APHA, 2013). They also counsel clients, families, groups, and the community on the importance of assuming responsibility for their own health. This education may occur on an individual, family, or group level, in an institutional, ambulatory, or home setting, or it may occur in the community with vulnerable at-risk populations.

As professional nurse educators, the APHN and NP provide formal and informal teaching of staff nurses and undergraduate and graduate students in nursing and other disciplines (Figure 39-1). They also serve as role models by instructing (or being a preceptor to) students in advanced practice in the clinical setting.

Administrator

The APHN and NP may function in administrative roles. As a health administrator, they may be responsible for all

administrative matters within an agency setting. They may be responsible for and have direct or indirect authority and supervision over the organization’s staff and client care. In this capacity, nurses in advanced practice serve as decision-makers and problem solvers. They may also be involved in other business and management aspects such as supporting and managing personnel; budgeting; establishing quality control mechanisms; and program planning and influencing policies, public relations, and marketing (ACHNE, 2007; Drennan, 2012; Quad Council, 2011).

Consultant

Consultation is an important part of practice for APHNs and NPs. The consultant problem-solves with an individual, family, or community to improve health care delivery. Steps of the consultation process include assessing the problem, determining the availability and feasibility of resources, proposing solutions, and assisting with implementing a solution, if appropriate (AACN, 2011; APHA, 2013). The APHN and NP may serve as a formal or informal consultant to other nurses, providing them with information on improving client care. They may also consult with physicians and other health care providers or with organizations or schools to improve the health care of clients. For example, nurse consultants are often used at the district or state level of public health departments. APHNs and NPs work closely with nurse supervisors, other nurse practitioners, and staff public health nurses to develop programs and improve the services provided to clients at clinics and in the home. Nurse consultants in the public health arena may work with all other public health nurses or may work in departments as members of an interprofessional team such as maternal–child health, chronic diseases, or family planning (University of Michigan Center of Excellence, 2013).

Researcher

Improvement in nursing practice depends on the commitment of nurses to developing and refining knowledge through research. Practicing APHNs and NPs are in ideal positions to identify researchable nursing problems related to the communities they serve. They can apply their research findings to the community health practice setting.

All APHNs and most NPs are trained in the research process and, as researchers, can conduct their own investigations and collaborate with doctorate-prepared nurses, answering questions related to nursing practice and primary health care. The acts of identifying, defining, and investigating clinical nursing problems and reporting findings encourages peer relationships with other professions and contributes to health care policy and decision making (Harne-Britner and Schafer, 2009). For example, APHNs in administrative, consultant, or practitioner roles encounter situations daily that need further investigating (e.g., noncompliance with certain public health regimens or immunization schedules). They may, anecdotally or through needs assessments, identify a trend that, if examined, could be dealt with through population-based strategies (see the Evidence-Based Practice box). APHNs and NPs may collaborate with population-focused nurses at all levels to develop the

FIG 39-1 An advanced practice public health nurse leads a training session for a group of congregational nurses.

research design, collect and analyze the data, and determine the implications for further use of nursing interventions identified. APHNs play a critical role in ensuring that evidence-based research is shared and integrated into health care practice (APHA, 2013; Harne-Britner and Schafer, 2009; Issel et al, 2011; Kulbok and Ervin, 2012).

EVIDENCE-BASED PRACTICE

A retrospective cohort analysis of Latina clients ($n = 680$) served by public health nurses in an urban Midwest public health agency was conducted. The purpose was to evaluate outcomes of a public health nursing family home visiting program for Latina mothers with and without mental health problems. The program served at-risk Latina mothers by providing resources and support. The early intervention program provided foundational knowledge and skills development that encouraged healthy parenting practices and care for new babies. Researchers used the Problem Rating Scale for Outcomes to evaluate client progress, using a five-point, Likert-type scale that measured the dimensions of knowledge, behavior, and status based on problems identified and addressed by public health nurses. Comparisons were made between Latina mothers with documented mental health programs and mothers without. Of the 680 mothers, 158 had mental health problems and 522 did not. Mothers with mental health problem had more problems and received more visits than mothers without. However, across the length of service, mothers improved for all three outcome dimensions (knowledge, behavior, status) ($p < 0.001$). Findings demonstrated significant improvements over the course of the public health nurse home visiting intervention. Public health nurses provided valuable interventions and services that contributed to improving the health and outcomes of mothers and their children.

Nurse Use

This study supports the need for targeting home visiting interventions to underserved groups such as Latina mothers. It also highlights the role of the advanced public health nurse in evaluating and assessing similar programs for effectiveness.

Garcia G, McNaughton D, Radosevich D, et al: Family home visiting outcomes for Latina mothers with and without mental health problems. *Public Health Nurs* 30:429–438, 2013.

ARENAS FOR PRACTICE

Regardless of where public health nurses work (e.g., schools, homes, clinics, jails, shelters, or mobile vans), the core interventions to accomplish the goals of promoting and protecting the health of populations are similar across all practice arenas. Positions for NPs and APHNs vary greatly in terms of scope of practice, degree of responsibility, power and authority, working conditions, and innovation. These factors and the effects on practice are influenced by nurse practice acts and other legislation (e.g., reimbursement and prescriptive privileges) that govern the legal practice in each state (Phillips, 2014). The following areas include traditional as well as alternative practice settings for APHNs and NPs.

Primary Care

Research indicates that the opportunities for APNs in primary care settings has increased, and this trend is expected to

continue (APHA, 2013; Fairman et al, 2011). Primary care settings such as private practices, large health systems, community health centers, patient-centered medical homes, and others, provide various roles for the advanced practice nurse. For example, many practices employ NPs, physicians assistants, RNs, licensed practical nurses, pharmacists, behavioral health providers, community health workers, and physicians to provide care in a formal or informal team structure (Ladden et al, 2013). Evidence indicates that appropriately trained nurses in primary care can produce the same high-quality care and achieve equally positive health outcomes for clients as physicians. In general, preliminary research found no appreciable differences between physicians and nurses in health outcomes for clients, process of care, resource utilization, or cost (Laurant et al, 2005; Newhouse et al, 2011).

Independent Practice

Nurses form an **independent practice** for several reasons, including a personal or professional desire to break new ground for nursing and to meet health care needs within a community. It is important to investigate the state's nurse practice act to determine the limitations and laws related to this arrangement. For example, NPs may provide a more comprehensive array of health services in states where they have legislative authority to prescribe drugs. Nurses in many states have successfully lobbied for third-party reimbursement for all RNs who provide direct care services to individual clients (Phillips, 2014). The independent practice option is more likely to be chosen by NPs and APHNs in states that have established legislation to provide for this nursing practice.

Another option for NPs and APHNs interested in independent practice is to contract with physicians or organizations to provide certain services for their clients or staff. Nurses need to define a service package and market it attractively. An example is providing a home visit to new parents after 2 weeks to assess the newborn, respond to parental concerns, and provide counseling and anticipatory guidance about nutrition, development, and immunization needs. This service may be marketed to pediatricians and family practice physicians who would offer or recommend the service to their clients as an option. An NP may negotiate with a local school board to provide preschool children with health examinations or physical assessments before the children participate in sports. Under a contract, APHNs may develop and implement health and safety programs on accident prevention and health promotion activities for small companies.

Nursing Centers

Nursing centers or nurse-managed health clinics, a type of joint practice developed by advanced practice nurses to address vulnerable populations, provide opportunities for collaborative relationships for APHNs, NPs, baccalaureate-prepared nurses, other health care professionals, and community members (National Nursing Centers Consortium, 2014; Paterson et al, 2009). Primary health services may be provided by NPs, depending on state legislation. Community APHNs, along with nurses and nursing students, focus on the neighborhood level

and understand community needs. A central mission of nurse-managed clinics is community development such as health care accessibility and resources; public involvement; interprofessional practice; and health promotion and disease prevention supported by the principles of primary health care (National Nursing Centers Consortium, 2014; Paterson et al, 2009). Nursing center models are discussed in more detail in Chapter 21.

Retail Clinics

Retail clinics are staffed primarily by nurse practitioners with convenient hours. The first retail clinic opened in Minneapolis in 2000, but their growth between 2006 and the present has been substantial. They offer routine preventive and acute care services. Although still generally operated by large retail pharmacies, involvement of hospital systems in retail clinic ownership is a more recent phenomenon (Aiken, 2011; Kaissi and Charland, 2013).

Faith Community Nursing/Parish Nursing

Faith community nursing, also known as **parish nursing**, is a concept that began in the late 1960s in the United States when increasing numbers of churches employed registered nurses to provide holistic, preventive health care to congregation members. Faith community nursing is a model of care that uses nurses based within faith communities such as churches and synagogues to provide health services to the members of those communities. Faith community nursing is a practice specialty that focuses on the intentional care of the spirit, promotion of an integrative model of health, and prevention and minimization of illness within the context of a faith community. Although primarily for faith community nurses and the nursing profession, it is also aimed at other health care providers, spiritual leaders, families, and members of faith communities (ANA, 2012).

Because these activities are complementary to the population-focused practice of APHNs, faith community nurses either have a strong public health background or work directly with both baccalaureate-prepared nurses and APHNs. Faith community nurses positively affect client outcomes by providing health services in health promotion and disease prevention, chronic disease management, and culturally sensitive services (Roberts, 2014). See Chapter 45 for further discussion about faith community/parish nursing.

Institutional Settings

Ambulatory/Outpatient Clinics

NPs and APHNs may be employed in the primary care unit of an institution (e.g., the ambulatory center or outpatient clinic). These centers/clinics generally provide hospital referral, hospital follow-up care, and health maintenance and management for nonemergency problems. The population served is usually more culturally and economically diverse and represents a larger geographic area than that served by private practices. In these outpatient settings, NPs typically practice jointly with physicians to provide acute and chronic primary care. Hospital acute care outpatient services may include clinics for general

medicine or family practice, or specialty-oriented clinics, such as pediatric, obstetric-gynecologic, and ear, nose, and throat clinics. Outpatient clinics organized for chronic care may be problem oriented (e.g., hypertension, diabetes, or acquired immunodeficiency syndrome [AIDS] clinics).

Emergency Departments

Persons without access to health care, such as the medically uninsured and the homeless, often do not seek health care services until they become ill. Hospital emergency departments (EDs) are increasingly used for nonemergency primary care. Although this is an inappropriate use of expensive health services, it is a result of the current system, which limits access to routine and preventive health care. Emergency department care is one of the most expensive services offered in health care today (Wood et al, 2010).

Emergency services often require long waits for persons who have nonemergency problems. Fast-track/nonemergency sections (sometimes called urgent care) of EDs have become commonplace to accommodate these situations. NPs in these settings see clients with nonemergency problems and provide the necessary treatment and appropriate counseling. APHNs may also help educate clients on the importance of health care and how to gain access to the preventive health care system. APHNs, with their knowledge of community health resources, can help ensure that psychosocial needs are assessed and met. APHNs can act as liaisons or go-betweens for community programs that serve the needs of special populations.

Long-Term Care Facilities

The elderly age group represents the fastest growing population (especially those over 85 years of age) in the United States (Administration on Aging, 2012). The data reveal a long anticipated trend that we are living longer, resulting in higher percentages of elderly Americans. By 2030, it is projected that one in five people will be aged 65 or older. Statistics reveal a shortage of advanced practice nurses specializing in gerontological nursing to care for the growing older adult population (Donald et al, 2013).

Gerontology is an increasingly important field of study, and many courses are available on the health needs of older adults. NPs and APHNs with an interest in geriatrics need to continue their education in this area to increase their knowledge and skills specific to this at-risk aggregate (Donald et al, 2013). Many NPs and APHNs view long-term care facilities as exciting areas for practice and a way of increasing quality of care while containing costs for older adults and the disabled. U.S. federal legislation provides reimbursement for NPs and APHNs to provide care to clients in Medicare-certified nursing homes and to recertify eligible clients for continued Medicare coverage. In long-term care facilities where clients are not ambulatory, NPs and APHNs may make regular nursing home rounds, assess the health status of clients, and provide care and counseling as appropriate. In long-term care facilities in which the residents are more ambulatory, NPs and APHNs may also provide health maintenance and other primary health care services to the nursing home clients.

Industry/Occupational Health

The *Healthy People 2020* (USDHHS, 2014a) objectives include a section on occupational health and safety with goals to reduce work-related injuries and deaths. Thousands of new cases of disease and death occur each year from occupational exposures.

APHNs and NPs are increasingly useful in occupational health programs as business and industry seek ways to control their health care costs and to provide preventive and primary on-site care services. These services help reduce absences from work and increase productivity of workers. The APHN in an industrial/occupational setting assesses the health needs of the organization on the basis of claims data, cost-benefit health research, results of employee health screening, and the perceived needs of employee groups (Levin et al, 2013). With their advanced administrative and clinical skills, APHNs plan, implement, and evaluate company-wide health programs. The role of the occupational health nurse is discussed in Chapter 43.

Government

U.S. Public Health Service

The U.S. Public Health Service operates the National Health Service Corps, which places health providers in federally designated areas with shortages of health workers, and the Indian Health Service, which provides health services to Native Americans.

During the 1970s, both the Corps and the Indian Health Service offered to pay to educate RNs to become nurse practitioners if they would promise to work for a designated period of time with the Public Health Service. These programs were discontinued during the 1980s when more emphasis was placed on physician recruitment. In 1988, Congress reauthorized two loan repayment programs for the education of NPs—one with the Corps and one with the Indian Health Service. More recently in 2009, the American Recovery and Reinvestment Act invested an additional \$300 million into the Corps hoping to double its field strength by providing more scholarships and loan repayment options for health care providers. Depending on the needs of the area, an NP employed by the Public Health Service may be the only health care provider in the setting or may practice with a group of providers to serve a rural, an urban underserved, or a Native American population (USDHHS, 2014b).

Armed Services

The increased availability of physicians reduced the active recruitment of nurses to advanced degree programs by the armed forces during the 1980s. NPs are used in ambulatory clinics serving active duty and retired personnel and their dependents. Care of the war veteran with post-traumatic stress disorder, amputation, and multiple rehabilitation needs, along with integration into the community, is ongoing and essential. APHNs use their skills with needs assessment and program planning/evaluation to develop programs aimed at improving the health of the aggregate military population (U.S. Department of Defense/Today's Military, 2014).

Public Health Departments

Public health departments are increasingly employing advanced practice nurses with master's degrees. In fact, the Public Health Accreditation Board (2014) mandates that public health departments recruit qualified individuals and provide appropriate certification documentation when applying for accreditation. These APHNs and NPs have administrative and clinical skills to work collaboratively with physicians and to manage and implement clinical services provided by the health departments. Home care and hospice services are nursing sections in many public health departments and require the services of population-oriented nurse clinical specialists.

Health departments also provide primary care services in well-child clinics, family planning clinics, and general adult primary health care clinics. A public health department may use NPs and APHNs, depending on the size of the department, the department's health priorities in the community, and financial constraints.

APHNs should possess basic competencies for responding to disasters whether the health threats are natural, intentional, or technological (mass casualty incidents, unfolding infectious disease outbreaks, bioterrorism, or evolving environmental disasters). APHNs are well positioned to collaborate with leaders of the community to develop and implement systems-level preparedness and response plans for populations before, during, and after an event (Aiken, 2011; University of Michigan Center of Excellence, 2013).

Schools

School health nursing, discussed in Chapter 42, involves comprehensive assessment and management of care, with particular emphasis on health education, to promote healthy behaviors in children and their families. Innovative practice occurs in school nursing (Nelson, 2009). APHNs and NPs may be employed as school health nurses by school boards or county health departments to provide specific services to schools, such as confirming that immunization status is current; performing hearing and vision screenings; and providing many organizational, community assessment, and political functions. School-based health services may be staffed by APHNs and/or nurses prepared as school, pediatric, or family nurse practitioners. Services provided by these advanced nurse practitioners include not only basic health screening, but also monitoring of children with chronic health problems and finding health care for children with limited access to medical care. These nurses work collaboratively with parents, community leaders, educators, and physicians to ensure that each child within the school community receives needed services. APHNs and NPs may be well suited to manage school health services if they meet specific criteria developed by individual states.

Other Arenas

Home Health Agencies

Major legislative changes in Medicare and third-party reimbursement for hospital services resulted in unprecedented growth in the home health care industry through the 1990s. Home health care is less expensive than extended hospital care and thus is an attractive option for third-party payers (Riggs et al, 2011). In

addition, equipment and drug companies are developing products for home use, physicians and hospitals are exploring the development of home services, and consumers are demanding more services. Advanced practice nurses have traditionally been involved in home care in many capacities. Because of their knowledge and skills in the following areas, NPs and APHNs are well qualified to provide home health care that yields positive outcomes for clients and their families. Home health APNs engage in holistic health assessments and coordinate services with an interprofessional team for clients with complex health needs; are involved in coaching, consultation, evaluating, and using research findings; provide leadership in both the clinical and professional arenas; and collaborate interprofessionally to accomplish client goals and outcomes (Levin et al, 2013). The role of the nurse in home health is discussed in Chapter 41.

Many APNs today are practicing in telehealth environments. Telehealth is the practice of health care delivery, diagnosis, consultation, treatment, and transfer of medical data and education using interactive video, visual, audio, and data telecommunication (Kvedar et al, 2014).

Correctional Institutions

Residents of prisons and jails are a population with health needs that can be met by APHNs and NPs. APHNs are an asset within prison systems, planning and implementing coordinated health programs that include health education as well as health services. Where personnel resources are limited, APHNs provide health education and counseling for inmates and/or their families to prepare prison clients for going back into the community on their release. NPs often practice in on-site health clinics at correctional institutions, providing both primary care services and health education programs (Almost et al, 2013).

ISSUES AND CONCERNS

Legal Status

The legal authority of nurses in advanced practice is determined by each state's nurse practice act and, in some states, by additional rules and regulations for practice (Phillips, 2014). In the 1970s, regulations for the direct care role performed by NPs, including diagnosis and treatment, were less defined in state nursing laws than they are today, and the legal status of NPs were being questioned. Since 1971, when Idaho revised its nurse practice act to include the practice of NPs, other states have amended their nurse practice acts or revised their definitions of nursing to reflect the new nursing roles. NPs are regulated by their state boards of nursing through specific regulations (Phillips, 2014). Legislative authority to prescribe has changed dramatically in the last several years. By 2002, NPs in all states (including the District of Columbia) had prescriptive authority, some with independent authority to prescribe and some dependent on physician collaboration (Phillips, 2014).

Reimbursement

The third-party reimbursement system in the United States, both public and private, is complicated. To practice independently

BOX 39-2 Landmark U.S. Legislation for Advanced Practice Nurses

- 1977: Rural Health Clinic Services Act authorized NP and PA services to be directly reimbursed when provided in a rural area.
- 1989: As part of the Omnibus Budget Reconciliation Act (OBRA), Congress recognized NPs as direct providers of services to residents of nursing homes.
- 1990: Congress established a new Medicare benefit through federally qualified health centers, where services of NPs are directly reimbursed when provided in these centers.
- 1997: Passage of the Balanced Budget Act of 1997 (PL 105-33). NPs can now be directly reimbursed, regardless of geographic setting, at 85% of what the physician would have been paid (if the service is covered under Medicare part B).
- 2003: Individuals applying for Medicare provider numbers, such as NPs, must possess a master's degree from an NP program, as well as national certification and state licensure.
- 2010: Passage of the Patient Protection and Affordable Care Act. As a result, there will be a higher demand for primary care providers, such as NPs, with an emphasis on prevention, chronic care management, and cost-effective quality care.

or work collaboratively with physicians, NPs need to be reimbursed adequately. Because states regulate the insurance industry, available third-party private reimbursement depends in large part on state statute. Advanced practice nurses want direct access to third-party payers. The most common mechanism by which NPs get access to direct payment is through benefits-required laws. Laws also include the right to practice without being discriminated against by another provider or a health care agency (Phillips, 2014).

The Rural Health Clinic Services Act of 1977 (PL 95-210) was the first breakthrough in third-party reimbursement for nurses in primary care roles (Box 39-2). The law authorized Medicare and Medicaid reimbursement to qualified rural clinics for services provided by NPs and PAs, regardless of the presence of a physician (Wasem, 1990). The intent of the act was to improve access to health care in some of the nation's underserved rural areas; however, its use from state to state has varied dramatically. Recent legislative changes to include the coverage of services by certified nurse midwives, clinical psychologists, and social workers have improved the effectiveness of the Rural Health Clinic Services Act for reimbursement options.

In 1989, Congress mandated reimbursement for services furnished to needy Medicaid clients by a certified family nurse practitioner or certified pediatric nurse practitioner whether or not under the supervision of a physician. With the 1997 passing of the Balanced Budget Act, NPs could be directly reimbursed, regardless of geographic setting, at 85% of what a physician would have been paid (if the service is covered under Medicare part B) (Pearson, 1998). Since January 1, 2003, individuals applying for Medicare provider numbers as NPs must possess a master's degree from an NP program, as well as national certification and state licensure. Once an NP has a provider number, he or she submits bills, using the standard government

form, to the local Medicare insurance carrier agency for each visit or procedure.

Institutional Privileges

Because of their direct care role, NPs in the community are more concerned than APHNs about **institutional privileges**. Traditionally it has been difficult for NPs to obtain hospital privileges within institutions where their clients are admitted. However, with the broadening scope of practice and professional responsibilities, more nurse practitioners are obtaining hospital privileges (often referred to as credentialing). An application process is generally required and reviewed by a group of physicians in the department of medicine. The criteria for nurse practitioners wishing to obtain hospital privileges vary by hospital and state; however, most hospitals require that nurse practitioners have national certification.

Employment and Role Negotiation

For NPs and APHNs to collaboratively provide comprehensive primary health care, they must understand and develop negotiating skills. Positive working relationships with health professionals, organizations, and clients require role negotiation, particularly when few guidelines exist for a role or a role is new and undeveloped. NPs and APHNs need to assess the internal politics of the organization as part of their role negotiation. Networking is another necessary skill. Forums, joint conferences, collaborative practice, and research provide opportunities to expand their functions.

Because NPs and APHNs in some locations often seek employment, as opposed to being sought by employers, assertiveness is needed. Increased financial constraints have reduced the number of job opportunities. NPs and APHNs should feel comfortable about marketing their skills. Marketing strategies should be designed to project an image that shows a nurse's individual achievement. In assessing and analyzing the needs of target markets, nurses must consider professional and institutional goals, and the target client group's goals.

Methods of obtaining positions and negotiating future roles include providing **portfolios** of credentialed documents and samples of professional accomplishments such as audio-visual materials, program plans and evaluations conducted, client education packets, and history and physical assessment tools developed. Portfolios are folders that contain all of these documents to showcase the nurse's abilities. NPs and APHNs should keep current portfolios containing examples of their professional activities. Names, addresses, and telephone numbers of professional and personal references should be furnished in the portfolios (but only after the referring persons have granted permission). A new application that can assist in keeping portfolios current is an electronic portfolio, or e-portfolio, where information is housed on the Internet and can be easily updated and shared/transmitted to employers and others. Many websites provide e-portfolio management and services, such as Decision Critical website (www.healthstream.com).

ROLE STRESS

Factors causing stress for advanced practice nurses include legal issues (as discussed previously), **professional isolation**, **liability**, collaborative practice, conflicting expectations, and professional responsibilities. NPs and APHNs will want to identify self-care strategies to cope with predictable stressors, some of which are discussed here.

Professional Isolation

Professional isolation is a source of conflict for NPs and APHNs. Because they practice across all age groups, NPs and APHNs are likely to be hired in remote practice employment sites. Rural communities unable to support a physician, for example, may find the NP an affordable and logical alternative for primary care services. The autonomy of practice in these sites attracts many NPs and APHNs, who may fail to consider the disadvantages of isolated practice. Long drives, long hours, lack of social and cultural activities, and lack of opportunity for professional development are often experienced by these rural practitioners. These sources of stress, which could lead to job dissatisfaction, can be reduced or eliminated by negotiating the employment contract to include educational and personal leaves.

Liability

All nurses are liable for their actions. Because more legal action is appearing in the judicial system, specifically concerning NPs, the importance of liability and/or malpractice insurance cannot be overemphasized ([AANP, 2014b](#)). Although malpractice insurance may not be required to function as an NP or an APHN, most nurses carry their own liability insurance. It is in the best interest of NPs and APHNs to thoroughly investigate the coverage offered by various companies rather than to assume that the coverage is adequate. Practitioners who function without a physician on site are particularly vulnerable. The scope of the NP's and APHN's authority determines the liability standards applied. The limits of each practitioner's authority are legislated by individual states ([Phillips, 2014](#)).

Interprofessional Collaborative Practice

The future of NPs and APHNs depends on whether they make a recognized difference in the health of families and communities, and on their ability to practice collaboratively with physicians. **Interprofessional collaborative practice** defines a peer relationship with mutual trust and respect. Working out a collaborative practice takes a considerable amount of time and energy. Until such practice relationships evolve within joint practice situations, the quality health care that nursing and medicine can collaboratively provide will not be achieved. The arrangement demands the professional maturity to work together without territorial disputes, and the structure and philosophy of the organization must support joint practice as a mechanism for health care delivery. The growing pains of establishing such a practice produce stress for all involved; however, the results and benefits to clients and professionals are worth

the effort (Interprofessional Education Collaborative Expert Panel, 2011).

Interprofessional collaborative practice for APHNs and NPs involves more disciplines than just medicine. Advanced practice nurses work with baccalaureate-prepared nurses and other nurses, social workers, public health professionals, nutritionists, occupational and physical therapists, and community leaders and members to meet their goals for the health of individuals, families, groups, and communities. To work toward the *Healthy People 2020* objectives, collaboration of multidisciplinary groups is essential. APHNs, NPs, and baccalaureate-prepared nurses can provide leadership in attaining this collaborative effort.

Conflicting Expectations

Services provided by NPs and APHNs in health promotion and maintenance are often more time consuming and complex than just the management of clients' health problems. NPs and APHNs frequently experience conflict between their practice goals in health promotion and the need to see the number of clients required to maintain the clinic's financial goals. The problem becomes worse when the clinic administrator or physician views NPs and APHNs only as medical extenders and limits reimbursement to the nurse. A practice model that can assist nurses in including health promotion and maintenance activities as well as medical case management into each client visit uses (1) flexible scheduling, (2) health maintenance flow sheets, and (3) problem-oriented recording with nursing goals and plans prominently displayed in the health record. For APHNs, program planning and evaluation based on systematic needs assessments conducted with communities are methods to show the needs and benefits of health promotion/disease prevention. Being an educator and role model in carrying out *Healthy People 2020* objectives emphasizes the importance of health promotion and disease prevention in the health care system.

Professional Responsibilities

Professional responsibilities contribute to role stress. Most states require NPs and APHNs in expanded roles to be nationally certified and to maintain certification. Recertification requires documentation of continuing education hours. Because there may not be many nurse practitioners in an area, continuing education may not be locally available and may require travel and lodging expenses in addition to time away from the practice site. Anticipating professional responsibilities and travel expenses in financial planning decreases these concerns. Negotiating with the employer for educational leave and expenses should be part of any contract.

Quality of client care, however, cannot be measured or ensured by continuing education or the nurse's credentials. Professional responsibility includes monitoring one's own practice according to standards established by the profession and protocols, if used, and a personal feeling of responsibility to the community. Continuous quality improvement is another professional responsibility for NPs and APHNs. This process should evaluate need, cost, and effectiveness of care in relation to client outcomes (Kelly et al, 2014).

TRENDS IN ADVANCED PRACTICE NURSING

Advanced practice nurses are prominent in multiple health care arenas today, and this is unlikely to change in the future (Naylor and Kurtzman, 2010). With the goals of the Patient Protection and Affordable Care Act (PPACA, 2010) and *Healthy People 2020* objectives, a substantial need for health care providers exists. The prominence of interprofessional education and practice, along with team-based and patient-centered care, is congruent with the PPACA and *Healthy People 2020*. APHNs and NPs have the knowledge and skills base to lead the health care team in both individual- and population-based outcomes in prevention and population health.

APHNs and NPs, in collaboration with nurses, community agencies and members, and other disciplines, have the potential to make an impact on health promotion and disease prevention at the individual, family, group, and community levels. Population-focused APHNs and NPs are in excellent positions to use the *Healthy People 2020* National Health Promotion and Disease Prevention objectives and the Healthy People in Healthy Communities model in planning their advanced practice nursing interventions (Zanzano et al, 2011).

QSEN FOCUS ON QUALITY AND SAFETY EDUCATION FOR NURSES

The Advanced Practice Nurse in the Community

Targeted Competency: Informatics—Use information and technology to communicate, manage knowledge, mitigate error, and support decision making.

Important aspects of informatics include:

- **Knowledge:** Describe examples of how technology and information management are related to the quality and safety of patient care
- **Skills:** Use information management tools to monitor outcomes of care processes
- **Attitudes:** Value nurses' involvement in design, selection, implementation, and evaluation of information technologies to support patient care

Informatics Question

You are an adult/geriatric NP who has just been hired at a nursing center, where that targeted patient population is patients over the age of 65, covered by Medicare insurance. Because your nursing center provides primary care for a substantial portion of your community's Medicare population, you have been approached by the local hospital and home care agency to help them track ER visits (not resulting in admission) and hospital readmission rates, within 30 days of a hospitalization.

- What data points will you want to track to establish a preintervention baseline for these data?
- Assuming you are involved in developing an educational module for at-risk patients, families, and home care nurses, what data points will you want to track after implementing this educational module?
- Which EHR (hospital, home care, nursing center) might contain these data points?
- How might you envision shared documentation/communication among the hospital, home care agency, and nursing center to effectively manage the targeted patients?

Prepared by Gail Armstrong, PhD(c), DNP, ACNS-BC, CNE, Associate Professor, University of Colorado Denver College of Nursing

PRACTICE APPLICATION

Case 1: APHN

Martha Corley is an APHN who coordinates the after-care services for a community hospital's early discharge clients. Martha has worked with the nursing staff to develop a nursing history form to identify family and social supports available to clients who are likely to need nursing or supportive care for a limited time after discharge. With this and additional information from head nurses, Martha visits selected clients to begin discharge planning. She consults with each client and family to validate assessed needs. The physician is also consulted about medical therapies to be continued at home. Martha has access to nurses and other resources throughout the community that accept cases on contract. She outlines the initial care plan with nurse case managers assigned to the client and receives regular progress reports. An essential aspect of her practice is to evaluate outcomes of her interventions.

Which of the following is the best example of evaluation of Martha's nursing care?

- A. Assessment of client and family satisfaction with her services
- B. Reported medical complications of her caseload
- C. Review of related literature about home care programs
- D. Collected data on hospital readmissions of her clients

Case 2: Family Nurse Practitioner

Julie Andrews is an NP who practices with two board-certified family practice physicians in an urban office. Julie has her own

appointment schedule and sees 12 to 20 adults and children on an average day. Although she sees some acutely ill clients, most of her appointments are for routine health maintenance visits. The two physicians also refer clients to Julie for management of stable chronic health problems such as hypertension and diabetes. She has received a number of referrals from Martha Corley (see [case 1](#)) of clients with hypertension and diabetes. Assignment of these clients to Julie by the physicians did not begin until Julie had been with the practice for about a year. During the first months of practice, Julie assessed the numbers and types of client problems seen in a typical week. She found that hypertension was the most frequent chronic problem. Julie reviewed a sample of records of clients with hypertension and found that many had recorded blood pressures indicating uncontrolled hypertension.

On the basis of this information, what advanced practice nursing intervention could Julie provide?

- A. Continue to see the clients referred to her through the physicians and Martha.
- B. Conduct an in-service education program on hypertension for the staff in the office.
- C. Provide nurse practitioner visits for hypertensive clients and compare the outcomes with those of hypertension clients seen by the physicians in the office.
- D. Provide care for all hypertensive clients in the office.

Answers can be found on the Evolve site.

KEY POINTS

- Changes in the health care system and nursing have occurred in the past few decades because of a shift in society's demands and needs.
- Trends such as a shift of health care from institution-based sites to the community, an increase in technology, self-care, cost-containment measures, accountability, third-party reimbursement, and demands for humanizing technical care have influenced the new roles of the APHN and NP.
- Educational preparation of the APHN has always been at the graduate level, whereas this has not been true of the NP; however, there are implications that both the NP and APHN educational preparation may be at the doctorate of nursing practice level.
- Specialty certification began through the ANA in 1976 for NPs, and through the ANCC in 1990 for APHNs.
- The major role functions of the NP and APHN in community health are clinician, consultant, administrator, researcher, and educator; typically, the NP spends a greater amount of time in direct care clinical activities and less time in indirect activities than the APHN.
- Major arenas for practice for NPs and APHNs in community health include primary care practice, institutional settings, industry, government, public health agencies, schools, home health, correctional health, nursing centers, retail clinics, and health ministry settings.
- Legal status, reimbursement, institutional privileges, and role negotiation are important issues and concerns to nurses who practice in an advanced role in public health nursing.
- Major stressors for NPs and APHNs include professional isolation, liability, collaborative practice, conflicting expectations, and professional responsibilities.
- The use of *Healthy People 2020* objectives is important in emphasizing health promotion and disease prevention in advanced practice nursing and in improving the health of the nation.

CLINICAL DECISION-MAKING ACTIVITIES

1. Explore the development of the NP and APHN in the community. Give details about the differences in the roles.
2. Investigate graduate programs in public health in a state or region to determine the requirements for admission, the

type of degree awarded, and whether or not NP and/or APHN preparation is available. Do the similarities and differences make sense to you? Why?

CLINICAL DECISION-MAKING ACTIVITIES—cont'd

3. Review your state's nurse practice act and any rules and regulations governing advanced practice roles. Are rules different for NPs and APHNs? Give examples.
4. Negotiate a clinical observation experience with an NP and an APHN in community and public health, and compare

and contrast their roles. Discuss the roles as you see them with the NP and APHN. When you consider your thoughts about the roles, have you considered what the APHN and NP have told you about their roles? How has their input changed your views?

The Nurse Leader in the Community

*Lisa Pedersen Turner, PhD, RN, PHCNS-BC**

Lisa Pedersen Turner felt called to the field of public and community health nursing while obtaining her BSN degree, inspired by the focus on preventing disease and helping underserved populations. Since then, she has provided care for a wide variety of vulnerable populations, including children in the schools, adults who are homeless, low-income families, and elders in long-term care facilities. She served as a nurse and clinic coordinator of the Good Samaritan Nursing Center at the University of Kentucky for twelve years. Her work at the Good Samaritan Nursing Center focused on providing school health services to underserved populations as well as developing a K-12 school health curriculum for a county in rural Kentucky. She has lectured and supervised students studying public health nursing in a myriad of community settings, including school clinics, homeless shelters, and free clinics for adults and children. She has contributed to several projects to evaluate school health services and has presented at national and international symposia on nursing clinics in the community. Her research interests are in the areas of vulnerable populations, access to health care, and obesity prevention. Dr. Turner currently serves as an assistant professor at Berea College, Berea, Kentucky.

 - Resource Tool 3.A: Declaration of Alma Ata

OBJECTIVES

After reading this chapter, the student should be able to do the following:

1. Explain why nurses need effective leadership, management, and consultation skills in today's public health care environment.
2. Explore what is meant by partnership and interprofessional practice and describe how these concepts are related to nursing leadership, management, and consultation.
3. Analyze what is meant by systems thinking in community-based and public health settings.
4. Describe the major competencies required to be effective as a nurse leader, manager, and consultant in community-based and public health settings.
5. Examine nursing leadership strategies to enhance client safety and reduce health care errors in community settings.
6. Explain how nurses provide leadership in care coordination in the community.

Future of Nursing Leadership

The profession of nursing has consistently ranked highly in public surveys as the most trusted profession (Jones, 2011). As such, the general public looks to nurses to act as leaders, providing guidance on health care choices. With more than 3 million nurses employed in the United States (American Nurses Association [ANA], 2011a), the nursing profession has the potential to greatly influence the health of the nation. It is therefore imperative that nurses understand how to be leaders, not only with their professional colleagues, but also within their communities. Leadership as a role for nurses began to emerge as the profession became more structured in the mid-1800s, moving from a loosely defined trade to an organized, educated profession (Smith, 2012). Florence Nightingale (1912), the founder of modern nursing, devoted a chapter in her book, *Notes on Nursing*, to what she called “petty management,” defining the importance of a nurse being able to think critically, act proactively, and take charge of a situation in an efficient manner, all essential leadership skills. Since then, the concept of nursing leadership has evolved to include such qualities as developing relationships, facilitating communication between individuals and groups, providing guidance and direction, inspiring groups and organizations, and demonstrating vision (Huber, 2014). Agencies, localities, and professional organizations increasingly recognize the need for effective leadership in public health and community life.

Population-focused nurses have a responsibility to provide leadership in creating a new future for healthier communities. Members of the public ask whether better approaches to health care delivery might be developed that will ensure that all people around the world live in health-promoting communities and have access to quality health care as well as to health promotion and illness prevention services. Population-focused nurses practice in a variety of settings, including public health departments, community-based clinics, occupational health settings,

schools, and **managed care organizations**. Leadership, management, and consulting skills are important to the success of client outcomes that depend heavily on cost-effective, efficient delivery of care. Care coordination and managing care transitions throughout the community, including acute and long-term care settings, are important to promoting a healthy community. Nurses need effective skills in communication, negotiation, and interprofessional practice and good leadership, management, and consultation skills, even if they do not have formal positions as managers or consultants.

Nurses must focus attention not only on the populations that are served by their organizations, but also on those that are not. Because they concern themselves with the total public, their focus is always on the future and on the interacting factors that influence the health of the public. Nurses work with partnerships of community members and community organizations. **Partnerships** can be complex and require time and thoughtful attention. This chapter examines the roles and functions of nurse leaders, managers, and consultants in the twenty-first century. It emphasizes nursing leadership in public health and community-based nursing practice, personnel management, and consultation with groups and individuals.

MAJOR TRENDS AND ISSUES

Ensuring client safety and quality of care, performing evidence-based practice, eliminating disparities in health care access and outcomes, and focusing on consumer participation in and satisfaction with care are key trends in health care.

The Institute of Medicine report titled *To Err Is Human* (Kohn et al, 2000) focused attention on the incidence of health care errors. The issue of reducing health care errors continues to be a topic of interest for health leaders. In 2011, the Secretary of the U.S. Department of Health and Human Services

(USDHHS), Kathleen G. Sebelius, followed up on this report in a presentation describing new measures the USDHHS is implementing to improve patient safety, including monetary incentives for hospitals providing quality care and resources for providers to form accountable care organizations (National Research Council, 2011a). This is a concern in the community just as in hospitals and long-term care agencies. For example, studies in the United States (Lancaster, 2010), Europe (Gusdal et al, 2011; McCann et al, 2012), and Australia (Kalisch et al, 2012) show that older adults living in the community are at high risk for medication errors. Sometimes this is because they are taking high-risk medications (Gusdal et al, 2011; Kalisch et al, 2012), or because they cannot read instructions for medications (McCann et al, 2012), or because of medication complexity (polypharmacy) and not understanding how to take medications that have been prescribed for them (Kalisch et al, 2012; Lancaster, 2010).

Evidence-based practice is another trend important for public health nurses. Basing clinical practice patterns and community programs on research and other forms of evidence such as best practice data is a key strategy for ensuring high-quality care. One example of evidence-based practice in a community setting is a social media intervention developed by a group of community nurses aimed at educating 15- to 24-year-olds to reduce the incidence of risky sexual behaviors (Jones et al, 2012). In this program, the researchers evaluated the effectiveness of delivering education about the signs, symptoms, screening, treatment, and prevention of *Chlamydia* through a Facebook site. The researchers concluded that the use of social media sites may be an effective mechanism for delivering health information and promoting behavioral changes for adolescents and young adults.

The health system in some local areas has been reorganized to provide a full continuum of services in a **seamless system of care**. Large, vertically integrated systems are able to do this. **Vertical integration** means that the system owns all of the services that clients might need (e.g., clinics, hospitals, and home health agencies). In other cases, free-standing agencies collaborate and contract with one another to achieve seamlessness. The goal is to reduce fragmentation, which should be helpful for vulnerable populations. Nurses coordinate clients' care across agencies, but this new trend in the health care system places added emphasis on relationships, such as alliances, agency partnerships, joint programs, and participation in **service delivery networks** (Berry et al, 2013). Nurses actively participate in these groups and need good negotiating and **political skills** to be effective.

Another important trend is related to the movement toward more community partnerships (Plumb et al, 2012). Partnerships with community members and community agencies are essential to effective public and community health practice. The public has an increasing interest in becoming involved in planning for health services and in being active partners in their own care. Partnerships succeed when strong communication mechanisms are in place to ensure definition of needs and problems, timely problem resolution, and ongoing development of shared visions. In public and community health, the development of

shared visions and goals and the operational mechanisms to make those goals a reality is the key to success. Nurses need to be able to listen well and collaborate with lay community members, whose goals and ideas may differ from those of health care professionals. For example, a successful community partnership was created between the public grade schools and two schools of nursing to explore the implementation of a school-based obesity prevention program (Tucker et al, 2011). The program sought input from school personnel, parents, students, and other relevant partners in order to tailor the intervention to the community. A win-win situation resulted where the school community benefited from having an obesity program implemented without extra demands on their faculty, and the nursing schools benefited by having a clinical learning opportunity for their students. Above all, the students enrolled in the intervention benefited by successfully learning healthy habits for life.

The public is increasingly using the Internet, a wide variety of publications, and lay support groups to obtain health information. People need help deciding which information is good and how best to work with their health care providers to adapt information to their own health profiles. Those with low health literacy (see Chapter 16) need special help in obtaining the health information necessary to be effective partners in health care (National Research Council, 2011b).

To know whether an agency is performing as expected, nurses must be familiar with their professional standards of care, the standards held by accrediting bodies, such as The Joint Commission, and guidelines for practice, such as those published by the federal Agency for Healthcare Research and Quality, the **U.S. Clinical Preventive Services Task Force** (2014), and the Task Force on Community Preventive Services (**Centers for Disease Control and Prevention [CDC]**, 2013a). Nurse leaders also need to know how to use electronic health records and management information systems to link client outcomes with clinical and administrative processes. Registries are examples of clinical databases dedicated to certain population groups, such as people with cancer, diabetes, injuries, or population groups such as women. Nurses should know how to work with the taxonomies for nursing diagnoses, interventions, and outcomes of nursing actions (Bulechek et al, 2013) because these are being included in electronic health records and will help nurses identify changing health needs (Englebright et al, 2014).

One trend that combines the idea of partnerships with a structured method for rapid performance improvement is the use of collaboratives. A **collaborative** is a group of similar organizations that agree to use common processes for providing clinical care and share certain types of data so all may learn. A well-known example is the Health Care Disparities Collaboratives (HDCs) used by the Federal Bureau of Primary Health Care. The HDCs are a nationwide initiative to improve care for people with chronic conditions (**Bureau of Primary Health Care**, 2014). Community health centers may apply to participate in HDCs that target certain chronic health problems, such as diabetes or cardiovascular disease.

A major trend in public health is a stronger focus on implementing the core functions of public health and providing the

essential services of public health ([Council on Linkages between Academia and Public Health Practice, 2010](#)). Competencies have been identified for generalist public/community health nurses that build on the core function and essential services ([Education Committee of the Association of Community Health Nurse Educators, 2010](#)).

EVIDENCE-BASED PRACTICE

A systematic review of studies (Wong et al, 2013) examined the relationship between nursing leadership practices and patient outcomes. Twenty English-only research articles examining leadership practices of nurses in formal leadership roles and patient outcomes were included in the review. Leadership was defined as “the process through which an individual attempts to intentionally influence another individual or a group in order to accomplish a goal” (p. 710). The researchers further classified leadership into two styles, either relationally oriented (focusing on people and relationships) or task-oriented (focusing on structures and tasks). The findings suggest relationships between positive relational leadership styles and higher patient satisfaction and lower patient mortality, medication errors, restraint use, and hospital-acquired infections. Relational leadership styles were also positively and indirectly related to nurse’s motivation to perform and improve work environments.

Nurse Use

The development of leadership skills among nurses may successfully improve a variety of patient and work outcomes. Relationally oriented leadership styles appear to be especially effective in the current health care environment, thereby reinforcing the importance of emotional intelligence competencies among nurse leaders. Studies should continue to be done to show evidence of the relationship between leadership and patient outcomes. Further research is also needed to evaluate the effectiveness of other leadership styles.

Wong CA, Cummings GG, Ducharme L: The relationship between nursing leadership and patient outcomes—a systematic review update. *J Nurs Manag* 21:709-724, 2013.

DEFINITIONS

Leadership can be defined as the process of influence that occurs between a leader and an individual, group, organization, community, or society, often by inspiring, enlivening, and engaging others to participate in the achievement of goals ([Kelly and Tazbir, 2013](#)). Therefore, nursing leadership refers to the influence that nurses exert on improving client health, whether clients are individuals, families, groups, or entire communities. **Management**, on the other hand, refers to “the process of planning, organizing, coordinating, and controlling resources and staff to achieve organizational goals” ([Kelly and Tazbir, 2013, p. 510](#)). For nurses, these resources might be people, as when a nurse coordinates an interprofessional team, or financial resources. An example of managing financial resources is when a nurse monitors the budget for an immunization program to make sure that personnel time, supplies, and equipment are being used efficiently. Nurses also manage time. For example, home health nurses must manage their time in order to provide clients with direct and indirect nursing services, such as health education and making referrals, respectively.

It is important to point out that leadership and management are two different skills. Leadership sets the direction, and management ensures that goals will be achieved. Nurses must possess strong clinical leadership and management skills to be effective, whether or not they hold management positions.

Consultation in nursing refers to the process that occurs when a nurse works with an individual, group, organization, or community with the specific purpose of assisting them to solve actual or potential problems related to the health status of patients or to the health care organization ([Wilson, 2008](#)). Clinical consultation increasingly focuses on ways to better coordinate the care delivery process across sites of care. Population-focused nurses have a breadth of knowledge that makes them desirable consultants for colleagues both inside and outside the organizations in which they work. For example, a nurse working in a home health agency might be called on by a school nurse to give suggestions about the most effective way to intervene for a child using a respirator. Another example that occurs frequently is the informal consultation provided by nurses in the community, who help nurses working in hospitals make effective community referrals. At the population level, nurses who consult with a local health department about developing a program for obesity prevention in school-age children are focusing their efforts on a particular target population. An example would be the nurse leader of a community-based diabetes program who works with clinical colleagues in a hospital to improve the self-management education for people with diabetes.

Consultation is closely linked with the ideas of empowerment and self-management. When consultants help clients identify and work through problems and learn new skills that clients see as most important, they are enabling clients to solve more of their own problems. This is very similar to the traditional nursing philosophy of helping people to solve their own problems, whether they are individuals, families, groups, or communities. Empowerment is consistent with Jean Watson’s theory of human caring ([Watson, 2008](#)), in which the nurse may advocate for the client but also may assist the client to advocate for themselves ([Smith et al, 2013](#)).

LEADERSHIP AND MANAGEMENT APPLIED TO POPULATION-FOCUSED NURSING

Goals

Nursing leaders work with others to ensure a healthy community. They serve as an advocate for vulnerable and high-risk populations and work toward achieving health equity, eliminating disparities, and improving the health of all groups. Nurse leaders also participate in establishing public and organizational policies and programs that promote a healthy living and working environment; and work with interprofessional teams to design ways to coordinate care across sites and over time, in order to evaluate and continually improve health care outcomes.

One way nurses lead is by participating in a *Healthy Communities Program* ([CDC, 2013b](#)) at the local level. Working with others to develop policies for smoke-free public spaces is an

example of promoting healthy living and working environments. Another example is collaborating with consumers and professionals from other disciplines to evaluate root causes of medication errors in home-bound elders and design a process improvement strategy to reduce errors.

Nursing managers use a systems perspective to achieve agency and professional goals for client services and clinical outcomes. Managers help personnel perform their responsibilities effectively and efficiently; and they mentor other staff members, and foster lifelong learning. Furthermore, nurse managers develop new services that will enable the agency to respond to emerging community health needs, monitor health outcomes for particular population groups, and identify changes or variances suggesting new problems.

An example of how nurses show management abilities occurs when they develop plans for broad-based immunization clinics, such as smallpox vaccination clinics. Doing this in advance of confirmed bioterrorism is a way of preparing to meet an emerging community health need that achieves goals of protecting the public's health and helping personnel work effectively and efficiently. Table 40-1 shows examples of ways population-focused nurse leaders and managers facilitate primary, secondary, and tertiary preventive services.

Theories of Leadership and Management

Leadership and management theories help explain individual and group behavior as well as organizational and system dynamics. Theories that help explain and predict individual behavior often focus on employee motivation and job satisfaction. Some theories address interpersonal issues such as leadership, communication, conflict resolution, and group dynamics. Working with consumers, staff members, and other health professionals in an adult daycare facility to design a memory improvement program for participants highlights the use of these theories. This type of project requires knowledge of motivation and

leadership, team work, change theory, and project planning, management, and evaluation. Organizational and systems theories explain issues at a broader agency or community level. These theories focus on the best ways to organize work, on how to obtain the resources necessary to accomplish agency goals, on organizational level change, on power dynamics, and understanding systems. Systems theories help explain the dynamics of rapid, interconnected change and the emergence of patterns of activity (Weberg, 2012).

Good leadership skills are essential for nurse leaders and are among the key competencies for generalist public/community health nurses recommended by the Quad Council of Public Health Nursing Organizations (2011) and for "entry level public health professionals" by the Council on Linkages between Academia and Public Health Nursing Practice (2010, p. 4).

The transformational leader is able to transform, or change, the situation to one that differs from the status quo (Luzinski, 2011). Transformational leaders are sometimes found in **learning organizations**, or agencies that create cultures that support ongoing learning, experimentation, and creation of new knowledge (Roussel, 2011). Transformational leadership is essential to promoting a culture of safety and positive work environments for others (Institute of Medicine [IOM], 2011).

Systems theories and **systems thinking** emphasize the interdependence of multiple parties. Nurses often recognize interdependence of units within an agency but may be less aware of agency interdependence. Economists analyze how distribution of resources affects policies, which players in a system will be influenced by policies, and how they will be influenced. These are called **distribution effects**. For example, if the federal government reduces money for health and social services, the clients of those services may be negatively affected. Employees of service agencies are also affected because agencies are likely to downsize to manage the reduced funding. Consequently, employees may either lose their jobs or experience wage cuts.

TABLE 40-1 Examples of Levels of Prevention and Population-Focused Nursing Leadership and Management

Levels of Prevention	Nursing Leadership (Sets Goals)	Nursing Management (Directs Use of Resources)
Primary (prevention of illnesses or problems before they begin)	Works with a community coalition to design a broad-based strategy for ensuring health and social needs of uninsured and underinsured populations are met. Works with nurses and interprofessional colleagues to develop goals related to preventing health care errors and ensuring client safety	Develops policies and procedures for a referral program for low-income mothers and children to obtain nutrition services. Ensures that individuals and families understand care routines to promote adherence and reduce chances of health care error
Secondary (screening for illness and treatment of health problems before they worsen)	Works with local government and health department to design lead screening and abatement programs in high-risk census tracts. Monitors data about a caseload of clients to determine whether patterns are developing that might indicate a health problem or issue needs to be resolved	Designs protocols for lead screening program and hires staff to implement program. Works with other members of care team to design protocols to improve specific health outcomes
Tertiary (treatment of health problems to foster stabilization or delay exacerbation)	Participates on a planning commission with local health department, hospitals, police, and political leaders to update a community-wide disaster response plan that accounts for bioterrorism. Collaborates with interprofessional teams to set goals for performance improvement and rapid changes in quality of care problems	Serves as chair of a committee that organizes, staffs, and monitors budget for a smallpox vaccination program. Monitors implementation of performance improvement activities to ensure timely and appropriate completion or revision as necessary

Table developed by J. Sebastian (2010) for the 8th edition of *Public Health Nursing*.

Others likely to be affected include voluntary agencies and religious groups, which might be expected to provide more services.

Roy's adaptation model of nursing has been extended to include nursing management (Alligood, 2014). Roy argues that agencies are composed of interdependent systems. The role of nurse managers is to help the agency adapt to changing circumstances in the most effective way possible. Roy's model is particularly helpful for explaining and predicting how nurse managers and consultants can help agencies adapt to change. Nurse leaders should analyze how well interdependent units function to achieve agency goals. Furthermore, nurse leaders function as change agents because they foster agency adaptation. Complexity leadership theory accounts for the unpredictability of the behavior of people and organizations (Weberg, 2012). The combination of unpredictability and interdependence leads to disequilibrium and potentially to adaptation and growth. Communities exemplify **complex adaptive systems**. Nurse leaders must understand the analytical, political, and communication skills needed to work effectively in these systems.

Clinical **microsystems** are the systems, people, information, and behaviors that take place at the point of client care (Pardini-Kiely et al, 2010). Evidence-based clinical improvements can be implemented quickly in a clinical microsystem that has sufficient data about the practice, information systems that support clinical decision making, and a well-functioning team. For example, nurses working in a mobile health unit are part of a clinical microsystem. The team can make rapid changes in responses to quality problems if team members work well together and the mobile health clinic has an information system that makes it possible to track population health outcomes and clinical practice patterns.

Population-focused nurse leaders should assess the systems within which they work to evaluate risks to client safety. In the community these risks might be related to communication problems, inadequate follow-up, or lack of continuity of care. Nurses should maintain accountability for the outcomes of individuals, families, and groups and should do their best to ensure that complete care is provided across the continuum and that clients feel empowered to manage their own care.

Nurse Leader and Manager Roles

First-line nurse managers may be team leaders or program directors (e.g., director of a satellite occupational health clinic or director of a small migrant health clinic), whereas mid- or executive-level nurse managers may be division directors (including multiple programs or departments), local or state commissioners of health, or directors of large home health agencies with multiple offices. They function as coaches, facilitators, role models, evaluators, advocates, visionaries, community health program planners, teachers, and supervisors. Population-focused nurse leaders have ongoing responsibilities for the health of clients, groups, and communities, as well as for personnel and fiscal resources under their supervision. Nurse

leaders may have positions as managers or they may be excellent clinicians and change agents who are seen as opinion leaders.

CONSULTATION

Goal

The goal of consultation is to help others empower themselves to take more responsibility, feel more secure, deal with their feelings and with others in interactions, and use flexible and creative problem-solving skills (Hamric et al, 2014). The functions of a consultant differ from those of a manager because consultation is typically a temporary and voluntary relationship between a professional helper and a client. The similarities between consultants and leaders are in the emphasis on empowerment and helping others develop. Consulting relationships are based on cooperation and respect between consultants and clients, who share equally in problem solving (Hamric et al, 2014).

The nurse's job responsibilities may include internal and external consultation. Internal consultants are members of the organization who work in a temporary capacity to help the client create or sustain change. For example, a nurse may be employed to consult with other nurses in the agency about client care problems or, as an employee of the health department, may serve as a consultant to a local community retirement center about the public health care needs of its residents. If the nurse is an internal consultant, the nurse is employed on a full-time salaried basis by a community agency in which the consultation takes place. If the nurse is an **external consultant**, the nurse is employed temporarily on a contractual basis by the client. The client of the external nurse consultant may be a colleague, another health provider, or a community group or agency. Consulting may occur informally when a staff nurse asks a colleague for advice or help in solving a problem. The nature of the consultation relationship, whether it is internal or external, should not change the goal of consultation.

Theories of Consultation

Several models of consultation have been developed. Although nurses often consult with individuals about their own health care, or with another nurse or health professional about the needs of an individual client, this section emphasizes population-based consultation. At this level, the nurse focuses on the needs of a group, organization, or community. The client in this case is an organization or group. Content models emphasize the role of consultant as the expert who provides specific answers to problems or issues identified by the client. This approach has the advantage of being relatively quick and often responsive to client requests, but it does not help engage the client in problem solving and learning how to address similar issues in the future (Schein, 2011). This chapter focuses on Edgar Schein's model of process consultation because it is consistent with the nursing process and with nursing values of empowering clients and collaboratively working as partners with clients. The **process model consultation** focuses on the process of problem solving and collaboration between consultant and the client. The major goal of the process model is to help the client assess both the

problem and the kind of help needed to solve it (Schein, 2011). Process consultation includes assessing the underlying agency culture that influences the problem and its solution (Schein, 2010). Both consultant and client participate in the problem-solving steps that lead to changes or to actions for problem solution.

Although consultants should emphasize process consultation, they should be willing to share their expert knowledge when appropriate. Because process consultation is collaborative, Schein (2011) recommends that consultants be willing to offer opinions and advice at all stages of the consultation process. Thus, although the major emphasis should be on process consultation, consultants may find it effective to integrate both context and process.

In the process model, the consultant is a resource person whose primary goal is to provide the client with choices for decision making. Process consultation includes the same steps as the nursing process: establishing a nurse–client relationship based on trust to assess the problem, planning and implementing actions, and evaluating the outcomes of nursing interventions. Nursing interventions may be described as direct client care or as consultation activities, depending on the goal of the intervention.

Consultation may occur before a problem occurs or after a problem exists. For example, a parent–teacher council developing a school-based family center contacts the nurse to assist with options for future nursing and health care for the students and their families. The board wishes to be proactive and plan for the needs of high-risk students and families. The administrator of a minimum-security prison has found that inmates are missing work for minor health problems and that health costs are skyrocketing. The nurse is asked to help explore solutions to the problem. Prison administration is reacting to an existing problem requiring immediate intervention.

The client is identified by determining who in the situation has the problem and needs to change. The following vignette illustrates this point:

Barry Henderson, RN, has been asked by the pastor of his congregation to consult with the parish council regarding the potential establishment of a health ministry. Barry decides that the consultation contract needs to include representatives of the parish council and parishioners themselves to find effective answers to the question. He realizes that time would be wasted and resistance to change would still be present if the focus were on only one group at a time. If he met separately with the parish council, they may decide such a program should include only one set of services. The parishioners either may want a different set of services or may desire to have services and programming organized in a very different manner. For example, the parish council may be especially interested in blood pressure screening, whereas the parishioners may be interested in wellness classes to keep the congregation healthy and in-home visiting for those who are ill. After spending much energy meeting with both groups separately, Barry believes that by being a messenger between the two groups rather than a facilitator for problem solving, the consultant role has been diluted. On the other hand, by meeting with both groups together, Barry could serve as a

resource, helping them explore all viewpoints and alternatives for developing the new program. In this case, both the parish council and the parishioners are Barry's clients.

Consultation Contract

The consultation relationship is based on expectations. The consultant has expectations concerning time, money, resources, and the participation of the client in the process. Clients have expectations about what they will gain from the consultation relationship. Discussing the terms of a **consultation contract** makes expectations explicit, lessens the likelihood of violations of contract terms, and reduces the risk of additional demands being made on either party. **Contracting** involves identifying expectations and responsibilities by both parties. Some contracts are informal, verbal agreements between individuals, whereas others (such as the consulting contract) are formal, written agreements. Areas to include in the written consultation contract are as follows:

- Client and consultant goals
- The identified problem
- The time commitment
- Limitations of the contract
- Cost
- Conditions under which the contract may be broken or renegotiated
- Intervention strategies suggested
- Expected benefits for the client
- Methods of data collection to be used
- Potential interventions
- Evaluation methods to be used
- Confidentiality

Writing a contract for consultation relationships has a number of advantages. The contract terms assist the consultant in determining the number of hours that must be devoted to the interaction and in identifying needed resources and out-of-pocket expenses required to complete the interaction. **Negotiation** of the contract assists the client in identifying realistic expectations of the consultant and firmly establishes what the consultant will and will not do. The client has the opportunity during the negotiation to place limits on what the consultant can do, and the contract allows for future renegotiation of terms. Pricing methods for consultation services vary with the nature of the services. Consultants may price their services on the basis of the actual number of billable hours required to perform the service, or they may set a flat fee during the contract negotiation phase. Flat fees are more attractive to clients because they reduce uncertainty over the total cost of the consultation. They create an incentive for consultants to be efficient and to use an accurate method of estimating their services before the contract negotiation meeting.

The initial contact is made when the client or someone in a family, group, agency, or community communicates with the nurse about a potential problem that requires intervention. The communication may be a person-to-person contact during a home visit, may be written, or may occur by telephone. On initial contact, the client and the nurse have an exploratory meeting to define the problem, assess the nurse's interest and

ability to help, and formulate future actions. If the nurse has little experience with the type of problem presented, the client may wish to seek assistance elsewhere. The nurse may also conclude that the situation is not within the nurse's expertise and will want to recommend someone else to work with the client.

Next, the terms of the relationship are discussed. The nurse consultant finds out what the client expects to gain from the relationship and develops terms for the interaction. Finally, in the initial exploratory meeting, the setting for the consultation is decided, the time schedule is set, the goals of the interaction are established, and the mode of intervention is chosen.

When the terms of the contract are agreed on, the data-gathering methods will be part of the agreement. Data-gathering methods used by consultants include direct observation, individual and group interviews, use of questionnaires or surveys, and tape recordings. While data are being gathered and after the diagnosis has been finalized, the nurse implements the intervention. After fulfilling the terms of the contract, the nurse must disengage or reduce the amount of involvement with the client. Decreased contacts allow each side to evaluate the effectiveness of the intervention. During disengagement, the nurse reassures the client that future interactions are possible at the client's discretion. When the agreed-on period of disengagement has passed, the relationship is terminated. The nurse typically provides the client with a written summary of the findings and recommendations resulting from the interactions during the disengagement and termination phases (Zuzelo, 2010).

An example of an internal consultative intervention follows:

The director of nursing in a local health department telephoned the state public health nursing consultant for alcohol and other substance abuse prevention and requested a meeting at the local health department. The purpose of the meeting was to help staff analyze the evidence base and develop the protocols for a community-wide substance abuse prevention program they wished to provide. Several departments within the health department had been providing different aspects of substance abuse prevention but a coordinated effort was not in place. The nurse consultant, Paula, met with the client, Maggie, and reviewed her findings, sharing her analysis of the current situation and contributing factors. The central issue was defined as an organizational culture that did not promote interprofessional teamwork. This resulted in difficulties providing comprehensive and coordinated substance abuse prevention initiatives. Maggie then spoke with the other department directors to identify barriers and facilitators to interprofessional teamwork. Each director agreed to speak with staff in their departments to obtain their input on barriers and facilitators. One suggestion made by staff members was to hold an off-site retreat for team-based planning related to transitional care programs such as this one. Paula worked with Maggie to help develop suggestions for the agenda and logistics that Maggie shared with the other directors. The directors asked Paula to facilitate the retreat. After revision of the program plan during the retreat, Paula met with Maggie and the other directors to help them develop

additional strategies to foster an organizational culture that promoted interprofessional teamwork. She maintained contact with Maggie until the updated evidence base and program plan had been approved by the health department board and termination of the consultation occurred.

QSEN FOCUS ON QUALITY AND SAFETY EDUCATION FOR NURSES

Targeted Competency: Teamwork and Collaboration—Function effectively within nursing and interprofessional teams, fostering open communication, mutual respect, and shared decision-making to achieve quality patient care. Important aspects of teamwork and collaboration include the following:

- **Knowledge:** Describe own strengths, limitations, and values in functioning as a member of a team.
- **Skills:** Initiate plan for self-development as a team member.
- **Attitudes:** Acknowledge own potential to contribute to effective team functioning.

Teamwork and Collaboration Question

You have been selected to lead a task force aimed at reducing obesity rates in your community. Although you feel you are knowledgeable about obesity prevention and have several ideas for nursing interventions to reduce the obesity rate, you feel somewhat overwhelmed to be the person in charge of the task force. What can you do to feel more confident in your new leadership role?

Answer

First, reflect on what knowledge, values, and skills you bring to the task force that are strengths and identify areas that you feel less confident in. For example, you may feel you have a good understanding of obesity prevention but lack experience in team building and conflict resolution. Next, make a plan for how you can improve your weaknesses. For example, you could attend a continuing education workshop about team building or read the current literature on strategies for conflict resolution. Consider inviting people and organizations to join your taskforce who are proficient in the areas you feel weakest in. By reminding yourself of your strengths and actively working to improve your weaknesses, you are taking the steps to seeing your potential to being an effective leader on the task force.

Nurse Consultant Role

An agency whose delivery of care is similar to that of an official public health service will most likely employ a nurse who provides traditional or nursing consultation for a broad range of community health activities (e.g., a community or public health nurse clinical specialist). A community health agency that provides a program approach to the delivery of community health services, such as family planning, maternity, child health, handicapped children's services, school health, or home health, will tend to employ specialist consultants. These consultants may have skills and training in specific clinical areas (e.g., a nurse with expertise in maternal and child health). Agencies providing primary health care require a consultant with both general knowledge of public health practice and specialized knowledge in a primary care clinical area. This is also a requirement in agencies involved in long-term and home health care.

The nurse consultant employed in an official public health agency functions as an **internal consultant** to the employing agency. As a representative of the agency, the nurse provides nursing and consultation to colleagues, other disciplines, agency

administration, and other health and human service agencies and/or community groups. Two primary roles of the internal consultant are resource person and facilitator.

With knowledge of available resources, the nurse consultant can identify gaps in service, identify the critical services provided by the health care delivery system, and promote services for meeting health or social needs of the population. The consultant facilitates staff nurse problem solving about individual client and family needs, health needs of a group of clients, or professional concerns and attitudes. The consultant may assist managers and administrators in solving problems about personnel, program needs, organizational goals, community relationships, and client population needs. The consultant may also facilitate communication across agencies by working with inter-agency **coalitions** or **alliances**.

Consultants from federal agencies are often used as external nurse consultants. The nurse consultant from the federal agency may come to the local or state agency to serve on request as facilitator or resource person helping with program planning, development, and implementation. The primary role function of this consultant is to serve as a resource person, although the consultant may facilitate movement toward identifying actual program objectives.

An example of a vital role nurse consultants can play is in helping a community agency or a coalition conduct community needs assessments and develop strategic plans and associated action plans for achieving *Healthy People 2020* goals (see the *Healthy People 2020* box) (USDHHS, 2010).

HEALTHY PEOPLE 2020

Objectives Related to the Four Overarching Goals

The following are examples of some of the proposed objectives related to leadership, management, and consultation by public health nurses:

- AHS-2: (Developmental) Increase the proportion of persons with coverage of appropriate evidence-based clinical preventive services.
- HC/HIT-11: (Developmental) Increase the proportion of meaningful users of health information technology.
- PHI-1: Increase the proportion of federal, tribal, state, and local public health agencies that incorporate core competencies for public health professionals into job descriptions and performance evaluations.
- PHI-14: Increase the proportion of national and local public health jurisdictions that conduct a public health system assessment based on national performance standards.

AHS, Access to health services; HC/HIT, health communication/health information technology; PHI, public health infrastructure.

From U.S. Department of Health and Human Services: *Healthy People 2020*, Washington, DC, 2010. Available at <http://www.healthypeople.gov/HP2020/Objectives/TopicAreas.aspx>. Accessed September 2, 2010.

COMPETENCIES FOR NURSE LEADERS

Nurses should watch for opportunities to participate in leadership development institutes or consider ongoing formal education through advanced public health nursing degree programs. Leadership development programs are available at various levels and are provided by civic and professional organizations. Civic programs introduce participants to the full range of leadership and quality-of-life issues in a community, including

health, education, politics, the arts, and business. This breadth of concerns is consistent with nurses' understanding that health results from the interaction of many facets of social and economic influences. Other leadership development opportunities are provided by professional organizations (e.g., the International Honor Society for Nursing, the American Public Health Association), continuing education, and local groups. Graduate degree programs in public health nursing provide systematic academic development of public and leadership competencies and prepare nurses to sit for advanced nursing certification through the American Nurses Credentialing Center, such as the Nurse Executive Certification. Nurses should take advantage of opportunities such as these for lifelong learning and the strengthening of leadership skills.

The following section describes essential competencies that nurses must master in order to become effective leaders in the community.

Leadership Competencies

Nurses need effective leadership, interpersonal, political, organizational, fiscal, analytical, and information competencies. Some competencies are similar to those required for leadership in other clinical areas, such as good communication skills and the ability to delegate effectively. Working in the community means being able to work with populations and groups, to build coalitions and work with partnerships. Leadership essential to these roles involves identifying a shared vision and influencing others to achieve the vision, emphasizing that client needs are the basis for health services, empowering others, delegating tasks and managing time appropriately, and making decisions effectively. Public health nurse managers should be involved in developing agency-level vision, mission, and goal statements.

Empowerment

Leaders help others empower themselves to make organizations more responsive to client needs. This means removing barriers to decision making and allowing staff nurses the authority to make client decisions in "real time," as needs demand, rather than requiring nurses to obtain numerous approvals. **Empowerment** is more than simply increasing nurses' authority—it includes ensuring that they have the necessary knowledge, skills, and resources to effectively make the decisions for which they are held accountable. For example, nurse managers who are responsible for preparing their own department or program budgets and for approving program spending must be given the opportunity to learn budgetary concepts. Nurses are likely to feel more empowered to do their work in a less bureaucratic environment that supports clinical autonomy and collaborative professional relationships (Spence Laschinger et al, 2010).

The concept of empowerment underpins the consulting process. Consultants assist others in identifying solutions to problems and, more importantly, in developing the ability to manage problems independently in the future.

Delegation

Effective delegation is a key competency of public health nurses. *The Education Committee of the Association of Community*

LINKING CONTENT TO PRACTICE

This chapter emphasizes the use of leadership, management, and consultative skills and knowledge in public health nursing practice, whether one has an official leadership or consulting role or not. Use of the theories and principles of leadership, management, and consultation with public health and nursing science is key to promoting healthy communities and achieving the goals of *Healthy People 2020* (USDHHS, 2010). Entry-level public health nurses are expected to possess competencies in these areas, including communication, collaboration, team building, analysis, program planning and management, managing budgets, and understanding and implementing policies (Quad Council of Public Health Nursing Organizations, 2011; Council on Linkages between Academia and Public Health Practice, 2010). Public health nurses focus on working with communities in addition to other staff members and colleagues, and work with broad problems and issues that require systems thinking, leadership, and building coalitions (Olson, 2013). When a public health nurse thinks about empowerment, for example, he or she considers how to provide information and foster skill development for empowerment of other staff members and of community members. Thinking about working in partnership with community groups and policy makers influences a public health nurse's use of theories and principles of leadership, management, and consultation.

Health Nurse Educators (2010) listed delegation among the competencies for community/public health nurses. This group noted that delegation is part of ensuring that care is appropriately coordinated within an interprofessional health care team. It has become increasingly necessary because of the complexity of care in public health and community settings (Resha, 2010).

Agency efficiency increases when tasks are assigned to the first level in the hierarchy where employees possess the necessary skills and knowledge to complete the task and where the task is related to the goals of those positions. **Delegation** develops others' talents and can contribute to job satisfaction. Asking a nurse in a nursing clinic for homeless families to develop a booklet describing community resources for this population

helps the staff nurse learn more about community resources, the gaps that exist in local resources, and where opportunities exist for interagency collaboration. The nurse is also likely to learn about visual presentation, layout and brochure design issues, and how to present material at the appropriate reading level. Finally, delegation is an important tool in time management. A school nurse may delegate locating resources for a screening clinic to the parent–teacher association, and the time saved can be spent on developing a teaching plan for volunteers who will help with the actual screening. Strategies for delegating responsibilities are listed in Box 40-1. Figure 40-1 provides a sample timetable for conducting a health fair, showing how the nurse might decide which activities need to be completed and suggesting those that might be delegated.

Delegation has become an increasingly important skill for nurses, whether they have official roles as managers or not. As more agencies increase their use of unlicensed assistive personnel and lay community workers, nurses are increasingly delegating selected aspects of practice to others and supervising the completion of those tasks. Two types of delegation occur in clinical practice. Direct delegation involves speaking to an individual personally and transferring responsibility for a task to that person (ANA and National Council of State Boards of Nursing [NCSBN], 2006). Indirect delegation results when an

BOX 40-1 Delegating Responsibility

Nurse managers share responsibility for any tasks they delegate to others. The nurse manager delegates responsibility for a task but retains final accountability for the safe, effective outcome of the task (ANA, 2010). It is critical, then, that nurse managers know that the individuals to whom they are delegating responsibility are both prepared and capable of effectively performing the tasks. Nurse managers should provide clear guidelines and plan specific times to obtain progress reports on task completion. This will allow the opportunity to manage problems as they arise and to provide staff with helpful feedback or instruction if needed.

FIG 40-1 Sample timetable for conducting a health fair.

agency has policies and procedures in place that allow tasks to be performed by someone other than the person who is accountable (ANA and NCSBN, 2006). Sometimes nurses mistakenly think that they are not accountable for tasks that are indirectly delegated through agency policies (e.g., policies for cross-training). However, if nursing care has been delegated, then nurses and their organizations are accountable for the safe and effective completion of that care (ANA and NCSBN, 2006). Organizations are responsible for ensuring that staffing is sufficient to allow for safe and appropriate delegation of care (ANA and NCSBN, 2006; Cipriano, 2010).

The first source of guidance for delegating tasks to unlicensed individuals is the state nurse practice act (ANA and NCSBN, 2006). The next source of assistance comes from specialty professional organizations. For example, the National Association of School Nurses and the ANA included care coordination, and working with parents, teachers, community members, and “adjunct personnel” (ANA, 2011b, p. 39) in the standards of professional performance for school nurses. Related responsibilities include ensuring optimal outcomes and quality of care.

To delegate effectively, public health nurses must understand the differences between responsibility, accountability, and authority (Weydt, 2010). The nurse may have the authority to delegate certain tasks to another individual or group. That individual or group accepts the responsibility to complete the task, but the nurse retains accountability to ensure the safety and quality of the outcome.

For example, a school nurse has the responsibility to assess a child with physical disabilities and develop a plan of care for that child. Selected aspects of that plan of care, such as assisting with feeding or emptying a catheter bag and recording output, could be delegated to an assistant, provided that person had received appropriate training and was competent to perform the task. This means that it is not adequate that the nurse know the individual has been certified as a nursing assistant; the nurse also needs to know that the individual is competent to safely perform the delegated task. It is important to ensure that those to whom certain tasks have been delegated have been trained to accept the responsibility and carry it out effectively. Public health nurses must also provide adequate time to plan the delegation process and to communicate with the person or group to whom a task is being delegated (ANA and NCSBN, 2006). Communication should occur throughout the process to allow for feedback and clarifications when needed. The nurse retains the legal accountability for safe client care. This responsibility may be shared with the person to whom one is delegating, but accountability is never transferred (ANA and NCSBN, 2006; ANA, 2010).

Critical Thinking

Public health nursing leaders and consultants must be adept at critical thinking. Critical thinking includes analyzing and synthesizing data, using knowledge and values in making judgments, and using creative approaches in decision making and problem solving (Michelangelo, 2013). It includes reflection about the connections between sociocultural and biophysiological aspects

of health status and services. Critical thinking may be fostered through the use of guided group discussions, in which group members are assisted to think about the connections just described and about the distribution effects that decisions may have on others. It is also fostered through activities to stimulate creativity, such as brainstorming. In the example of the occupational wellness program, the nurse manager would need to critically think about ways to increase program quality.

Decision Making

Finally, a core leadership skill is the ability to make decisions effectively. Decision making and problem solving are critical aspects of nursing practice in complex clinical environments (Michelangelo, 2013). This is a two-stage process in which the nurse first must decide how much input to seek from others and second must generate alternatives for the decision and choose among the alternatives. Including others in the decision-making process is beneficial in part because others may have information and ideas that would lead to a better decision, and also because others may support the decision more if they are involved in making it. This also fosters team building and collaboration, which are two competencies for public health nurses (Quad Council of Public Health Nursing Organizations, 2011; Council on Linkages between Academia and Public Health Practice, 2010).

A decision tree can be used for selecting a leadership style that varies from a unilateral, independent decision process, to progressively more participative styles, with the most participative style involving delegating authority to a group that will be responsible for making the decision. Although many assume that autocratic decision making is not effective, in fact it may be both effective and efficient under certain circumstances, such as emergencies. In other situations, it is better to seek input from others, individually or as a group, to seek suggestions for solutions from the group, or to simply turn a problem over to a group to solve on their own.

The next stage of the decision-making process is to generate alternative solutions and to choose among those solutions. Both risk and cost are important dimensions in most situations. The goal involves low cost and low risk to clients and staff. Other dimensions might be unique to the situation. For example, if the nurse is trying to decide whether to develop an in-house wellness program for an occupational setting or to contract with a consulting group for that service, the nurse could compare the risks and benefits of both alternatives. The occupational health nurse might decide that the advantages of an in-house wellness program are that (1) it allows for staff participation in identifying key dimensions and goals and brainstorming creative solutions, (2) participants' values are built into the dimensions and goals, and (3) it allows for both creative and logical thinking processes.

Interpersonal Competencies

Nurse leaders, managers, and consultants need effective interpersonal skills in communicating, motivating, appraising and coaching, contracting, supervising, team building, and promoting diversity.

Communication

Good communication skills, including skills in the use of assertiveness techniques and conflict resolution (P. Kritek, quoted in IOM, 2010, p. 44) as well as communicating through the media and professional and scientific literature, are essential to being effective in leadership roles. Nurses have a particular challenge in communicating because many of those with whom they work may be in a different health profession or in a different field altogether. Nurses often communicate with lay workers or with the public through media outlets such as newspaper columns, television and radio interviews, blogs, and public service announcements. It is especially critical to listen carefully, to make underlying assumptions clear, and to speak in the other's language. This may mean avoiding the use of professional jargon and speaking in more commonly shared language or speaking in the listener's primary language. It is increasingly important for nurses to be bilingual or multilingual, depending on the ethnic composition of the community.

Communication must be culturally competent to be effective. Because communication involves words, tone of voice, posture, eye contact, and spatial relationships, cultural norms often influence the meanings given to different aspects of body language. For example, whereas most advise direct eye contact when communicating, in some cultures this may be viewed as aggressive, especially when the eye contact is prolonged. Some cultures prefer the closer-space relationships that may make others feel they are being crowded. Other aspects of communication are important as well, such as the appropriate place for reprimands. It is never appropriate to reprimand or criticize in public, although public praise is usually an excellent idea. Nurse managers and consultants should be sensitive to the power of written communication and be aware that, although putting a message in writing is a good way to avoid confusion, it also may be seen as aggressive, distrustful, or a bid for power. The key is to make certain that the message that is communicated is the message that was intended. Effective communication skills are listed in Box 40-2.

Creating a Motivating Workplace

One of the more difficult skills to master is motivating other people; in fact, one cannot ever really motivate others, because motivation is internal. However, the skillful leader can create a motivating environment, working to make certain that both individual and agency goals are met to the extent possible.

BOX 40-2 Effective Communication Skills

- Listen actively.
- Restate the main points.
- Speak in the listener's language.
- Maintain culturally appropriate eye contact and body language.
- Provide an appropriate environment.
- Be aware of the power of written communication.
- Use simple, direct words.
- Use "I" statements and say how you feel.
- Provide frequent feedback.
- Reflect on the meaning of the message.

Sometimes individual motivation may be low because employees do not believe they have the skills necessary to achieve their goals, or they believe that the system will not allow them to do so. The effective nurse leader identifies which perceptions are inaccurate and helps individuals develop plans for improving their personal capacities for achieving goals. Although adequate salaries are important, compensation is not the only way to create a motivating environment for professionals. One home health aide supervisor is known for the high level of morale among her staff and the unusually low level of turnover. She makes a point of being available for discussion before the aides leave the agency in the morning and on their return in the afternoon. She always gives each person a birthday card, and thanks them for a job well done. For the long-term good, leaders should work with others in the community to increase salaries if they are not competitive.

Appraisal and Coaching

Employee appraisal and coaching are closely related to motivation and individual development (Mackenzie, 2013). The purpose of performance evaluation is to assist employees to more effectively meet the objectives of their roles and to help them develop their potential in ways that facilitate achieving agency goals. Performance evaluation should not take place just before an annual appraisal interview is scheduled. It should be a regular part of the job, with the manager providing regular feedback on employee progress toward goals. Performance appraisal is particularly challenging for nurse managers because so many community health workers practice independently in the field. For example, nurse managers in home health must plan either to make visits with the nursing staff on a regular basis or to obtain other forms of input on employee performance, such as planning telephone or office conferences with staff.

Coaching involves working one-on-one with others to improve clinical care delivery (Kalkbrenner, 2012). With coaching, managers retain responsibility for decisions but request input and explain decisions. They support progress by helping the employee break the tasks into manageable parts, providing resources for accomplishing tasks and for acquiring the necessary skills, and praising task accomplishment. Coaching is most useful with people who may not yet be skillful in a particular area and who are not confident about their skills.

Supervision

Nurse managers who delegate tasks to others must supervise the completion of those tasks and build in mechanisms to make certain that the tasks are completed safely and effectively (ANA, 2010; ANA and NCSBN, 2006). **Supervision** means decision making and implementation of activities in an ongoing relationship. It may occur either on site when the nurse manager is present and while the activity is being performed, or off site when the nurse is providing care in a community setting. It is important for nurse managers to build effective means of providing off-site supervision because so many community health activities do not take place within a single agency (e.g., home health care occurs in individual homes, and school health services are provided in individual schools).

Handling criticism is a difficult skill that involves both the giving and the taking of criticism related to job performance. Nurse managers should provide constructive critique as close as possible to the time they observe a problem with an employee's job performance. Constructive criticism focuses on the behaviors necessary to meet the job expectations and helps identify sources of problems, resources for managing problem behavior, and feedback. For example, if an employee is chronically tardy, the nurse manager should speak privately with the employee about the job expectation for promptness, identify why the employee is frequently tardy, establish a behavioral goal with time frames and consequences of achieving or not achieving the goal, and assist the employee to develop a plan for achieving the goal. The employee may be unaware of the importance of being punctual and can easily change the behavior. On the other hand, a behavior modification plan may be useful to help change the behavior. Behavioral consequences may include both positive reinforcers, such as praise, and disciplinary measures, such as oral and written warnings, limited raises, suspension, and termination. Suspension and termination are normally used only with problems related to safety, inability to perform job duties, breach of confidentiality, and illegal acts; they are detailed in agency policies and procedures.

Team Building

Finally, team building and managing diversity are group-level skills needed by nurse leaders, managers, and consultants (Armitage and Hingham, 2011). Interprofessional teams increasingly are used to assess clients, plan client care or services, and manage quality improvement activities. Teams may include members of multiple health disciplines as, for example, with community health coalitions. They also may include people from other backgrounds, including lay community health workers. Nurse managers and consultants can facilitate team building by assisting the team to develop goals and ground rules, identifying who will fill various roles and determining how to share leadership, developing strategies for ongoing cooperation and recognition of contributions of each member, and resolving conflict.

Promoting Diversity

A key challenge to nurse managers is promoting and managing diversity in positive ways that value different perspectives and provide insights into culturally competent strategies to eliminate disparities. By 2060, minorities are projected to comprise 57% of the U.S. population (U.S. Census Bureau, 2012). Nurse leaders must work with others to create workplaces that build on the strengths of a diverse workforce to provide excellent health care and eliminate disparities in outcomes. Nurses should partner with schools, faith communities, health care agencies, and universities to encourage minority group members who are interested in nursing careers. This will help build a community nursing workforce that better reflects the population as a whole (Loftus, 2010; Sullivan Commission, 2004). Nurse managers must understand cultural values and norms to communicate effectively and interpret behavior accurately. They must know how to prevent any form of racial, sexual, or ethnic harassment and ensure a positive and welcoming environment in the workplace.

Power Dynamics and Conflict Resolution

Power imbalances can occur within groups, community organizations, and policy-making bodies, and affect health care professionals and community members. Managing power dynamics effectively requires that public health nurses understand community systems, collaboration, and strategies for providing information to empower others to work on their own behalf. Public health nurses work closely with community groups to build capacity for assessing strengths and needs, developing solutions to community health problems and promoting health and wellness, and managing long-term approaches for healthier communities. This is particularly important when working with vulnerable populations (Zandee et al, 2013).

Effective conflict resolution requires negotiation skills as well as skills in recognizing and managing power dynamics. Principled negotiation (Mafalo, 2012) emphasizes collaborative problem solving and development of mutually agreeable ways of achieving goals. Conflict resolution strategies can result in win-win, win-lose, or lose-lose outcomes. Strategies most likely to create win-win situations include collaborating, confronting problems directly, building consensus, and ensuring that all parties have an adequate opportunity for input (Mafalo, 2012).

Population-focused nurse leaders must understand power dynamics. Because nurses possess altruistic values, they may believe that being powerful is not necessary. However, it is impossible to create health-promoting public health services without some legitimacy in decision-making arenas. Membership on community agency boards and advisory committees puts nurse managers in the position to influence service delivery.

Consultants' advice may be followed because the client feels that the consultant possesses superior knowledge or skills and is trustworthy and credible. Internal nurse consultants may have power resulting from their roles in the organization. The client may not feel obligated to implement the recommendations of external consultants. On the other hand, external consultants may be viewed as influential because of an affiliation with other well-known consultants or a national organization. The consultant's ability to persuade clients by offering reasons, new techniques, or methods of problem solving may motivate clients to follow the consultant's advice.

Organizational Competencies

Nurses use organizational skills, such as planning, organizing, implementing, and coordinating as well as monitoring, evaluating, and improving quality. Nurses use these skills when managing programs and projects and when coordinating care for individuals, families, and groups.

Planning

Planning includes prioritizing daily activities to achieve goals. It also includes long-range planning, such as working with nurses in a department to plan a new program. Planning is a collaborative activity that can involve interprofessional teams, community groups, and policy makers. Developing a shared vision, goals, and measurable objectives provides the foundation for a plan. Nurses must be able to anticipate the cost of providing nursing services

to a certain population over a period of time and to develop a proposal (or a **business plan**) for a contract to provide the services. Because planning is primarily a cognitive activity, nurse managers and consultants may tend to lessen its importance and allow little time for adequate planning. However, planning is the basis for direct nursing services and it is an essential competency for population-focused nurse care (ANA, 2013; Quad Council of Public Health Nursing Organizations, 2011), so it is important to make adequate time for planning.

Several documents are available to help nurse managers and consultants plan nursing services. *Healthy People 2020* (USDHHS, 2010) defines the national health goals for the United States by the year 2020 and should be the basis for program planning. The *Healthy Communities Program* (CDC, 2013b) describes strategies for working with community groups to achieve *Healthy People* goals at a local level. The Task Force on Community Preventive Services wrote *The Guide to Community Preventive Services* (CDC, 2013a) to provide evidence-based strategies for community health planning.

Organizing

Organizing involves determining appropriate sequencing and timelines for the activities necessary to achieve goals and arranging for the appropriate people to carry out the plan. Flow sheets and timetables are helpful tools that allow nurse managers and consultants to visualize how tasks are organized and to identify gaps in the planning. Figure 40-1, as shown earlier, illustrates a timetable for conducting a health fair.

Implementing and Coordinating

Implementing and coordinating a plan includes not only following the timelines, but also making certain that the relevant regulations and policies are adhered to, that activities are appropriately documented, and that the work of all team members is coordinated. One strategy that helps ensure coordination is use of an action plan (Mauksch and Safford, 2013). This is a table that includes the program goals and objectives, activities to meet the objectives, identification of those responsible for each activity, the timeframe for completing the activities, and the plan for evaluating achievement of the objectives. Team members should review the action plan at regular meetings and make changes as necessary. Action plans are also used to coordinate care for people with chronic illnesses such as obesity (see, e.g., Mullersdörff et al, 2010). Nurse managers and consultants should give sufficient attention to the change process by helping those involved identify the need for change, keeping them informed, soliciting their input, and making modifications in the plan as necessary.

Monitoring, Evaluating, and Improving

Monitoring, evaluating, and making improvements are critical to nursing services. Nurses should monitor nursing services on a regular basis and make improvements as soon as the need for improvements becomes apparent. Professional standards and the standards of various accrediting bodies guide the focus of monitoring and evaluating. The Joint Commission standards for home health and ambulatory care clinics ([\[.jointcommission.org/\]\(http://www.jointcommission.org/\)\) provide detailed and explicit minimal standards that all such agencies should be expected to meet.](http://www</p></div><div data-bbox=)

In addition to professional standards of practice available from the ANA and specialty nursing organizations, the Agency for Healthcare Research and Quality has published clinical guidelines for prevention and treatment of selected health problems, such as wound care, pain, and tobacco cessation. Using evidence-based clinical guidelines is a key way to improve the quality of care. Finally, nurses should evaluate and monitor changes in client health outcomes. Effective outcomes management programs using information systems can be applied for ongoing planning and program improvements for target populations such as women and children (Monsen et al, 2010).

Fiscal Competencies

Forecasting Costs

Nurse leaders must be skilled in the area of fiscal management. Nurse managers and consultants must be able to project the cost of public health nursing services. This is especially important in today's tight economic environment because the forecast should include an assessment of the risk rating of the likely health and illness experiences of a target population. Combining community health assessment skills, epidemiologic projections, and consultation are key steps in this process and make it possible to design health programs to reduce health risks among various populations. After developing a profile of the anticipated health and illness experiences of a target population, the next step is anticipating the amount and kind of nursing resources needed by the population. These skills are basic to the development of proposals for new nursing services and contracts with external groups.

Develop and Monitor Budgets

Nurse managers have taken on more responsibility for developing and monitoring their own department budgets as agencies have decentralized. They must be able to develop a justifiable **budget** and monitor how actual spending compares with planned spending. Expenses commonly included in an operating budget are salaries and benefits, equipment, supplies, travel, and overhead. It is helpful to obtain staff input when developing a budget in order to make financial projections as realistic as possible. Nurse managers should review program action plans with staff to determine the resources necessary to implement the program. Combining anticipated volume, revenues, and expenses allows the nurse manager to anticipate a breakeven point for new services (i.e., determining when a new program can be expected to be financially self-sufficient).

Variance analysis means identifying the difference between actual and planned results, determining the cause of the variation, and correcting problems when they exist. Spending more than anticipated is not always negative; it may simply indicate that client or service volume was higher than anticipated. This could, however, be of concern in an agency that is fully capitated and receives a set amount of money to see a client for usually a year, regardless of the cost of the services the client needs. Additional services do not bring in additional revenues.

Nurses in fully capitated environments have more opportunity than ever before to focus on health promotion and illness prevention services.

Higher expenses than planned are not always under the control of the nurse manager. For example, if the prevailing wage increases because of changes in the labor market, an agency may spend more than expected on salaries. On the other hand, spending less than predicted does not always indicate that a program is running efficiently; client volume may be down, or staff may not be providing adequate services. The most important thing for a public health nurse to do initially is to monitor expenses carefully and analyze why expenses might differ from the original plan.

For example, if a nurse manager observes that more has been spent on salaries and supplies than originally budgeted, and less on travel, should he or she think this is desirable or undesirable? To analyze the variance, the nurse should ask if the prices for labor and supplies were higher than expected or if the agency has used more nursing time or supplies than planned (Finkler et al, 2012; Talley et al, 2013). The answers to these questions will help determine whether the variance resulted from factors under the manager's control, such as inefficiency, or from factors outside of the manager's control, such as higher wages or higher prices than expected. The answers will also help determine whether the variance resulted from an increase in client volume or an alteration in case mix, with the agency serving sicker clients.

Conduct Cost–Effectiveness Analysis

Regardless of the type of reimbursement system in place, nurses should be able to conduct a simple **cost–effectiveness analysis** of their interventions. Such analyses are not measurements of the efficiency of a program (see Chapter 25 for a discussion of this distinction) but are comparisons of the money spent for the outcomes across two or more interventions. Cost–effectiveness analyses compare alternative approaches for achieving the same goals. The nurse should measure the full costs and benefits (or savings) of each alternative intervention and construct ratios to compare the alternatives. The final result might be stated as the number of people who were able to achieve a desired health outcome (e.g., losing weight or adhering to an exercise program) for each additional dollar spent. The results of cost–effectiveness analyses sometimes raise new questions that must be analyzed. For example, in a study of the cost–effectiveness of varying levels of worksite wellness programs in rural employment sites (Saleh et al, 2010), investigators found that the lower intensity interventions of screening and general awareness were more cost-effective than higher intensity interventions. However, the higher intensity interventions yielded better health outcomes in many areas. What would you recommend to management in an occupational setting, based on these results?

Analytical and Information Competencies

It is increasingly important for nurses to have excellent analytical competencies and competencies in the use of information. For example, access to useful and needed data helps nurses and other

health professionals monitor clinical outcomes, identify systems issues that can result in health care errors, and plan to better meet the health needs of their populations. Population-focused nurses need a good understanding of descriptive and clinical epidemiology as well as the ability to analyze graphical data displays such as histograms, flowcharts, and line graphs. Use of aids such as checklists, reminders, and clinical decision support are all good ways to improve the quality of care and prevent errors (Pardini-Kiely et al, 2010). Because nurses are interested in identifying patterns of health problems, care delivery, and outcomes in community settings, more nurses are including nursing taxonomies (or languages) in electronic client records. Nursing leaders who participate in incorporating electronic records and information systems should have a conceptual framework to guide the project (Englebright et al, 2014).

FUTURE OF NURSING LEADERSHIP

As noted at the beginning of this chapter, as the most trusted profession, nursing is in a position of influence. Using that power in a responsible and effective way is the task of the nurse leader.

With the passage and implementation of the Affordable Care Act of 2010 (ACA), nurses have the opportunity to take a pivotal leadership role in leading the nation in transforming the health care system (Wakefield, 2013). In 2013, Kathleen G. Sebelius, Secretary of the U.S. Department of Health and Human Services, expressed the vital role nurses can play in whether or not the ACA is successful, stating nurses are “at the heart of our healthcare system” (Nurse.com News, 2013). Nurse leaders are needed to provide education to individuals and communities about the ACA and assist them in navigating the health insurance marketplace. The ACA could impact nursing in a variety of ways, including the following: (1) increased nursing workforce needs, (2) an expansion of nursing roles outside of acute care, (3) a need for more nurse practitioners, (4) increased accountability for health care quality and value, and (5) opportunities for the development of innovative nursing care delivery models (Sherman, 2012). Nurse leaders are needed to address these potential influences and to develop innovative solutions to the challenges that arise.

In 2010, the IOM released its landmark report, *The Future of Nursing: Leading Change, Advancing Health*. In this report sponsored by the Robert Wood Johnson Foundation (RWJF), the committee described a vision of a transformed health care system in which quality care is accessible to the diverse populations of the United States, wellness and disease prevention are promoted, health outcomes improve, and compassionate care is provided across the life span (IOM, 2010). To achieve this health care system, the IOM (2010) recommends that the nursing workforce become prepared to “assume leadership positions across all levels” and suggests that nursing have representatives on boards, executive management teams, and in other key leadership positions. By working with policy makers, government leaders at all levels, and advocacy organizations, nurse leaders have the power to change the health care system to provide accessible, quality, evidence-based care to individuals and populations.

PRACTICE APPLICATION

The nurse manager of a nursing clinic in a residential facility for frail older adults approached the local college of nursing for assistance with health promotion and health monitoring activities for the residents. The facility was undergoing renovation and was expected to more than triple its capacity by the time the renovation was completed. The nurse manager thought the health promotion activities that were already in place would be inadequate to serve the growing needs. Most of the residents were more than 70 years of age and had several chronic illnesses. The residential complex was 10 to 15 miles away from health care facilities.

Shirley, the nurse manager, supervised a staff of three nurses and one homemaker aide. She contracted with a local physical therapy firm for services as needed for the residents. Shirley had asked the staff if they thought they could realistically expand their services, and they suggested consultation. The staff commented that residents needed nurses who could provide health monitoring and skilled nursing services in their apartments, because so many were increasingly homebound. Staff members

were hesitant about expanding into home care themselves because they feared it would mean a cutback in the health promotion activities they currently offered. They thought the needs, and the resources that would be required to meet the needs, should be evaluated before making any final decision.

What should the staff do to complete the evaluation of the problem?

- A. Call a meeting of persons affected by the problem and decide on using an internal or external consultant to help evaluate the problem.
- B. Write a contract and indicate how they want the evaluation to be done.
- C. Develop a plan to implement home health services because the plan would include an analysis of needs and resources.
- D. Continue with their health promotion activities and decide about home health services when more resources could be identified.

Answers can be found on the Evolve site.

KEY POINTS

- Nurse leaders may function in formal roles as managers or consultants, or they may use managerial and consulting skills in their everyday clinical practice.
- Nurse leaders, managers, and consultants should work with organizations, coalitions, and community groups to design local strategies that will help achieve the *Healthy People 2020* goals.
- The goals of nursing leadership and management are (1) to achieve organization and professional goals for client services and clinical outcomes, (2) to empower personnel to perform their responsibilities effectively and efficiently, (3) to develop new services that will enable the organization to respond to emerging community health needs, and (4) to work with others for a healthy community.
- Systems thinking promotes sensitivity to the interdependence of parts of a system and the potential causes and consequences of organizational actions.
- Nurse managers may be team leaders or program directors, directors of home health agencies or community-based clinics, or commissioners of health. They function as visionaries, coaches, facilitators, role models, evaluators, advocates, community health and program planners, and teachers. They have ongoing responsibilities for clients, groups, and community health and for personnel and fiscal resources under their direction.
- The goal of consultation is to stimulate clients to take responsibility, feel more secure, deal constructively with their feelings and with others in interaction, and internalize skills of a flexible and creative nature.
- Consultation models can be categorized as content or process models. Process model consultation helps the client assess both the problem and the kind of help needed to solve the problem.
- Consultation involves seven basic phases: initial contact, definition of the relationship, selection of setting and approach, data collection and problem diagnosis, intervention, reduction of involvement and evaluation, and termination.
- Nurse consultants may function as internal consultants within an organization or external consultants outside the client organization.
- Nurse managers and consultants need a wide variety of competencies, including leadership, interpersonal, organizational, and political skills. Leadership skills include abilities to influence others to work toward achieving a vision, empower others, delegate tasks, manage time, and make decisions effectively.
- Interpersonal skills include communication, motivation, appraisal and coaching, contracting, team building, and diversity management skills.
- Organizational skills include planning, organizing, and implementing community nursing services; monitoring and evaluating services; quality improvement; and managing fiscal resources.
- Political skills are those used in negotiation and conflict management and managing power dynamics among health care teams and within the community.
- Population-focused nurses need analytical and informatics skills to be able to identify and monitor trends, improve health care safety, and evaluate outcomes.
- In general, both nurse managers and consultants must hold a minimum of a baccalaureate degree in nursing.

KEY POINTS—cont'd

Organizations employing nurses without this credential should help them obtain additional education in the areas of community or nursing, management theories and principles, and theories and principles of consultation.

- By working with policy makers, government leaders at all levels, and advocacy organizations, nurse leaders have the power to change the health care system to provide accessible, quality, evidence-based care to individuals and populations.

CLINICAL DECISION-MAKING ACTIVITIES

1. Discuss with your class members the implications that managed care and discounted fee-for-service preferred provider organizations have for nurse managers and consultants in community-based organizations and in the public health departments. What other implications can you think of in addition to those described in the text?
2. Draft a vision and mission statement for a nursing clinic with your classmates. Develop goals and objectives that follow the vision and mission you selected. What type of employees would you need to hire? List some of the policies and procedures you would need to have in such a clinic on the basis of your vision, mission goals, and objectives.
3. Have several class members obtain the vision, mission, and philosophy statements from agencies in which students have community health clinical experiences. Compare these statements in terms of the agencies' target populations, basic values, and essential functions.
4. Interview one or more practicing staff nurses working with populations. Ask them to describe the activities of their jobs that could be categorized as consultation. During the interview, attempt to determine the following:
 - A. How they define consultation
 - B. The goals they are attempting to achieve with their consulting activities
 - C. The model they seem to be applying in their consulting activities
 - D. The intervention strategies they use
 - E. Whether their activities are of a generalist or a specialist nature and of an internal or external consultative nature
 - F. The strengths and limitations they perceive in themselves regarding their consultative functions (e.g., education, experiential, organizational, relational, economic)
5. Interview one or more nurse consultants. During the interview, attempt to determine the answers to the preceding questions. Compare the responses of the two groups (public health nurse consultants and population-focused staff nurses). Analyze the factors you think account for the similarities and differences.
6. Visit a nurse-managed clinic for underserved populations. Talk with nurses and other staff members about how they work together as a team and what they do to promote client involvement in determining needed clinic services. Develop a case analysis of the microsystem within the clinic and how clinical care delivery is continuously monitored, evaluated, and improved within the system. What recommendations might you have for strengthening the clinical information system in the clinic?

The Nurse in Home Health, Palliative Care, and Hospice

Karen S. Martin, RN, MSN, FAAN

Karen S. Martin is a health care consultant who has been in private practice since 1993. She works with clinicians, managers, administrators, educators, researchers, and software developers nationally and internationally. Her focus is evaluation and improvement of practice, documentation, and information management systems to meet quality, data exchange, and interoperability standards for electronic health records. Karen has been employed as a staff nurse, director of a combined home care/public health agency, and, from 1978 to 1993, the Director of Research of the Visiting Nurse Association of Omaha, Nebraska, where she was the principal investigator of Omaha System research.

Kathryn H. Bowles, RN, PhD, FAAN

Kathryn H. Bowles is the van Ameringen Professor of Nursing Excellence at the University of Pennsylvania School of Nursing and the Director of the Center for Integrative Science in Aging. For several years, Dr. Bowles was the Director of Nursing Research at the Visiting Nurse Association of Greater Philadelphia and is currently the Beatrice Renfield Visiting Scholar at the Visiting Nurse Service of New York, with a focus on bringing evidence-based practice to home care. Her program of research focuses on improving the care of adults using information technology such as decision support for hospital discharge planning and referral decision making, as well as testing telehealth technologies in community-based settings.

OBJECTIVES

After reading this chapter, the student should be able to do the following:

1. Compare different practice models for home and community-based services.
2. Summarize the basic roles and responsibilities of home health, palliative, and hospice nurses.
3. Explain the professional standards and educational requirements for nurses in home health, palliative care, and hospice.
4. Describe the three components of the Omaha System.
5. Analyze how nurses in home health, palliative care, and hospice use best practices, evidence-based practice, and quality improvement strategies to improve the care they provide.
6. Cite examples of trends and opportunities in home health, palliative care, and hospice involving technology, informatics, and telehealth.

Summary

Home health, palliative, and hospice nursing are rapidly expanding practice specialties. Assessment, planning, intervention, and evaluation are the focus of the services. For the purposes of this chapter, home health, palliative, and hospice nursing refer to a wide variety of holistic services typically provided to clients of all ages in their residences and other noninstitutional settings. Note that some agencies have agreements with work and school settings as well as residential and acute care facilities so that nurses provide services in locations in addition to homes. Mergers and collaborative agreements that cause practice boundaries to blur are increasing rapidly.

Numerous references in this chapter describe home health research, finances, and client personal preference, suggesting that the home is the optimal location for diverse health and nursing services (Buhler-Wilkerson, 2007; Beales and Edes, 2009; Hospice Association of America [HHA], 2010; Ferrante et al, 2010; National Association for Home Care and Hospice [NAHC], 2010; Sternberg et al, 2011; Moorman and Macdonald, 2013; Oguh et al, 2013; Nurse Family Partnership [NFP], 2014; Rockoff, 2014). Client residences include houses, apartments, trailers, boarding and care homes, hospice houses, assisted living facilities, shelters, and cars. Home health, palliative, and hospice services are provided by formal caregivers who include nurses, social workers, physical and occupational therapists, home health aides, chaplains, physicians, and others. Because of the nature of home health, palliative, and hospice

practice, a team approach and interprofessional collaboration are required. The specific disciplines involved vary with the program, the intensity of the client and family's needs, and the location of the program and home.

The Triple Aim model for health care was published in 2008 (Berwick, Nolan, & Whittingham, 2008). However, the primary concepts of the model have been the foundation and core values of home health and related community-based services from their inception: services that are client centered, that involve or engage the client and family, and are of high quality, efficient, and cost effective. The Triple Aim is a good strategy to encourage health promotion, prevention, and healthier lifestyles. However, all illness, including chronic illness, cannot be prevented or cured. As the population ages in this country and internationally, the need for home health, palliative, and hospice services is expected to continue and increase.

Access to other health care professionals, resources, and equipment is very different when home and institutional care settings are compared. Many nurses find home health, palliative, and hospice practice very rewarding because they observe the impact of their services and practice with a high degree of autonomy. Nurses who make home visits need to have good organizational, communication, critical thinking, and documentation skills. They need to understand ever-changing reimbursement regulations. Competence, integrity, adaptability, and creativity are essential characteristics. Home health nurses need

to anticipate danger from people and circumstances in the physical environment to be savvy about their own safety as well as the safety of their clients (Humphrey and Milone-Nuzzo, 2010; Marrelli, 2012).

Home health care is a broad concept and approach to services. It includes a focus on primary, secondary, and tertiary prevention; the primary focus can involve aggregates, similar to other population-focused nurses. (See the **Levels of Prevention** box.) Initiatives involving primary and secondary prevention have always been important to home health care.

LEVELS OF PREVENTION

Home Health

Primary Prevention

The nurse (a) administers seasonal and H1N1 flu vaccine or (b) provides case management interventions so clients obtain the vaccines at convenient locations.

Secondary Prevention

The nurse monitors clients in their homes for early signs of new health problems in order to initiate prompt treatment. When the nurse works collaboratively with the physician and/or nurse practitioner, effective interventions can be provided. An example is monitoring clients for medication side effects.

Tertiary Prevention

The nurse provides instruction about dietary modifications and insulin injections to newly diagnosed diabetic clients. The purpose of these interventions is to prevent development of complications from diabetes. Diabetic clients and their families implement the therapeutic plan with the goal of maintaining the highest possible level of health.

Home health nursing is “a specialty area of nursing practice that promotes optimal health and well-being for patients, their families, and caregivers within their homes and communities. Home health nurses use a holistic approach aimed at empowering patients/families/caregivers to achieve their highest levels of physical, functional, spiritual, and psychosocial health. Home health nurses provide nursing services to patients of all ages and cultures and at all stages of health and illness, including end of life” (American Nurses Association [ANA], 2014, p. 7). Home health nurses include generalist nurses, public health nurses, clinical nurse specialists, and nurse practitioners. They and their interprofessional team members provide diverse services to target populations such as new parents, frail elders, and clients who have injuries, surgery, disabilities, and acute or chronic health problems. Some home health agencies include wellness programs, health fairs, school nurses, communicable disease, and other programs that are similar to public health department.

Hospice and palliative care are equally broad concepts and approaches to care. Hospice and palliative nursing are specialized areas of practice designed to “provide evidence-based physical, emotional, psychosocial, and spiritual or existential care to individuals and families experiencing life-limiting, progressive illness” (HPNA/ANA, 2007, p. 1). The Hospice

and Palliative Nurses Association (HPNA) did not define their specialty in their new 2014 publication, but, instead, endorsed the National Consensus Project of Palliative Care’s (NCP) definition. “**Palliative care** means patient and family-centered care that optimizes quality of life by anticipating, preventing, and treating suffering. Palliative care throughout the continuum of illness involves addressing the physical, intellectual, emotional, social, and spiritual needs and [facilitating] patient autonomy, access to information, and choice” (NCP, 2013, p. 9). The HPNA and others refer to palliative care as a broad term occurring over a longer period of time, and hospice as a subset with a short time period (ANA/HPNA, 2014; Gomes et al, 2013).

In the United States, funding sources determine many aspects of hospice and palliative care. As of 2012, 67% of hospitals were able to support inpatient palliative care programs, an increase from 24.5% in 2000 (Center to Advance Palliative Care (CAPC), 2013; ANA/HPNA, 2014). Lack of funding may decrease the continuity and comprehensive nature of palliative and hospice programs and services and often separate them. Palliative services can be initiated whether or not cure is possible and can be considered a continuum of care. Services are more flexible and reimbursed based on the client’s individual coverage, making funding more challenging. In contrast, hospice involves supportive services when a life-limiting illness does not respond to curative treatment, is the end-of-life portion of the continuum, and is regulated as a 6-month time period by Medicare. The time period is divided into two 90-day certification periods that must be authorized by physicians (Perry and Parente, 2010; Centers for Medicare and Medicaid Services [CMS], 2014a). Advanced practice hospice and palliative nursing are emerging roles. Nurses work closely with members of other disciplines to provide comprehensive interprofessional care; volunteers are important team members.

When entering a home, the home health, palliative, or hospice nurse is a guest and needs to earn the trust of the family and establish a partnership with the client and family (Figure 41-1). It is essential that clients and families are involved in making decisions for home-based services to be efficient and effective. Family is defined by the individual client and includes any caregiver or significant other who assists the client with care at home. Family caregiving involves transportation, helping clients meet their basic needs, and providing care such as personal hygiene, meal preparation, medication administration, and simple as well as complex treatments. Today’s clients and **family caregivers** provide many aspects of care in the home that were previously provided in hospitals or in home by professional caregivers. Care can be confusing, challenging, stressful, and frightening for family caregivers (Buhler-Wilkerson, 2007; Gorski, 2010; Carcone et al, 2012; Moorman and Macdonald, 2013; Oguh et al, 2013; Utens et al, 2014). Clients need to be monitored regularly, and some require 24-hour care. It is likely that family members are grieving when clients receive end-of-life care. Nurses need to identify support services that enable family caregivers to provide care while maintaining their own physical and emotional health status.

EVOLUTION OF HOME HEALTH, PALLIATIVE CARE, AND HOSPICE

Home health care provided by formal caregivers in the United States originated in the nineteenth century. In many communities, the initial programs evolved into visiting nurse associations. The movement expanded rapidly in the United States, resulting in the formation of 71 agencies prior to 1900, and 600 organizations by 1909. Additional historical details are described in [Chapter 2](#) and other publications ([Buhler-Wilkerson, 2002](#); [Donahue, 2011](#)).

Home health services were included as a major benefit when Medicare and Medicaid legislation was passed in 1965 and implemented in 1966. (See [Chapter 5](#), Economics of Health Care Delivery.) Both resulted in significant changes nationally. The Medicare benefit was designed to provide intermittent, shorter visits with temporary lengths of stay to people age 65 and older. Medicaid covered a wider range of services than Medicare, and included children, pregnant women, parents of certain Medicaid-eligible children, and persons with certain disabilities. For clients who qualified for Medicare or Medicaid services, the home health agency was required to develop a plan of care for clients and obtain the signature of a physician.

During the next 30 years, the number of Medicare-certified agencies grew rapidly as a result of the aging population and prospective payment legislation that decreased the length of hospital stays. This trend changed when the Balanced Budget Act of 1997 was enacted, changing the home health payment system from a fee-of-service model to prospective payment based on a standardized assessment completed at admission. The Act prompted the closure of more than 30% of

the country's Medicare-certified home health agencies and a dramatic decline in the number of clients served ([NAHC, 2010](#); [Zerwekh and Warner, 2014](#)).

Hospice care was introduced in the United States in the 1970s by Florence Wald, often referred to as the mother of the hospice movement. Before establishing Connecticut Hospice in 1974, Dr. Wald collaborated with Dame Cicely Saunders, a British nurse, physician, and social worker who founded St. Christopher's Hospice in England in 1967 ([Zerwekh, 2006](#); [ANA/HPNA, 2014](#); [Zerwekh and Warner, 2014](#)). During the same era, Dr. Elisabeth Kübler-Ross, a physician, published *On Death and Dying* (1969), a book that was widely read by the public and health care professionals. Dr. Ross described the inhumanity of a death-denying society such as the United States, the need to provide sensitive end-of-life care and involve clients in choices, and an emphasis on the quality of life ([Zerwekh, 2006](#); [Malloy et al, 2008](#); [Perry and Parente, 2010](#); [Sanders et al, 2010](#); [ANA/HPNA, 2014](#)).

In 1987, the first comprehensive, integrated palliative care program was established at the Cleveland Clinic. In 1999, the Robert Wood Johnson Foundation funded the Center to Advance Palliative Care (CAPC) to stimulate the development of high-quality palliative care programs in hospitals and other health care settings. In 2010, the CAPC convened a consensus panel to establish criteria for palliative care assessment components at hospital admission and during the hospital stay ([Weissman and Meier, 2011](#); [CAPC, 2013](#)). Assessment items include recent history of the illness, pain and symptom assessment, patient-centered goals of care, and transition of care plans. The Center's goal is to help clinicians identify those individuals and their families who need palliative care consultation and then palliative care.

Both home-based and inpatient hospice as well as palliative models share a focus on comfort, pain relief, and mitigation of other distressing symptoms. The purpose of the hospice movement is to humanize the end-of-life experience and provide palliative care. However, because of reimbursement requirements in this country, palliative services are not restricted based on the disease or progress, and may be appropriate for those with a serious, complex illness regardless if they are expected to recover fully, live with a chronic illness for an extended time, or experience serious disease progression ([Perry and Parente, 2010](#); [Sanders et al, 2010](#); [Levine et al, 2013](#); [Wiener et al, 2013](#); [Hill et al, 2014](#)). Medicaid reimbursement for hospice care began in 1980 and Medicare in 1983; reimbursement determines many aspects of the programs, including the types and length of services. For hospice services, physicians need to indicate that clients have six months or less to live, and clients acknowledge that they have a terminal prognosis and select care that is comfortable, not life-extending. Because the time of death is difficult to predict and many people in this country are reluctant to acknowledge a terminal prognosis, hospice care often begins late in the disease process. Barriers and stigmas continue to be associated with hospice for some clients, families, and physicians; because they equate hospice with hopelessness and giving up, they will not consider hospice. A number of the same people are receptive to the concept of palliative care, and

will accept those services (Zerwekh, 2006; HAA, 2010; Perry and Parente, 2010; Levine et al, 2013; Sacco et al, 2013; Hill et al, 2014; Rockoff, 2014).

DESCRIPTION OF PRACTICE MODELS

Population-focused home care, transitional care, home-based primary care, home health, and hospice/palliative care are models in current use. All involve **interprofessional collaboration** as well as a focus on care coordination, critical thinking, best practices, and evidence-based practice. Best practices suggest using credible, established evidence from a variety of sources including research, experience, and expert clinicians; **evidence-based practice** suggests increased emphasis on programs of research that demonstrate consistently good outcomes. The models vary regarding the size and extent of participation, focus of the services, target population, research, political involvement, and funding. With each model, nurses have essential roles in the provision of care, documentation of services, program development and management, outcome and effectiveness analysis, and public education.

Population-Focused Home Care

Using an evidence-based and data-driven approach to population-focused home care, certain models of care delivery have produced superior outcomes. These models usually include structured approaches to regular visits with assessment protocols, focused health education, counseling, and health-related support and coaching.

The Nurse-Family Partnership (NFP) was initiated in 1977 by a researcher, David Olds, and a nurse, Harriet Kitzman; it is probably the best known and well-funded nurse home visit program in the United States (Olds et al, 1997; Kitzman et al, 2000; NFP, 2014). The Partnership involves nurses who provide structured education and case management during regularly scheduled home visits to pregnant women; visits continue until the children's second birthday. Recipients of care have been ethnically diverse, low-income, first-time mothers and their families who lived in New York, Tennessee, and Colorado. The goals of the program are to improve pregnancy outcomes, improve child health and development, and improve economic self-sufficiency of the families. Longitudinal, randomized controlled trials documented numerous life-long improvements in health outcomes that were statistically significant and economically sound. Mothers had fewer children, were more likely to become employed, and were less likely to enter the criminal justice system; children were less likely to be abused; and both mothers and children demonstrated improved health and development. The researchers estimate that nurses visited more than 28,000 families in 43 states in 2013. Testing is beginning internationally. Federal and private funding continues to increase as the program maintains successful outcomes and grows (Olds et al, 1997; Kitzman et al, 2000; Donelan-McCall et al, 2009; Eckenrode et al, 2010; NFP, 2014; Olds et al, 2014).

The Program of All-Inclusive Care for the Elderly (PACE) began in 1972, and is a managed care model of integrated health and personal care services for noninstitutionalized individuals

aged 55 and older who meet frailty criteria (Dobell and Newcomer, 2008; National PACE Association, 2014). Interprofessional care is provided in adult daycare centers with home-based assessments and supportive services also provided as needed. Nurses are essential team members (Madden et al, 2014). Home health care and hospice can be services offered through this model. Because of the model's success and ongoing research, it is now included in Medicare and Medicaid capitation plans. Outcomes include lower rates of hospitalization, readmission, and potentially avoidable hospitalization (Segelman et al, 2014). As of 2014, 104 PACE programs operated in 31 states (National PACE Association, 2014).

Transitional Care

As a result of a fragmented health care system, increasing complexity of client care, and rising costs, transitional care has gained much needed attention in this country and internationally (Meadows et al, 2014). **Transitional care** is defined as "a set of actions designed to ensure the coordination and continuity of health care as clients transfer between different locations and different levels of care in the same location" (Coleman and Berenson, 2004, p. 1). Challenges to quality care originate from a lack of depth, accuracy, and timeliness of information received from the referring site; the need for complex medication reconciliation; and difficulties with communication and coordination among community-based providers.

Transitional care programs that involve home health have emerged as low- and high-intensity interventions that include, but vary from, traditional home care interventions. Low-intensity interventions include coaching, telephone follow-up, and specific disease management programs (Boling, 2009). High-intensity transitional care programs are designed for populations who have complex or high-risk health problems. An example is the Transitional Care Model, where advanced practice nurses perform transitional care from hospital to home providing in-hospital visits and discharge planning followed with home visits, primary care office visits, and telephone follow-up for 1 to 3 months after discharge (Brooten et al, 2001; Naylor, 2004). Numerous studies have been conducted to test the Model with additional high-risk groups (Naylor et al, 1999; Naylor et al, 2007). The research model is currently implemented in **practice settings** in collaboration with major insurance companies and home care agencies (Naylor et al, 2013).

Outcomes achieved with the Transitional Care Model consistently show cost savings and improvements in clinical and quality outcomes for clients receiving the intervention compared with usual care (Naylor et al, 2011). The most common outcome across all populations is a consistent reduction in readmissions to a hospital. The Transitional Care Model strategies emphasize screening in acute care for high-risk clients; engaging the elder/caregiver in designing personalized goals and the plan of care; managing symptoms; educating and promoting self-management; and collaborating with the multidisciplinary team members to assure continuity and a team approach. Both the low and high intensity transitional care programs have spread rapidly into practice as hospitals seek ways to avoid the financial penalties instituted through the

Readmission Reduction Program enacted through the 2010 Patient Protection and Affordable Care Act (CMS, 2013a; Kaiser Family Foundation, 2013).

There are additional transitional care interventions that home health nurses can adopt to improve the safe transition of clients they are admitting to service. For example, home health agencies should work closely with the acute care interprofessional team to educate them about the benefits of home health, and how to identify clients for referral (Bowles et al, 2009; Meadows et al, 2014). Evidence-based discharge decision support software is now available to help those in acute care. The software helps identify patients who need home health care and is having an impact on readmissions (Bowles et al, 2014). Once the referral is made, the home health nurse should request specific information about the hospitalization and what the client was taught to help establish a baseline and develop a care plan (Bowles et al, 2010). Finally, because clients and family caregivers often find it difficult to learn during hospitalization, home health nurses should ask hospital staff what clients were taught about their conditions, medications, self-care, and symptoms. The home health nurse can reinforce information, evaluate the client's ability to adhere to the treatment plan, prioritize the first home visit, and prevent unnecessary rehospitalization.

Home-Based Primary Care

The goal of home-based primary care is to offer clients an alternative to receiving services in a primary care clinic, community center, or physician's office. These clients have functional or other health problems that make the trip from their homes to other care sites very difficult.

The Veterans Health Administration Hospital-Based Home Care Program targets individuals who have complex chronic disabling diseases with the goal of maximizing the independence of the client and reducing preventable emergency room visits and hospitalizations (Beales and Edes, 2009; Marsteller et al, 2009; Sperber et al, 2014; Schectman and Stark, 2014; True et al, 2014). An interprofessional team provides comprehensive longitudinal primary care that incorporates telehealth and electronic health records (EHRs). Nurses serve as case managers, continually evaluate clients' needs, and deliver care. Approximately three fourths of Veterans Health Administration facilities offer the Home Care Program. The program has produced positive outcomes, but many authors describe mixed evidence. They cite veterans' hesitation to use the services; describe the investment of time and effort to create and maintain the provider teams, and challenges with communication; and question if telehealth and telephone contacts are adequate substitutes for in-person care or are supplements to in-person interaction (Beales and Edes, 2009; Marsteller et al, 2009; Chang et al, 2009; Sperber et al, 2014; Bidassie et al, 2014).

In 1967, the American Academy of Pediatrics originated the concept of a **medical home** in an attempt to establish centralized, accessible health care records for medically complex, chronically ill children (Friedberg et al, 2009; Sternberg et al, 2011). Although there are distinct variations of medical homes, the models typically include superb access to care; patient

engagement in care; EHRs that may be client controlled; care coordination; integrated, comprehensive care; ongoing, routine client feedback; and publicly available information about practices (Davis and Stremikis, 2010; Ferrante et al, 2010; Sternberg et al, 2011; Swartwout et al, 2014). More recently, the Centers for Medicare and Medicaid Services (CMS) and politicians supported the medical home as a model to decrease costs and incorporated the concept into health care reform. Nurse practitioners are especially interested in the policy implications and in participating as leaders in this movement (Swartwout et al, 2014). As noted with the Veterans Health Administrations' experiences, the model continues to have supporters, but the effectiveness of the evidence is limited; some medical home interventions may lead to modest improvements in outcomes and moderate cost savings (Leff et al, 2009; Arend et al, 2012; Evans et al, 2013).

Home Health

Staff members of home health agencies provide care at home and help clients and their families achieve improved health and independence in a safe environment. According to CMS (2012a) and NAHC (2010), approximately 12 million clients received **Medicare-certified** home health services in 2010. An unknown number of additional clients receive services from non-Medicare-certified agencies. Persons who were 65 years and older accounted for more than 70% of all home health clients; agencies provide care to twice as many women as men. Recipients of home health services had diverse needs, but circulatory disease was the most common diagnosis, followed by neoplasms and endocrine diseases, especially diabetes. It was estimated that 10,581 Medicare-certified home health agencies employed over one million employees; approximately half of those were clinical staff. In 2012, the estimated number of agencies increased to 12,253 (CMS, 2013b). The size of individual agencies varied from those that employ a few nurses to the Visiting Nurse Service of New York with its 2,600 nurses, more than 20,000 employees, 35,000 census, and 2,425,000 annual visits (VNSNY, 2014).

Annual national expenditures for home health care in 2009 were over 72 billion. Home health accounted for approximately 3% of the country's total health expenditures in contrast to 37% for hospitals and 26% for physicians and clinical services. As the largest payer, Medicare accounted for 41% of total home health reimbursement. In addition to Medicare, state and local governments accounted for 15% of home health reimbursement, Medicaid for 24%, private insurance for 8%, out-of-pocket or private pay 10%, and other sources 2% (CMS, 2012a; NAHC, 2010).

Home health agencies can be divided into six general categories although the distinctions continue to blur as more agency mergers and purchases occur. A description of each follows:

- Official/public: approximately 13% of total home health agencies
- Visiting Nurse Association: approximately 5% of total home health agencies
- Private and voluntary: approximately 6% of total home health agencies

FIG 41-2 Types of home health agencies.

- Combination: approximately 0.3% of total home health agencies
- Hospital based: approximately 12% of total home health agencies
- Proprietary: approximately 62% of total home health agencies (Figure 41-2)

Official or public agencies receive tax revenue and are operated by state, county, city, or other local government units, such as health departments. Typically, official agencies also offer well-child clinics, immunizations, health education programs, and home visits for preventive health care.

Visiting Nurse Associations are usually freestanding, voluntary, nonprofit organizations governed by a board of directors, and usually financed by earnings and tax-deductible contributions. Sometimes they are categorized with combination agencies because of their similar characteristics.

Voluntary and private agencies are nonprofit home health agencies and usually receive some funds from United Way, donations, and endowments. Currently, there are about the same number of voluntary and private agencies.

Combination agencies have characteristics of both governmental and voluntary agencies. The number of combination agencies continues to decrease although some are large agencies.

Hospital-based agencies grew rapidly during the 1970s and 1980s when the advent of diagnostic-related groups led to earlier hospital discharges. Some hospitals and their home health agencies are separating because of recent changes in Medicare reimbursement.

Proprietary agencies are free-standing, for-profit agencies that are required to pay taxes. Many are part of large chains. Proprietary agencies now dominate the industry.

In addition to Medicare-certified home health agencies, there are other agencies that are not certified. These are often private agencies, governed by individual owners or corporations that offer private duty, home health aide, and homemaker services.

Although the programs, size, administration, organization, and board structures of Medicare-certified agencies differ, they must meet ever-changing licensure, certification, and

accreditation **regulations** established by national and state groups (Buhler-Wilkerson, 2007; NAHC, 2010; Fazzi et al, 2010a; Fazzi Associates, 2010b). The primary source of those regulations is CMS (2012b; NAHC, 2010). To be Medicare-certified, key criteria identified in the Conditions of Participation are (a) the client must be home-bound; (b) services must be intermittent and include a skilled service provided by a nurse, physical therapist, or speech and language pathologist; (c) a plan of care must be initiated and followed; and (d) Medicare forms, physician orders, and client records must be completed on a timely basis. **Skilled nursing services** is the Medicare term that describes the duties of the registered nurse, and refers to the requirement of nursing judgment. Those services involve assessment, teaching, and selected procedures. Using Omaha System terms, the focus of assessment is Environmental, Psychosocial, Physiological, and Health-related Behaviors while interventions are categorized as Teaching, Guidance, and Counseling; Treatments and Procedures; Case Management; and Surveillance (Martin, 2005; Monsen et al, 2011; Omaha System, 2014).

The Conditions of Participation are lengthy, complex, and subject to change. OASIS was mandated as one portion of the conditions in 1999 and is described later in this chapter. Beginning in 2011, the physician or the allowed nonphysician practitioner need to have a face-to-face encounter prior to signing orders and initiating care. Agencies provide orientation and review sessions for all clinicians, but often employ one or more nurses as experts to ensure that their agencies are compliant. These nurses need to be detail oriented, and develop skills by reading and rereading the Conditions, attending workshops or classes, and communicating with peers. In addition to their daily responsibilities, these nurses usually serve as leaders when surveyors, accreditors, and auditors visit.

Hospice and Palliative Care

Hospice and palliative care are similar and, yet, very different. Similarities that are described throughout this chapter include a client-focused approach, holistic and evidence-based practice, emphasis on ethics, communication skills, interprofessional collaboration, care coordination, focus on transitions of care, and caregiving skills including symptom management and pain control. The Hospice and Palliative Nurses Association (HPNA) is an umbrella organization that represents hospice and palliative nurses and other members of the team employed in home-based organizations as well as acute and long-term care, outpatient, and other settings (ANA/HPNA, 2014). The organization's mission is to advance expert care during serious illness; it is based on four pillars of education, advocacy, leadership, and research. Differences between hospice and palliative care include the length of care, frequency and intensity of services; the maturity of the practice within agencies; and funding sources and regulations that directly impact care. Hospice is a formalized program in hospice and home health agencies. For that reason, it is the focus of this section of the chapter. Palliative care has no specific federal designation as a specialty; rather it exists as a consultative discipline delivering a philosophy of care. Palliative care clinicians must meet the regulatory requirements

for home health or other setting where they practice (ANA/HPNA, 2014).

The Trajectories of Palliative Care includes similarities and differences between hospice and palliative care. Palliative care is an extended continuum of chronic serious illness to acute serious illness during which stabilization and exacerbations may occur. Services and treatment will vary during this time. The continuum encompasses diagnosis and limited signs and symptoms, increasing severity of signs and symptoms, onset of a relatively short period of hospice care, death, and bereavement care for family members.

Hospice programs are usually operated and staffed as independent entities or corporations even when they are part of a larger organization because of the specialized nature of the practice and the complex regulations and financial requirements. An increasing number of home health agencies are establishing palliative programs as a subspecialty of their home health program or a subspecialty in their hospice program. In neither case is there a Medicare, Medicaid, or other funding source specific to palliative care as there is to hospice. Similarly to home health, hospice and palliative providers introduce clinicians to the regulations, but employ nurse experts who are responsible for current knowledge of the ever-changing clinical and financial rules. Responsibilities of the experts include orientation, performance improvement, documentation, and compliance.

More than 1 million clients received Medicare-certified hospice services in 2010 with an average stay of 71 days. The average length of stay will rise if home health nurses and others provide information about end-of-life hospice care to clients and families, and hospice becomes more widely accepted by the public. Health care professionals and the media are making slow progress to introduce palliative care and hospice services (Candy et al, 2011; Weissman and Meier, 2011; CAPC, 2013; Sacco et al, 2013; Rockoff, 2014). However, because of the hospice stigma, more home health agencies are developing palliative care programs that do not include the 6-month admission requirement. Even when nurses, physicians, and others discuss quality of life and encourage the transition from palliative services to hospice, clients and/or families may continue in denial and not accept hospice until the last several days of life. Brief stays make it difficult for the hospice team to provide comprehensive, more cost-effective services to clients and families. For many in this country, death is not viewed as a normal or natural part of the life cycle (Rockoff, 2014).

Initially, cancer was the primary diagnosis of most clients in hospice programs. Currently, cancer is the diagnosis of about one third of hospice clients, and various neurologic, cardiac, and other end-stage diseases comprise two thirds of the diagnoses. Palliative care expanded from the hospice model. Clients who receive palliative care have diverse chronic illness diagnoses (Zerwekh, 2006; NAHC, 2010; HAA, 2010; Perry and Parente, 2010; Candy et al, 2011; ANA/HPNA, 2014).

Medicare, Medicaid, managed care, private insurance, and private donations fund most hospice services. Medicare reimbursement accounts for almost 85% of the total while private insurance is approximately 8%, Medicaid is 5%, and other

sources are 3%. The number of Medicare-certified hospices grew from 31 in 1984 to 3,407 in 2010. Hospice services account for approximately 2.8% of the total Medicare budget, just less than home health services (CMS, 2013b). Typically, services are provided nationally based on Medicare criteria although there are differences based on the Medicare intermediaries. More diversity occurs with non-Medicare sources of reimbursement. For example, each state administers and funds its own Medicaid programs, and criteria for hospice admission, types and locations of services, types of clinician providers, number of visits, and length of stay vary.

Medicare-certified hospice programs are not required to complete OASIS. Instead, the industry has been developing quality measures that will be reported by providers. CMS has mandated that hospices begin their data set reporting process with two measures: one that is client related and one that is structural. It is expected that the number of measures will increase as the industry identifies, proposes, and refines a data set. It is likely that new CMS regulations will include a Hospice Information Set (HIS) and that hospice reimbursement will be reduced just as home health reimbursement is scheduled for reduction (CMS, 2014a; Fazzi Associates, 2014; Martin and Utterback, 2014).

After the client acknowledges a terminal prognosis and selects comforting care rather than life-extending or curative care, hospice organizations coordinate services in partnership with the client and family and provide financial case management. The four types of care and the percentage used were (1) routine home care with intermittent visits, 96.5%; (2) continuous home care when condition is acute and death is near, 1.1%; (3) general inpatient/hospital care for symptom relief, 2.2%; and (4) respite care in a nursing home of no more than 5 days at a time to relieve family members, 0.2% (NAHC, 2010; HAA, 2010).

Medicare-certified hospice providers can be divided into the following four general categories:

- Home health agencies: approximately 17% of total hospice providers
- Hospital-based facilities: approximately 16% of total hospice providers
- Skilled nursing facilities: approximately 0.6% of total hospice providers
- Free-standing facilities: approximately 67% of total hospice providers (NAHC, 2013a)

The focus of hospice care is comfort, peace, and a sense of dignity at a very difficult time, a focus that is similar to palliative care. Comprehensive services emphasize continuity of care. According to Zerwekh (2006), hospice addresses four foci: (1) attention to the body, mind, and spirit; (2) death is not a taboo topic; (3) health care technology should be used with discretion; and (4) clients have a right to truthful discussion and participation in treatment decisions. Hospice is the only Medicare benefit that includes medications, medical equipment, 24-hour/seven-day-a-week access to care, and support for family members after death. Those who receive Medicare-certified hospice services are evaluated during the 6-month period to determine if they are eligible to continue.

The client's family and friends are essential hospice team members who are involved in symptom and medication management, personal care, and the use of supplies. Death produces intense emotions even when family members have prepared for it. Bereavement services that are part of hospice involve attending the funeral or other services for the deceased client, and contact at anniversaries of death, holidays, and the client's birthday for 13 months after the client's death. Hospice organizations usually offer support group opportunities for families or refer them to support groups in the area (Malloy et al, 2008; Levine et al, 2013; Wiener et al, 2013).

The interprofessional hospice team includes nurses, physicians, social workers, therapists, chaplains, counselors, aides, pharmacists, and volunteers. Volunteers are an important part of the team. In 2009, there were approximately 102,000 employees and 50,000 volunteers; nurses, aides, and social workers were the largest groups of employees (NAHC, 2010). Most agencies and team members consider conferences and continuing education essential to develop and renew their skills involving topics such as end-of-life comfort measures, new medications and treatments, compassion fatigue, spirituality, complex family dynamics, and cultural awareness. Working with clients who are dying involves unique emotional stress; hospice programs address the team's well-being as well as that of the clients and families (Hinds et al, 2005; Zerwekh, 2006; ANA/HPNA, 2014; HAA, 2010; Mack and Joffe, 2014).

Home Care of Dying Children

"The death of a child alters the life and health of others immediately and for the rest of their lives" (Hinds et al, 2005, p. S70). The needs of dying children and their families are unique because of the degree of emotional impact, and because the young are not expected to die or precede the death of their parents. It is essential that nurses understand the child's physical, cognitive, psychosocial, and spiritual development and family dynamics, cultural heritage, and spiritual beliefs in order to provide appropriate pain management, assist the child and family to communicate with each other, advocate for their needs in the community, and provide case management and continuity of care (Hinds et al, 2005; Hinds et al, 2012; Levine et al, 2013; Wiener et al, 2013; Hill et al, 2014; Mack and Joffe, 2014).

Bereavement programs as described for hospice programs are especially important for families who have lost a child. Parents, grandparents, and siblings can participate in a variety of support groups offered by the hospice program or other bereavement organizations (Levine et al, 2013; Wiener et al, 2013).

SCOPE AND STANDARDS OF PRACTICE

Nursing is a theory and practice-based profession that incorporates art and science. Examples of nursing, family, and systems theories are mentioned and summarized in other chapters of this book. Chapter 7 focuses on cultural diversity. Many publications are available, including an article about students and cultural awareness (Mager and Grossman, 2013). Chapter 15

HOW TO Use a Hospice Approach to Care in Any Setting

The hospice philosophy of care means providing comfort measures to individuals before death and support for their families before and after death. Individuals may be any age. Death may occur in the individual's home, a hospital setting, or an uncontrolled setting such as the community. How does one adapt nursing care in any situation? What basic skills can professional caregivers use that can be applied in any situation or setting? How do professional caregivers adapt to the death of a hospice client, inpatient death, or a sudden, unexpected death where, for example, many people have died as a result of a natural disaster or a terrorist act?

- Be prepared. Consider your own philosophy of death so that you can assist others without distraction when that time comes.
- Cultures vary in their beliefs about and responses to death. Know the differences in cultural responses so that you can effectively help people in their time of need.
- Death events cannot be totally controlled even in a hospice environment where the eventual death has been illustrated to family and friends and the dying individual before the death. Expect the unexpected and take cues from the client and the loved ones regarding their needs.
- Shock, disbelief, and crisis reactions occur even with prepared, hospice deaths. Ask family and caregivers what they need; provide them with the basics such as food or blankets; provide comfort; if it is not contraindicated, provide the family/friends with personal effects or mementos of the individual; give sensitive, caring support. Sit with them and listen.
- In a disaster, the philosophy of care is to provide the greatest good to the greatest number of people. Using triage, the needs of those with less severe injuries have priority over the needs of those who are closer to death. Responsibilities of caregivers and health professionals will be stretched to the maximum. A leader for a group of clients needs to be identified and must delegate responsibility to a caregiver who can assist the dying and their loved ones.

From Mistovich JJ, Karren KJ: *Prehospital Emergency Care*, ed 10, Upper Saddle River, NJ, 2014, Pearson Education.

addresses evidence-based practice; the concept is addressed frequently in this chapter, and two examples are included. Melnyk is one of the most prolific authors on this topic (Melnik and Fineout-Overholt, 2011; Malloch and Melnyk, 2013; Melnyk et al, 2014). Several chapters of this book describe the Quad Council's (2011) eight domains of practice; those domains are linked to information in this chapter in the Linking Content to Practice box.

The **nursing process** is the theoretical framework used by the ANA, which notes that the nursing process is the essential methodology by which client goals are identified and achieved. Their scope and standards publications, including those for home health nursing and palliative nursing, are organized according to the nursing process and contain two sections: the Standards of Care and the Standards of Professional Performance (ANA, 2014; ANA/HPNA, 2014). Both include the six steps of the nursing process: assessment, diagnosis, outcomes identification, planning, implementation, and evaluation; the steps are linked to standards and more specific measurement criteria that are stated in behavioral objectives. The standards address quality of care, performance appraisal, critical thinking

LINKING CONTENT TO PRACTICE

The Nurse in Home Health, Palliative Care, and Hospice

The individuals, families, and communities served by home health, palliative, and hospice nurses are described throughout this chapter as are the knowledge, skills, and attitudes of nurses who function well in those settings. The descriptions are evident in the text, clinical examples, boxes/figures/tables, references, and other parts of the chapter. The competencies in this chapter are congruent with the following core competencies of the [Quad Council's Domains of Public Health Nursing \(2011\)](#): (1) Analytic/assessment skills, (2) Policy development/program planning skills, (3) Communication skills, (4) Cultural competency skills, (5) Community dimensions of practice skills, (6) Basic public health sciences skills, (7) Financial planning and management skills, and (8) Leadership and systems thinking skills. Students and new graduates cannot be expected to have developed all of these skills when they begin home health or hospice practice ([Mager and Grossman, 2013](#)). However, as nurses proceed in their career development and gain valuable work experience, they will progress along the novice to expert continuum.

skills, education, collegiality, ethics, collaboration, research, and resource use.

OMAHA SYSTEM

According to [Clark and Lang \(1992\)](#), “If we cannot name it, we cannot control it, finance it, teach it, research it or put it into public policy” (p. 27). The [Omaha System](#) was initially developed to operationalize the nursing process and provide a practical, easily understood, computer-compatible guide for daily use in diverse community settings. It is the only ANA-recognized terminology developed inductively by and for nurses who practice in the community. Approximately 21,000 multiprofessional clinicians, educators, and researchers use Omaha System point-of-care [electronic health records \(EHRs\)](#) across the continuum in the United States and other countries, and 2000 more use paper-and-pen records. EHRs are longitudinal collections of clinical and demographic client-specific data that are stored in a computer-readable format. By 2005, 85% of all counties in Minnesota had one or more public health or home care agencies or schools/colleges of nursing using Omaha System software. That number continues to increase. During 2014, Minnesota became the first state to recommend that the Omaha System be used as a standardized terminology in the EHRs of all community health care settings in the state. Details about Omaha System application, users, case studies, inclusion in reference terminologies, research, best practices/evidence-based practice, and listserv are described in publications and on the website ([Martin, 2005](#); [Martin et al, 2011](#); [Omaha System, 2014](#); [Topaz et al, 2014](#)).

Description of the Omaha System

As early as 1970, the nurses, other staff, and administrators of the Visiting Nurse Association (VNA) of Omaha, Nebraska, began addressing [nursing practice](#), [documentation](#), and [information management](#) concerns. Information management is the integration of clinical, demographic, financial,

administrative, and staffing data; manipulation or processing of these data; and production of various reports that transform data into meaningful information for decision making ([Martin, 2005](#)). At that time, clinicians were not using computers, and there was no systematic nomenclature or classification of client problems and concerns, interventions, or client outcomes to quantify clinical data and integrate with a problem-oriented record system. Between 1975 and 1993, the VNA of Omaha staff conducted four extensive, federally funded development and refinement research studies that established reliability, validity, and usability of the Omaha System. The result of the research was the Problem Classification Scheme, the Intervention Scheme, and the Problem Rating Scale for Outcomes. These three components of the Omaha System were designed to be used together, be comprehensive, relatively simple, hierarchical, multidimensional, and computer compatible. The Omaha System has existed in the public domain since the initial research in 1975. Because it is not held under copyright, software companies can use it as the foundation of their software without obtaining licenses or paying fees. They are expected to replicate the structure, terms, and codes as presented, and cite their source ([Martin, 2005](#); [Martin et al, 2011](#); [Omaha System, 2014](#)).

As depicted in [Figure 41-3](#), the Omaha System conceptual model is based on the dynamic, interactive nature of the nursing or problem solving process, the practitioner–client relationship, and concepts of diagnostic reasoning, critical thinking, and quality improvement. The client as an individual, a family, or a community appears at the center of the model. This location suggests the range of Omaha System application, client-centered care, and the essential partnership between clients and practitioners. More recently, the term

FIG 41-3 Omaha System model of the problem-solving process. (From Martin KS: *The Omaha System: a key to practice, documentation, and information management*, reprinted ed 2, Omaha, NE, 2005, Health Connections Press.)

Client engagement has been used to describe this partnership, especially in acute care practice. Most nurses and other clinicians employed in community settings recognized that partnership was essential from the beginning of their employment. The outer circle is the practitioner–client relationship. Additional details about the conceptual model are described in the following paragraphs.

The Omaha System was intended for use by nurses and all members of the health care delivery team. The goals of the research were to (1) develop a structured and comprehensive system that could be both understood and used by members of various disciplines, and (2) foster collaborative practice. Therefore, the Omaha System was designed to guide practice decisions, sort and document pertinent client data uniformly, and provide a framework for an agency-wide, multidisciplinary clinical information management system capable of meeting the daily needs of clinicians, managers, and administrators (Martin, 2005; Garvin et al, 2008; Correll and Martin, 2009; Westra et al, 2010; Martin et al, 2011; Monsen et al, 2011; Omaha System, 2014).

Problem Classification Scheme

The **Omaha System Problem Classification Scheme** is a comprehensive, orderly, nonexhaustive, mutually exclusive taxonomy designed to identify diverse clients' health-related concerns. Its simple and concrete terms are used to organize a

comprehensive assessment, an important standard of nursing practice. The Problem Classification Scheme consists of four levels. Four domains appear at the first level and represent priority areas. Forty-two terms, referred to as client problems or areas of client needs and strengths, appear at the second level. The third level consists of two sets of problem modifiers: health promotion, potential and actual, as well as individual, family, and community. Clusters of signs and symptoms describe actual problems at the fourth level. The content and relationship of the domain and problem levels depicted in **Box 41-1** are further illustrated by the case example at the end of this chapter. Understanding the meaning of and relationships among the terms is a prerequisite to using the scheme accurately and consistently to collect, sort, document, analyze, quantify, and communicate client needs and strengths.

Intervention Scheme

The **Omaha System Intervention Scheme** is an important standard of nursing practice in providing interventions. Four broad categories of interventions appear at the first level of the Intervention Scheme. An alphabetical list of 75 targets or objects of action and 1 “other” appear at the second level. Client-specific information generated by clinicians is at the third level. The contents of the category and target levels are depicted in **Boxes 41-2** and **41-3**, respectively. The Intervention Scheme provides the terms for care plans and services. It enables

BOX 41-1 Domains and Problems of the Omaha System Problem Classification Scheme

Environmental Domain

Material resources and physical surroundings both inside and outside the living area, neighborhood, and broader community:

- Income
- Sanitation
- Residence
- Neighborhood/workplace safety

Psychosocial Domain

Patterns of behavior, emotion, communication, relationships, and development:

- Communication with community resources
- Social contact
- Role change
- Interpersonal relationship
- Spirituality
- Grief
- Mental health
- Sexuality
- Caretaking/parenting
- Neglect
- Abuse
- Growth and development

Physiological Domain

Functions and processes that maintain life:

- Hearing
- Vision
- Speech and language

- Oral health
- Cognition
- Pain
- Consciousness
- Skin
- Neuro-musculo-skeletal function
- Respiration
- Circulation
- Digestion-hydration
- Bowel function
- Urinary function
- Reproductive function
- Pregnancy
- Postpartum
- Communicable/infectious condition

Health-Related Behaviors Domain

Patterns of activity that maintain or promote wellness, promote recovery, and decrease the risk of disease:

- Nutrition
- Sleep and rest patterns
- Physical activity
- Personal care
- Substance use
- Family planning
- Health care supervision
- Medication regimen

BOX 41-2 Categories of the Omaha System Intervention Scheme

Teaching, Guidance, and Counseling

Activities designed to provide information and materials, encourage action and responsibility for self-care and coping, and assist the individual, family, or community to make decisions and solve problems.

Treatments and Procedures

Technical activities such as wound care, specimen collection, resistive exercises, and medication prescriptions that are designed to prevent, decrease, or alleviate signs and symptoms for the individual, family, or community.

Case Management

Activities such as coordination, advocacy, and referral that facilitate service delivery; promote assertiveness; guide the individual, family, or community toward use of appropriate community resources; and improve communication among health and human service providers.

Surveillance

Activities such as detection, measurement, critical analysis, and monitoring intended to identify the individual, family, or community's status in relation to a given condition or phenomenon.

From Martin KS: *The Omaha System: A Key to Practice, Documentation, and Information Management*, reprinted ed 2, Omaha, NE, 2005, Health Connections Press.

clinicians to describe, quantify, and communicate their practice, including improving or restoring health, describing deterioration, or preventing illness.

Problem Rating Scale for Outcomes

The **Omaha System Problem Rating Scale for Outcomes** consists of three five-point, Likert-type scales for measuring the entire range of severity for the concepts of Knowledge, Behavior, and Status. Each of the subscales is a continuum providing a framework for measuring and comparing problem-specific **client outcomes** at regular or predictable times, because evaluation is an important standard of nursing practice. Suggested times include admission, specific interim points, and discharge. The content and relationships of the scale are depicted in **Table 41-1**. Using the Problem Rating Scale for Outcomes with the Problem Classification Scheme and the Intervention Scheme creates a comprehensive problem solving model for practice, education, and research.

PRACTICE GUIDELINES

Nursing practice is based on education, experience, and evidence. Because home health, palliative, and hospice nurses usually work with clients and their families in their homes, they must develop skills to conduct home visits efficiently, effectively, and safely (**Box 41-4**). A positive attitude about client-centered care, the nurse–client partnership, and patient engagement is essential. Critical thinking skills are also essential. Effective care coordination requires familiarity with community resources. Knowledge and skills involving medications, treatments, documentation, and equipment are necessary. Excellent strategies include accompanying skilled home health, palliative, and hospice nurses when they make home visits as well as having

BOX 41-3 Targets of the Omaha System Intervention Scheme

anatomy/physiology	medication administration
anger management	medication coordination/ordering
behavior modification	medication prescription
bladder care	medication set-up
bonding/attachment	mobility/transfers
bowel care	nursing care
cardiac care	nutritionist care
caretaking/parenting skills	occupational therapy care
cast care	ostomy care
communication	other community resources
community outreach worker services	paraprofessional/aide care
continuity of care	personal hygiene
coping skills	physical therapy care
daycare/respite	positioning
dietary management	recreational therapy care
discipline	relaxation/breathing techniques
dressing change/wound care	respiratory care
durable medical equipment	respiratory therapy care
education	rest/sleep
employment	safety
end-of-life care	screening procedures
environment	sickness/injury care
exercises	signs/symptoms-mental/emotional
family planning care	signs/symptoms-physical
feeding procedures	skin care
finances	social work/counseling care
gait training	specimen collection
genetics	speech and language pathology care
growth/development care	spiritual care
home	stimulation/nurturance
homemaking/housekeeping	stress management
infection precautions	substance use cessation
interaction	supplies

expert mentors. However, novice nurses also need a commitment to life-long learning, practice, and self-evaluation (Zerwekh, 2006; Humphrey and Milone-Nuzzo, 2010; Abele and Nies, 2011; Marrelli, 2012). The following is a brief summary of steps included in a home visit; these steps can be modified slightly for other noninstitutional settings:

- Review client data, including the referral from the intake department, hospital discharge summary, orders, and plan of care to become familiar with the client's history, purpose of the visit, and expectations.
- Contact the client or family by calling the telephone number listed on the referral information to obtain agreement for the visit, schedule the day and time, and discuss the address.
- Gather agency and Medicare forms, a nursing bag, cellular phone or pager, portable computing device, teaching

TABLE 41-1 Omaha System Problem Rating Scale for Outcomes

Concept	1	2	3	4	5
Knowledge: Ability of client to remember and interpret information	No knowledge	Minimal knowledge	Basic knowledge	Adequate knowledge	Superior knowledge
Behavior: Observable responses, actions, or activities of client fitting occasion or purpose	Not appropriate behavior	Rarely appropriate behavior	Inconsistently appropriate behavior	Usually appropriate behavior	Consistently appropriate behavior
Status: Condition of client in relation to objective and subjective defining characteristics	Extreme signs/symptoms	Severe signs/symptoms	Moderate signs/symptoms	Minimal signs/symptoms	No signs/symptoms

BOX 41-4 Guidelines for Home Health and Hospice

- You are a guest in your client's home and neighborhood. Your behavior and your manners must convey that you recognize this role.
- Respect the client's cultural, religious, and ethnic heritage. Hesitate before contradicting that heritage. Clients are more likely to follow their heritage than your advice.
- The client may not respect your cultural, religious, and ethnic heritage. If you are a male nurse, the client may expect, and even request, a female nurse. Develop interpersonal skills—and a tough skin.
- Almost every home health client has family members, significant others, or friends who offer advice and can serve as either your advocate or your foe. Try to enlist them as your advocate.
- The client "owns" the health-related problem that initiated your services. That problem is just one portion of the client's past, present, and future. Thus it is the client who experiences, learns to understand, and ultimately solves the problem. It is your goal to help clients and their families become independent as quickly as possible. Talk to your peers and supervisors if you sense that you may be losing that perspective.
- Enjoy the unique autonomy and challenges of providing highly complex care in the home and community setting. Home health practice requires integration of high-technology skills, teaching, case management, and monitoring. Remember the need and benefits of collaboration with other members of the health care team. The nurse is usually responsible for judging whether or not the client can safely remain at home. However, data and information to support this and other decisions need to be communicated with team members orally and through the electronic health record.
- Maintain your sense of humor. You will need it!

Adapted from Black JM, Hawks JH: *Medical Surgical Nursing*, ed 8, St Louis, 2009, Saunders, p. 94.

materials, and supplies; understand the client's location; follow the agency policy when checking-out for the visit.

- Observe the neighborhood for resources and safety when approaching the client's home.
- Greet the client/family to begin developing a positive, appropriate professional relationship; involve them as much as possible during the visit and post-visit activities.
- Obtain signatures and complete needed forms.
- Provide care by completing a comprehensive assessment, identifying client problems, providing interventions, and evaluating client outcomes. Interventions may include teaching, guidance, and counseling; treatments and procedures; case management; and surveillance (Martin, 2005).

- Discuss the plan of care with the client and family during informal or formal conferences; modify as needed.
- Document some or all of the visit details in the home, preferably while using a portable computing device and an EHR.
- Discuss the next visit as well as follow-up activities and referrals.
- Proceed to the next scheduled visit after checking in, according to the agency policy.
- Complete remaining visit documentation, submit forms, coordinate referrals to other community resources, and communicate with agency colleagues, the referral source, physicians, and others as appropriate. Obtain revised orders if needed.
- Revisit to reassess the client and provide care.

Clinical Example from Community-Focused Practice

The example describes an innovative and collaborative community-focused program developed in Tucson, Arizona, by the Pima County Health Department and the Pima County Public Library (Innes, 2012; Robert Wood Johnson Foundation (RWJF), 2013). The Library requested that the Health Department hire a social worker to increase safety and a welcoming environment in five high-risk libraries. Concerns included loitering, behavioral health concerns, encampment, and abandonment. Many patrons were homeless and/or had chronic diseases that were not being managed. Children and elders were left at the library by family members while they completed errands or went to work.

After a root-cause analysis was conducted and a logic model developed, the decision was made by Kathleen Malkin, Public Health Nursing Division Manager, and the Health Department and Library management staff to hire one full-time public health nurse in January 2012, a first in this country. It was decided that a nurse could better meet the identified needs of the patrons and library staff. In addition to increasing safety and a welcoming environment, a goal was to coordinate with community resource agencies to provide nutritious snacks for children and reduce hunger concerns.

During the first year, the program expanded to include five public health nurses working in six high-risk libraries. They made 180 visits to the libraries and had 2,181 patron encounters. Client problems and clinician interventions were documented. The most frequently identified problems were health care supervision, nutrition, circulation, hearing, personal care,

and cognition. The nurses instructed the library staff on communicable disease prevention topics. During the first year, calls made to the police and 911 were reduced by 6% and calls to 911 for medical emergencies were reduced by 20%.

In the second year, the program expanded to 13 library sites, including two bookmobile sites serving rural communities. Student nurses assisted the public health nurses as they completed community assessments and tailored services to the needs of each library. Working with library patrons, nurses completed 3,746 encounters and 1,160 assessments; 1,420 health education sessions; and 192 referrals for services. They also provided health education to 76 library staff members. During the third year, nurses provided diverse health education and services to patrons. Services include assistance applying for public or private insurance, diabetes education, flu vaccine, and health education for library staff.

Using the Omaha System and an automated documentation system to capture community-level data had numerous benefits. Included were communication between the nurses and between the nurses and their health department; an evidence-based approach to practice; a standardized method of assessment, care planning, services, and evaluation; and a process that generated accurate and consistent data capable of conversion to information and useful reports.

PRACTICE LINKAGES

There are no limits to the diversity of clients who live in the community, their problems, and their strengths; the interventions that nurses provide; and the client outcome data that are generated. Although many examples are diverse, as can be seen in the practice application on [page 907](#), they represent a small fraction of the actual roles and responsibilities of home health, palliative, and hospice nurses. The examples illustrate fundamental principles of professional practice: (1) a holistic approach to the steps of the nursing or problem solving process; (2) client engagement or a partnership with clients as unique individuals, families, and communities; and (3) a focus on outcomes.

The following sections of the chapter are designed to increase the reader's understanding about the links between systematic best practices, evidence-based practice, and other aspects of the home health, palliative, and hospice milieu. The typical nurse will not be involved with the theme of each section daily, but will over a period of months.

Setting short- and long-term goals provides criteria for evaluation and increases continuity of care and the potential for improved outcomes. Research has shown that goals set with the client rather than for the client are more successful regarding self-motivation, adherence, and attainment ([Evans et al, 2013](#); [Sacco et al, 2013](#); [Naylor et al, 2013](#); [Bowles et al, 2014b](#)).

Outcome and Assessment Information

The Centers for Medicare and Medicaid Services (CMS) mandated the [Outcome and Assessment Information Set \(OASIS\)](#) as part of the Conditions of Participation for Medicare-certified home health agencies in 1999 ([Fazzi Associates, 2010b](#); [CMS,](#)

FIG 41-4 The outcome model. (From Centers for Medicare and Medicaid Services: *Outcome-based quality improvement [OBQI] implementation manual*, August 2010, p. 2.9.)

[2012b](#); [O'Connor and Davitt, 2012](#)). Completion of OASIS provides a systematic comparative measurement of client outcomes at two points in time. The goal of OASIS is to demonstrate improved, cost-effective client outcomes as a result of home health services for agency reports and for public reporting. It was designed to represent selected core items that are a part of a comprehensive assessment for an adult, nonmaternity home health client, and form the basis for measuring client outcomes for outcome-based quality improvement. OASIS also provides data for calculating the agency's reimbursement, and promotes a standardized approach to surveys ([Figure 41-4](#)) ([CMS, 2012b](#); [Fazzi Associates, 2010b](#); [NAHC, 2013a](#); [Fazzi Associates, 2014](#)).

OASIS-C has had major revisions to improve its comprehensiveness, ease of use, reliability, and validity. The current version has 114 data elements or structure/process/outcome items, each followed by a list of choices or fill-in-the-blanks. The next revision, OASIS-C1, consists of approximately 110 data elements and is compatible with ICD-10. OASIS-C1 was scheduled to replace OASIS-C late in 2014. However, due to delays in the implementation of ICD-10, a modified OASIS-C1 (referred to as OASIS-C1/ICD-9 version) was created and implemented January 2015 ([CMS, 2015](#)). OASIS-C1/ICD-10 version will go into effect when the ICD-10 is implemented ([CMS, 2015](#)). (See Resource Tool 41.A on the Evolve website for one part of this assessment.)

OASIS is a complex and important component of home health practice. A nurse or other clinician provides care in the client's residence. While providing care, the clinician collects and completes the functional, demographic, and clinical data assessment items, the primary sections of OASIS. The goal of data collection is to use an evidence-based approach to care; generate outcomes data across time; improve communication among the agency's clinicians, other agency staff, and external groups; and improve reimbursement.

Registered nurses or physical, occupational, or speech and language pathology therapists complete OASIS items at the start of care, after hospitalization, at the 60-day recertification date following admission, at discharge, and at other points in time.

Clinicians need to complete the initial OASIS accurately and consistently to reflect a client's actual status, and integrate OASIS with the other portions of the agency's comprehensive assessment. They or their colleagues compare initial data to future versions as do Medicare surveyors and reimbursement reviewers. Many home health agencies use a computerized clinical information system so that the clinician completes OASIS electronically; regardless, final data from OASIS must be submitted to CMS electronically.

OASIS offers a challenging assignment for those who provide direct care, and one that requires extensive orientation and review. In many agencies, nurse experts serve as compliance officers to help ensure accurate and consistent completion. Not only is evidence of the quality of care related to OASIS, but so is agency reimbursement and a publically available comparison to other agencies. Agencies may receive sanctions or be denied payment by CMS for services already provided based on claims data, audits, or surveys that reflect responses on OASIS. More recently, agencies have received Additional Development Requests (ADRs) generated by CMS. ADRs require agencies to submit extensive verification that the services they provided were essential; if verification is not adequate, agencies must initiate a legal appeal or return funds to CMS.

Target areas for emphasis on OASIS mirror challenges identified by nurses and home health agencies. Included are diabetic foot care, fall prevention, depression intervention, pain, pressure ulcers, safety, medication management, and infection control. Box 41-5 illustrates M2000 from OASIS, one of the items related to medication management. Although all target areas are important, the latter two are of special concern to many nurses employed in hospice and palliative programs as well as diverse public health and other health care settings; they are summarized below.

Medication Management

Medication management is an important component of home health practice. The goal is to assist clients and family caregivers to become independent and reliable in managing medication administration at home, and prevent rehospitalizations. However, home health clients experience many challenges

including the complexity of their chronic conditions, cognitive status, coordination of their medical care, drug–drug interactions and side effects of medications, and cost. Many home health clients are expected to take ten to thirty prescription and over-the-counter medications throughout the day. Too often, the number of medications is more than is clinically indicated, and results in increased confusion, urinary incontinence, increased weakness, and changes in sleeping patterns. Riker and Setter (2012) describe this as *polypharmacy*, and discuss its assessment, causes, and management.

Corbett et al (2010) found that medication discrepancies were astoundingly widespread during the transition from hospital to home. In their study of 101 subjects, 94% had at least one discrepancy, most had 3.3, and some had more; discrepancies were identified in almost all classes of medications. Home health nurses expect to spend considerable time with medication reconciliation, and address medications during initial and subsequent home visits. Unlike clients in residential settings, home health clients may or may not have all of their medications, may not take them as ordered, and may store them inappropriately. When nurses ask to see medications, they are often given a box or bag that includes current medications and ones that are extremely outdated or were prescribed for other family members.

Home health nurses use numerous interventions including those that are evidence-based. Teaching clients to use a medication organizer for oral medications is frequently an initial intervention. However, that does not ensure that medications will be taken appropriately; subsequent teaching, return demonstrations, and surveillance are essential. In addition, clients and caregivers need diverse materials about medication benefits, interactions, and side-effects as well as the steps they should take to communicate that information to others. Materials need to be simple, understandable, and in the appropriate language. Clients who cannot read need graphic materials.

Many tools are available in addition to those specific for home health nurses. Morisky and his colleagues (1986) were early researchers who established concurrent and predictive validity for a four-item self-reported medication scale; they continued to expand their research. Corbett et al (2010) emphasized the need for sufficient medication teaching at hospital discharge, accurate assessment at home care admission, and the use of more sophisticated Agency for Healthcare Research and Quality (AHRQ) toolkits. The 17 toolkits are designed for professionals, clients, and consumers for use in acute care settings and at home (AHRQ, 2011). Reidt et al (2014) conducted a study to explore the benefit of a pharmacist serving as a home health agency team member; findings included a positive clinical impact on clients. An excellent, comprehensive resource is the Medication Adherence Educators Toolkit, the product of a competition by schools of pharmacy (AACP/NCPA, 2013). It consists of four sections: assessing medication adherence, improving medication adherence through the use of aids, empowering patients to improve medication adherence, and resolving barriers to medication adherence. The toolkit includes evidence-based detailed information that addresses literacy, e-reminders, interprofessional practice, and cultural awareness.

BOX 41-5 Example of an Item from OASIS-C

M2000 Drug Regimen Review: Does a complete drug regimen review indicate potential clinically significant medication issues (for example: adverse drug reactions, ineffective drug therapy, significant side effects, drug interactions, duplicate therapy, omissions, dosage errors, or noncompliance [non-adherence])?
 0—Not assessed/reviewed [Go to M2010]
 1—No problems found during review [Go to M2010]
 2—Problems during drug review
 NA—Patient is not taking any medications [Go to M2040]

Centers for Medicare and Medicaid Services (CMS): OASIS C1. 2015. Available at <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HomeHealthQualityInits/OASIS-C1.html>. Accessed April 24, 2015.

As experienced in an evidence-based practice improvement project at a large home care agency in the northeastern United States, other factors such as dementia and medication nonadherence present challenges. Home care nurses searched and critically evaluated the literature to find and use evidence-based screening tools to identify clients with cognitive impairment and medication adherence issues and created plans of care based on the latest published evidence to address these issues (Ferrar et al, 2012).

Infection Prevention

Infection prevention is an important priority in home health and hospice practice. Infection prevention usually focuses on wound care, and invasive devices such as urinary and intravenous catheters as well as chest, tracheostomy, gastrostomy, and other tubes. Preventing infection by promoting appropriate vaccinations such as flu and pneumonia is also a priority. Most importantly, nurses need to assume that every client is potentially infected or colonized with an organism that can be transmitted, and recognize that all blood and body secretions may contain transmissible agents. They need to be familiar with the infectious process, research evidence and best practices, bag technique, personal protective equipment, cleaning equipment, medical waste management, and infection control programs. Nurses need to practice sound technique during each and every client encounter (see [How To](#) box).

HOW TO Promote Infection Prevention Standards

The practice of standard precautions means that all blood and body fluids must be treated as potentially infectious. Standard precautions are implemented to prevent exposure and infection of family caregivers and health care providers.

- Use extreme care to prevent injuries when handling needles, scalpels, and razors. Do not recap, bend, break, or remove needles from syringes before disposal. Discard needles and syringes in puncture-resistant containers made of plastic or metal and dispose of them as directed by agency policy or community guidelines.
- Wear barrier precautions such as gloves, masks, eye covering, and gowns when contact with blood and body fluids is expected. Use masks in combination with eye protection to eliminate contact with respiratory secretions or sprays of blood or body fluids during invasive respiratory procedures or wound irrigations.
- Use aseptic technique with all sterile injection equipment.
- Double bag and discard soiled dressings or other materials contaminated with body fluids in polyethylene garbage bags.
- Clean kitchen counters, dishes, and laundry with warm water and detergent after use. Clean bathrooms with a household disinfectant.
- Hand hygiene is the single most important practice in preventing infections. Hand hygiene should be performed before and after providing client care and before and after preparing food, eating, feeding, or using the bathroom.
- For clients with multidrug resistant organisms, limit the amount of nondisposable equipment brought into the home; use disposable stethoscopes, etc. when possible.

Nurses need to become familiar with evidence-based practice literature specific to infection prevention. The Centers for Disease Control and Prevention (CDC) offers a variety of materials including guidelines to prevent the most frequent infections (CDC, 2014). Publications by other authors describe home health and hospice infection prevention and control programs and lessons learned as well as nosocomial and health care acquired infections (Swanson and Jeanes, 2011; McGoldrick, 2013; Poff et al, 2014). Evidence-based publications are also available that target specific therapies and illustrate the translation of research into practice. Gorski (2004, 2010) is a home infusion therapy expert and has published extensively about central venous access devices (CVADs). Gorski states that infections are preventable when four topics are implemented consistently: attention to hand hygiene, site assessment and care, use of aseptic technique with all infusion-related procedures, and thorough education for the client and family. In 2013, the American Society for Parenteral and Enteral Nutrition (ASPEN) published a comprehensive set of recommendations about parenteral nutrition safety (Ayers et al, 2014). Specific details about parenteral nutrition infusion and blood samples are described in the Evidence-Based Practice box.

EVIDENCE-BASED PRACTICE BOX

The question "What practices maintain patient safety during the infusion of parenteral nutrition?" is included in ASPEN's parenteral nutrition safety publication. One of the 18 recommendations for this question is vascular access devices used for parenteral nutrition administration should not be used to obtain blood samples for laboratory tests unless no peripheral access is available. Evidence indicates that vascular access devices are a leading cause of serious adverse complications, in particular, central-line associated bloodstream infection. In addition, blood specimens drawn from vascular access devices have resulted in incorrect values and inappropriate treatment. When the recommendation was followed in recent years, infection rates were reduced substantially. Many home care organizations have added this recommendation to their protocols; all should do so.

Nurse Use: Nurses who provide parenteral nutrition care in the home should become familiar with this comprehensive publication.

From Ayers et al: A.S.P.E.N. parenteral nutrition safety consensus recommendations. *JPEN J Parenter Enteral Nutr* 38:296–333, 2014.

ACCOUNTABILITY AND QUALITY MANAGEMENT

Evidence-Based Quality/Performance Improvement

All providers, whether they are within community-based settings, hospitals, long-term care, or private practices, are accountable to their clients, reimbursement sources, and professional standards. Accountability is directly linked to quality or the degree to which health services for individuals, families, and communities increase the likelihood of desired health outcomes, and are consistent with current professional knowledge. Florence Nightingale is often credited with establishing standards of care, demonstrating the value of evidence-based practice, and analyzing health-related outcome data successfully.

Most home health, palliative, and hospice providers have a long history of evaluating the quality of care they provided to their clients. Often, agencies use a systematic, triangulated approach in their pursuit of excellence that includes hiring qualified personnel, new employee orientation, mentoring programs, case conferences, supervisory shared visits, record audits, utilization reviews, quality studies, client satisfaction surveys, in-service education, recognition for outstanding performance, and annual evaluations. Some agencies became accredited as a way to distinguish themselves from other providers.

The sophistication of quality and performance improvement strategies used in home health, palliative care, and hospice has dramatically improved in recent years. Changes were prompted by the interest in research-based practice that has evolved into programs of research and evidence-based practice, use of computers and the Internet, guidelines developed by the [National Quality Forum \(2014\)](#), and the mandate from Medicare to use OASIS and Outcome-Based Quality Improvement. Nurses should have access to current research literature, critique that research, and apply it to their practice ([Melnyk and Fineout-Overholt, 2011](#); [O'Connor and Davitt, 2012](#); [CMS, 2014b](#); [Melnyk et al, 2014](#)). Several frameworks have been described to guide evidence-based practice projects ([Levin et al, 2010](#); [Melnyk and Fineout-Overholt, 2011](#); [Malloch and Melnyk, 2013](#)).

Evaluating the quality of care professionally and legally should be done in many ways, but documentation is of special significance. The steps of the nursing process must be documented and include communication with team members, physicians, and community resources. It is through the clinical record that nurses demonstrate that they are delivering quality care and identifying strategies to improve the quality of care.

Outcome-Based Quality Improvement

Outcome measurement and cost control are the focus of the CMS [Outcome-Based Quality Improvement \(OBQI\)](#) program. Their definition of outcomes is (1) health status changes between two or more time points, where the term “health status” encompasses physiologic, functional, cognitive, emotional, and behavioral health; (2) changes that are intrinsic to the client; (3) positive, negative, or neutral changes in health status; and (4) changes that result from care provided or natural progression of disease and disability, or both ([CMS, 2014b](#)).

Data from OASIS-C are part of the two-stage CMS OBQI framework to produce various reports (see [Figure 41-5](#)). The first stage, outcome analysis, enables an agency to compare its performance to a national sample, note factors that may affect outcomes, and identify final outcomes that show improvement in or stabilization of a client's condition. Comparing agency data and trends to a national sample is also known as [benchmarking](#), an analysis process that has been used by many businesses but is relatively new to health care. CMS collects and publishes Health Compare Scores publicly. The second stage, known as outcome enhancement, enables the agency to select specific client outcomes and determine strategies to improve care. Reports include agency-client-related characteristics (case mix), potentially avoidable events (adverse event outcomes), and end-result and utilization outcomes. The reports are for a

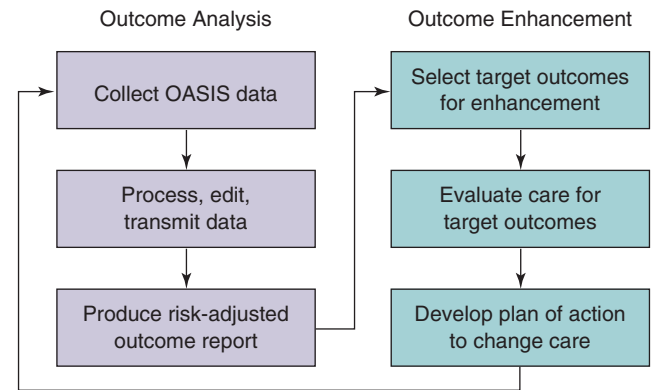

FIG 41-5 Two-stage Outcome-Based Quality Improvement framework. (From Centers for Medicare and Medicaid Services: *OASIS-C guidance manual*, December 2012b, p. F.3.)

12-month period, the agency's previous 12-month period, and national reference or comparative data. Comparisons are risk adjusted for client differences, both over time for the agency and between the agency and the reference group. Similarly to OASIS, a detailed manual describes the OBQI program; the most recent manual was published in 2010 ([CMS, 2014b](#)).

Accreditation

Home health and hospice providers participate in several different continuous quality improvement options. They may elect to meet the [accreditation](#) standards of one of the following groups and complete the Medicare survey according to their guidelines: the Joint Commission, the Community Health Accreditation Program of the National League for Nursing, or the Accreditation Commission for Health Care. If providers do not seek accreditation, Medicare surveyors will conduct regular reviews. In 2007, the Public Health Accreditation Board was established to offer national public health accreditation. Because some home health and hospice programs are integrated with health departments, they will participate in public health accreditation ([PHAB, 2014](#)).

After an agency applies for accreditation, a lengthy self-study must be completed that addresses all aspects of the agency's operation, and an accreditation team schedules a site visit. Both accrediting organizations review agencies' organizational structure, compliance with Medicare Conditions of Participation, care provided during home visits and documentation of those visits, and the outcomes of client care with a focus on improved health status. Site visitors accompany nurses and other clinicians on home visits to observe the steps of the problem-solving process in action. To maintain accreditation, agencies must follow guidelines and undergo periodic reviews. In the future, accreditation may become a requirement for licensure of all home health agencies.

PROFESSIONAL DEVELOPMENT AND COLLABORATION

Education, Certification, and Roles

Nurses are employed in home health, palliative care, and hospice from a variety of educational and practice backgrounds. They

should be educated to function at a high level of competency so that they can be relied on not only by their professional colleagues, but also by the community. They have diverse roles and responsibilities in their practice settings; autonomy is a fundamental characteristic that was mentioned earlier in this chapter. Nurses are responsible for basing their practice on research evidence. A growing number of home health, palliative, and hospice nurses are conducting research; some are members of interprofessional research teams. Their studies add to the body of knowledge for evidence-based practice, especially when the focus is outcomes of care. The application of existing evidence and generation of new research must be priorities to increase the quality and cost-effectiveness of care (Smith, 2012; Mager and Grossman, 2013; ANA, 2014; ANA/HPNA, 2014).

The educational preparation of the 132,400 nurses employed in home health agencies varies greatly (NAHC, 2010). According to the ANA (2014), a baccalaureate degree in nursing should be the minimum requirement for entry into professional practice. According to the 2014 Home Health Nursing Scope and Standards, completion of a baccalaureate degree is the appropriate and preferred educational preparation. Roles for nurses include care management and coordination of care, education, advocacy, administration, supervision, and quality improvement. The nurse with a baccalaureate degree functions in the role of a generalist, providing skilled nursing and coordinating care for a variety of clients. Nurses with a master's degree are prepared for roles as clinical specialists, nurse practitioners, researchers, administrators, or educators. Educational programs are increasing to prepare nurses for advanced practice roles in home health. As home health continues to expand, the need for specialized nurse clinicians will also increase to meet the highly technological and complex care needs of individuals, families, and communities. In managed care, more clinical specialists will be needed to provide case management and to develop programs to meet the needs of the population served by the managed care network. Nurse practitioners can provide primary care to frail older adults and other homebound clients.

The Hospice and Palliative Nurses Association (HPNA) offers many conferences, certification examinations, and credentialing (ANA/HPNA, 2014). There are approximately 14,000 credentialed registered hospice and palliative nurses. Licensed registered nurses may qualify for two levels of specialty practice certification that are differentiated by education, complexity of practice, and performance of certain nursing functions. Generalists provide direct care, function as educators, case managers, nurse clinicians, administrators, and other roles. The advanced practice certification is for a nurse prepared at the master's level or higher as a clinical nurse specialist or nurse practitioner. Roles of the advanced practice nurse include expert clinician, leader and facilitator of interprofessional teams, educator, researcher, consultant, collaborator, advocate, case manager, or administrator.

Interprofessional Collaboration

Typically, home health, palliative, and hospice nurses are members of interprofessional teams. The primary goal of the team is to help clients achieve their maximum level of health,

BOX 41-6 Factors for Successful Interprofessional Collaboration

Knowledge

1. Understand how the group process can be used to achieve group goals.
2. Understand problem solving.
3. Understand role theory.
4. Understand what other professionals do and how they view their roles.
5. Understand the differences between client levels of acuity across levels of care, including acute care, home care, ambulatory care, and long-term care.

Skills

1. Use principles of group process effectively.
2. Communicate clearly and accurately.
3. Communicate without using the profession's jargon.
4. Express self clearly and concisely in writing.

Attitudes

1. Feel confident in role as a professional.
2. Trust and respect other professionals.
3. Share tasks with other professionals.
4. Work effectively toward conflict resolution.
5. Be flexible.
6. Adopt an attitude of inquiry.
7. Be timely.

self-care, and independent functioning in a safe environment. Medicare regulations, professional organizations, and state licensing boards influence team composition and functions. Box 41-6 shows successful interprofessional collaboration depending on the knowledge, skills, and attitudes of each team member. When team members work collaboratively in partnership with clients, families, and volunteers, the plan of care can be implemented effectively and reinforced by all. Although each team member has a specific responsibility, any overlap in responsibilities can be beneficial for reinforcement. Team members communicate through e-mail, phone calls, and face-to-face case conferences to review the plan of care, client progress, and team effectiveness (Martin, 2005; Zerwekh, 2006; Humphrey and Milone-Nuzzo, 2010; Marrelli, 2012).

Details about the role of nurses have been described in other sections of this chapter. Nurses often serve as the team leader or care manager in part because nursing service may be the client's primary need. Larger agencies may expand their nursing services to include wound and ostomy, intravenous, psychiatric/mental health, nurse practitioner, and other nursing specialists.

Physicians are an integral part of interprofessional teams; they submit initial and interim orders and review and sign the initial and updated plan of care. Many agencies hire a physician on a part-time basis or have an agreement with a physician who serves as a voluntary consultant. Because state laws are changing rapidly, nurse practitioners are increasingly involved and may have responsibilities similar to physicians. In addition, agencies may have specialized services such as podiatrists, pharmacists, registered dietitians, respiratory therapists, music therapists, psychologists, and chaplains.

FIG 41-6 Interprofessional team. (From www.omahasystem.org/photogallery.html. Used with permission from Karen S. Martin, RN, MSN, FAAN.)

The services of physical therapists, occupational therapists, speech and language pathologists, social workers, and home health aides are available in most agencies. They may be employed by the agency or hired through contractual agreements. Their roles are summarized below.

- Physical therapists: Provide maintenance, and preventive and restorative treatment that includes strengthening muscles, restoring mobility, controlling spasticity, gait training, and teaching active and passive resistive exercises.
- Occupational therapists: Focus on upper extremities to restore muscle strength and mobility for functional skills and performance of activities of daily living.
- Speech and language pathologists: Evaluate speech and language abilities, develop a plan of care, and teach clients to improve their communication involving speech, language, or hearing.
- Social workers: Help clients and families manage social, emotional, and environmental factors that affect their well-being through identification and referral to appropriate community resources.
- Home health aides: Provide personal care and assist with activities of daily living under the supervision of nurses or physical therapists. Home health aides or homemakers may also help with light housekeeping, laundry, meal preparation, and shopping.

LEGAL, ETHICAL, AND FINANCIAL ISSUES

The potential for human error as well as illegal and unethical activity exists in every health care organization. Examples of Medicare fraud and abuse in home health and hospice include inappropriate use of services, excessive payments to administrative staff or owners, “kickbacks” for referrals, and billing for visits and/or medical supplies that are not authorized or not provided. In addition, the complex regulations of CMS are difficult to understand and have not been interpreted consistently by Medicare surveyors.

Nurses are confronted with legal and ethical issues regularly. They need to be familiar with the living will, power of attorney for health care and do-not-resuscitate documents. In addition, they need to be informed about local, state, and federal regulations that govern their profession and nursing license; and those that govern their employers. They need to be alert for potential problems or violations and identify solutions in a proactive manner. The privacy guidelines of the Health Insurance Portability and Accountability Act of 1996 ([USDHHS, 2014a](#)) ensures protection of clients’ personal health information and includes provisions about informed consent. The legislation also allows clients full access to their health care records ([Marquis and Huston, 2011](#); [Smith, 2012](#)).

Nurses are expected to follow professional, legal, and ethical standards to deliver care to clients, develop trusting relationships, act as client advocates, and help clients and families increase their self-advocacy skills. Because these responsibilities can produce tension, nurses need to recognize their personal values and biases to make certain they do not interfere with those of clients and families. Nurses should continually reassess client and family needs to avoid inappropriate use and overuse of services. The safety of clients who live alone as well as family caregiver neglect and/or abuse are ethical concerns. If the clients’ needs are greater than what reimbursement allows, nurses need to talk to the clients, their families, and agency personnel to consider alternatives. In addition, many agencies have established ethics committees to assist with ethical dilemmas.

Home health, palliative, and hospice nurses are at risk for malpractice claims related to the complexity of care, failure to adhere to standards of practice, and other errors ([Marquis and Huston, 2011](#); [Smith, 2012](#)). Nurses and their employers need to be proactive by taking responsibility for personal and agency actions. A focus on communication with clients, families, and the health care team; commitment to providing quality care; documentation refresher sessions; performance improvement programs; use of evidence-based practice guidelines; and appropriate use of information technology and telehealth are strategies that can help reduce risks.

Reimbursement for home health, palliative care, and hospice is complex and tenuous; historical milestones are described earlier in this chapter, and more details about economics and reimbursement are included in [Chapter 5](#). Medicare, state and local governments, Medicaid, and managed care are the principal funding sources for home health and hospice ([Buhler-Wilkerson, 2007](#); [HAA, 2010](#); [NAHC, 2010](#); [Fazzi et al, 2010b](#); [NAHC, 2013a](#); [Zerwekh and Warner, 2014](#); [Fazzi Associates, 2014](#)). If clients meet the eligibility criteria for the Conditions of Participation, Medicare is used as their primary payment source. When clients no longer meet those criteria and still require care, their services may be reimbursed by Medicaid, private insurance, donations, or the agency’s United Way and other special needs funds. Home health and hospice providers are watching closely to see what impact the 2010 Patient Protection and Affordable Care Act (ACA) will have on their clients and programs ([Kaiser Family Foundation, 2013](#); [Zerwekh and Warner, 2014](#); [Fazzi Associates, 2014](#)). Several provisions may

be beneficial to rural agencies, improve transitions of care, provide more preventive services, and offer more options to those who are disabled to live at home rather than in long-term care facilities. Other provisions may be negative: hospice providers have new regulations involving medications, reimbursement for visits is being questioned more aggressively, and Medicare funding to home health is scheduled to decrease. In addition, the increasing speed of consolidation and merger of health care systems is resulting in closures of facilities or reduction of services that include home health agencies.

Nurses who work in home health, palliative care, and hospice are involved with financial aspects of care to a greater extent than most other nurses. Nurses and their social work colleagues must be well informed about services that are covered by Medicare and other funding sources, and recognize how tenuous those funding sources are. Clients and families often ask for help to understand decisions about care and the numerous notices and bills that they receive. Nurses participate directly in decisions about the frequency, length, and type of client services, and their documentation needs to accurately support those decisions. Nurses must be knowledgeable about the reimbursement of medical supplies and should discuss problematic situations with clients, families, and agency personnel. Clients and families may be unhappy when their specific requests cannot be granted.

TRENDS AND OPPORTUNITIES

National Health Objectives

The overarching goals of the *Healthy People 2020* objectives (USDHHS, 2014b) are as follows:

- Attain high-quality, longer lives free of preventable disease, disability, injury, and premature death.
- Achieve health equity, eliminate disparities, and improve the health of all groups.
- Create social and physical environments that promote good health for all.
- Promote quality of life, healthy development, and healthy behaviors across all life stages.

Nurses who work with clients and families in the home and community have opportunities to promote achievement of key objectives. They can assess client status, identify available resources and gaps to meet client needs, encourage clients and families to use resources, and coordinate care with other providers and community agencies. They can participate in numerous population-level projects and campaigns.

The Healthy People 2020 box highlights objectives relevant to home health and hospice nurses. Note that many objectives relate to lifestyle issues. With appropriate health education, referral to community resources, and follow-up, there is a potential to reduce morbidity and mortality and decrease chronic disabilities. Nurses can make important contributions on one-to-one and population-focused levels.

Organizational and Professional Resources

It is increasingly important for nurses to be involved in political, economic, and regulatory issues at the local, state, and national

HEALTHY PEOPLE 2020

Examples of National Health Objectives for the Year 2020

- AOCBC-11: Reduce hip fractures among older adults.
- C-1: Reduce the overall cancer death rate.
- C-13: Increase proportion of cancer survivors beyond 5 years.
- CKD-9: Reduce kidney failure due to diabetes.
- HD-3: Reduce stroke deaths.
- HDS-1: (Developmental) Increase overall cardiovascular health in the U.S. population.
- HDS-5: Reduce the proportion of persons in the population with hypertension.
- IID-4: Reduce invasive pneumococcal infections.

U.S. Department of Health and Human Services: *Healthy People 2020: 2020 Topics and Objectives-Objectives A-Z*. 2014b. Available at <http://www.healthypeople.gov/2020/topicsobjectives2020/default.aspx>. Accessed May 6, 2014.

levels before they affect practice and services to clients. Joining organizations, reviewing the Internet, networking with colleagues, and reading professional literature provide opportunities to become informed and influence decisions.

Nationally, several prominent home health organizations have extensive resources and websites. The National Association for Home Care & Hospice (NAHC) is a trade organization formed in 1982. A few years later, the Hospice Association of America (HAA) and NAHC developed an organizational partnership. Many agencies join as members, but nurses can also participate in the nursing section after joining as individual members. Lobbying is NAHC's primary focus; it also schedules an annual meeting, publishes a journal (*Caring*), and offers educational opportunities. The Visiting Nurse Association of America, formed in 1983, has a similar focus, but membership is limited to community-based, nonprofit home health and hospice providers. *Home Healthcare Nurse*, *Home Health Care Management and Practice*, *Family and Community Health*, *Journal of Community Health Nursing*, and *Home Health Care Services Quarterly* are additional journals for home health clinicians and managers.

Hospice and palliative care organizations also have extensive resources and websites. The National Hospice and Palliative Care Organization was formed in 1978 to stimulate public and professional interest. The Hospice Foundation of America was founded in 1982; its initial mission was fundraising. The Hospice Nurses Association was formed in 1986. About 12 years later, the organization expanded and became the Hospice and Palliative Nurses Association (HPNA), and also changed the name of its national certification board. HPNA now has more than 11,000 members. The organization schedules conferences, publishes the *Journal of Hospice and Palliative Nursing*, and offers certification and credentialing. The *American Journal of Hospice and Palliative Care*, *Journal of Pediatric Oncology Nursing*, *International Journal of Palliative Nursing*, and other related journals address nursing practice, pain control, oncology, and medical practice. It is interesting to note that the title of the organization's publication changed from *Hospice and Palliative Nursing Scope and Standards of Practice* in 2007 to *Palliative Nursing: Scope and Standards of Practice—An Essential*

Resource for Hospice and Palliative Nurses in 2014 (HPNA/ANA, 2007; ANA/HPNA, 2014).

Home health, palliative, and hospice nurses belong to a variety of specialty organizations such as Infusion Nurses Society; Wound, Ostomy, and Continence Nurses Society; American Public Health Association; and Healthcare Information and Management Systems Society along with nurses employed in diverse settings. It is important that they share their knowledge about community-focused practice by being active members, speaking, and writing for publication.

Technology, Informatics, and Telehealth Technology

Advances in technology, informatics, and **telehealth** are pervasive in health care and nursing practice; they are a window to the present and future. Many home health and hospice nurses have developed specialized skills with the following: extensive dressing changes, parenteral nutrition, chemotherapy, intravenous therapy for hydration and antibiotics, intrathecal pain management, ventilators, and apnea monitors. As mentioned earlier in the chapter, clients and family caregivers must learn to complete procedures and manage equipment frequently. It is the responsibility of the nurse and fellow team members to determine if such procedures and equipment can be used safely; when the answer is yes, team members must provide sufficient education, demonstrations, and monitoring so that care continues safely. Advances in technology, informatics, and telehealth should not be viewed as replacements for nurses and team members, but as tools to improve the quality of their practice. The tools are evolving rapidly, influencing the practice of home health nurses, and transforming home health operations.

Informatics

Informatics is one of the most important new tools for nurses, including those employed in community settings (Sensmeier, 2011; Cipriano et al, 2013; Friedman et al, 2013; Nelson and Staggers, 2014; Sockolow et al, 2014; HealthIT.gov, 2014). Nurses face urgent information management challenges that include the need for timely, reliable, and valid quantified data and information about clients, the services they receive, and their outcomes of care. They also need verbal and automated methods to communicate with other nurses and health care providers wherever they are in the community. Increasingly, agencies require clinicians to document care during the visit rather than in their office or other location (Martin, 2005; Correll and Martin, 2009; Westra et al, 2010; Martin et al, 2011; Monsen et al, 2011; Martin and Utterback, 2014; Sockolow et al, 2014; Topaz et al, 2014; Fazzi Associates, 2014).

The American Nurses Association anticipated the impact of information technology on the profession, and took the first step early in the 1990s. They began to recognize standardized terminologies that could be used by nurses and other health care disciplines to describe, document, and quantify their daily practice accurately and consistently (ANA, 2012; ANA, 2014; Omaha System, 2014). The Omaha System and 11 more interface or point-of-care and reference terminologies have been

recognized. The Omaha System is an interface or point-of-care terminology; clinicians see it imbedded in their clinical documentation systems and need to learn to use it accurately and consistently.

The second step involves **interoperability**—the exchange of coded data and ability to use those data (ANA, 2012; Sensmeier, 2011; Bowles et al, 2013). SNOMED CT and Logical Observation Identifiers, Names, and Codes (LOINC) are examples of reference terminologies that facilitate interoperability by sharing data generated by the interface terminologies. Minnesota is the first state to recommend that health care providers use both ANA-recognized standardized point-of-care and reference terminologies. In 2014, Minnesota released their decision that the Omaha System should be the point-of-care terminology for the software used by all home health, public health, and other community-based providers (Omaha System, 2014).

The third step is **meaningful use**. This suggests that better health care does not come solely from the adoption of technology itself, but through the exchange and use of electronic health information to best inform clinical decisions at the point-of-care (Martin et al, 2011; HealthIT.gov, 2014; Omaha System, 2014). Meaningful use incorporates complex processes and workflow involving nurses and all health care clinicians, and it requires data integration and accessibility. Minnesota's requirement is part of their eHealth and Integrating the Healthcare Enterprise (IHE) strategy to actualize meaningful use through the use of the Consolidated Continuity of Care Document (C-CDA). Their mandate indicates that all providers will have interoperable EHRs by 2015. When more states proceed, there will be a nation-wide health information network.

Health care providers throughout the United States are converting to EHRs rapidly. EHRs are becoming ubiquitous, and the Office of the National Coordinator was established for that reason (HealthIT.gov, 2014). As part of the 2009 American Recovery and Reinvestment Act (ARRA), and the Health Information Technology for Economic and Clinical Health (HITECH) Act, CMS provides reimbursement incentives for eligible professionals and hospitals to become "meaningful users" (Sensmeier, 2011; Friedman et al, 2013; Kaiser Family Foundation, 2013). In physician practices, EHR use increased from approximately 48% in 2009 to 72% in 2012 (CDC, 2012). The percentage of use in hospitals more than doubled in two years, increasing from 16% in 2009 to 35% in 2013 (Paddock, 2012). Although home health agencies cannot obtain funding through AARA, their reported use of EHRs was 43% in 2007, and exceeded 58% in 2013 (NAHC, 2013b). The privacy guidelines of HIPAA (USDHHS, 2014a) ensure protection of clients' personal health information and include provisions about informed consent.

Personal health records (PHRs) are another important development (Anderson et al, 2012; HealthIT.gov, 2014). A PHR is also an electronic collection of health-related information, but individuals manage and control their own health information rather than clinicians and agencies. Typically, a PHR includes a health history, medications, allergies, and results from laboratory and other tests.

The Blue Button is a PHR initiative that began in 2010 by the Department of Veterans Affairs. Soon an online patient

portal was launched. While their initiative is limited to veterans, many other groups use the Blue Button symbol. Usage of the Blue Button logo and brand is free, but must conform to user guidelines (The Blue Button, 2014). The goal is to encourage as many people as possible to use a Blue Button site to download their own health information.

Increasingly, individuals and families served by home health, palliative, and hospice nurses have informatics skills. They may use the Internet frequently and be well informed about diagnoses, treatments, and medications. They may also use smart phones, other mobile devices, and social media. Nurses need to inquire about their clients' skills rather than make assumptions based on their age or other factors.

Telehealth

Telehealth supports long-distance health care, client and professional health-related education, and public health and health administration using electronic information and telecommunications technologies (Institute of Medicine (IOM), 2012; Schlachta-Fairchild et al, 2014). The technology used varies to include videoconferencing, the Internet, store-and-forward imaging, streaming media, satellite, wireless communications, and plain old telephone systems. Telehealth equipment and program components include telephone triage and advice, and biometric telemonitoring equipment to measure vital signs, weight, cardiac function, and point-of-care diagnostics. The system may or may not include video technology for live interaction (IOM, 2012; Schlachta-Fairchild et al, 2014).

The increased availability of telehealth coincides with trends described in this and other chapters in this book: an aging population, increased chronic illness and costs, and changes in health care reimbursement. New trends promote new opportunities: home health, palliative, and hospice nurses can use innovations such as telehealth in combination with in-person visits. They can monitor health status and symptom recognition, provide education, increase communication, and enable clients to become active partners in their own care (Fazzi et al, 2010; IOM, 2012; Madigan et al, 2013; Schlachta-Fairchild et al, 2014; Fazzi Associates, 2014). Telehealth has emerged as a viable and acceptable way to supplement the delivery of health care economically.

Numerous studies have confirmed that telehealth is used successfully to improve physical, emotional, and financial health outcomes for diverse home health clients. Chen et al (2011) studied those who had multiple chronic conditions. Many researchers explored the relationship between telehealth and circulatory problems. The study by Wakefield et al (2011) focused on diabetes and hypertension, Gellis et al (2012) on heart or chronic respiratory failure, Madigan et al (2013) on heart failure, Woods and Snow (2013) on circulatory and/or respiratory diagnoses, Hoban et al (2013) on heart failure, and Heeke et al (2014) on heart failure. Gellis and colleagues (2014) also studied elders with depression. Woods and Snow (2013) found that those who participated in a telemonitoring intervention had significantly lower rates of rehospitalization and emergency room use. When Heeke and colleagues (2014) completed their pilot study, no clients had been readmitted to the hospital.

Telemonitoring is increasingly being used with infants, women with high-risk pregnancies, and adults with various health problems. Smart homes are emerging to help the older adult to "age in place" (Rantz et al, 2013). Sensors can monitor activities and detect adverse events such as a fall or lack of movement and trigger a call for help. Medication management devices remind clients to take their medications, dispense medications, and send alerts to providers if devices are not accessed as expected (Marek et al, 2013). The next generation of devices is expected to focus on handheld devices such as smartphone technology, making telemonitoring even more ubiquitous.

SUMMARY

These are changing times for home health, palliative care, and hospice. The need for nurses prepared to practice in these specialties is expected to grow as the population ages, chronic illness rises, and more care is delivered in the community. Practice will become ever more complex and diverse as individuals and their families request more choices and personalized care. Practice will require a strong educational background and a commitment to life-long learning. It will require the use of enhanced critical thinking and sound judgment as well as interpersonal, communication, and technological skills. It is a good time to celebrate the past, embrace the present, and look forward to the future.

FOCUS ON QUALITY AND SAFETY EDUCATION FOR NURSES

Targeted Competency

Client-Centered Care: Recognize the client or designee as the source of control and full partner in providing compassionate and coordinated care based on respect for client's preferences, values, and needs.

Important aspects of client-centered care include:

- **Knowledge:** Demonstrate comprehensive understanding of the concepts of pain and suffering, including physiologic models of pain and comfort.
- **Skills:** Elicit expectations of client and family for relief of pain, discomfort, or suffering.
- **Attitudes:** Recognize that client expectations influence outcomes in management of pain or suffering.

Client-Centered Care Question

Visit a community-based hospice or palliative care unit. Spend time observing the care provided in this setting.

1. How is care provided in this setting different from care you have seen in the acute care setting? In the home care setting?
2. Notice how nurses and nursing assistants assess pain in this environment.
3. Discuss with the nurses how they address concerns around pain and suffering with clients and families in this environment. How do nurses evaluate clients' and families' expectations around pain?
4. Discuss with the nurses differences in care approaches between a community-based hospice or palliative care versus care approaches for home hospice and palliative care. Is there additional education that is required for the client and family, because the family often provides some aspects of care for home hospice and palliative care?

Prepared by Gail Armstrong, PhD(c), DNP, ACNS-BC, CNE, Associate Professor, University of Colorado Denver College of Nursing.

PRACTICE APPLICATION

The first example is an individual who lives alone, the second is an individual whose family includes an involved spouse, and the third and fourth clients are the community. Ideally, the student who visits Martha P. and the home health nurse who visits Mr. and Mrs. Jones use portable computing devices and document in the EHRs in the home. The childcare health consultants use a single electronic documentation system, can communicate easily about practice, and are creating a state-wide database. The public health nurses who are part of the Library Nurse Project use laptops for documentation.

Martha P. is an older woman who lives in a deteriorating home. She is a relatively typical client for a student or home health nurse to visit. [Box 41-7](#) consists of a story and answers designed to promote independent learning and group discussion. Note that the story and answers should be congruent: all pertinent data in the story should be reflected in the answers and all answers should match pertinent details in the story.

Mr. Jones, the second clinical example, is also a relatively typical client. After reading the example, identify the Omaha System problems, interventions, and ratings that are illustrated in the story. Discuss key characteristics of practice during this visit and an appropriate care plan for the next visit.

Mr. Jones, 70 years old, was discharged from the hospital yesterday after heart surgery for coronary artery disease and was referred to the local home health agency. Today, the home health nurse admitted him for [skilled nursing care](#) services. The nurse assessed Mr. Jones' cardiovascular status, the healing of his incisions, adjustment to his postsurgical status, and level of self-care. The nurse talked to Mr. and Mrs. Jones about exercise, nutrition, the signs and symptoms of possible postoperative cardiac problems, and their coping. Together, they looked at his medications. Mrs. Jones indicated that they were getting along well, but were concerned about the high cost of his new medications. They reviewed Mr. Jones' discharge packet. The nurse emphasized the need to maintain close communication with his physician and nurse practitioner, and the need to participate in the local exercise and nutrition rehabilitation program that they had prescribed. Mr. and Mrs. Jones indicated that they would do so. Before the visit ended, the nurse completed the necessary forms, documented the visit, and offered to call a local social service agency about financial assistance for medications. They made an appointment for the nurse's return visit.

The third clinical example describes the Arizona childcare health consultant program. In 1987, two public health departments in Arizona began to offer childcare health consultation services to childcare programs. They recognized that if the health and safety of young children in childcare environments was not addressed, related efforts to advance quality standards for children could not succeed ([Ford and Linker, 2002](#)). The nurses from Pima and Maricopa counties scheduled regular

visits to childcare centers, family childcare homes, and Head Start centers. They worked collaboratively with providers to impact issues such as communicable disease, playground safety, safe infant sleep, medication management, and the inclusion of children with special health needs in the group setting. The nurses kept anecdotal notes and frequency counts for the number of consultation visits they made and how many staff members attended their educational programs. In time, they and their health departments realized that they had an information overload: their data were inconsistent and difficult to access, and were not organized in a way to produce meaningful reports.

In 2005, Kathi Ford and the Pima County Health Department participated in a pilot childcare quality improvement project that involved childcare health consultants. Such a consultant is a "licensed health professional with education and experience in child and community health and childcare and preferably specialized training in child care health consultation" ([AAP/APHA, 2011](#), p. 33). The Omaha System and an automated clinical information system were used to capture their data. Although their nursing practice did not change, the data collection, analysis, and reporting changed dramatically. Using community as the modifier, it was possible to describe and quantify common problems, interventions, and changes in Knowledge, Behavior, and Status.

Arizona has voluntary quality improvement and rating system for child care, First Things First's "Quality First" program. Early in 2010, all [First Things First](#)-supported child care health consultants began to document their services in a single web-accessed charting system based on the Omaha System. Soon, data from the Omaha System's Problem Rating Scale for Outcomes suggested needed modifications in the service delivery model ([Ramler et al, 2006](#); [Banghart and Kreader, 2012](#)).

The home visit is the hallmark of nursing in home health and hospice. Nurses are guests when they enter a client's home, and must recognize that their services can be accepted or rejected. The interpersonal relationship established during the first visit is critical, as is the initial assessment of the client, support system, and environment.

- A.** What strategies should the nurse use to develop a positive relationship during the first visit?
- B.** What are the most important elements to assess in the home environment?
- C.** What should the nurse do to establish a partnership with the client?
- D.** What is necessary for the nurse to include in the client contract?
- E.** How can the nurse determine the client's preferred learning style?

Answers can be found on the Evolve site.

BOX 41-7 Martha P.: Older Woman Living in a Deteriorating Home

Joan B. Castleman, RN, MS, Clinical Associate Professor
College of Nursing, University of Florida
Gainesville, Florida

Information Obtained During the First Visit/Encounter

Martha P. was a 93-year-old woman who lived by herself in a deteriorating house. She had kyphosis and arthritis that contributed to her unsteady gait. Martha rarely used her cane in her house, but steadied herself by holding on to furniture.

When a student nurse arrived, Martha was shivering under a thin blanket. Boxes filled with old papers were stacked along the walls. The student nurse asked Martha if she had wood for the stove that heated the house. She replied that she ran out of wood yesterday and said, "I don't know what I'm going to do, but I'm not leaving this house." She reported that people from a church had brought the last load of wood. The student asked permission to contact Concerned Neighbors, a volunteer organization that could provide firewood. Martha was pleased. The student expressed concern that the boxes of paper, especially those near the stove, were a fire hazard. "Those boxes have been there for years, and I use them to light the stove," Martha said. When the student asked if she could help Martha move the four boxes near the stove to the other wall, she grudgingly agreed.

The student nurse noted that Martha was wearing a "Lifeline necklace," a fall alert system, and asked about her history of falls. Martha described how she moved around her home and fell in the bathroom last week when she was trying to take a sponge bath. She pushed the button, and "two nice gentlemen from the fire department came to pick me up." The student and Martha walked around her house. They talked about where she fell in the past, how fortunate she was not to have injuries, and ways to decrease her risk of falling in the future. Martha was willing to have a personal care assistant visit weekly to help her with a bath and shampoo as long as there was no charge. Before leaving, the student took Martha's vital signs and blood pressure and noted that they were within normal limits. The student called Concerned Neighbors and arranged for firewood to be delivered that day; the student also telephoned a local health assistance organization to schedule a home health aide to provide personal care for the next week. Although Martha sounded grumpy, she asked the student to return.

Application of the Omaha System

Problem: Residence (High Priority)

Problem Classification Scheme

Modifiers: Individual and Actual

Signs/symptoms of Actual:

- Inadequate heating/cooling
- Cluttered living space
- Unsafe storage of dangerous objects/substances

Intervention Scheme

Category: Teaching, Guidance, and Counseling

Targets and Client-specific Information: Safety (moved boxes away from stove; Martha unwilling to dispose of papers)

Category: Case Management

Targets and Client-specific Information: Other community resources (referred to Concerned Neighbors; arranged delivery of firewood)

Category: Surveillance

Targets and Client-specific Information: Home (needed wood)

Problem Rating Scale for Outcomes

Knowledge: 2—minimal knowledge (not aware/unwilling to recognize fire hazards)

Behavior: 2—rarely appropriate behavior (unable/unwilling to make changes)

Status: 2—severe signs/symptoms (residence was livable but needed changes)

Domain: Physiological

Problem: Neuro-Musculo-Skeletal Function (High Priority)**Problem Classification Scheme**

Modifiers: Individual and Actual

Signs/symptoms of Actual:

- Limited range of motion
- Decreased balance
- Gait/ambulation disturbance

Intervention Scheme

Category: Teaching, Guidance, and Counseling

Targets and Client-specific Information: Mobility/transfers (ways to decrease risk of falling, absence of injuries, continue wearing "Lifeline necklace")

Category: Surveillance

Targets and Client-specific Information:

- mobility/transfers (how, when falls occurred)
- signs/symptoms—physical (falls/injuries; vital signs, blood pressure)

Problem Rating Scale for Outcomes

Knowledge: 2—minimal knowledge (knew few options to decrease falls)

Behavior: 2—rarely appropriate behavior (had not used cane in house; did wear and use "Lifeline necklace")

Status: 3—moderate signs/symptoms (activities restricted, fell last week)

Domain: Health-Related Behaviors

Problem: Personal Care (High Priority)**Problem Classification Scheme**

Modifiers: Individual and Actual

Signs/symptoms of Actual:

- Difficulty with bathing
- Difficulty shampooing/combing hair

Intervention Scheme

Category: Teaching, Guidance, and Counseling

Targets and Client-specific Information: Personal hygiene (needed help with bathing, shampoo)

Category: Case Management

Targets and Client-specific Information: Paraprofessional/aide care (referred to health assistance organization for home health aide)

Problem Rating Scale for Outcomes

Knowledge: 3—basic knowledge (knew she needed to bathe, but not aware of assistance)

Behavior: 3—inconsistently appropriate behavior (tried to take a sponge bath)

Status: 3—moderate signs/symptoms (cannot bathe safely without help)

This case illustrates use of the Omaha System with a client in the home. Talk with your classmates and other colleagues about how use of the Omaha System can guide your practice and documentation and can generate aggregate data to promote high-quality home health service. Identify Martha P.'s strengths and how to maximize those when providing care.

KEY POINTS

- Home health, hospice, and palliative nursing practice provided in the client's home differ from care in institutional settings. The home setting affects practice in unique ways including establishing trust, developing care partnerships (patient engagement), selecting interventions, collecting outcomes and data, ensuring client safety, and promoting quality.
- Family members, including caregivers and significant persons who provide assistance and/or care, are essential members of the health care team.
- Home health has its roots in public health nursing, with an emphasis on health promotion, illness prevention, and caring for people in their communities.
- Home health and hospice practice and reimbursement changed when they became major Medicare benefits.
- Five models of care are described in this chapter: population-focused home care, transitional care, home-based primary care, home health, and palliative care/hospice. Home health, palliative, hospice, and all other nurses should become familiar with the models to inform clients and their families about options and educate providers who are potential referral sources.
- Medicare-certified home health and hospice agencies are divided into various types of administrative and organizational structures. However, many aspects of nursing practice are the same in the various types.
- Standards of home nursing practice originate from the ANA and specialty organizations, and encourage adoption of evidence-based practice.
- Consistently demonstrating professional competency is essential for home health, hospice, and palliative nurses.
- Home health nurses practice in accordance with the [ANA \(2014\) Home Health Nursing Scope and Standards of Practice](#).
- Hospice and palliative nurses use the *Palliative Nursing: Scope and Standards of Practice—An Essential Resource for Hospice and Palliative Nurses* published by the [ANA and Hospice and Palliative Nurses Association \(2014\)](#).
- Interprofessional collaboration is inherent in home health, palliative care, and hospice.
- The Omaha System was developed and refined through a process of research. Reliability and validity were established for the entire system.
- The Omaha System is unique in that it is the only comprehensive vocabulary developed initially by and for nurses practicing in the community.
- The Omaha System consists of the Problem Classification Scheme (assessment), Intervention Scheme (care plans and services), and Problem Rating Scale for Outcomes (client change/evaluation).
- The Omaha System is designed to enhance practice, documentation, and information management. These areas are of concern to community health educators and students as well as clinicians and administrators.
- Interprofessional clinicians employed in Medicare-certified home health agencies use OASIS-C at designated intervals; it is the outcome measurement tool mandated by the Centers for Medicare and Medicaid Services' conditions of participation.
- Evidence-based quality/performance improvement is important in all home health and hospice agencies. Currently, Medicare's Outcome-Based Quality Improvement program is used for outcome measurement and cost control.
- Exciting trends and opportunities are pervasive in home health, palliative, and hospice care. Many nurses are developing skills using technology, informatics, and telehealth; a commitment to life-long learning is necessary.

CLINICAL DECISION-MAKING ACTIVITIES

1. Make a home visit with an experienced home health or hospice nurse and do the following:
 - A. Evaluate the process and content of the nurse–client interaction to determine what aspects of the visit were based on evidence-based practice; describe the process of the visit.
 - B. Compare actual roles and functions with the *Home Health Nursing: Scope and Standards of Practice* ([ANA, 2014](#)), the *Palliative Nursing: Scope and Standards of Practice—An Essential Resource for Hospice and Palliative Nurses* ([ANA/HPNA, 2014](#)), or other specialty standards as appropriate for the client population.
 - C. Observe and discuss whether that nurse uses a client problem/nursing diagnosis, intervention, or outcome measurement system or framework. Is it important to use a system or framework approach? Explain.
2. Work with a partner or in a small group. Select a client you have visited or invent a fictitious client, and list data for a typical referral and initial visit. Independently apply the three parts of the Omaha System to the client data. Compare each portion of your selections with that of your partner or group members.
3. Make a joint home visit with another health care professional and assess as in the preceding activity. Attend a client/family–provider conference and write a summary of the group process. Has your attitude changed after you listened to the opinions expressed by family members?
4. Review a client record. What client outcomes were met through home health care? What specific outcomes showed an improvement or a stabilizing condition?
5. Interview a home health or hospice nurse who uses electronic health records (EHRs). Ask about the advantages of

CLINICAL DECISION-MAKING ACTIVITIES—cont'd

EHRs and challenges associated with them. How can aggregate clinical data generated by EHRs help nurses better understand the needs of their clients? How might knowing the needs of their clinical population assist in reviewing the research literature and planning new interventions?

6. Review your state's laws governing advance directives. Consider the legal and ethical advantages and disadvantages of

having such directives. How would you write an advance directive for yourself?

7. Participate in a telehomecare visit using video technology or observe the analysis of data from remote monitoring. Trace the nurse's decision making and changes in the plan of care based on the telemonitoring data. Determine what outcomes might be expected from this type of care.

The Nurse in the Schools

Lisa Pedersen Turner, PhD, RN, PHCNS-BC

Lisa Pedersen Turner felt called to the field of public and community health nursing while obtaining her BSN degree, inspired by the focus on preventing disease and helping underserved populations. Since then, she has provided care for a wide variety of vulnerable populations, including children in the schools, adults who are homeless, low-income families, and elders in long-term care facilities. She served as a nurse and clinic coordinator of the Good Samaritan Nursing Center at the University of Kentucky for twelve years. Her work at the Good Samaritan Nursing Center focused on providing school health services to underserved populations as well as developing a K-12 school health curriculum for a county in rural Kentucky. She has lectured and supervised students studying public health nursing in a myriad of community settings, including school clinics, homeless shelters, and free clinics for adults and children. She has contributed to several projects to evaluate school health services and has presented at national and international symposia on nursing clinics in the community. Her research interests are in the areas of vulnerable populations, access to health care, and obesity prevention. Dr. Turner currently serves as an assistant professor at Berea College, Berea, Kentucky.

OBJECTIVES

After reading this chapter, the student should be able to do the following:

1. Discuss professional standards expected of school nurses.
2. Differentiate between the many roles and functions of school nurses.
3. Describe the different variations of school health services and coordinated school health programs.
4. Discuss common health problems of children and adolescents seen in the school setting.
5. Analyze the nursing care given in schools in terms of the primary, secondary, and tertiary levels of prevention.
6. Anticipate future trends in school nursing.

Tertiary Prevention in Schools

Controversies in School Nursing

Ethics in School Nursing

Future Trends in School Nursing

In the fall of 2013, approximately 50.1 million children attended a public school in the United States (35.3 million in elementary and middle schools, 14.8 million in high schools), and an additional 5.2 million students attended a private school (U.S. Department of Education, 2013). These children and adolescents need health care during their school day, and this is the job of the school nurse. There were, in 2010, approximately 73,600 registered nurses currently working as school nurses (Health Resources and Services Administration [HRSA], 2010). The school nurse serves an important role in providing health services and health promotion in the school setting (Board et al, 2011; National Association of School Nurses, 2011).

A common misperception is that school nurses only put bandages on cuts and soothe children with stomachaches. However, that is not their major role. The National Association of School Nurses (NASN) defines **school nursing** as “a specialized practice of professional nursing that advances the well-being, academic success and lifelong achievement and health of students” (Board et al, 2011). School nurses give comprehensive nursing care to the children and the staff at the school (NASN, 2011). At the same time, they coordinate the health education program of the school, consult with school officials to help identify and care for other persons in the school community, and provide leadership in promoting health and safety (NASN, 2011). The school nurse provides care to the children not only in the school building itself, but also in other settings where children are found—for example, in juvenile detention centers, in preschools and daycare centers, during field trips, at sporting events, and in the children’s homes (Nic Philibin et al, 2010). The school nurse, therefore, must be flexible in giving nursing care, education, and help to those who need it.

This chapter discusses the history of nursing in the schools and the functions of school nurses today. In addition, the standards of practice for school nurses are discussed, as the nurse takes on a variety of roles. Different types of school health services are reviewed, including government-financed programs. The primary, secondary, and tertiary levels of nursing care that nurses give to children in the schools are presented. The most common health problems that the school nurse finds in children are also discussed under their appropriate prevention levels. The chapter ends with a discussion of the ethical

dilemmas that may arise for school nurses, and the future of nursing in the schools is predicted for ever-changing communities.

HISTORY OF SCHOOL NURSING

The 1800s and Beyond

The history of school nursing began with the earliest efforts of nurses to care for people in the community. In the late 1800s in England, the Metropolitan Association of Nursing provided medical examinations for children in the schools of London (Wright, 2011). By 1892 nurses in London were responsible for checking the nutrition of the children in the schools (Wright, 2011). These ideas spread to the United States where, in 1897, nurses in New York City schools began to identify ill children. They then excluded these children from classes so that other children would not be infected (Earles and Jones, 2011). Health education was also important during this time. Many states had laws in the late 1800s mandating that nurses teach within the schools about the abuse of alcohol and narcotics (Earles and Jones, 2011).

In the early 1900s in the United States, the main health problem in the community was the spread of infectious diseases. On October 2, 1902, in New York City, Lillian Wald’s Henry Street Settlement nurses began going into homes and schools to assess children. These public health nurses were at first in only four schools caring for about 10,000 children. They made plans to identify children with lice and other infestations and those with infected wounds, tuberculosis (TB), and other infectious diseases (Earles and Jones, 2011; Judd et al, 2010).

The need for school nurses was immediately recognized by the health care community. By 1910, Teachers College in New York City added a course on school nursing to their curriculum for nurses. In 1916 a school superintendent requested that a public health nurse be sent to the schools to care for children of immigrants (Judd et al, 2010). By the 1920s school nurse teachers were employed by most municipal health departments. As the years went by and communities struggled with serious economic issues and hardships during the Depression, school nurses continued to provide health care to children in the schools through the federal Works Progress Administration program (WPA) (Judd et al, 2010).

In the 1940s the nurses were mostly employed by the school districts directly. The nurses also provided home nursing and health education for the children and their parents (Earles and Jones, 2011). In addition, school nurses became concerned with the condition of school buildings (Judd et al, 2010).

After World War II and into the 1950s, as a result of the increased use of immunizations and antibiotics, the number of children with communicable disease in the schools fell. School nurses then turned their attention to screening children for common health problems and for vision and hearing. School nurses were less likely to teach health concepts in the children's classrooms and more likely to consult with teachers about health education (Earles and Jones, 2011). However, there was an increased emphasis on employee health, and school nurses began screening teachers and other school staff for health problems (Earles and Jones, 2011).

The 1960s saw an upsurge in the call for higher levels of education for school nurses. A position paper delivered at the 1960 American Nurses Association (ANA) convention called for the Bachelor of Science in nursing degree as the minimum educational preparation for school nurses. By 1970 the first school nurse practitioner program was started at the University of Colorado. There, school nurses learned advanced concepts of school nursing practice to provide primary health care to children (Earles and Jones, 2011).

Table 42-1 gives the highlights of school nursing history over the last century.

Federal Legislation in the 1970s, 1980s, 1990s, and 2000s

Community involvement in health in schools was a major thrust in the 1970s and 1980s. Counseling and mental health services were added to the responsibilities of school nurses, who began to directly teach children concepts of health. Children were no longer just being screened for illnesses (Earles and Jones, 2011). Because of federal laws that required schools to make accommodations for handicapped children, medically fragile children were attending schools, often for the first time. One of these laws, PL 93-112, **Section 504 of the Rehabilitation Act** of 1973, was an important step in helping all children enjoy a normal educational experience (Robert Wood Johnson Foundation, 2010). This law was followed by PL 94-142, **Education for All Handicapped Children Act**, which required that children with disabilities have services provided for them in the schools.

Following the passage of the **Americans with Disabilities Act** in 1992, PL 105-17 **Individuals with Disabilities Education Act (IDEA)** passed in 1997. Both of these laws required that more children be allowed to attend schools. Schools had to make allowances for their special needs, which included ensuring that their school experience was in balance with their health care needs by developing **individualized education plans (IEPs)** and **individualized health plans (IHPs)**. That meant that more children with human immunodeficiency virus (HIV), acquired immunodeficiency syndrome (AIDS), chronic illnesses, or mental health problems were in the classrooms and needed more attention from the school nurse (Robert Wood Johnson Foundation, 2010).

TABLE 42-1 High Points In School Nursing History

Decade	Major Events in School Nursing
1890s	English and American nurses are used in schools to examine children for infectious diseases and to teach about alcohol abuse.
1900s	Henry Street Settlement in New York City sends nurses into schools and homes to investigate children's overall health.
1910s	School nursing course added to Teachers College nursing program.
1920s and 1930s	School nurses are employed by community health departments.
1940s	School districts employ school nurses.
1950s	Children are screened in schools for common health problems.
1960s	Educational preparation for school nurses is debated.
1970s	School nurse practitioner programs began. Increased emphasis put on mental health counseling in schools.
1980s	Children with long-term illness or disabilities attend schools.
1990s	School-based and school-linked clinics are started. Total family and community health care is offered.
2000s	School nurses give comprehensive primary, secondary, and tertiary levels of nursing care.

From Schlachta-Fairchild L, Varghese SB, Deickman A, et al: Telehealth and telenursing are live: APN policy and practice implications. *J Nurse Pract* 6:98-106, 2010.

The **No Child Left Behind Act** of 2001 requires a healthy environment in the schools, which also affects children who have health problems (Ringwalt et al, 2011).

Also during the 1990s, the responsibilities of the school nurse were extended to include the development of complete clinics and health care agency centers within or attached to the schools (Earles and Jones, 2011). These school-based clinics will be discussed later in this chapter. By 2002, some school nurses were responsible for several schools, and they provided care under a variety of nursing roles. To address obesity and to promote healthy eating and physical activity through changes in school environments, Congress passed the **Child Nutrition and WIC Reauthorization Act** of 2004 (PL 108.265, Section 204). This act designated that each local education agency (LEA) participating in federal school meal programs, such as the National School Lunch or Breakfast Program, must establish a local school wellness policy.

The **Healthy, Hunger-Free Kids Act** of 2010 authorizes funding and sets policy for the National School Lunch Program, the School Breakfast Program, the Summer Food Service Program, and other child and adult food programs (Office of the Press Secretary, 2010). This law seeks to reform the foods available at school so that healthier, more nutritious foods are

TABLE 42-2 Federal Legislation Affecting School Nursing

Law	Effect on School Nurses and Children
1973: PL 39-112, Section 504 of Rehabilitation Act	Children cannot be excluded from schools because of a handicap. The school must provide health services that each child needs.
1975: PL 94-142, Education for All Handicapped Children Act	All children should attend school in least restrictive environment. Requires school district's committee on handicapped to develop individualized education plans (IEPs) for children.
1992: Americans with Disabilities Act	Persons with disabilities cannot be excluded from activities.
1997: PL 105-17, Individuals with Disabilities Education Act (IDEA) with updates in 2004	Educational services must be offered by schools for all disabled children from birth through age 22 years.
2001: No Child Left Behind Act of 2001	All children must receive standardized education in a healthy environment.
2004: Child Nutrition and WIC Reauthorization Act of 2004	Every local education agency (LEA) participating in federal school meal programs must establish a local school wellness policy.
2010: Healthy, Hunger-Free Kids Act of 2010	Reform of the National School Lunch Program and National School Breakfast Program through increased funding and setting policy on nutritional quality of foods served on school grounds. Also opens eligibility requirements to improve access to the free and reduced-price lunch program.

Compiled from Betz CL: Use of 504 plans for children and youth with disabilities: nursing application. *Pediatr Nurs* 27:347–352, 2001; Whalen LG, Grunbaum JA, Kann L, et al: *Profiles 2002. School Health Profiles. Surveillance for Characteristics of Health Programs among Secondary Schools*. Washington, DC, 2004, Centers for Disease Control and Prevention, USDHHS.

served. In recent times this law has become controversial because schools are having difficulty complying with the terms of the Act.

Table 42-2 summarizes the effects of these laws on school nurses and schoolchildren.

STANDARDS OF PRACTICE FOR SCHOOL NURSES

The professional body for school nurses is the **National Association of School Nurses** (NASN), headquartered in Washington, DC. This association provides the general guidelines and support for all school nurses. It revised the standards of professional practice for school nurses in 2011. These standards require that all school nurses use the nursing process throughout their practice: assessment, analysis, planning,

implementation, and evaluation. The major concepts addressed in the standards include the following:

- Give and evaluate appropriate up-to-date nursing care.
- Collaborate well with other health providers and school staff.
- Maintain school health office policies, including privacy and safety of health records.
- Teach health promotion and maintenance to children, families, and communities. (NASN, 2011)

In addition, the professional standards rely on nurses to give care based on 11 criteria (NASN, 2011). These criteria include the ability to do the following:

- Develop school health policies and procedures.
- Evaluate their own nursing practice.
- Keep up with nursing knowledge.
- Interact with the interprofessional health care team.
- Ensure confidentiality in providing health care.
- Consult with others to give complete care.
- Use research findings in practice.
- Ensure the safety of children, including when delegating care to other school personnel.
- Have good communication skills.
- Manage a school health program effectively.
- Teach others about wellness.

EDUCATIONAL CREDENTIALS OF SCHOOL NURSES

School nursing requires the nurse to be able to practice independently, supervise others, and delegate care in a community (Board et al, 2011; Sheets et al, 2012). The NASN recommends that school nurses be registered nurses who also have bachelor's degrees in nursing and a special certification in school nursing (Board et al, 2011; NASN, 2011; Sheets et al, 2012). However, not all school nurses have been educated this way. There are no general laws regarding the educational background of school nurses. School nurses in some states are required to be registered nurses, and others require specialty certification for school nurses. Yet, licensed practical nurses are also seen in some schools. Table 42-3 lists the education requirements for school nurses for each state.

School nurses in some schools may be advanced practice nurses who specialize in caring for children. They may be nurse practitioners who have specialized in child health nursing (pediatrics), in family nursing, or in the school nurse practitioner role. Clinical nurse specialists who are school nurses may also be found in child health nursing or community or public health nursing. The higher the educational level of the school nurse, the better that nurse is able to give complete care to children and their families. These **advanced practice nurses** may be certified by professional organizations, such as the ANA, or their own professional organization. Most hold master's degrees in nursing.

Most school nurses do not start their nursing careers in the schools. Rather, the majority have prior experience in nursing, most from working either in hospitals or with communities. It is helpful if their previous experience entailed working with

TABLE 42-3 States' Requirements for School Nurses

State	Minimum Education Standard Mandated by Law			Requires Previous Nursing Experience in a Clinical Nursing Setting	Requires School Nurse Certificate or Professional Development Training for School Health	Nurse-to-Student Ratio
	Minimum not mandated	Licensed Practical Nurse	Registered Nurse			
Alabama		X ^a	X			Goal: 1:500
Arkansas		X				Goal: 1:750
Arizona			X ^b		Yes	
California			X ^b			
Colorado			X ^b		Yes, if baccalaureate degree is not in nursing	
Connecticut			X		Yes	At least one school nurse or nurse practitioner per local or regional board of education
District of Columbia	X					
Delaware			X ^b	Min. 3 years	Yes	At least one full-time nurse per school
Florida		X ^c			Encouraged	
Georgia		X				Goal: 1:750
Hawaii	X					
Iowa			X ^b			Goal: 1:750
Idaho			X ^b	Min. 2 years	Yes	
Illinois			X ^b		Yes	
Indiana			X ^d			Goal: 1:750
Kansas			X			
Kentucky			X ^e		Provisional certificate for non-BSN prepared RN	
Louisiana			X	Min. 2 years		1:1500
Massachusetts			X ^b	Min. 2 years		At least one nurse per school
Maryland			X		Yes	
Maine			X ^b	Min. 3 years		1:800
Michigan			X			
Minnesota			X ^b		Yes	1:1000
Missouri	X					Goal: 1:750
Mississippi		X			Yes	
Montana	X					
North Carolina			X			1:3000
North Dakota	X					
Nebraska			X		Yes	Goal: 1:750
New Hampshire			X ^b			
New Jersey			X ^b		Yes	At least one nurse per district
New Mexico			X ^f	If LPN: Min. 1 year		
Nevada			X ^b			
New York			X ^b			
Ohio			X ^b		Yes	
Oklahoma			X ^b			
Oregon			X ^b	Min: Practicum in a school setting	Yes	1:225 "medically complex" students 1:125 "medically fragile students" Goal: 1:750 students in district
Pennsylvania			X ^b		Yes	1:1500
Rhode Island			X		Yes	

TABLE 42-3 States' Requirements for School Nurses—cont'd

State	Minimum Education Standard Mandated by Law			Requires Previous Nursing Experience in a Clinical Nursing Setting	Requires School Nurse Certificate or Professional Development Training for School Health	Nurse-to-Student Ratio
	Minimum not mandated	Licensed Practical Nurse	Registered Nurse			
South Carolina			X			
South Dakota			X			
Tennessee			X			1:3000 or 1:school system
Texas	X				Yes	
Utah	X					1:5000
Virginia		X				1:1000
Vermont			X ^b	Min. 4 years		
Washington			X ^b			
Wisconsin			X			
West Virginia			X ^b		Yes	1:1500 for grades K-7
Wyoming			X ^b		Yes	

^aRequires there may not be more than five LPNs for each RN within each school system.

^bRequires bachelor's degree.

^cPreferred entry is a BSN or higher.

^dRequires at least one BSN prepared RN to coordinate health services.

^eRequires nurse must at least be working toward completion of a bachelor's degree.

Requires school nurses in supervisory positions to have a master's degree in nursing.

Data from: National Association of State Boards of Education: *State School Health Policy Database: Requirements For School Nurses*, 2013.

Available at http://www.nasbe.org/healthy_schools/hs/bytopics.php?topicid=2130. Accessed April 15, 2014.

children, so that they are aware of children's special health needs. While it is common that school nurses come to the field with prior nursing experience, it is possible for newly graduated nurses to work in the schools, depending on the entry criteria of their state and local health departments and schools. Ideally, the less-experienced nurses should complete an extended orientation period until they feel comfortable practicing alone.

ROLES AND FUNCTIONS OF SCHOOL NURSES

School nurses give care to children as direct caregivers, educators, counselors, consultants, and case managers. They must coordinate the health care of many students in their schools with the health care that the children receive from their own health care providers.

In *Healthy People 2020 Objectives*, goal ECBP-5 states that there should be one full-time registered nurse for every 750 children in each school (USDHHS, 2010). The NASN supports the 1:750 nurse-to-student ratio, but also notes that a 1:1 ratio may be necessary for individual students who require daily and continuous nursing services (DuRant et al, 2010). Table 42-3 lists the nurse-to-student ratio for each state, if specified by the state. However, only approximately 45% of the nation's schools have met that standard (USDHHS, 2010). Having fewer nurses in the schools means that the nurses are expected to perform many different functions. It is therefore possible that they are unable to give the amount of comprehensive care that the students need (Maughan and Adams, 2011).

School Nurse Roles

Direct Caregiver

The school nurse is expected to give immediate nursing care to the ill or injured child or school staff member. **Direct caregiver** is the traditional role of the school nurse.

Although most school nurses are in public or private schools and give care only during school hours, the nurse in a boarding school provides nursing care to children 24 hours a day and 7 days a week. In boarding schools, the children live at school and go home only for vacations. The nurse also lives at the school and may be on call all the time. The nurse in the boarding school is very important to the children because this nurse is the gatekeeper to their complete health care (Earles and Jones, 2011). The nurse makes all of the health care decisions for the child and has a referral system to contact other health care providers, such as physicians and psychological counselors, if needed.

Health Educator

The school nurse in the **health educator** role may be asked to teach children both individually and in the classroom. The nurse uses different approaches to teach about health, such as teaching proper nutrition or safety information. Many school nurses teach the older elementary girls and boys about the coming changes in their bodies as puberty arrives. Other school nurses may teach the health education classes that are required by the states to be included in the programs.

Case Manager

The school nurse is expected to function as a **case manager**, helping to coordinate the health care for children with complex health problems. This may include the child who is disabled or chronically ill and who may be seen by a physical therapist, an occupational therapist, a speech therapist, or another health care provider during the school day. The nurse sets up the schedule for the child's visits so that those appointments do not unnecessarily impact negatively on the child's academic day.

Consultant

The school nurse is the person best able to provide health information to school administrators, teachers, and parent-teacher groups. As a **consultant**, the school nurse can provide professional information about proposed changes in the school environment and their impact on the health of the children. The nurse can also recommend changes in the school's policies or engage community organizations to help make the children's schools healthier places (Nic Philibin et al, 2010). This is a population-level role for the school nurse; the population consists of all children, families, staff, and the surrounding community.

Counselor

The school nurse may be the person whom children trust to tell important secrets about their health. It is important that, as a **counselor**, the school nurse have a reputation as being a trustworthy person to whom the children can go if they are in trouble or if they need to confide about a personal matter (Nic Philibin et al, 2010). Nurses in this situation should tell children that if anything they reveal points out that they are in danger, the parents and school officials must be told. However, privacy and confidentiality, as in all health care, are important.

In addition, the school nurse may be the person to help with grief counseling in the schools. (See later discussion on the school crisis team.)

Community Outreach

When participating in **community outreach**, nurses can be involved in community health fairs or festivals in the schools, using that opportunity to teach others. They can be part of an influenza immunization program for the school staff and can promote a health education fair and do blood pressure screenings. They can initiate a liaison, coordinating with local health charities to provide education to the schools (Avery et al, 2013).

Researcher

Little research has been done on nurses caring for children in the schools. The school nurse is responsible for making sure that the nursing care given is based on solid, evidence-based practice. Outcomes regarding school nurse services need to be studied (Nic Philibin et al, 2010). Therefore, the school nurse, as an educator, is in the right position to do studies as a **researcher** that advance school nursing practice.

EVIDENCE-BASED PRACTICE

Because of the obesity epidemic in the United States, interventions to increase physical activity and reduce sedentary behaviors have become a priority for public health practitioners. This research study evaluated the feasibility and efficacy of a school nurse-delivered intervention aimed at improving diet and activity and reducing body mass index (BMI) among overweight and obese adolescents. This study used a pair-matched cluster-randomized controlled school-based trial. Six high schools were randomized into either the six-session counseling intervention or the control group. The intervention, "Lookin' Good Feelin' Good" consisted of six one-on-one school nurse-led counseling sessions conducted over two months during school hours. Those in the control group had six one-on-one visits with the school nurse over two months to be weighed and review informational pamphlets on weight management. Although there was no significant difference in BMI, activity, or caloric intake between the groups at two months, those in the intervention group ate breakfast on more days of the week and had a lower intake of sugar than the control group.

Nurse Use

This study indicates that a school-nurse-delivered obesity intervention is feasible and may improve select behaviors that may result in obesity.

Pbert L, Druker S, Gapinski MA, et al: A school nurse-delivered intervention for overweight and obese adolescents. *J Sch Health* 83(3):182-193, 2013.

SCHOOL HEALTH SERVICES

School health services vary in their scope. However, there are common parts to the programs.

Federal School Health Programs

The federal government, through the coordination of the Centers for Disease Control and Prevention, has developed a plan that school health programs are encouraged to follow (CDC, 2013a) (Figure 42-1).

This plan was originally developed in 1987 after the CDC began funding schools for HIV-prevention education programs. By 1992 this educational system was so successful that it was expanded to include school health programs to teach children prevention of other chronic illnesses. These include diseases caused in part by risk factors such as poor diet, lack of exercise, and smoking.

Then, in 1998, the government expanded the program again to include a more complete school health education program that included the parents and the community in the children's care. By 2009, 22 states had been funded for their school health programs by the CDC. The funding has paid for the development of health education plans of study, or curricula, which include policies, guidelines, and training for these health programs. The states then use these courses to teach the children. The schools are actively involved in helping the children practice problem solving, communication, and other life skills so they can reduce their risk factors (CDC, 2009).

According to the CDC (2009), two states in particular have been very successful with these programs. West Virginia has developed a program called the Instructional Goals and Objectives for Health Education and Physical Education, which increased the ability of the children to pass the President's

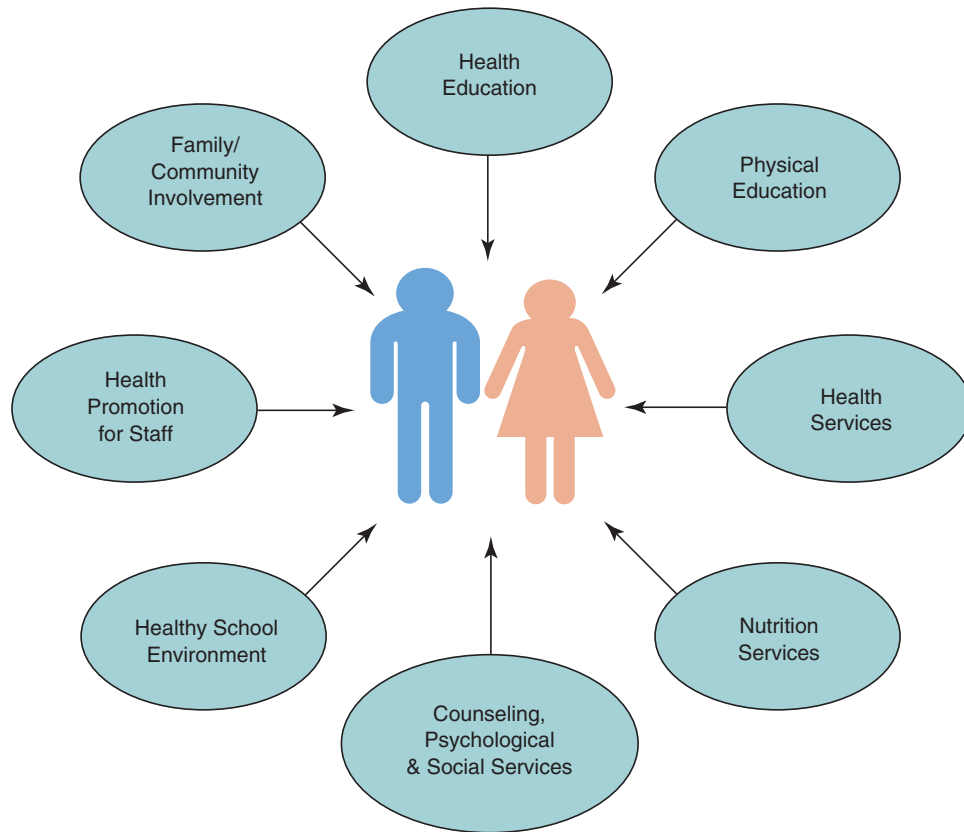

FIG 42-1 The eight components of a coordinated school health program. (From Centers for Disease Control and Prevention: *Adolescent and School Health: Components of Coordinated School Health*, 2013b, CDC. Available at <http://www.cdc.gov/healthyyouth/cshp/components.htm>. Accessed April 15, 2014.)

LINKING CONTENT TO PRACTICE

School nurses play a primary role in the implementation of the CDC School Health Program components. These components are described below and addressed throughout this chapter. The emphasis in this program design is working with the school as a population or community. This plan has eight parts:

- **Health education**—This section includes teaching children about how to stay healthy and how to prevent becoming ill or being injured. The health education is offered in a planned, sequential, K-12 curriculum that addresses all dimensions of health.
- **Physical education**—Taking part in physical activity during the school day is recommended for all children. This is to provide regular exercise as well as to provide sports programs outside the normal school day. This, it is hoped, may help reduce obesity, high blood pressure, and other diseases later in life (CDC, 2013b).
- **Health services**—The purpose of this segment is to reduce illness in children. Specifically, the schools can provide services to ensure access or referral to primary care, prevent and control communicable disease, provide emergency care for illness or injury, and provide educational and counseling opportunities for promoting and maintaining health across all settings (CDC, 2013a). This is also the section of comprehensive school health that promotes the school nurse to student ratio of 1:750 as discussed earlier in this chapter (USDHHS, 2010).
- **Nutrition services**—Information on nutrition and diet should be taught to all children. In addition, the schools should provide healthy food choices for students in their meal programs (both breakfast and lunch). The U.S. Department of Agriculture's Team Nutrition Program called *Making It Happen* is a federal program that encourages schools to have nutritious foods available for all students (CDC, 2013b).
- **Counseling, psychological, and social services**—This section promotes the health of children who receive special education services (IDEA), as well as children who have mental health needs. Working with families at risk because of socioeconomic needs is also part of this area (Kanter and Abramson, 2014).
- **Healthy school environment**—The emphasis in this area is to reduce tobacco use in teenagers as well as reducing violence overall in the schools. Education regarding the prevention of HIV/AIDS is also a part of this section (Jackson, 2011).
- **Health promotion for staff**—Nurses can help provide health care for teachers and other staff members in the schools. Staff can ask nurses about their health and obtain health education at school during their workday (Baisch et al, 2011).
- **Family/community involvement**—The school health program should contact families and community leaders to find out what health services are needed the most and how they can work together to emphasize health education for all. This includes being involved as health educators when adolescents take part-time jobs.

Physical Fitness Test. In Michigan, the Governor's Council on Physical Fitness, Health, and Sports developed an Exemplary Physical Education Curriculum project that made up educational materials and plans for children to achieve high physical fitness scores. All of these programs were paid for by the federal school health program funding.

School Health Policies and Practices Study 2012

After the CDC began funding educational programs about prevention of HIV in the schools in 1987, there was clearly a need to expand these programs. By 1992 the CDC began giving money to fund other school health programs that taught students about heart disease, cancer, stroke, diabetes, and substance abuse prevention. These programs have been evaluated by the [School Health Policies and Practices Study 2012](#) (CDC, 2013c), which looked at all eight parts of the school health program in all 50 states and the District of Columbia. The study found that 12.5% of districts had at least one school-based health center (SBHC) that offered both health services and mental health or social services to students. It also found that 67.5% of districts prohibited all tobacco use in all locations. The study noted that 14.8% of districts required and 26.5% recommended that schools offer a self-serve salad bar. Results also showed that 93.6% of districts required physical education in elementary schools, 91.9% for middle schools, and 92.4% for high schools. Nearly three fourths of states had adopted health education standards based on the 2007 National Health Education Standards (NHES) (CDC, 2013c).

School-Based Health Programs

Because many schoolchildren may not receive health care services other than screening and first aid care from the school nurse, the U.S. government began funding [school-based health centers](#) (SBHCs) during the 1990s. These are family-centered, community-based clinics run within the schools. These clinics give expanded health services, including mental health and dental care, as well as the more traditional health care services (Bannister and Kelts, 2011). The SBHCs can range in size from small to large; some school clinics are open to the community only during the school year and others are open 24 hours a day all year round. An example of the more limited clinic is the SBHC in Worcester, MA, where six clinics are run in the schools (elementary through high school) by the Family Health Center of Worcester, Inc. during the school year months of August through May (Family Health Center, 2010).

Another example of a clinic is the [school-linked program](#), which is coordinated by the school but has community ties (Bannister and Kelts, 2011). An example of this is the Collaborative Model for School Health in Pitts County, North Carolina. The nurses employed by the local hospital in that area provide health care for children in kindergarten through fifth grade. There is collaboration between the county health department, the local university's nursing school, and other private health care providers to give primary, secondary, and tertiary nursing care. An evaluation of the program has shown that the children's school attendance and learning has increased as a result of the presence of more complete school health services (Trapp, 2010).

At a center in Texas, an urban SBHC is located in a school district where many of the children lack health insurance. The school nurses there are assisted by three part-time nurse practitioners and one public health nurse. The school nurse is responsible for the record keeping on the children's immunizations, does the screening, and gives first aid to injured children. Then the school nurse refers children who need additional health care to the SBHC in the school. Parents like the program because they trust the school nurse. They also like its location inside the school because everyone can receive health care without having to travel far to get to a clinic (Texas Association of School-Based Health Centers, 2010).

SCHOOL NURSES AND HEALTHY PEOPLE 2020

Many *Healthy People 2020* proposed objectives are directed toward the health of children. In addition, several point directly at the care that nurses give to children in the schools. The *Healthy People 2020* box lists the objectives that involve school-age children. These objectives are concerned with the children with disabilities in the schools, the number of children with major health problems, and the ratio of nurses to children in the schools. Nurses can accomplish the goals using the three levels of prevention, as discussed next.

HEALTHY PEOPLE 2020

Objectives Related to School Health and School Nursing

- AH-5: Increase educational achievement of adolescents and young adults.
- AH-9: (Developmental) Increase the percentage of middle and high schools that prohibit harassment based on a student's sexual orientation or gender identity.
- ECBP-2: Increase the proportion of elementary, middle, and senior high schools that provide comprehensive school health education to prevent health problems in the following areas: unintentional injury; violence; suicide; tobacco use and addiction; alcohol or other drug use; unintended pregnancy, HIV/AIDS and STD infection; unhealthy dietary patterns; and inadequate physical activity.
- ECBP-5: Increase the proportion of the nation's elementary, middle, and senior high schools that have a nurse-to-student ratio of at least 1:750.
- IID-10: Maintain vaccination coverage levels for children in kindergarten.
- IID-11: Increase routine vaccination coverage levels for adolescents.
- IVP-27: Increase the proportion of public and private schools that require students to wear appropriate protective gear when engaged in school-sponsored physical activities.
- NW-2: Increase the percentage of schools that offer nutritious foods and beverages outside of school meals.
- RD-5: Reduce the number of school days or work days missed among persons with current asthma.
- TU-15: Increase tobacco-free environments in schools, including all school facilities, property, vehicles, and school events.

From U.S. Department of Health and Human Services: *Healthy People 2020 Objectives*, 2010. Available at <http://www.healthypeople.gov/hp2020/Objectives/TopicAreas.aspx>. Accessed April 15, 2014.

THE LEVELS OF PREVENTION IN SCHOOLS

The three levels of prevention—primary, secondary, and tertiary—have always been a part of health care in the schools

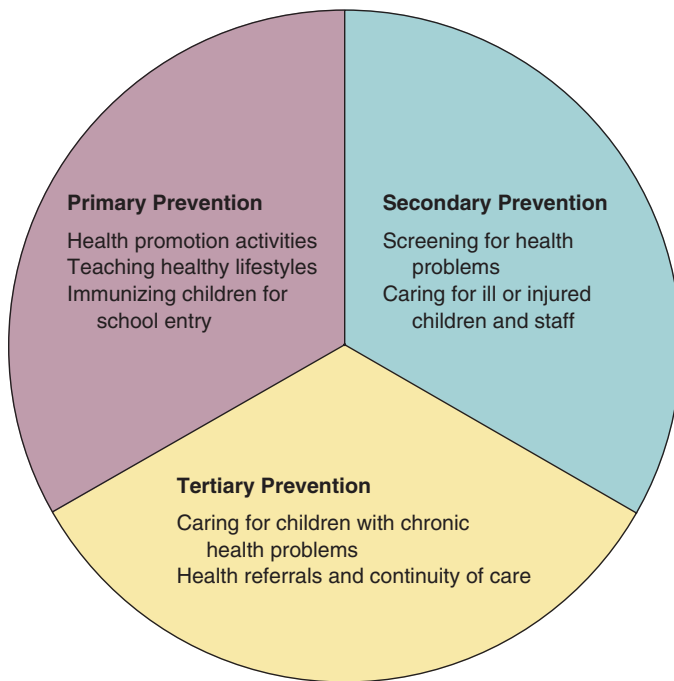

FIG 42-2 Levels of prevention in schools.

(Selekman, 2012). **Primary prevention** provides health promotion and education to prevent health problems in children. **Secondary prevention** includes the screening of children for various illnesses, monitoring their growth and development, and caring for them when they are ill or injured. **Tertiary prevention** in the schools is the continued care of children who need long-term health care services, along with education within the community (Figure 42-2).

Primary Prevention in Schools

Children need continued health services in the schools. The school nurse sees them on an almost daily basis and is the person who is usually given the role of teaching them about and promoting their health.

The school nurse may have the opportunity to go into the classroom to teach health promotion concepts, such as hand-washing or tooth-brushing skills. He or she may spend time with the teachers, giving them the latest information on healthy lifestyles for children or ways to spot a child who may be ill or in need of counseling.

HOW TO Teach Young Children in School

When teaching children in preschools and elementary schools, keep the lesson to no more than 10 minutes. Use a lot of examples, pictures, and stuffed animals in the talk. Always remember the developmental stage of the children when teaching them.

In addition, nurses can teach healthy food choices and encourage school districts that allow vending machines to have nutritious foods instead of “junk food” available in the machines (CDC, 2013b). The Food-Safe Schools (FSS) project sponsored by the American Nurses Foundation and the CDC Division of

Adolescent School Health has educated many school nurses on how to promote proper food storage and preparation in the schools. The hope is to reduce the incidence of foodborne diseases in the schools (CDC, 2010a). These are examples of population-level health care for schools.

School nurses use the nursing process while they care for children in the schools. In their primary prevention efforts, they assess children and families to determine their level of knowledge about health issues. Finding out whether children are at risk for preventable problems is also completed. The nurse then analyzes the assessment findings. Plans are made to develop teaching plans or health promotion activities. Once these activities are implemented, the nurse can evaluate and revise the plan.

The areas of primary prevention that the school nurse focuses on include preventing childhood injuries, preventing substance abuse behaviors, reducing the risk of the development of chronic diseases, and monitoring the immunization status of children. These primary prevention activities are completed for the population of children in the school. The activities for the population are determined by the analysis of the assessments completed on all of the children in the school to determine the most pressing priorities for the population.

Prevention of Childhood Injuries

Accidents (unintentional injuries) are the leading cause of death among children and teenagers (Heron, 2013). The school nurse educates children, teachers, and parents about preventing injuries. Working with the national **Safe Kids Campaign**, the school nurse can provide educational programs reminding children to use their seat belts or bicycle helmets to prevent injuries. Other classes can be on crossing the street, water safety, and fire safety. The school nurse, as the trusted person at school, is able to quickly give information to help prevent injuries from occurring, since most injuries are preventable (Diaz and Wyckoff, 2012; Rains and Robinson, 2012).

School nurses also provide health promotion to prevent playground injuries, which number over 100,000 injuries to children per year. School nurses assess school playgrounds for equipment safety on the basis of the **U.S. Consumer Product Safety Commission (2010)** guidelines. School sports also have the potential to cause injuries to children, and the school nurse is usually involved in deciding with parents and coaches on how to best prevent injuries on the sports field (Rains and Robinson, 2012).

Scooter and skateboard injuries have been increasing (AAP, 2009). School nurses also promote skateboard and scooter safety by providing health educational workshops to children and their families.

The nurse can implement these programs on a community-wide scale. Research has shown that once behaviors of children related to safety are taught, their effects spread quickly throughout the community. This makes the entire community safer (Selekman, 2012).

Substance Abuse Prevention Education

Primary prevention interventions by the school nurse include educating children and adolescents about the effects of drugs

and alcohol on their bodies. Preventing use of and “saying no” to drugs have been part of the school health program for many years. Teenagers are taught by the school nurse to stay away from street drugs (such as marijuana, cocaine, crack, and heroin) and alcohol.

There has been an increase in the use of “club drugs” such as lysergic acid (LSD), ketamine, gamma hydroxybutyrate (GHB), Rohypnol, and Ecstasy (MDMA). The school nurse can provide instruction about the serious side effects of Ecstasy, especially that it causes a very high body temperature that can lead to death. Teaching the teenagers about the dangers of all drugs is the responsibility of the school nurse. In addition, the school nurse can teach parents and other members of the community about the latest drug fads, increasing everyone’s awareness of these dangerous trends (Embrey, 2012).

Disease Prevention Education

The nurse has the opportunity to teach children healthy lifestyles to reduce their risk of disease later in life. For example, children can be taught ways to reduce their risk of becoming obese by teaching and reinforcing healthy nutrition and exercise (Morrison-Sandberg et al, 2010). The school nurse can then reinforce the teachers’ educational plans or develop the program further for other age groups to teach them how to take care of their heart.

Dissemination of health promotion information to the parents of the children is often a challenge for the school nurse. In Newark, Delaware, the school nurse at one of the elementary schools has a “School Nurse’s Corner” webpage (Laudorn, 2010). On this page, the nurse shares important health information related to school-age children, such as immunization requirements and childhood obesity. In this way, the school nurse is able to promote the health of not only the schoolchildren, but also the community.

Vaccinations for Schoolchildren

All states have laws that require that children receive immunizations, or vaccinations, against communicable diseases before they attend school (CDC, 2010b). School nurses must be up to date on the latest laws on immunizations for children in their own state. For children entering kindergarten, these vaccinations include diphtheria, pertussis, and tetanus (the DTaP series); measles, mumps, and rubella (the MMR series); polio; and others. Chapters 13 and 14 have a more complete discussion of communicable diseases and immunizations in children.

The school nurse must keep a complete file of all of the children’s vaccination records in order to meet the state’s laws. These files will contain the student’s name, date of birth, address and telephone number, parents’/guardians’ names, and contact information. They will also include the student’s primary health care provider’s name, telephone number, and address. Most important, the information should include all the vaccinations with the dates the child received booster shots. This makes it easy for the school nurse to find out which children still need immunizations or boosters.

The **Health Insurance Portability and Accountability Act (HIPAA)** of 1996 requires that all health information be private.

This Act presents a challenge for the school nurse and personnel within the school and the school system. Teachers and school administrators as well as interprofessional health care partners feel they have the right to know about health issues of their students. Thus, they often challenge the school nurse if the nurse declines to share information to protect the child’s privacy. (Cruise, 2015).

There is conflicting information on whether the immunization status of children is covered by the law. Whereas some believe that school clinics and school nurses are allowed to have that information without permission because they are considered to be public health officials, others state that this only applies to sharing medical information (Office of Health and Human Services, 2010).

The CDC provides recommendations for vaccinations, but it is up to each individual state to determine which immunizations are required for enrollment and attendance at a school or childcare facility (CDC, 2012). Vaccine requirements and exemptions laws vary from state to state (CDC, 2012). Depending on the state’s law, children may be prevented from enrolling in or attending school if they have not had the required immunizations or have not provided the required paperwork for exemptions (either for medical, religious, or philosophical/conscientious belief reasons) (CDC, 2012).

Each school nurse must be aware of the vaccine requirements for their state and make every effort to find missing data in the student’s immunization record. The nurse will need to contact the parents to get the immunization history for the child. Written notes will need to be sent to each child’s home at least one year before each new immunization is needed so that the parents have time to get the child to his or her health care provider for the shots. If the parents or guardians do not speak English, these notes will need to be translated into the family’s language. If the parents have lost the information that gives the child’s immunization history, they should be encouraged to contact their physician or nurse practitioner to get it.

Many problems with children not being immunized or having incomplete vaccination records may arise in families who have moved a great deal or who may not have a regular physician. The parents may have no idea whether the child has even received the shots. Families may also be without health care insurance to pay for the immunizations, or they may have insurance that does not pay for preventive care. In these cases, the parents have to pay for the immunizations, which can be expensive. Certain low-income families without health care insurance may qualify for federal programs that provide free immunizations to children. Each state has its own program, so school nurses will want to become familiar with what their state provides.

Some parents may request that their child be exempted from the required immunizations because of their belief that not all immunizations are good for their children, for medical reasons, or for religious or philosophical reasons. The school nurse will want to be aware of the laws in the state regarding acceptable reasons for immunization exemption. At the same time, the nurse has the opportunity to teach parents and the rest of the community about the overall benefits to society from the use

of immunizations. It is important, in light of the measles outbreak at Disneyland in 2014-15, that school nurses be alert to the development of vaccine preventable diseases in their communities or schools so that unvaccinated children may be sent home from school for their protection against the disease outbreak (Cruise, 2015).

School nurses can also play an important role in immunizing children against seasonal flu. The American Academy of Pediatrics (AAP, 2013) recommends that all people who are six months of age and older receive an annual seasonal influenza vaccination, especially children younger than five years of age and all children with chronic medical conditions. Vaccination against influenza should begin as soon as that season's vaccine becomes available (Li and Freedman, 2009). During the 2009 H1N1 influenza outbreak, school nurses were at the front line of the epidemic. In fact, it was a school nurse in Queens, New York, who first notified the CDC that the influenza epidemic had reached U.S. soil (Robert Wood Johnson Foundation, 2010). School nurses were challenged to reduce the spread of the epidemic among school-age children. School nurses may administer the influenza vaccine to children at the school with the parents' permission and can educate students, families, and school staff about the vaccine itself (Bobo et al, 2013).

Secondary Prevention in Schools

Because secondary prevention involves caring for children when they need health care, this is the largest responsibility for the school nurse. This includes caring for ill or injured students and school employees. It also involves screening and assessing children, and referral to appropriate health agencies or providers. The school nurse uses the nursing process during secondary prevention activities. When an ill or injured child comes to the school's health office, the nurse must immediately assess the child for the degree of illness or injury.

Children seek out the school nurse for a variety of different needs:

- Headaches
- Stomachaches
- Diarrhea
- Anxiety over being separated from the parents
- Cuts, bruises, or other injuries

In addition, children may seek reassurance from the school nurse or even appear to hide in the nurse's office. This may be a result of harassment or bullying from other children in the school (Frisen and Bjarnelind, 2010).

Once the assessment data are gathered, the nurse determines the course of action and follows it through the implementation and evaluation phases. This occurs for direct child health care as well as for screening children for other health problems. If assessment data identify a child as having a health problem, the school nurse continues to follow the nursing process to further care for that child.

Nursing Care for Emergencies in the School

Events that occur in or near schools may cause a crisis for children, teachers, and staff. The school nurse must have an **emergency plan** in place so that a routine can be followed when

emergencies occur. Disaster planning in the schools includes becoming prepared for natural disasters (such as fire or severe weather), man-made disasters (such as school shooting or structure collapse), as well as health condition emergencies (such as asthma attack or seizure) (Doyle, 2011). The NASN recommends that school nurses provide leadership to schools in all phases of emergency preparedness and management (Cagginello et al, 2011).

The following summarizes the NASN's recommendations of the role of the school nurse during each phase of disaster planning (Cagginello et al, 2011):

- **Prevention/Mitigation:** perform an ongoing assessment to identify hazards
- **Preparedness:** serve on planning groups, establish emergency response plans, provide training to school personnel
- **Response:** perform triage, coordinate the first-aid response team, provide direct hands-on care to victims, act as a counselor to help everyone cope with the emotional aspects of this serious event (Box 42-1)
- **Recovery:** provide direct support, act as liaison between community resources and those in need; school may become an emergency shelter for community-at-large

The U.S. Department of Education (2010) recommends that all schools have crisis plans in place to help the children, teachers, parents, and community cope with the sudden event. **Crisis teams** are prepared to help everyone respond quickly to the crisis, to ensure the safety of the school, and to follow up on the effects of the crisis on the members of the school (Lerner et al, 2013). The crisis plan includes an administrative policy made either for the entire school district or, if the schools are large, for each individual school. The plan includes the names of the persons on the crisis team: the superintendent of the school district, the school nurse, the guidance counselor, the school psychologist or social worker, teachers, police or school security, clergy from the community, and parents. Plans to obtain and share information can be made quickly (Lerner et al, 2013).

The nurse can help the crisis team make a checklist for everyone to follow that explains what to do in every possible crisis situation. Then, at the end of the crisis, the crisis team will want to take time to counsel all of the people who helped in the crisis, including the teachers, emergency personnel, and parents,

BOX 42-1 Dealing with a Disaster: Responsibilities of the School Nurse

- Provide triage.
- Communicate with emergency medical personnel.
- Assess the school community for the presence of shock and stress.
- Recommend reduced television viewing of the disaster.
- Provide grief counseling.
- Communicate with the children, parents, and school personnel.
- Follow up with assessment of children for anxiety, depression, regression, and post-traumatic stress disorder.

Modified from Lerner MD, Lindell B, Volpe J: *A Practical Guide for Crisis Response in Our Schools*. 2010, American Academy of Experts in Traumatic Stress. Available at <http://store.nc-cm.org/servlet/Detail?no=1>. Accessed March 19, 2011.

as well as the children. That way everyone can talk about the crisis. The crisis plan should be reviewed every year to see what parts of the plan need updating. Drills take place to act out the plan to see how it works and how it can be revised to make it more workable (Lerner et al, 2013).

Individualized emergency plans are made for all students who may have a health problem that could result in an emergency situation in the school (Doyle, 2011). This plan could be for the child with food allergies (e.g., to peanuts), one who has sensitivity to insect bites that could result in anaphylactic shock, or those with chronic illnesses such as asthma, diabetes, or hemophilia. The individualized emergency plan should include the student's medical history, list of medications, location of emergency medication, and list of personnel trained to administer emergency medication. It is important that the school nurse communicate with school personnel about students requiring emergency medication to ensure quick access to emergency medications at all times.

The nurse may not always be at the school and the emergency may have to be handled by a teacher, administrator, secretary, custodian, or coach (Doyle, 2011). This issue is especially applicable to school nurses in rural settings, who may have several schools for which they are responsible when such schools may be far apart. Therefore, all emergency procedures are written and easily accessible to anyone in the school. Along with

the procedures and an emergency manual written or obtained by the school nurse, an injury or illness log is available for personnel to fill out so that there is an accurate record of what happened. Along with this form, procedures for notifying the parents or legal guardians about the emergency are spelled out and include what was done for the child and where the child was sent if transfer to a hospital or other medical agency was required.

Because the school nurse may have to give nursing care to a child or adult in respiratory or cardiac arrest, the nurse must have current certification in cardiopulmonary resuscitation (CPR) and the use of the automated external defibrillator (AED), which should be available to all school nurses. All fifty states have passed laws requiring that public gathering places have AEDs available, some requiring them in the schools (AED Brands, 2010). Other education in the area of emergency nursing would also be helpful to the school nurse, including pediatric advanced life support (PALS) or emergency nursing for pediatrics (ENPC) certification (USDE, 2010).

Emergency Equipment in the School Nurse's Office

The school nurse needs a great deal of equipment to deal with emergencies in the school. These needs are based on the guidelines of the NASN (Pontius and Doyle, 2012). The school office will need to have basic emergency items on hand (Box 42-2).

BOX 42-2 Emergency Items for Schools With and Without a School Nurse Present

Supplies for Schools WITHOUT a School Nurse Present

- Accessible keys to locked supplies
- Accessible list of phone resources
- Automated external defibrillator (AED) if school meets the AHA guidelines
- AED supplies stored with AED (razor, alcohol pads, dry towel, scissors, electrode pads)
- Biohazard waste bags
- Blunt scissors
- Clock with a second hand
- CPR trained staff on-site when students are on the premises
- Disposable blankets
- Emergency cards on all staff
- Emergency cards on all students
- Established relationship with local EMS personnel
- Eye protection (full peripheral glasses or goggles, face shield)
- Ice (not cold packs)
- Individual care plans/emergency plans for students with specialized needs
- First aid tapes
- Nonlatex gloves
- One-way resuscitation mask
- Cell phone or other two-way communication device
- Posters with CPR/abdominal or chest thrusts instructions
- Refrigerator or cooler
- Resealable plastic bags
- School-wide emergency operations/response plan

- Sharps container
- Soap and source of water/hand sanitizer for hand and wound cleansing
- Source of oral glucose (i.e., frosting gel, glucose tablets, juice box)
- Splints
- Staff names who have received basic first aid training
- Variety of bandages and dressings
- Water source/normal saline for wound/eye irrigation

Additional Supplies for Schools WITH a School Nurse Present

- C-spine immobilizers of different sizes
- Glucose monitoring device*
- Medications**
 - Albuterol
 - Epinephrine (auto injector preferred)
- Oxygen
- Nebulizer
- Penlight
- Self-inflating resuscitation device in two sizes (500 ml and 1 liter) with appropriate sized masks to meet needs of population being served
- Stethoscope
- Sphygmomanometer and cuffs in pediatric, adult regular, and adult large sizes
- Suction equipment (minimal source, does not have to be electric, i.e. bulb suction or v-vac type device)

*Committee acknowledges challenges with maintenance and expense of test strips. Monitoring of machine must also be in compliance with CLIA (Clinical Laboratory Improvement Amendments).

**All medications including oxygen should be in accordance with state laws, pharmacy, and nurse practice acts.

From: Pontius D, Doyle J: Emergency Preparedness and Response in the School Setting—The Role of the School Nurse: National Association of School Nurses. Available at <https://www.nasn.org/PolicyAdvocacy/PositionPapersandReports/NASNPositionStatementsFullView/tabid/462/ArticleId/117/Emergency-Preparedness-The-Role-of-the-School-Nurse-Adopted-2011>. Accessed April 15, 2014.

Additional equipment may be obtained if a nurse is present in the school (Box 42-3). Various sizes of these items are needed since children may be of different ages in the school. Another recommended item for the nurse's office includes an epinephrine auto injector kit (EpiPen auto injector) in case a child goes into anaphylactic shock after exposure to an allergen (Pontius and Doyle, 2012). This should be locked in a medication cabinet because of the needle in the kit. The school nurse will need to teach other school personnel how to use the EpiPen auto injector in an emergency (Kruger et al, 2009).

Gloves to meet standard precautions guidelines and a telephone available for calling emergency personnel and parents are essential. Next to the telephone, paper and pen should be available so that instructions from the emergency personnel can be written down. The AED should be located in a central location at the school for easy access in an emergency. It should not be locked in the nurse's office but available for school staff to obtain in case the nurse is off site that day.

Giving Medication in School

The school nurse, as part of secondary prevention, may be responsible for giving medications to children during the school day (Zacharski et al, 2012). These may include prescribed medications, medications that the parents have asked the school's nurse to give (such as cold remedies), or vitamins. In all instances, the nurse will want to develop a series of guidelines to help with the legal administration of medications in the school. The school nurse will inquire of parents if the child is taking any medications (Zacharski et al, 2012). HIPAA requires that all of this information be confidential (Nic Philibin et al, 2010). A current, signed parental consent form for giving the medication is essential for the student's file (Zacharski et al, 2012).

The prescribed drug must have the original prescription label on it and be in the original container so that there are no errors. A current drug reference in the nurse's office is necessary so that it can be consulted for information. The nurse is responsible for giving the medication and is expected by state law to know its action, side effects, and implications. The school nurse must have a means of contacting a pharmacist to ask questions regarding the medication if needed.

Delegation. Some states allow school nurses to delegate medication administration to unlicensed assistive personnel (UAP) or to a licensed practical nurse (Zacharski et al, 2012). There are several benefits and challenges associated with delegation in the school setting. On the positive side, delegation allows services to be provided in the absence of a school nurse, which is especially helpful if a nurse is covering multiple schools (Resha, 2010). Also, delegation gives the ability to provide one-on-one care for children with complex medical needs (Resha, 2010). The challenge with delegation is ensuring the UAPs receive adequate training, and regular supervision and monitoring of the UAP (Resha, 2010). Delegation can be done safely in the school environment provided the nurse has clear policies and procedures to follow, understands the "Five Rights of Delegation," understands the scope of practice under the state's Nurse Practice Act, and has a trusting relationship with the UAP and school administrators (Board et al, 2010; Resha, 2010).

QSEN FOCUS ON QUALITY AND SAFETY EDUCATION FOR NURSES

Targeted Competency: Safety

Safety minimizes risk of harm to patients and providers through both system effectiveness and individual performance.

Important aspects of safety include:

- **Knowledge:** Describe factors that create a culture of safety (such as open communication strategies and organizational error reporting systems).
- **Skills:** Communicate observations or concerns related to hazards and errors to patients, families, and the health care team.
- **Attitudes:** Value own role in preventing errors.

Safety Question

Imagine you are working as a nurse in an elementary school. Due to budget cuts, you are only at the school two days a week. Juan, a student in the third grade, is newly diagnosed with asthma and will have an inhaler at school for emergencies. Your state allows nurses to delegate the administration of inhaler medications to unlicensed personnel. You decide to delegate the administration of Juan's emergency inhaler to his classroom teacher, Mr. Smith. What steps would you take to ensure you safely delegated this medication?

Answer

First, you would need to establish open communication between Mr. Smith and yourself. After the initial medication training, you can maintain open communication by checking in with Mr. Smith on a regular basis to assess his knowledge and comfort level in administering Juan's inhaler. Second, in the event that Mr. Smith gives Juan a dose from the inhaler, have a system in place to document when and why the medication was given. Periodically review the records to ensure that everything was documented correctly and that the medication was given for appropriate reasons. Last, in the event of a medication error, reflect on what you can do differently to prevent future errors.

Assessing and Screening Children at School

Children should receive screening for vision, hearing, height and weight, oral health, tuberculosis, and scoliosis in the schools. For each of these areas, the school nurse will keep a confidential record of all of the screening results for the children in the school according to the HIPAA rules. In addition, each state has different laws regarding the screenings and the nurse will need to be aware of these laws.

Screening for tuberculosis (TB) in schoolchildren is also done in several states. This can be problematic because the nurse cannot read the Mantoux test, or the TST test, until three days after it is administered. Often nurses are part time and may not be at the school on the day the child's test needs to be read. In some states, school nurses are required to participate in a training program to read the tests (Cruise, 2015). It may be more efficient to have the children screened for TB at a health clinic and then have the school nurse read the test and send that information to the health clinic for follow-up. If the site is positive, the child has been exposed to TB and needs further health screening.

The school nurse can also screen children and adolescents for hypertension, or high blood pressure. One study found that of the adolescent students whom the school nurse referred to a family physician for follow-up for elevated cholesterol or blood

pressure, 60% actually went to the doctor, 58% had further tests, 10% were referred to specialists, and 3% were prescribed medication (Kilty and Prentice, 2010). These findings indicate the importance of the school nurse in providing effective prevention strategies related to screening, follow-up, and treatment.

Physical examinations to participate in a school sport also may be given in the school. The school nurse arranges for the sports physicals and helps to monitor the examinations being done by the school's physician or nurse practitioner. In addition, some children may not have a regular physician or other primary health care provider such as a nurse practitioner to give them health care. For these children, the AAP recommends that children have a physical and developmental examination in the school setting. This would include obtaining information on their language skills and their motor abilities. Their social abilities and their height and weight are also tested. As the children grow up, their level of physical growth can be noted as well as their sexual maturation. Dental assessments are also to be made. Some states are passing laws requiring these assessments and giving nurses the right to complete the assessment and refer to a dentist.

Screening Children for Pediculosis (Lice)

School nurses must screen children for lice infestation. Prevalence of head lice in U.S. schools ranges from 10% to 40%, being found most commonly in school-aged children, typically in late summer and autumn (Wolfram, 2010). Lice are found most often in white middle-class children because of their oval hair shafts. Lice also are more often seen in clean hair. Therefore, the suggestion that lice are associated with unclean homes in poverty areas is incorrect (Wolfram, 2010). The school nurse needs to check children for lice because in many areas, children with lice are excluded from school. During the "lice check," the nurse must check the children's hair for both lice and nits (Pontius and Teskey, 2011).

It is the responsibility of the school nurse to teach children, parents, and teachers how to prevent lice and treat cases of infestation. The nurse can do this by teaching children not to share combs and hats, and teaching parents to completely treat the child with anti-lice medications. Parents also need to be told to remove all nits from the head with a fine-toothed comb and to wash all bed linens and clothing (Pontius and Teskey, 2011).

Identification of Child Abuse or Neglect

The school nurse is mandated by state laws to report suspected cases of child abuse or neglect. These laws differ from state to state and the nurse must be aware of the particular requirements for reporting in his or her state.

When the nurse identifies a child who may be abused, or receives information from a teacher or other staff member that leads to the belief that a child has been abused, the nurse must contact the appropriate legal authorities as well as the school's principal. A confidential file should be made about the incident. However, the nurse contacts the government authorities, usually the state or county child protection department, who look into the suspected case. In all cases, the child must be protected from

harm, and those who have no right to know that child abuse or neglect is suspected should not be given any information.

Communicating with Health Care Providers

The school nurse often makes an assessment of a child that requires referral to the child's family physician or other health care provider. The findings from these assessments must be communicated accurately to the child's parent and the provider. The nurse must be able to disseminate the information quickly and accurately to the child's parents. Again, HIPAA privacy rules must be followed (Nic Philibin et al, 2010).

One way to do this is to write a detailed report about the findings. This information can be given to the child to give to his or her parents. However, the child may lose the report on the way home. The information can be mailed to the parents, but this takes more time. There is also an issue, in some instances, that are related to parental literacy issues. (Cruise, 2015). Perhaps the best way is to telephone the parents, telling them that the child needs to see the physician or nurse practitioner and that the child will be bringing the information home that day. In this way, the parents can ask the child for the report, the parent can read the report, or if unable to do so can provide it to the child's physician or nurse practitioner. With the phone call the child is aware that the parents expect the report.

HOW TO Develop Good Relationships with Families

School nurses need to have good relationships with families. The school nurse can make this possible by doing the following:

1. *Being visible at school events.*
 2. *Sending home invitations for parents and guardians to call the nurse at any time.*
 3. *Inviting parents to visit the school health office.*
 4. *Calling parents or guardians to ask about ill children.*
 5. *Offering to help families cope with children who have long-term illnesses.*
 6. *Acting as a referral source for families with health care needs.*
 7. *Including parents and members of the community in health education activities.*
-

Efforts to Prevent Suicide and Other Mental Health Problems

Suicide is the third leading cause of death in teenagers. Recommendations have been made about reducing the incidence of suicide in teenagers. A suicide prevention program developed in one school district (see later discussion) contains ideas for the school nurse to use. Suicide prevention must be addressed by school nurses. Nurses can lead educational programs within the schools to emphasize coping strategies and stress management techniques for children and adolescents who have problems, and to teach about the risk factors. The school nurse can teach faculty members to look for the risk factors. The school nurse can also help organize a peer assistance program to help teenagers cope with school stresses (Ramos et al, 2013).

If a student threatens suicide at school, the school nurse can intervene by ensuring the safety of the student and by removing him or her from the school situation immediately. While parents are being notified, the nurse is able to assess the child's suicide

risk and refer the child or teenager to crisis intervention or mental health services.

In the unfortunate instance in which a teenager who attended the school has committed suicide, the school nurse is called upon to help the school population, both students and teachers, cope with the death. Grief counseling is set up and coordinated by the school nurse, usually in collaboration with guidance counselors and school administrators. In addition, further assessments can be made regarding the suicide potential among the deceased teenager's friends, since suicide clusters have been noted.

Other mental health problems may affect students. Adolescents may have early signs of mental or emotional problems such as behavior problems in class or severe class or test anxiety. Families may be in crisis, and this translates into problems for the children. Sometimes, children with mental health issues come to the school nurse with somatic complaints and nothing can be found on assessment. The nurse should be alert to the possibility that the child is experiencing emotional, hunger, or family problems in such cases and look further for the source of the complaints (Cruise, 2015).

Children who are homeless have special problems. Because these children do not have a stable address, this also means that they probably have frequently moved from school to school. Children whose parents are addicted to drugs or alcohol can also benefit from support from the school nurse. This lack of a stable environment may increase chances that they may develop a mental or emotional problem. The school nurse can be an advocate for these children and their families.

Violence at School

In 2009, in the previous 30 days prior to the survey, approximately 5.6% of high school students carried a weapon on school property and 5% of high school students missed at least one day of school because they felt unsafe (CDC, 2010c). Approximately 38% of public schools reported to police at least one incident of violence during the 2005-2006 school year (CDC, 2010c). In 2007, 23% of students reported gangs at their schools (CDC, 2010c). In 2006, there were 29 violent crimes (including rape, sexual and aggravated assault, and robbery) at school per 1000 students (CDC, 2010c). In the past several years, there have been school shootings by students or other attackers against other students and teachers.

Bullying is at the center of attention among child and adolescent advocates. Approximately 20% of high-school students experience bullying in the U.S. (CDC, 2011). Since 2007, the incidence of cyber bullying has risen (Patchin and Hinduja, 2013). Physical injury, social and emotional distress, and even death can result from bullying (CDC, 2011). Students may come to the school nurse complaining of psychosomatic illnesses, such as headaches and stomachaches, due to bullying (CDC, 2011). Students who are being bullied may feel sad or lose hope and begin considering harming themselves (CDC, 2011). The school nurse needs to be knowledgeable about bullying and provide leadership to implement bullying prevention strategies, such as increased supervision and anti-bullying policies (DeSisto and Smith, 2014). In an effort to reduce the prevalence of bullying, 49 states now have anti-bullying laws (Clark, 2013).

The school nurse's primary goal is to prevent violence from occurring and prioritize the safety of everyone on the school's campus (Tuck et al, 2013). Interventions that the nurse can implement to prevent violence include (Tuck et al, 2013):

- Facilitate student connectedness to the school community.
- Engage parents in school activities that promote connections with their children, and foster communication, problem solving, limit setting, and monitoring of children.
- Support activities and strategies to help establish a climate that promotes and practices respect for others and for the property of others.
- Support policies of zero tolerance for weapons on school property, including school buses.
- Advocate for adult monitoring in the hallways between classes and at the beginning and end of the school day, and the assignment of staff to monitor the playground, cafeteria, and school entrances before and after school.
- Serve as positive role models, developing mentoring programs for at-risk youth and families.
- Educate students and their parents about gun safety.

If violence occurs, the school nurse should do the following (Tuck et al, 2013):

- Coordinate emergency response until rescue teams arrive;
- Provide nursing care for injured students;
- Apply crisis intervention strategies that help de-escalate a crisis situation and help resolve the conflict;
- Identify and refer those students who require more in-depth counseling services; and
- Participate in crisis intervention teams.

By helping to identify the student who might be considering school violence or by teaching students and teachers about these warning signs in students, the school nurse may be able to help prevent violent actions through education and follow-up of children who need help. The U.S. federal government has many agencies that can be used as resources to help school nurses develop programs in their schools (CDC, 2010d).

Tertiary Prevention in Schools

Using the nursing process, the school nurse gives nursing care related to tertiary prevention when working with children who have long-term or chronic illnesses or special needs. As prevalence of chronic conditions such as asthma and diabetes increases among children, today's school nurse faces a school population that is more medically diverse than ever seen in the past (Robert Wood Johnson Foundation, 2010). The nurse participates in developing an individual education plan (IEP) for students with long-term health needs (Box 42-3).

For example, nurses must have information about children's medications to be administered during school hours. They also need to know if the children need any therapy during the school day, such as physical or occupational therapy. If the child has a hearing or vision problem, the nurse may need to ask the teacher to seat the child in the best place in the classroom so the child can see or hear better. If a child is in a wheelchair or uses crutches, the school building itself may need to be altered so that the child can get around the school and use the restrooms. It is the responsibility of

BOX 42-3 States That Require School Nurses to Participate in Individualized Education Plans for Students

- Alabama
- Arizona
- Colorado
- Delaware
- District of Columbia
- Hawaii
- Illinois
- Indiana
- Iowa
- Louisiana
- Maryland
- Massachusetts
- Minnesota
- Mississippi
- Nevada
- New Jersey
- New Mexico
- New York
- North Carolina
- Oklahoma
- Rhode Island
- South Carolina

- Vermont
- Virginia
- Washington
- West Virginia
- Wisconsin

Compiled from Centers for Disease Control and Prevention: *State Level School Health Policies and Practices: A State-by-State Summary from the School Health Policies and Programs Study 2006*. Atlanta, 2006, CDC, USDHHS.

the nurse to tell the school's administrators about any needs such as these.

Children with Allergies

Food and insect sting allergies that result in anaphylaxis are being diagnosed more frequently (Zacharski et al, 2012). Anaphylaxis is a severe allergic reaction that occurs quickly and can be life-threatening. Food allergies affect approximately 4% to 6% of children in the United States (CDC, 2013d). Milk, eggs, fish, shellfish, wheat, soy, peanuts, and tree nuts account for 90% of serious allergic reactions in the United States (CDC, 2013d).

The school nurse must take a leadership role in coordinated care for these students. The school nurse must develop a plan for preventing exposure to a known allergen and responding to an allergy emergency, collaborating with the student, the student's parents, and school personnel to determine the best plan of action (Zacharski et al, 2012). The school nurse must provide annual training to school personnel who are involved with the student (Zacharski et al, 2012). Most states have laws that allow students to carry emergency medication and, if developmentally appropriate, self-administer as needed (Zacharski et al, 2012). Some states allow trained unlicensed assistive personnel to administer the emergency medication if the student is unable to do so and a nurse is not available.

Children with Asthma

Asthma is the leading cause of children being absent from school because of a chronic illness (CDC, 2013e). Children may be hospitalized with an asthma attack or they may have just returned home from the hospital. Asthma can also be caused by allergic triggers that affect children in the school. Possible culprits are chalk dust from the blackboards, molds or mildew in the school, or dander from pets that live in some classrooms (CDC, 2013e).

There may also be concerns about the quality of the air in the school building because many doors are shut. Industrial arts classes and other sources of air pollution can occur in the school (U.S. EPA, 2010). The school nurse can keep track of the indoor air quality of the school so that school administrators have data about what can affect the children. Figure 42-3 contains the questions developed by the U.S. Environmental Protection Agency that the school nurse should answer regarding the air quality of the school.

The nurse uses tertiary prevention when helping children who have asthma. This includes administering, or helping them use, their inhalers or other asthma rescue medications (NASN, 2013). It also includes instructing the teachers, children, and parents about asthma and ways to reduce allergens in the classroom (NASN, 2013). The nurse will also want to seek information about the types of cleaning solutions used in schools. Many school systems are going with non-toxic cleaners, but many still use chemicals, such as bleach-based solutions, that can be dangerous to children if not properly stored and used (Cruise, 2015). Schools have management programs in place to help children with asthma (NASN, 2013).

Children with Diabetes Mellitus

Diabetes is one of the most common chronic diseases in children and adolescents; about 151,000 people below the age of 20 years have diabetes (CDC, 2013f). Every year, more than 13,000 children and adolescents are diagnosed with type 1 diabetes (CDC, 2013f). In the last couple of decades, type 2 diabetes (formerly known as adult-onset diabetes) has been reported among U.S. children and adolescents with increasing frequency (CDC, 2013f). Case management and coordination of care are critical roles for the school nurse in caring for diabetic students (Butler et al, 2012). The school nurse must establish a plan of care for children with diabetes. This includes methods of monitoring blood glucose levels and administering insulin or other medications during the school day (Butler et al, 2012). Special nutritional needs also need to be discussed with parents, teachers, and cafeteria staff. There may be significant challenges getting the child's nutritional restrictions met due to the institutional nature of most school food services and lack of education of staff about nutrition-related health concerns (Butler et al, 2012; Cruise, 2015).

Children Who Are Autistic or Who Have Attention-Deficit/Hyperactivity Disorder

Because all children are expected to attend some school regardless of their illness, children with autism go to regular schools in most cases. Because a child with autism has severe communication problems, the school nurse provides help for the child, the teachers, and the parents so that the child's school day is pleasant and productive. The nurse can give the child prescribed medications for mood or prevention of seizures. The nurse is also responsible for preparing the teachers about the communication problems that the child may have. The nurse may recommend the use of sign language, picture boards, or other types of communication devices that are used by the child. In addition, the nurse can teach the parents about autism. The

Health Officer/School Nurse

This checklist discusses three major topic areas:

Student Health Records Maintenance
Public Health and Personal Hygiene Education
Health Officer's Office

Instructions:

1. Read the *IAQ Backgrounder*.
2. Read each item on this Checklist.
3. Check the diamond(s) as appropriate or check the circle if you need additional help with an activity.
4. Return this checklist to the IAQ Coordinator and keep a copy for future reference.

Name: _____

Room or Area: _____

School: _____

Date Completed: _____

Signature: _____

MAINTAIN STUDENT HEALTH RECORDS

There is evidence to suggest that children, pregnant women, and senior citizens are more likely to develop health problems from poor air quality than most adults. Indoor Air Quality (IAQ) problems are most likely to affect those with preexisting health conditions and those who are exposed to tobacco smoke. Student health records should include information about known allergies and other medically documented conditions, such as asthma, as well as any reported sensitivity to chemicals. Privacy considerations may limit the student health information that can be disclosed, but to the extent possible, information about students' potential sensitivity to IAQ problems should be provided to teachers. This is especially true for classes involving potential irritants (e.g., gaseous or particle emissions from art, science, industrial/vocational education sources). Health records and records of health-related complaints by students and staff are useful for evaluating potential IAQ-related complaints.

Include information about sensitivities to IAQ problems in student health records

- Allergies, including reports of chemical sensitivities.
- Asthma.
- ◇ Completed health records exist for each student.
- ◇ Health records are being updated.
- Need help obtaining information about student allergies and other health factors.

Track health-related complaints by students and staff

- Keep a log of health complaints that notes the symptoms, location and time of symptom onset, and exposure to pollutant sources.
- Watch for trends in health complaints, especially in timing or location of complaints.
- ◇ Have a comprehensive health complaint logging system.
- ◇ Developing a comprehensive health complaint logging system.
- Need help developing a comprehensive health complaint logging system.

Recognize indicators that health problems may be IAQ

- Complaints are associated with particular times of the day or week.
- Other occupants in the same area experience similar problems.
- The problem abates or ceases, either immediately or gradually, when an occupant leaves the building and recurs when the occupant returns.
- The school has recently been renovated or refurbished.
- The occupant has recently started working with new or different materials or equipment.
- New cleaning or pesticide products or practices have been introduced into the school.
- Smoking is allowed in the school.
- A new warm-blooded animal has been introduced into the classroom.
- ◇ Understand indicators of IAQ-related problems.
- Need help understanding indicators of IAQ-related problems.

HEALTH AND HYGIENE EDUCATION

Schools are unique buildings from a public health perspective because they accommodate more people within a smaller area than most buildings. This proximity increases the potential for airborne contaminants (germs, odors, and constituents of personal products) to pass between students. Raising awareness about the effects of personal habits on the well-being of others can help reduce IAQ-related problems.

Obtain Indoor Air Quality: An Introduction for Health Professionals

- Contact IAQ INFO, 800-438-4318.
- ◇ Already have this EPA guidance document.
- ◇ Guide is on order.
- Cannot obtain this guide.

Inform students and staff about the importance of good hygiene in preventing the spread of airborne contagious diseases

- Provide written materials to students (local public health agencies may have information suitable for older students).
- Provide individual instruction/counseling where necessary.
- ◇ Written materials and counseling available.
- ◇ Compiling information for counseling and distribution.
- Need help compiling information or implementing counseling program.

Provide information about IAQ and health

- Help teachers develop activities that reduce exposure to indoor air pollutants for students with IAQ sensitivities, such as those with asthma or allergies (contact the American Lung Association [ALA], the National Association of School Nurses [NASN], or the Asthma and Allergy Foundation of America [AAFA]). Contact information is also available in the IAQ Coordinator's Guide.
- Collaborate with parent-teacher groups to offer family IAQ education programs.
- Conduct a workshop for teachers on health issues that covers IAQ.
- ◇ Have provided information to parents and staff.
- ◇ Developing information and education programs for parents and staff.
- Need help developing information and education program for parents and staff.

Establish an information and counseling program regarding smoking

- Provide free literature on smoking and secondhand smoke.
- Sponsor a quit-smoking program and similar counseling programs in collaboration with the ALA.
- ◇ "No Smoking" information and programs in place.
- ◇ "No Smoking" information and programs in planning.
- Need help with a "No Smoking" program.

HEALTH OFFICER'S OFFICE

Since the health office may be frequented by sick students and staff, it is important to take steps that can help prevent transmission of airborne diseases to uninfected students and staff (see your IAQ Coordinator for help with the following activities).

Ensure that the ventilation system is properly operating

- Ventilation system is operated when the area(s) is occupied.
- Provide an adequate amount of outdoor air to the area(s). There should be at least 15 cubic feet of outdoor air supplied per occupant.
- Air filters are clean and properly installed.
- Air removed from the area(s) does not circulate through the ventilation system into other occupied areas.
- ◇ Ventilation system operating adequately.
- Need help with ventilation-related activities.

☐ **No Problems to Report.** I have completed all the activities on this checklist, and I do not need help in any areas.

FIG 42-3 Indoor air quality checklist. (From U.S. Environmental Protection Agency: *School and Child Care-Based Asthma Education Programs*, 2010. Available from <http://www.epa.gov/asthma/school-based.html>. Accessed April 15, 2014.)

nurse can also help parents work with others in the health care system, such as speech-language therapists and developmental specialists, so that the child can have a positive learning experience at school (Bellando and Lopez, 2009; Blackborow et al, 2013).

Children with attention-deficit/hyperactivity disorder (ADHD) also attend school. As of 2011, 6.4 million children between 5 and 17 years of age have been diagnosed with ADHD (CDC, 2013g). The school nurse can help these children learn appropriate behaviors to reduce classroom disruptions. An example of a common disruption is medication management at school (Blackborow et al, 2013).

Children with Special Needs in the Schools

Children who need urinary catheterization, dressing changes, peripheral or central line intravenous catheter maintenance, tracheotomy suctioning, gastrostomy or other tube feedings, or intravenous medication also attend schools. The nurse may supervise a health aide who is assigned to the child to care for complex nursing needs. In all these cases, the school nurse provides tertiary care to maintain the child's health. The nurse has the skills needed to assess the child's well-being. In addition, the nurse may have to teach another person in the school how to care for the child in case the nurse is not in the building when the child needs help. It is the responsibility of the school nurse to keep up with the latest health care information through in-service programs.

An example of how a school nurse can help an injured child return to school after long absences follows. Enrique, a sixth-grade boy who had received serious facial burns, is preparing to return to school. Enrique is afraid of how the children will respond to the pressure mask he wears to minimize future scarring. The nurse has a meeting with Enrique's mother and the school's principal and also contacts nurses from the hospital's burn unit to determine a plan to Enrique's reentry to school. According to their plan, the school nurse first teaches a lesson to the boy's classmates about burns and their treatment. After the lesson, Enrique joined the class with the nurse and showed his classmates his face with and without his pressure mask. Both Enrique and the nurse answered the children's questions. In addition to the education provided, changes were made in Enrique's schedule so he could be out of the sun during the school day and during gym time. The nurse found that Enrique's burns were soon forgotten and he was accepted by his friends.

Children with HIV or AIDS may also attend school. Because of privacy and confidentiality laws, the school nurse may not even know that the child attends the school. In these cases, the nurse may be aware of the child's HIV status either by direct notification from the parents or physician or just by knowing that certain drugs the child is prescribed during the school day are anti-HIV medications. In all cases, the nurse must maintain confidentiality. This means that information cannot be released to anyone, including teachers, other health professionals, other students, or staff.

As part of regular health education in the school, the school nurse can provide education about HIV/AIDS prevention and risks to the children, school employees, and community. The school nurse should also be part of the school health advisory

committee to develop an HIV/AIDS health curriculum that teaches not only about HIV/AIDS prevention, but also about the disease itself, so that children and families are not afraid to go to school with children who have the disease.

Children with DNAR Orders

As part of tertiary prevention, the school nurse also maintains the health of children with terminal diseases who go to school. These children have been largely mainstreamed into the regular school population. The PL 94-142 Education for All Handicapped Children Act stated that all children should go to school in the "least restrictive environment" (AAP, 2010). Therefore, there may be children who have **do-not-attempt-resuscitate orders** (DNAR orders) at school, and some may die at school. DNAR orders are signed by the parents and the physician according to the state's law. Under law, the school nurse is bound to obey the DNAR order; however, it is not clear how the schools view them.

The AAP's committees on school health and bioethics reaffirmed a set of guidelines to help school health providers and the schools decide what to do when a child with a DNAR order attends the school (AAP, 2010). A formal request to the school and the school board from the physician is a must regarding the written DNAR order. The school nurses should be involved in discussions regarding when to use the DNAR order. The decision not to do anything for a dying child, and how to function if the child were to suddenly face death, is made in advance of discussions between the school nurse, the parents, the physician, and the school officials (Tuck et al, 2014).

When a child dies in school, the nurse is responsible for helping the children who witnessed the death. The nurse becomes a grief counselor and helps the children and teachers cope with the death. Further education about death and dying given by the school nurse would also help the school community cope with death in the schools. (Tuck et al, 2014).

Homebound Children

Even though the laws regarding disabled persons state that all children should go to school, some children cannot. Instead, they may be taught in the home or in another institutional setting such as the hospital. In these situations, the school nurse can be a liaison between the child's teacher, physician, school administrators, and parents regarding the child's needs. The nurse helps these individuals develop the child's IEP so that it is appropriate for the child and does not remove necessary learning from the plan. The child should be allowed to go to school when he or she is able, at which point the school nurse coordinates the child's health care needs and classes.

Pregnant Teenagers and Teenage Mothers at School

Many teenage girls who are pregnant attend school. Therefore, the school nurse may provide ongoing care to the mother as well as coordination of care the teen may need outside the school system, ie, visits to the physician or nurse practitioner (Brewin et al, 2013; Norris et al, 2009). Although this may appear to be primary prevention, it is tertiary prevention because adolescent pregnancies are considered to be high risk. This is discussed in more detail in Chapters 29 and 35.

CONTROVERSIES IN SCHOOL NURSING

School nursing has evolved into a complex health care role, and some areas of the field still cause controversy, such as birth control education and giving out birth control to students in the schools. Although differences in opinion exist relating to sex education, reproductive services, and screening for sexually transmitted diseases in the schools, the literature supports a comprehensive approach to sexual health education (Bradley et al, 2012). The school nurse should make an effort to communicate with the community, school board, teachers, parents, and students about what they think about different types of services in the schools.

ETHICS IN SCHOOL NURSING

The school nurse may be faced with ethical issues in the schools. For example, a child may have a DNAR order that the parents wish to be used if the child dies at school (see earlier text), but following the DNAR order may be against the nurse's personal beliefs. Perhaps a girl asks the nurse where she can get an abortion and wishes to talk to the school nurse about how she feels, but the nurse is against abortions. Alternatively, a teenager asks for emergency contraception, which the nurse cannot condone. In these cases, the nurse must give nursing care to the student client and keep personal beliefs out of the discussion. However, if the nurse feels so strongly that he or she cannot work with the situation, another school nurse should be called for help, or the student should be referred to other health providers who can give the care the student needs. Care should never be denied or ignored; referral is a good option.

FUTURE TRENDS IN SCHOOL NURSING

The future of school nursing is strong. The amount of health care being given in the schools is increasing. In the future, school nursing will entail telehealth and telecounseling to teach health education (Hoffmann et al, 2012; Schlachta-Fairchild et al, 2010). The Internet will be used by school nurses to work with children and parents. Teleclinics operated out of the schools will be seen more frequently (Hoffman et al, 2012; Schlachta-Fairchild et al, 2010). Online resources are listed in Table 42-4. The school nurse is responsible for keeping up with the latest changes in health care and health practice so that the health of children in the schools can be enhanced by new trends in health care.

PRACTICE APPLICATION

The elementary school principal has notified the school nurse that Melissa and John, 8-year-old twins who receive daily physical therapy for mild cerebral palsy, have transferred to the school. The nurse must comply with federal laws related to providing education and services to all children with disabilities.

A. What nursing responsibilities should the school nurse carry out?

B. What factors must be considered when the nurse coordinates the IEP and IHP plans?

C. How will this situation impact other children at school?

D. What is the central focus of Melissa's and John's education?

Answers can be found on the Evolve site.

KEY POINTS

- School nurses provide health care for children and families.
- In the early 1900s school nurses screened children for infectious diseases.
- By 2005 school nurses provided direct care, health education, counseling, case management, and community outreach.
- The National Association of School Nurses (NASN) is the professional organization for school nurses.
- School nurses have varying educational levels depending on state laws.
- The U.S. government supports school-based health centers, school-linked programs, and full-service school-based health centers.
- *Healthy People 2020* has objectives to enhance the health of children in schools.
- Primary prevention provides health promotion and education to prevent childhood injuries and substance abuse.
- The school nurse monitors the children for all of their state-mandated immunizations for school entry.

KEY POINTS—cont'd

- HIPAA privacy rules regarding the health information of children apply in schools.
- Secondary prevention involves screening children for illnesses and providing direct nursing care.
- School nurses develop plans for emergency care in the schools.
- Giving medications to children in the school must be monitored carefully to prevent errors.
- School health nurses are mandated reporters to tell the authorities about suspected cases of child abuse and/or neglect.
- Disaster-preparedness plans should be set up for all schools with the school nurse as a member of the crisis response team.
- Tertiary prevention includes caring for children with long-term health needs, including asthma and disabling conditions.
- School nurses carry out catheterizations, suctioning, gastrostomy feedings, and other skills in the schools.
- Some ethical dilemmas in the schools are related to women's health care.
- Some school nurses use the Internet to help communicate with children and their families.

CLINICAL DECISION-MAKING ACTIVITIES

1. For the state where you live, make a list of the immunizations required for children attending schools. Then contrast this to the immunizations you received when in school. How has this changed over the years?
 2. Contact the nurse in your former high school. Interview the nurse, focusing on the major focus of the role. Describe what the nurse likes best and least about the role. What changes can be made to make the responsibilities easier?
 3. Arrange to visit an elementary school health office during screening activities. Observe the interaction between the nurse and the children. Describe how the nurse is using the nursing process during the screening process.
 4. Organize a group of nursing students to volunteer at a school health fair. Develop a health education booth for the fair.
- Describe how the health information can be used by the children, families, and the community.
5. Attend the annual school board meeting that discusses the budget for the next year. Analyze the budget for health services. How will this be adequate to care for the children? What issues influence the budgetary process?
 6. On the Internet, focus on your state's health department. What trends do you see relating to health in the schools?
 7. Volunteer as a participant in your school district's emergency response drill. How did the school nurse's responsibilities work to help reduce confusion and increase the provision of emergency care?

The Nurse in Occupational Health

Bonnie Rogers, DrPH, COHN-S, LNCC, FAAN

Bonnie Rogers is a Professor of Public Health and Nursing and is Director of the North Carolina Occupational Safety and Health Education and Research Center and the Occupational Health Nursing Program at the University of North Carolina, School of Public Health, at Chapel Hill, North Carolina. Dr. Rogers received her diploma in nursing from the Washington Hospital Center School of Nursing, Washington, DC; her baccalaureate in nursing from George Mason University, School of Nursing, Fairfax, VA; and her master of public health degree and doctorate in public health, the latter with a major in environmental health sciences and occupational health nursing from the Johns Hopkins University School of Hygiene and Public Health, Baltimore, MD. She holds a postgraduate certificate as an adult health clinical nurse specialist. She is certified in occupational health nursing, is a certified legal nurse consultant, and is a fellow in the American Academy of Nursing and the American Association of Occupational Health Nurses. Dr. Rogers completed an academic certificate program in Bioethics and Health Policy at Loyola University, Chicago, is a nurse ethicist and was invited to study ethics as a visiting scholar at the Hastings Center in New York. She was granted a National Institute for Occupational Safety and Health (NIOSH) career award to study ethical issues in occupational health.

In addition to managerial, consultant, and educator/researcher positions, Dr. Rogers has also practiced for many years as a public health nurse, occupational health nurse, and occupational health nurse practitioner. She has published nearly 200 articles and book chapters, and two books, including *Occupational and Environmental Health Nursing: Concepts and Practice*, and *Occupational Health Nursing Guidelines for Primary Clinical Conditions*, in their third and fourth editions, respectively. She is a member of several editorial panels and has given more than 450 presentations nationally and internationally on occupational health and safety issues. Dr. Rogers has had several funded research grants on clinical issues in occupational health, health promotion, research priorities, hazards to health care workers, and ethical issues in occupational health. She is Editor for the *Journal of Legal Nurse Consulting*.

Dr. Rogers is honored to serve as Chairperson of the NIOSH Board of Scientific Counselors. She was elected in 2013 as a Fellow in the Collegium Ramazzini. She is Vice President of the International Commission on Occupational Health (ICOH) and completed two terms as Chairperson of the Scientific Committee on Education and Training in Occupational Health, ICOH. Dr. Rogers is past president of the American Association of Occupational Health Nurses, completed several terms as an appointed member of the National Advisory Committee on Occupational Safety and Health, and is President of the Association of Occupational and Environmental Clinics. She is a consultant in occupational health and ethics.

Dr. Rogers has been Chairperson of the NIOSH National Occupational Research Agenda Liaison Committee for 15 years. She has served on numerous Institute of Medicine committees including the Nursing, Health and the Environment Committee, the Committee to Assess Training Needs for Occupational Safety and Health Personnel in the United States, the IOM standing committee on Personal Protective Equipment for Workplace Safety and Health, Respiratory Protection for Healthcare Workers in the Workplace Against Novel H1N1 Influenza A, and PPE for Healthcare Workers During an Influenza Pandemic: Current Research Issues.

OBJECTIVES

After reading this chapter, the student should be able to do the following:

1. Describe the nursing role in occupational health.
2. Discuss current trends in the U.S. workforce.
3. Use the epidemiologic model to explain work-health interactions and give examples of work-related illness, injuries, and hazards
4. Complete an occupational health history.
5. Differentiate between the functions of OSHA and NIOSH.
6. Explain an effective disaster plan in occupational health.

 Agent
 Environment

Organizational and Public Efforts to Promote Worker Health and Safety
 On-Site Occupational Health and Safety Programs
 Nursing Care of Working Populations
 Worker Assessment
 Workplace Assessment
 Healthy People 2020 Document Related to Occupational Health
 Legislation Related to Occupational Health

Nurses provide care to individuals to help them achieve optimal health; yet, at the same time in the course of their work, nurses face numerous hazardous substances such as blood, body fluids, or chemicals and often must lift heavy loads. Work can be both fulfilling and hazardous or risky. Many changes have occurred in the nature of work and workplace risks, the work environment, workforce composition and demographics, and health care delivery mechanisms. An analysis of the trends suggests that work–health interactions will continue to grow in importance, affecting how work is done, how hazards are controlled or minimized, and how health care is managed and integrated into workplace health delivery strategies. Although some workers may never face more than minor adverse health effects from exposures at work, such as occasional eyestrain resulting from poor office lighting, every industry has grappled with serious hazards (USDHHS, NIOSH, 2010).

In America, work is viewed as important to one's life experiences, and most adults spend about one third of their time at work (Rogers, 2015). Work—when fulfilling, fairly compensated, healthy, and safe—can help build long and contented lives and strengthen families and communities. No work is completely risk free, and all health care professionals should have some basic knowledge about workforce populations, work and related hazards, and methods to control hazards and improve health.

Important developments are occurring in occupational health and safety programs designed to prevent and control

work-related illness and injury and to create **environments** that foster and support health-promoting activities. Occupational health nurses have performed critical roles in planning and delivering worksite health and safety services, which must continue to grow as comprehensive and cost-effective services. In addition, the continuing increase in health care costs and the concern about health care quality have prompted the inclusion of primary care and management of non–work-related health problems in the health services' programs. In some settings, family services are also provided.

Health at work is an important issue for most individuals for whom the nurse provides care. With many individuals spending so much time at work, the workplace has significant influence on health and can be a primary site for the delivery of health promotion and illness prevention. The home, the clinic, the nursing home, and other community sites, such as the workplace, will become the dominant areas where health and illness care will be sought.

This chapter describes the nurse's role in occupational health—working with employees and the workforce population. The focus is on the knowledge and skills needed to promote the health and safety of workers through occupational health programs, recognizing work-related health and safety, and the principles for prevention and control of adverse **work–health interactions**. The prevalence and significance of the interactions between health and work underscore the importance of including principles of occupational health and safety in nursing

practice. The types of interactions and the frequent use of the general health care system for identifying, treating, and preventing occupational illnesses and injuries require nurses to use this knowledge in all practice settings. The epidemiologic triangle is used as the model for understanding these interactions, as well as risk factors, and effective nursing care for promoting health and safety among employed populations.

DEFINITION AND SCOPE OF OCCUPATIONAL HEALTH NURSING

Adapted from the [American Association of Occupational Health Nurses \(AAOHN\) \(2012\)](#), **occupational and environmental health nursing** is the specialty practice that focuses on the promotion, prevention, and restoration of health within the context of a safe and healthy environment. It includes the prevention of adverse health effects from occupational and environmental hazards. It provides for and delivers occupational and environmental health and safety programs and services to clients. Occupational and environmental health nursing is an autonomous specialty, and nurses make independent nursing judgments in providing health care services.

The foundation for occupational and environmental health nursing is research based. Recognizing the legal context for occupational health and safety, this specialty practice derives its theoretical, conceptual, and factual framework from a multidisciplinary base including, but not limited to:

- Nursing science
- Medical science
- Public health sciences such as epidemiology and environmental health
- Occupational health sciences such as toxicology, safety, industrial hygiene, and ergonomics
- Social and behavioral sciences
- Management, administration, and financial principles

Guided by an ethical framework made explicit in the [AAOHN Code of Ethics \(2009\)](#), occupational and environmental health nurses encourage and enable individuals to make informed decisions about health care concerns. Confidentiality of health information is integral and central to the practice. Occupational and environmental health nurses are advocates for client(s), fostering equitable and quality health care services and safe and healthy environments in which to work and live.

HISTORY AND EVOLUTION OF OCCUPATIONAL HEALTH NURSING

Nursing care for workers began in 1888 and was called industrial nursing. A group of coal miners hired Betty Moulder, a graduate of the Blockley Hospital School of Nursing in Philadelphia (now Philadelphia General Hospital), to take care of their ailing coworkers and families ([AAOHN, 1976](#)). Ada Mayo Stewart, hired in 1885 by the Vermont Marble Company in Rutland, Vermont, is often considered the first industrial nurse. Riding a bicycle, Miss Stewart visited sick employees in their homes, provided emergency care, taught mothers how to care for their children, and taught healthy living habits ([Felton,](#)

[1985](#)). In the early days of occupational health nursing, the nurse's work was family centered and holistic.

Employee health services grew rapidly during the early 1900s as companies recognized that the provision of worksite health services led to a more productive workforce. At that time, workplace accidents were seen as an inevitable part of having a job. However, the public did not support this attitude, and a system for workers' compensation arose that remains today ([McGrath, 1945](#)).

Industrial nursing grew rapidly during the first half of the twentieth century. Educational courses were established, as were professional societies. By World War II there were approximately 4000 industrial nurses ([Brown, 1981](#)). The American Association of Industrial Nursing (AAIN) (now called the American Association of Occupational Health Nurses) was established as the first national occupational nursing organization in 1942. The aim of the AAIN was to improve industrial nursing education and practice and to promote interprofessional collaborative efforts ([Rogers, 1988](#)). Passage of several laws in the 1960s and 1970s to protect workers' safety and health led to an increased need for occupational health nurses. In particular, the passing of the landmark Occupational Safety and Health Act in 1970, which created the Occupational Safety and Health Administration (OSHA) and the National Institute for Occupational Safety and Health (NIOSH), discussed later in this chapter, resulted in a great need for nurses at the worksite to meet the demands of the many standards being implemented. Under OSHA, the Act focuses primarily on protecting workers from work-related hazards. NIOSH focuses on education and research. In 1988 the first occupational health nurse was hired by OSHA to provide technical assistance in standards development, field consultation, and occupational health nursing expertise. In 1993 the Office of Occupational Health Nursing was established within the agency. In addition to direct health care delivery, nurses are more engaged than ever in policy making and management of occupational health services. In addition, in 1998, the AAOHN adopted the concept of environmental health as a significant component of the practice field. To this end, AAOHN has incorporated the term "environmental," as in occupational and environmental health nurse, in its documents and publications. In 1999, AAOHN published its first set of competencies in occupational health nursing, which have been updated, and established the AAOHN Foundation to support education, research, and leadership activities in occupational health nursing. Role expansion includes environmental health and forging sustainable relationships in the community to better improve worker health.

ROLES AND PROFESSIONALISM IN OCCUPATIONAL HEALTH NURSING

As U.S. industry has shifted from agrarian (agriculture) to industrial to highly technological processes, the role of the occupational health nurse has continued to change. The focus on work-related health problems now includes the spectrum of human responses to multiple, complex interactions of biopsychosocial factors that occur in community, home, and work

environments. The customary role of the occupational health nurse has extended beyond emergency treatment and prevention of illness and injury to include the promotion and maintenance of health, overall risk management, care for the environment, and efforts to reduce health-related costs in businesses. The interprofessional nature of occupational health nursing has become more critical as occupational health and safety problems require more complex solutions. The occupational health nurse frequently collaborates closely with multiple disciplines and industry management, as well as with representatives of labor.

Occupational health nurses constitute the largest group of occupational health professionals. The most recent national survey of registered nurses indicates that there are approximately 19,000 licensed occupational health nurses ([Health Resources and Services Administration, 2010](#)). Occupational health nurses hold positions as nurse practitioners, clinical nurse specialists, managers, supervisors, consultants, educators, and researchers. Data also show that approximately 60% of occupational health nurses report that they are employed in single-managed occupational health nurse units in a variety of businesses. The occupational health nursing role requires the nurse to adapt to an organization's needs as well as to the needs of specific groups of workers.

The professional organization for occupational health nurses is the American Association of Occupational Health Nurses. The AAOHN's mission is comprehensive. It supports the work of the occupational health nurse and advances the specialty. The AAOHN also does the following:

- Promotes the health and safety of workers
- Defines the scope of practice and sets the standards of occupational health nursing practice
- Develops the code of ethics for occupational health nurses with interpretive statements
- Promotes and provides continuing education in the specialty
- Advances the profession through supporting research
- Responds to and influences public policy issues related to occupational health and safety

The [AAOHN \(2012\)](#) provides the Standards of Occupational and Environmental Health Nursing Practice to define and advance practice and provide a framework for practice evaluation. The AAOHN Code of Ethics lists five code statements based on the goal of occupational and environmental health nurses to promote worker health and safety ([AAOHN, 2009](#)). Both documents can be obtained from the AAOHN at <http://www.aohn.org>.

Occupational health nurses have many roles, such as clinician, case manager, coordinator, manager, nurse practitioner, corporate director, health promotion specialist, educator, consultant, and researcher ([AAOHN, 2007](#)). The majority of occupational health nurses work as solo clinicians, but additional roles are being included increasingly in the specialty practice. In many companies, the occupational health nurse has assumed expanded responsibilities in job analysis, safety, and benefits management. Many occupational health nurses also work as independent contractors or have their own businesses that

provide occupational health and safety services to industry, as well as consultation.

Ethical conflict is nothing new in occupational and environmental health nursing practice. Traditional concerns about confidentiality of employee health records, hazardous workplace exposures, issues of informed consent, risks and benefits, and dual duty conflicts are now married with newer concerns of genetic screening, worker literacy and understanding, work organization issues, and untimely return to work ([Rogers, 2015](#)). With the current changes in health care delivery and the movement toward managed care, occupational health nurses will need increased skills in primary care, health promotion, and disease prevention. The aim of the occupational health nurse will be to devote much attention to keeping workers and, in some cases, their families healthy and free from illness and worksite injuries. Specializing in the field is often a requirement.

Academic education in occupational health and safety is generally at the graduate level. Training grants from NIOSH support Master's and doctoral education with emphases in occupational health nursing, industrial hygiene, occupational medicine, and safety. These programs, shown in the resource section, are offered through Occupational Safety and Health Education and Research Centers throughout the country. Certification in occupational health nursing is provided by the American Board for Occupational Health Nurses (ABOHN). ABOHN offers two basic certifications: the COHN (Certified Occupational Health Nurse) and COHN-S (Certified Occupational Health Nurse–Specialist). Eligibility for the COHN requires licensure as a registered nurse, whereas the COHN-S requires RN licensure plus a baccalaureate degree. In addition, certification is achieved through experience, continuing education, professional activities, and examination. Those interested in certification can view the requirements on the ABOHN website (www.abohn.org).

WORKERS AS A POPULATION AGGREGATE

The population of the United States was expected to increase from approximately 281.4 million people in 2000 to an estimated 335 million by the year 2025 ([Hollmann et al, 2000](#)). In reality, the population had grown to 307 million plus by 2009 ([U.S. Census Bureau, 2009](#)). By 2010 the U.S. population had become older, with the greatest growth among those older than age 65, and a reduction in those younger than 25. Since 1995 there has been a dramatic increase in the number of workers older than 55 ([Mosisa and Hipple, 2006](#)). Between 1977 and 2007, employment of older workers over age 65 increased by 101% compared with 59% of the total employment ([BLS, 2008a](#)). Bureau of Labor Statistics ([BLS, 2008b](#)) data show total workforce projection to increase by 8.5% from 2006 to 2016 with workers aged 55 to 64 increasing by 36.5% and those over 65 years of age increasing by 80%. By 2016 workers older than 65 will comprise 6.1% of the labor force, up from 3.6% in 2006. The number of adults age 65 years and older is expected to more than double between now and the year 2050. By that year, one in five Americans will be an older adult ([BLS, 2008a](#)).

In 2013 there were more than 143,929 million civilian wage and salary workers employed in the United States, of which more than 58% were employed in small businesses (<500 workers) (BLS, 2014). More than 91% of those who are able to work outside of the home do so for some portion of their lives. Neither of these statistics indicates the full number of individuals who have potentially been exposed to work-related health hazards. Although some individuals may currently be unemployed or retired, they continue to bear the health risks of past occupational exposures. The number of affected individuals may be even larger, as work-related illnesses are found among spouses, children, and neighbors of exposed workers. In addition, more than seven million individuals report that they work multiple jobs.

Americans are employed in diverse industries that range in size from one to tens of thousands of employees. Types of industries include traditional manufacturing (e.g., automotive and appliances), service industries (e.g., banking, health care, and restaurants), agriculture, construction, and high-technology firms, such as computer chip manufacturers. Although some industries are noted for the high degree of hazards associated with their work (e.g., manufacturing, mines, construction, and agriculture), no worksite is free of occupational health and safety hazards. In addition, the larger the company, the more likely it is that there will be health and safety programs for employees. Smaller companies are more apt to rely on external community resources to meet their needs for health and safety services.

Characteristics of the Workforce

The U.S. workplace has been changing rapidly. Jobs in the economy continue to shift from manufacturing to service. Longer hours, compressed workweeks, shift work, reduced job security, and part-time and temporary work are realities of the modern workplace. New chemicals, materials, processes, and equipment are developed and marketed at an ever-increasing pace.

The workforce is also changing. With the U.S. workforce expected to grow to approximately 166 million by the year 2018, it will become older and more racially diverse (BLS, 2008b). In 2008, the workforce was comprised of 48% women, 11% blacks, and 14% Hispanics (BLS, 2008b). These changes will continue to present new challenges to protecting worker safety and health.

The demographic trends in the U.S. workforce describe a changing population aggregate that has implications for the prevention services targeted to that group. Major changes in the working population are reflected in the increasing numbers of women, older individuals, and those with chronic illnesses who are part of the workforce. Because of changes in the economy, extension of life span, legislation, and society's acceptance of working women, the proportion of the employed population that these three groups represent will probably continue to grow.

For example, in the late 1990s while nearly 60% of all women were employed, women were predicted to account for 67% of the increase in the labor force in the twenty-first century

(BLS, 2014). These workers tended to be married, with children and aging parents for whom they were responsible. This aggregate of workers presents new issues for individual and family health promotion, such as child care and elder care, which can be addressed in the work environment. In 1990 more than half of the female labor force was concentrated in three areas: administrative support/clerical (26%), service (14%), and professional specialty (14%). Twelve percent were employed in fields such as labor, transportation and moving, machine operation, precision products, crafts, farming, construction, forestry, and fishing. In the male labor force, nearly 20% worked in precision production, crafts, or repair occupations, 13% in executive positions, 11% in professional specialty occupations, and 10% in sales. Other trends shaping the profile of the workforce include more education and mobility. Increasing mismatches between skills of workers and types of employment were seen in the 1990s.

Future employment trends projected to 2022 are shown in Figure 43-1. Of the 20 fastest growing occupations in the economy, 60% are related to health care. Health care is

FIG 43-1 Fastest growing occupations 2012–22. (From Bureau of Labor Statistics, 2014.)

experiencing rapid growth, due in large part to the aging of the baby-boom generation, who will require more medical care. In addition, some health care occupations will be in greater demand for other reasons. As health care costs continue to rise, work is increasingly being delegated to lower-paid workers in order to cut costs. For example, tasks that were previously performed by doctors, nurses, dentists, or other health care professionals increasingly are being performed by physician assistants, nursing and medical assistants, dental hygienists, and physical therapist aides. In addition, clients increasingly are seeking home care as an alternative to costly stays in hospitals or residential care facilities, causing a significant increase in demand for home health aides. Although not classified as health care workers, personal and home care aides are being affected by this demand for home care as well (Bartsch, 2009).

Characteristics of Work

There has been a dramatic shift in the types of jobs held by workers. Following the evolution from an agrarian economy to a manufacturing society and then to a highly technological workplace, the greatest proportion of paid employment was in the occupations of trade, transportation, and utilities with 25 million workers (BLS, 2008b). During the 1996 to 2000 period, service-providing industries accounted for virtually all of the job growth. Only construction added jobs in the goods-producing business sector, offsetting declines in manufacturing and mining.

The nature of work has been accompanied by many new occupational hazards, such as complex chemicals, nanotechnology, nonergonomic workstation design (requiring the adaptation of the workplace or work equipment to meet the employee's health and safety needs), and many issues related to work organization such as job stress, burnout, and exhaustion. In addition, the emergence of a global economy with free trade and multinational corporations presents new challenges for health and safety programs that are culturally relevant.

Work–Health Interactions

The influence of work on health, or work–health interactions, is shown by statistics on illnesses, injuries, and deaths associated with employment. Employers reported 3.4 work injuries and occupational illnesses per 100 workers in 2011 (BLS, 2012). Occupational injuries alone are reported to cost over \$100 billion in lost wages and lost productivity, administrative expenses, health care, and other costs (BLS, 2006). This figure does not include the cost of occupational diseases. These figures are often described as the “tip of the iceberg,” because many work-related health problems go unreported. However, even the recorded statistics are significant in describing the amount of human suffering, financial loss, and decreased productivity associated with workplace hazards. Laborers, truck drivers, construction, health care, manufacturing, transportation, and service providing industries (Figure 43-2) were among the top occupations representing days away from work due to injury or illness in 2007 (BLS, 2014).

The high number of work injuries and illnesses can be drastically reduced. In fact, significant progress has been made in

FIG 43-2 Occupational injuries and illnesses involving days away from work for selected occupations, 2007 (thousands). (From Bureau of Labor Statistics, 2014)

improving worker protection since Congress passed the 1970 Occupational Safety and Health Act. For example, vinyl chloride–induced liver cancers and brown lung disease (byssinosis) from cotton dust exposure have been almost eliminated. Reproductive disorders associated with certain glycol ethers have been recognized and controlled. Fatal work injuries have declined substantially through the years. Notably, from 1970 to 1995, fatal injury rates in coal miners were reduced by more than 75%, and the disease prevalence was reduced by 90%. However, since 1995 there has been a doubling of the disease incidence (NIOSH, 2008).

The U.S. workplace is rapidly changing and becoming more diverse. Major changes are also occurring in the way work is organized, with increased shift work, reduced job security, and part-time and temporary work as realities of the modern workplace. In addition, new chemicals, materials, processes, and equipment (such as nanotechnology and fermentation processes in biotechnology) continue to be developed and marketed at an accelerating pace creating new work-related hazards.

APPLICATION OF THE EPIDEMIOLOGIC MODEL

The Epidemiologic Triangle can be used to understand the relationship between work and health (Figure 43-3). The reader is referred to Chapter 12, Epidemiology for a fuller description. With a focus on the health and safety of the employed population, the **host** is described as any susceptible human being. Because of the nature of work-related hazards, nurses must assume that all employed individuals and groups are at risk of being exposed to occupational hazards. The **agents**, factors associated with illness and injury, are occupational exposures that are classified as biological, chemical, enviromechanical, physical, or psychosocial (Box 43-1). The third element, the

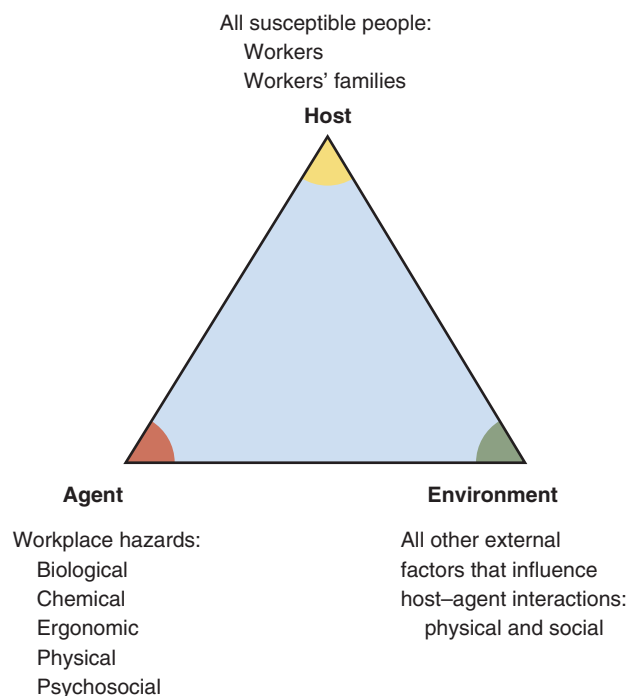

FIG 43-3 The epidemiologic triangle.

BOX 43-1 Categories of Work-Related Hazards

Biological and infectious hazards—Infectious/biological agents, such as bacteria, viruses, fungi, or parasites, that may be transmitted via contact with infected clients or contaminated body secretions/fluids to other individuals

Chemical hazards—Various forms of chemicals, including medications, solutions, gases, vapors, aerosols, and particulate matter, that are potentially toxic or irritating to the body system

Enviromechanical hazards—Factors encountered in the work environment that cause or potentiate accidents, injuries, strain, or discomfort (e.g., unsafe/inadequate equipment or lifting devices, slippery floors, workstation deficiencies)

Physical hazards—Agents within the work environment, such as radiation, electricity, extreme temperatures, and noise, that can cause tissue trauma

Psychosocial hazards—Factors and situations encountered or associated with one's job or work environment that create or potentiate stress, emotional strain, or interpersonal problems

Rogers B: *Occupational Health Nursing: Concepts and Practice*. In Press, 2015.

environment, includes all external conditions that influence the interaction of the host and agents. These may be workplace conditions such as temperature extremes, crowding, shift work, and inflexible management styles. The basic principle of epidemiology is that health status interventions for restoring and promoting health are the result of complex interactions among these three elements. To understand these interactions and to design effective nursing strategies for dealing with them in a proactive manner, nurses must look at how each element influences the others.

Host

Each worker represents a host within the worker population group. Certain host factors are associated with increased risk of adverse response to the hazards of the workplace. These include age, sex, health status, work practices, ethnicity, and lifestyle factors (Rogers, 2015). For example, the population group at greatest risk for experiencing work-related accidents with subsequent injuries is new workers with less than one year of experience on the current job. Most nonfatal injuries and illnesses involving days away from work occur among new workers (the highest percentages were in mining [44%]; agriculture, forestry, and fishing [43%]; construction [41%]; and wholesale and retail trade [34%]). Thirty-five percent of injury and illness cases with days away from work occurred among workers with 5 or fewer years of service with their employer (BLS, 2012). The host factors of age, sex, and work experience combine to increase this group's risk of injury because of characteristics such as risk taking, lack of knowledge, and lack of familiarity with the new job.

Older workers may be at increased risk in the workplace because of diminished sensory abilities, the effects of chronic illnesses, and delayed reaction times. Another population group that may be very susceptible to workplace exposure is women in their child-bearing years. The hormonal changes during these years (along with the increased stress of new roles and additional responsibilities) and transplacental exposures are host factors that may influence this group's response to potential toxins.

In addition to these host factors, there may be other, less well-understood individual differences in response to occupational hazard exposures. Even if employers maintain exposure levels below the level recommended by occupational health and safety standards, 15% to 20% of the population may have health reactions to the "safe" low-level exposures (Levy and Wegman, 2011). This group has been termed *hypersusceptible*. A number of host factors appear to be associated with this hypersusceptibility: light skin, malnutrition, compromised immune system, glucose-6-phosphate dehydrogenase deficiency, serum alpha1-antitrypsin deficiency, chronic obstructive pulmonary disease, sickle cell trait, and hypertension. Individuals who have known hypersusceptibility to chemicals that are respiratory irritants, hemolytic chemicals, organic isocyanates, and carbon disulfide may also be hypersusceptible to other agents in the work environment (Levy and Wegman, 2011). Although this has prompted some industries to consider preplacement screening for such risk factors, the associations between these individual health markers and hypersusceptible response are speculative and require further research.

Agent

Work-related hazards, or agents (see Box 43-1), present potential and actual risks to the health and safety of workers in the millions of business establishments in the United States. Any worksite commonly presents multiple and interacting exposures from all five categories of agents. The following paragraphs discuss each of these five agents in more detail.

TABLE 43-1 Selected Job Categories, Exposures, and Associated Work-Related Diseases and Conditions

Job Categories	Exposures	Work-Related Diseases and Conditions
All workers	Workplace stress	Hypertension, mood disorders, cardiovascular disease
Agricultural workers	Pesticides, infectious agents, gases, sunlight	Pesticide poisoning, "farmer's lung," skin cancer
Anesthetists	Anesthetic gases	Reproductive effects, cancer
Automobile workers	Asbestos, plastics, lead, solvents	Asbestosis, dermatitis
Butchers	Vinyl plastic fumes	"Meat wrappers' asthma"
Caisson workers	Pressurized work environments	Caisson disease ("the bends")
Carpenters	Wood dust, wood preservatives, adhesives	Nasopharyngeal cancer, dermatitis
Cement workers	Cement dust, metals	Dermatitis, bronchitis
Ceramic workers	Talc, clays	Pneumoconiosis
Demolition workers	Asbestos, wood dust	Asbestosis
Drug manufacturers	Hormones, nitroglycerin, etc.	Reproductive effects
Dry cleaners	Solvents	Liver disease, dermatitis
Dye workers	Dyestuffs, metals, solvents	Bladder cancer, dermatitis
Embalmers	Formaldehyde, infectious agents	Dermatitis
Felt makers	Mercury, polycyclic hydrocarbons	Mercurialism
Foundry workers	Silica, molten metals	Silicosis
Glass workers	Heat, solvents, metal powders	Cataracts
Hospital workers	Infectious agents, cleansers, radiation	Infections, latex allergies, unintentional injuries
Insulators	Asbestos, fibrous glass	Asbestosis, lung cancer, mesothelioma
Jack-hammer operators	Vibration	Raynaud's phenomenon
Lathe operators	Metal dusts, cutting oils	Lung disease, cancer
Office computer workers	Repetitive wrist motion on computers	Tendonitis, carpal tunnel syndrome, tenosynovitis, eye strain

Table 43-1 lists some of the more common workplace exposures, their known health effects, and the types of jobs associated with these hazards.

Biological Agents

Biological agents are living organisms whose excretions or parts are capable of causing human disease, usually by an infectious process. Biological hazards are common in workplaces such as health care facilities and clinical laboratories where employees are potentially exposed to a variety of infectious agents, including viruses, fungi, and bacteria. Of particular concern in occupational health is infectious diseases transmitted by humans (e.g., from client to worker or from worker to worker) in a variety of work settings. Bloodborne and airborne pathogens represent a significant class of exposures for U.S. health care workers at risk. Occupational transmission of bloodborne pathogens (including the hepatitis B and C viruses and the human immunodeficiency virus [HIV]) occurs primarily by means of needlestick injuries as well as through exposures to the eyes or mucous membranes (Dupler et al, 2013). The risk of hepatitis B virus infection following a single needlestick injury with a contaminated needle varies from 2% to greater than 40%, depending on the antigen status of the source person and the nature of the exposure. The risk of hepatitis C virus transmission depends on the same factors and ranges from 3.3% to 10% (Dupler et al, 2013).

Transmission of tuberculosis (TB) within health care settings (especially multidrug-resistant TB) has reemerged as a major public health problem (USDHHS, CDC, NIOSH, 2009). Since 1989 outbreaks of this type of TB have been reported in

hospitals, and some workers have developed active drug-resistant TB. In addition, among workers in health care, social service, and corrections facilities who work with populations at increased risk of TB, hundreds have experienced tuberculin skin test conversions. Reliable data are lacking on the extent of possible work-related TB transmission among other groups of workers at risk for exposure. Many workers in these settings were employed as maintenance workers, security guards, aides, or cleaning people, who were not well protected from inadvertent exposure. Education should be provided to all health care workers, including those not having direct client care, in the proper handling and disposal of potentially contaminated linens, soiled equipment, and trash containing contaminated dressings or specimens (Gonzalez and Conlon, 2013) (See *Evidence-Based Practice* box).

Chemical Agents

More than 300 billion pounds of **chemical agents** are produced annually in the United States. Of the approximately 2 million known chemicals in existence, less than 0.1% have been adequately studied for their effects on humans. Of those chemicals that have been linked to carcinogens, approximately half test positive as animal carcinogens. Most chemicals have not been studied epidemiologically to determine the effects of exposure on humans (Levy and Wegman, 2011). As a consequence of general environmental contamination with chemicals from work, home, and community activities, a variety of chemicals have been found in the body tissues of the general population. These tissue loads may result in part from the accidental release of chemicals into the environment, such as that which occurred

EVIDENCE-BASED PRACTICE

The aim of this study was to investigate occupational exposures of health care workers to blood and body fluids in eastern Ethiopia (Reda et al, 2010). Health care workers still fail to adhere to standard precaution guidelines despite evidence that such a failure increases the risk of mucocutaneous blood and body fluid exposure resulting in bloodborne infection. The major infectious occupational hazards in the health care sector are hepatitis B and C viruses (HBV, HCV) and human immunodeficiency virus (HIV).

A total of 475 health care workers were surveyed working in 10 hospitals in eastern Ethiopia with an 84.4% response rate. Lifetime needlestick risk was 30.5% and lifetime blood/body fluid exposure risk was 28.8%. Only 80.8% followed standard precautions regularly while 46.9% recapped and 5.9% reused syringes. 44.8% of health care workers reported they were dissatisfied by the supply of personal protective equipment and 70.9% perceived they were at risk in the workplace.

Nurse Use

Training programs and better provision of PPE are critically needed. Compliance with PPE must be emphasized along with effective teaching in infection control and safe work practice behavior.

Reda AA, Fisseha S, Mengistie B, et al: Standard precautions: occupational exposure and behavior of health care workers in Ethiopia, *PLoS One*, 5(12): e14420, 2010. doi:10.1371/journal.pone.0014420.

in Love Canal when chemicals leached out from buried industrial wastes.

In many workplaces, significant exposure to a daily, low-level dose of workplace chemicals may be below the exposure standards but may still create a potentially chronic and perhaps cumulative assault on workers' health. Predicting human responses to such exposures are further complicated because multiple chemicals often combine and interact to create a new chemical agent. Human effects may be associated with the interaction of these agents rather than with a single chemical. Another concern about occupational exposure to chemicals is reproductive health effects. Workplace reproductive hazards have become important legal and scientific issues. Toxicity to male and female reproductive systems has been demonstrated from exposure to common agents such as lead, mercury, cadmium, nickel, and zinc, as well as in antineoplastic drugs. Because data for predicting human responses to many chemical agents are inadequate, workers should be assessed for all potential exposures and cautioned to work preventively with these agents. High-risk or vulnerable workers, such as those with a latex allergy—a widely recognized health hazard—should be carefully screened and monitored for optimal health protection (USDHHS, CDC, NIOSH, 2009). To accurately assess and evaluate the exposure and recommend changes for abatement, it is essential that the nurse have a good understanding of the basic principles of toxicology, including routes of exposure (i.e., inhalation, skin absorption, and ingestion), dose-response relationships, and differences in effects (i.e., acute versus chronic toxicity).

Enviromechanical Agents

Enviromechanical agents are those that can potentially cause injury or illness in the workplace. They are related to the work

process or to working conditions, and they can cause postural or other strains that can produce adverse health effects when certain tasks are performed repeatedly. Examples are repetitive motions, poor or unsafe workstation-worker fit, slippery floors, cluttered work areas, and lifting heavy loads. Severity of illness or injury can be estimated from the number of days away from work. Sprains and strains, bruises/contusions, cuts/lacerations, fractures, and multiple injuries accounted for more days away from work than for all types of injury and illness. In 2011 (BLS, 2012), sprains, strains, and tears accounted for 38% of total injury and illness cases (n = 447,200) resulting in of days away from work. Twenty-two percent of these occurred as a result of overexertion in lifting or lowering (Figure 43-4). The back was the body part most often affected by disabling work incidents.

Back pain/injury is one of the most common and significant musculoskeletal problems in the world (USDHHS, CDC, NIOSH, 2009). In 2011, back injuries and disorders accounted for 36% of all nonfatal occupational injuries and illnesses involving days away from work in the United States. Although the exact cost of back disorders is unknown, the estimates are

FIG 43-4 Types of occupational injuries. (From Bureau of Labor Statistics, 2014.)

staggering and in the billions per year. Regardless of the estimate used, the problem is large both in health and economic terms. Moreover, workers in six occupations accounted for 26% of musculoskeletal cases: nursing assistants; laborers; janitors and cleaners; heavy and tractor-trailer truck drivers; registered nurses; and stock clerks. The research on these hazards, related human responses, and prevention is evolving. The most productive strategy in preventing these exposures is redesigning the workplace and the work machinery or processes.

Physical Agents

Physical agents are those that produce adverse health effects through the transfer of physical energy. Commonly encountered physical agents in the workplace include temperature extremes, vibration, noise, lasers, radiation, and electricity. For example, vibration, which accompanies the use of power tools and vehicles such as trucks, affects internal organs, supportive ligaments, the upper torso, and the shoulder-girdle structure. Localized effects are seen with handheld power tools; the most common is Raynaud's phenomenon. The control of worker exposure to these agents is usually accomplished through engineering strategies such as eliminating or containing the hazardous agent. In addition, workers must use preventive actions, such as practicing safe work habits and wearing personal protective equipment when needed. Examples of safe work habits include taking appropriate breaks from environments with temperature extremes and not eating or smoking in radiation-contaminated areas. Personal protective equipment includes hearing protection, eye guards, protective clothing, and devices for monitoring exposures to agents such as radiation.

Psychosocial Agents

Psychosocial agents are conditions that create a threat to the psychological and/or social well-being of individuals and groups (Rogers, 2015). A psychosocial response to the work environment occurs as an employee acts selectively toward the environment in an attempt to achieve a harmonious relationship. When such a human attempt at adaptation to the environment fails, an adverse psychosocial response may occur. Work-related stress or burnout has been defined as an important problem for many individuals (Rogers, 2015). Responses to negative interpersonal relationships, particularly those with authority figures in the workplace, are often the cause of vague health symptoms and increased absenteeism. Epidemiologic work in mental health has pointed to environmental variables such as these in the incidence of mental illness and emotional disorder.

The psychosocial environment includes characteristics of the work itself, as well as the interpersonal relationships required in the work setting and shift work. About 10% of U.S. workers do some form of shift work that has the potential to lead to a variety of psychological and physical problems, including exhaustion, depression, anxiety, and gastrointestinal disturbance. Strategies to minimize the adverse effects of shift work are beneficial. For example, a rotating shift allows the employee to move through a cycle of working the day shift, then the evening shift, and then the night shift over the course of several

weeks, with the goal of the workforce sharing the stress of the least desirable shifts. Job characteristics such as low autonomy, poor job satisfaction, and limited control over the pace of work have been associated with an increased risk of heart disease among clerical and blue-collar workers.

Interpersonal relationships among employees and coworkers or bosses and managers are often sources of conflict and stress. Another aspect is organizational culture. This refers to the norms and patterns of behavior that are sanctioned within a particular organization. Such norms and patterns set guidelines for the types of work behaviors that will enable employees to succeed within a particular firm. Examples include following organizational norms for working overtime, expressing constructive dissatisfaction with management, and making work a top priority (USDHHS/NIOSH, 2002). These factors and the employee's response to them must be assessed if strategies for influencing the health and safety of workers are to be effective.

Nonfatal violence in the health care worker's workplace is a serious problem that is underreported. Much of the study of health care worker violence has been in psychiatric settings; however, reports in other areas such as the emergency department have been provided. Risk factors associated with this type of violence must be identified and strategies implemented to reduce the risk (Rogers et al, 2009).

Environment

Environmental factors influence the occurrence of host-agent interactions and may direct the course and outcome of those interactions. The physical environment involves the geological and atmospheric structure of an area and the source of such elements as water, temperature, and radiation, which may serve as positive or negative stressors. Although aspects of the physical environment (e.g., heat, odor, ventilation) may influence the host-agent interaction, the social and psychological environment can be equally important (Gordis, 2008).

New environmental problems continue to arise, such as an increase in industrial wastes and toxins and indoor and outdoor environmental pollution, which present opportunities for significant health threats to the working and general population. The social aspects of the environment encompass the economic and political forces affecting society and its health. This includes factors such as sanitation and hygiene practices, housing conditions, level and delivery of health care services, development and enforcement of health-related codes (e.g., occupational health and safety, pollution), employment conditions, population crowding, literacy, ethnic customs, extent of support for health-related research, and equal access to health care. In addition, addictive behaviors such as alcohol and substance abuse and various forms of psychosocial stress may be an outgrowth of negative social environments.

Consider an employee who is working with a potentially toxic liquid. Providing education about safe work practices and fitting the employee with protective clothing may not be adequate if the work must occur in a very hot and humid environment. As the worker becomes uncomfortable in the hot clothing, protection may be compromised by rolling up a sleeve, taking

off a glove, or wiping the face with a contaminated piece of clothing. If the norms in the workplace condone such work practices (e.g., “Everyone does it when it’s too hot”), the interventions that address only the host and agent will be ineffective; strategies to address the environment itself must be considered, such as cooling fans or minimization of exposure through job rotation. The epidemiologic triangle can be used as the basis for planning interventions to restore and promote the health of workers. These efforts are influenced by society and by organizational activities related to occupational health and safety (Rogers, 2015).

The occupational environment, within the context of the social environment, is represented by the workplace and work setting and the interactive effects of this environment on the worker. The nurse must consider the hazards and threats posed by this environment and the commitment of the employer to providing a safe and healthful workplace through use of preventive strategies and controls (e.g., engineering, substitution) (Rogers, 2015).

ORGANIZATIONAL AND PUBLIC EFFORTS TO PROMOTE WORKER HEALTH AND SAFETY

Promotion of worker health and safety is the goal of occupational health and safety programs. These programs are offered primarily by the employer at the workplace, but the range of services and the models for delivering them have been changing dramatically over the past few years. In addition to specific services, legislation at the federal and state levels has had a significant effect on efforts to provide a healthy and safe environment for all workers. Under the Occupational Safety and Health Act and because of increased public concern about worker health and safety, companies are cited for not meeting minimal occupational health and safety standards. Criminal charges have been filed against business owners when preventable work-related deaths occurred. These events have redirected an emphasis on preventive occupational health and safety programming.

Unless they have OSHA-regulated exposures, business firms are not required to provide occupational health and safety services that meet any specified standards. With few exceptions, there is no legal recourse for specific services or level of personnel provided by employers to protect worker health and safety. Therefore, the range of services offered and the qualifications of the providers of occupational health and safety vary widely across industries. An important stimulus for health and safety programs is avoiding cost that can be attributed to the effectiveness of prevention services, as well as the need to support occupational health and safety and health promotion at the worksite.

On-Site Occupational Health and Safety Programs

Optimally, on-site occupational health and safety services are provided by a team of occupational health and safety professionals. The core members of this team are the occupational health nurse, occupational physician, industrial hygienist, and safety professional. In addition, more and more ergonomists are

playing an important role in the occupational health and safety team. The largest group of health care professionals in business settings is occupational health nurses; therefore, the most frequently seen model is that of the one-nurse unit. This nurse collaborates with a community physician or occupational medicine physician who provides consultation and accepts referrals when medical intervention is needed. The collaboration may occur primarily through telephone contact, or the physician may be under contract with the company to spend a certain amount of on-site time each week. As companies become larger, they are likely to hire additional nurses, safety professionals, industrial hygienists, and physicians, the latter usually on a part-time or consultant basis. An increasingly popular option is to contract some health, safety, and industrial hygiene work to external providers. The largest firms often have corporate occupational health and safety professionals who set policy and participate in company decision making at the corporate level. These professionals work with the nurses employed at the individual sites within the company. Depending on the needs of the company and the workers, additional professionals may be on the occupational health and safety team, including employee assistance counselors, physical therapists, health educators, physical fitness specialists, and toxicologists.

The services provided by on-site occupational health programs range from those focused only on work-related health and safety problems to a wide scope of services that includes primary health care (Box 43-2). Increasingly employers supporting health promotion programs are offering employees incentives to stay healthy, such as gym memberships, on-site exercise facilities, or massage therapists during work hours.

BOX 43-2 Scope of Services Provided Through an Occupational Health and Safety Program

- Health/medical surveillance
- Workplace monitoring/surveillance
- Health assessments
- Preplacement
- Periodic, mandatory, voluntary assessments and services
- Transfer of clients/services
- Retirement/termination
- Executive
- Return to work
- Health promotion
- Health screening
- Employee assistance programs
- Case management
- Primary health care for workers and dependents
- Worker safety and health education related to occupational hazards
- Job task analysis and design
- Prenatal and postnatal care and support groups
- Safety audits and accident prevention
- Workers’ compensation management
- Risk management, loss control
- Emergency preparedness
- Preretirement counseling
- Integrated health benefits programs

In industries that have exposures regulated by law, certain programs are required, such as respiratory protection or hearing conservation. The ability of a company to offer additional programs depends on employee needs, management's attitudes and understanding about health and safety, acceptance by the workers, and the economic status of the company. A significant increase in the number of health promotion and employee assistance programs offered in industry has occurred over the past few years. Health promotion programs focus on lifestyle choices that cause risks to health (e.g., job stress, obesity, smoking, stress responses, or lack of exercise) (O'Donnell, 2009). Employee assistance programs are designed to address personal problems (e.g., marital/family issues, substance abuse, or financial difficulties) that affect the employee's productivity. Since such efforts are cost-effective for businesses, they should continue to increase.

Similar types of occupational health and safety programs are available on a contractual basis from community-based providers. These may be offered by free-standing occupational health clinics, health maintenance organizations, hospitals, emergency clinics, and other health care organizations. In addition, consultants in each discipline work in the private sector (self-employed, in group practice, or in insurance companies) and in the public sector (in local and state health departments or departments of labor and industry). These services may be provided on-site, delivered at a specific location in the community, or offered through a mobile van that visits companies. These multiple resources have increased the options for companies that need occupational health and safety services, and they have also broadened the employment opportunities for health and safety professionals.

NURSING CARE OF WORKING POPULATIONS

The nurse is often the first health care provider seen by an individual with a work-related health problem. Consequently, nurses are in key positions to intervene with working populations at all levels of prevention (see the [Levels of Prevention](#) box). Prevention may be accomplished in the prepathogenesis period by measures designed to promote general optimal health, by protection against specific disease agents, or by the establishment of barriers against agents in the environment. These procedures have been termed *primary prevention*.

LEVELS OF PREVENTION

Occupational Health

Primary Prevention

Nurse provides education on use of personal protective equipment in the workplace to prevent injury/exposure.

Secondary Prevention

Nurse screens for hearing loss resulting from noise levels in the plant.

Tertiary Prevention

Nurse works with chronic diabetic workers to ensure appropriate medication use and blood glucose screening to avoid lost work days.

As soon as the disease is detectable, early in pathogenesis, secondary prevention may be accomplished by early diagnosis and prompt and adequate treatment. When the process of pathogenesis has progressed and the disease had advanced beyond its early stages, secondary prevention may be accomplished by means of adequate treatment to prevent sequelae and limit disability. Later, when defect and disability have been resolved, tertiary prevention may be accomplished by rehabilitation.

The occupational health nurse practices all levels of prevention (Rogers, 2015). Delivery of primary prevention services to employees is directed toward promoting health and averting a problem. In the occupational health setting, the purpose of health promotion is to maintain or enhance the well-being of individuals or groups of employees, and the company in general. This may include programs designed to enhance coping skills or good nutrition and knowledge about potential health hazards both inside and outside of the workplace.

Health protection (i.e., taking primary prevention measures) is designed to eliminate or reduce the risk of disease in order to prevent the development of an illness or injury. Walk-throughs by the occupational health nurse and/or other team members to identify workplace hazards are aimed at health protection.

Specific protection programs or interventions often require active participation on the part of the employee. Participation in an immunization program, employment of personal protective equipment such as respirators or gloves, and cessation of smoking are examples of specific health protection measures.

Secondary prevention occurs after a disease process has already begun. It is aimed at early detection, prompt treatment, and prevention of further limitations. For employees, early detection involves health surveillance and periodic screening to identify an illness at the earliest possible moment in its course, and elimination or modification of the hazard-producing situation. Interventions aimed at disability limitation are intended to prevent further harm or deterioration, and they include referral for counseling and treatment of an employee with an emotional or mental health problem whose work performance has deteriorated, as well as removal of workers from heavy-metal exposure who manifest neurologic symptoms.

Tertiary prevention is intended to restore health as fully as possible and assist individuals to achieve their maximum level of functioning. Rehabilitation strategies such as return-to-work programs after a heart attack or limited duty programs after a cumulative trauma injury are examples of tertiary prevention.

Worker Assessment

The initial step of assessment involves the traditional history and physical assessment, emphasizing exposure to occupational hazards and individual characteristics that may predispose the client to the increased health risk of certain jobs. The [occupational health history](#) is an indispensable component of the health assessment of individuals (Rogers, 2015). Because work is a part of life for most people, including an occupational health history in all routine nursing assessments is essential. Many workers in the United States do not have access to health care services in their workplaces, yet it is not unusual to find

health care providers in the community who have little or no knowledge about workplaces or expertise in occupation-related illnesses and injuries. Because of the large number of small businesses that do not have the resources for maintaining on-site health care, injured and ill workers are first seen in the public and private health care sector (e.g., in clinics, emergency departments, physicians' offices, hospitals, health maintenance organizations, and ambulatory care centers). Nurses are often the first-line assessors of these individuals and perhaps the only contact for education about self-protection from workplace hazards.

Identifying workplace exposures as sources of health problems may influence the client's course of illness and rehabilitation and may also prevent similar illnesses among others with potential for exposure (Levy and Wegman, 2011). Including occupational health data into client assessments begins with recognizing the possible relationship between health and occupational factors. The next step is to integrate into the history-taking procedure some routine assessment questions that will provide the data necessary to confirm or rule out occupationally induced symptoms.

Symptoms of hazardous workplace exposures may be indicated by vague complaints involving any body system. These complaints are often similar to common medical problems. Three points that occupational health histories should include are a list of current and past jobs the client has held; questions about exposures to specific agents and relationships between the symptoms and activities at work, job titles, or history of exposures; and other factors that may influence the client's susceptibility to occupational agents (e.g., lifestyle history such as smoking, underlying illness, previous injury, or disabling condition).

Questions about the employee's occupational history can be included in existing assessment tools. The more complete the data collected, the more likely the nurse is to notice the influence of work–health interactions. All employees should be questioned about their employment history. To describe only a current status of “retired” or “housewife” may lead to the omission of needed data. The nurse should be aware that not all workers are well informed about the materials with which they work or about potential hazards. For this reason, the nurse must develop basic knowledge about all of the types of jobs held by clients and the possible hazards associated with them. Because there is an increased likelihood of multiple exposures from other environments such as the home and the community that may interact with workplace exposures, the nurse should extend the questioning to include this information.

Identifying work-related health problems should be an integrated focus of any assessment effort. A systematic approach for evaluating the potential for workplace exposures is the most effective intervention for detecting and preventing occupational health risks. Figure 43-5 shows one short assessment tool that can be incorporated into routine history taking. Similar questions can be included in the assessment of workers' spouses and dependents, who may receive second-hand or indirect exposure to occupational hazards.

QSEN FOCUS ON QUALITY AND SAFETY EDUCATION FOR NURSES

Targeted Competency: Evidence-based Practice

Integrates the best current clinical evidence with client and family preferences and values to provide optimal client care

- **Knowledge:** Explain the role of evidence in determining best clinical practice
- **Skill:** Read original research and evidence reports related to area of practice
- **Attitude:** Appreciate the importance of reading relevant professional journals

Evidence-based Practice Question

The PHN Quad Council competency of leadership and systems thinking skills recommends the beginning PHN provide data to measure, report, and improve organizational performance. You are working as an occupational health nurse. You have noticed there are a lot of work days lost because of work-related injuries or exposure to some type of hazard in the workplace. In this chapter you will see which of the injuries and exposures are more likely to occur in industry. Choose one of the hazard categories and read the evidence available about this hazard category. What does the evidence suggest in terms of organizational changes that could help reduce the risk for this hazard? How can the occupational health nurse promote changes in practice using the evidence available?

Prepared by Gail Armstrong, PhD(c), DNP, ACNS-BC, CNE, Associate Professor, University of Colorado Denver College of Nursing.

During these health assessments, the nurse has the opportunity to teach about workplace hazards and prevention measures the worker can use. At the same time, the nurse is obtaining information that will be valuable in optimizing the fit between the job and the worker. Such assessments can be done during preplacement examinations before the client begins a job, on a periodic basis during employment, or when a work-related health problem or exposure becomes apparent. One important group to consider are the nearly 15 million truck drivers who face health hazards from long work hours and fatigue, shift work, sleep deprivation, chemical exposure, and sedentary work and lifestyle (Apostolopoulos et al, 2010). Life expectancy for these workers is only 63 years (Heron et al, 2009). The occupational health nurse can help identify physical and psychosocial health and life-threatening issues for this workforce and develop interventions to mitigate the risk. Work-related health assessments should also be conducted when an employee is being transferred to another job with different requirements and exposures. The goal of these assessments is to identify agent and host factors that could place the employee at risk and to determine prevention steps that can be taken to eliminate or minimize the exposure and potential health problem.

When the health data from such assessments are considered collectively, the nurse may determine some patterns in risk factors associated with the occurrence of work-related injuries and illnesses in a total population of workers. For example, a nurse practitioner in a clinic noted a dramatic increase in the number of dermatitis cases among her clients. When she looked at factors in common among these individuals, she determined that they all worked at a company with solvent exposure commonly associated with dermal irritations. She worked with the union and the company to assess the environment/agent exposure to the employees. This nursing intervention led to a safer

I. Present Job

- A. What is your job title? _____
- B. What do you do for a living? _____
- C. How long have you had this job? _____
- D. Describe the specific tasks of this job: _____

- E. What product or service is produced by the company where you work? _____

- F. Are you exposed to any of the following on your present job?
 Metals Radiation Stress
 Vapors, gases Vibration Others: _____
 Dusts Loud noise
 Solvents Extreme heat or cold
- G. Do you feel you have any health problems that may be associated with your work?
 If yes, describe: _____

- H. How would you describe your satisfaction with your job? _____

- I. Have any of your co-workers complained of illness or injuries that they associate with their jobs?
 If yes, describe: _____

II. All Past Work

Starting with your first job, please provide the following information:

Job title	Years held	Description of work	Exposures	Injuries/Illnesses	Personal protection equipment used
_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____
_____	_____	_____	_____	_____	_____

III. Other Exposures

- A. Do you have any hobbies that involve exposure to chemicals, metals, or any of the other agents mentioned before? If yes, describe: _____
- B. Are any other members of your household exposed to any of the substances listed above? If yes, describe: _____

- C. Do you live near any factories, dump sites, or other sources of pollution? If yes, describe: _____

FIG 43-5 Occupational health history form.

work environment and a decrease in dermatitis in this population group. Such an approach can be used at the company, industry, and community levels. The initial collection of data and the questioning about workplace exposures are vital steps for any intervention.

Workplace Assessment

The nurse may conduct a similar assessment of the workplace itself. The purpose of this assessment, known as a **worksite walk-through** or survey, is to become knowledgeable about the work processes and the materials, the requirements of various jobs, the presence of actual or potential hazards, and the work practices of employees (Rogers, 2015). Figure 43-6 shows a brief outline that can be used to guide a worksite assessment. More complex surveys are performed by industrial hygienists and safety professionals when the purpose of the walk-through is environmental monitoring using sampling techniques or a safety audit. However, most occupational health nurses have developed expertise in these areas and include such tasks as part of their functions. For all health care providers who assess workers, this information makes an important database. In addition, for the on-site health care provider, worksite walk-throughs assist the professional in developing rapport with and being seen as a credible worker among the employees.

A worksite survey begins with an understanding of the type of work that occurs in the workplace. All business organizations are classified within the North American Industry Classification System (NAICS) with a numerical code. This code, usually a two- to four-digit number, indicates a company's product and, therefore, the possible types of **occupational health hazards** that may be associated with the processes and materials used by its employees. NAICS codes are used to collect and report data on businesses. For example, illness and injury rates of one company are compared with the rates of other companies of similar size with the same code to determine whether the company is having an excess of illness or injury. In addition, by knowing the NAICS code of a company, a health care professional can access reference books that describe the usual processes, materials, and by-products of that kind of company.

The nurse will want to review the work processes and work areas by jobs or locations in the workplace. These preliminary data provide clues about what hazards may be present and an understanding of the types of jobs and health requirements that may be involved in a particular industry. A description of the work environment is next and provides an overall picture of general appearances, physical layout, and safety of the environment. Are safety signs posted and readable where needed? Is there clutter or dampness on the floor that could cause slips or falls?

A description of the employee group is necessary information to understand the demographics and the work distribution in the company. Knowing about shift work and productivity can be helpful in pinpointing potential stressors. Human resources' management and corporate commitment to health and safety are needed to develop a supportive culture for effective and efficient programming. Reviewing the status of policies and procedures and assessing opportunities for input into

improving service are important to establish the organization's strength in occupational health and safety management. Gathering data about the incidence and prevalence of work-related illnesses and injuries and the cost patterns for these conditions provides useful epidemiologic trend data and helps to target high-cost areas. The types of occupational safety and health services and programs are important to know. This will show whether required programs are being offered and includes health promotion and disease prevention strategies.

HOW TO Assess a Worker and the Workplace

Assessing the worker for a work-related problem is a critical practice element. You need to do the following:

- Complete general and occupational health history-taking with emphasis on workplace exposure assessment, job hazard analysis, and list of previous jobs.
- Conduct a health assessment to identify agent and host factors that interact to place workers at risk.
- Identify patterns of risk associated with illness/injury.

Assessing the work environment is necessary to determine workplace exposures that create worker health risk. You need to do the following:

- Understand the work being done.
- Understand the work process.
- Evaluate the work-related hazards.
- Gather data about incidence/prevalence of work-related illness/injuries and related hazards.
- Conduct a walk-through of the work environment.
- Examine prevention and control strategies in place for eliminating exposures.

Finally, examining control strategies that are effective in eliminating or reducing exposure is important in determining risk reduction. Control strategies follow a hierarchical approach. Engineering controls can reduce worker exposure by modifying the exposure source, such as putting needles in a puncture-proof container. Work practice controls include good hygiene and proper waste disposal and housekeeping. Administrative controls reduce exposure through job rotation, workplace monitoring, and employee training and education. Finally, personal protective control is the last resort and requires the worker to actively engage in strategies for protection such as use of gloves, masks, and gowns to prevent exposures (Rogers, 2015).

The more information that can be collected before the walk-through, the more efficient the process of the survey will be. After the survey is conducted, the nurse can use the information with the aggregate health data to evaluate the effectiveness of the occupational health and safety program and to plan future programs.

proposed to address the needs of large population groups such as the American workforce. As part of the *Healthy People 2020* document (USDHHS, 2010), occupational safety and health objectives were identified to promote good health and well-being among workers, including the elimination and reduction of elements in occupational environments that cause death, injury, disease, or disability. In addition, this document promotes the minimizing of personal damage from existing occupationally related illness.

HEALTHY PEOPLE 2020

Objectives Related to Occupational Health

- OSH-1: Reduce deaths from work-related injuries.
- OSH-2: Reduce nonfatal work-related injuries.
- OSH-3: Reduce the rate of injuries and illness cases.
- OSH-4: Reduce pneumoconiosis deaths.
- OSH-5: Reduce deaths from work-related homicides.
- OSH-6: Reduce work-related assault.
- OSH-7: Reduce the proportion of persons who have elevated blood lead concentrations from work exposures.
- OSH-8: Reduce occupational skin diseases or disorders among full-time workers.
- OSH-9: (Developmental) Increase the proportion of employees who have access to worksites that provide programs to prevent or reduce employee stress.
- OSH-10: Reduce new cases of work-related noise-induced hearing loss.

U.S. Department of Health and Human Services: *Healthy People 2020*. Washington, DC, 2010, U.S. Government Printing Office.

LEGISLATION RELATED TO OCCUPATIONAL HEALTH

The occupational health and safety services provided by an employer are influenced by specific legislation at federal and state levels. Although the relationship between work and health has been known since the second century (Ramazzini, 1713), public policy that effectively controlled occupational hazards was not enacted until the 1960s. The Mine Safety and Health Act of 1968 was the first legislation that specifically required certain prevention programs for workers. This was followed by the Occupational Safety and Health Act of 1970, which established two agencies, OSHA and NIOSH, each with discrete functions (Box 43-3) to carry out the act's purpose of ensuring "safe and healthful working conditions for working men and women" (PL 91-596, 1970). The reader is also referred to Chapters 3 and 5, the Affordable Care Act, for additional information on employer mandates.

In the context of the Occupational Safety and Health Act, OSHA, a federal agency within the U.S. Department of Labor, was created to develop and enforce workplace safety and health standards and regulations on workers' exposure to potentially toxic substances, enforcing these at the federal and state levels.

Specific standards and information about compliance can be obtained from federal, regional, and state OSHA offices, which

BOX 43-3 Functions of Federal Agencies Involved in Occupational Safety and Health

Occupational Safety and Health Administration (OSHA)

Determines and sets standards and permissible exposure limits (PELs) for hazardous exposures in the workplace.

Enforces the occupational health standards (including the right of entry for inspection).

Educates employees and employers about occupational health and safety.

Develops and maintains a database of work-related injuries, illnesses, and deaths.

Monitors compliance with occupational health and safety standards.

National Institute for Occupational Safety and Health (NIOSH)

Conducts research and reviews findings to recommend exposure limits for occupational hazards to OSHA.

Identifies and researches occupational health and safety hazards.

Educates occupational health and safety professionals.

Distributes research findings relevant to occupational health and safety.

can be found on the OSHA website. The **National Institute for Occupational Safety and Health (NIOSH)** was established by the Occupational Safety and Health Act of 1970 and is part of the Centers for Disease Control and Prevention (CDC). In 1996 NIOSH and its partners unveiled a ten-year **National Occupational Research Agenda (NORA)**, a framework to guide occupational safety and health research into the following decade. The NIOSH agency identifies, monitors, and educates about the incidence, prevalence, and prevention of work-related illnesses and injuries and examines potential hazards of new work technologies and practices (USDHHS, NIOSH, 2010). The second decade of NORA (Box 43-4) is focused on targeted sectors to reduce the still significant toll of workplace illness and injury.

Many standards have been established by OSHA and promulgated to protect worker health. One example is the **Hazard Communication Standard**. This standard is based on the premise that while working to reduce and eliminate potentially toxic agents in the work environment, an important line of

defense is to provide the work community with information about hazardous chemicals in order to minimize exposures. The Hazard Communication Standard, which was first established in 1983, requires that all worksites with hazardous substances inventory their toxic agents, label them, and provide information sheets, called material safety data sheets (MSDSs), for each agent. In addition, the employer must have in place a hazard communication program that provides workers with education about these agents. This education must include agent identification, toxic effects, and protective measures. Numerous standards have been established by OSHA for specific chemicals and

programs. A standard familiar to all health care professionals is the *Bloodborne Pathogens Standard*.

Workers' compensation acts are important state laws that govern financial compensation to employees who suffer work-related health problems. These acts vary by state, and each state sets rules for the reimbursement of employees with occupational health problems for medical expenses and lost work time associated with the illness or injury. Workers' compensation claims and the experience-based insurance premiums paid by industry have been important motivators for increasing the health and safety of the workplace.

LINKING CONTENT TO PRACTICE

Disaster Planning and Management

Although disaster planning and management have been functions of occupational health and safety programs, this is an area of legislation that affects businesses and health professionals. The legislation of the Superfund Amendment and Reauthorization Act (SARA) requires that written disaster plans be shared with key resources in the community, such as fire departments and emergency departments. Concern about disasters—such as the terrorist attacks on the World Trade Center and Pentagon on September 11, 2001; the methyl isocyanate leak in Bhopal, India; effects of hurricanes such as Katrina and Sandy; or the community exposure to chemicals at Times Beach, Missouri, and exposure to radiation from crippled nuclear plants in Japan—has mandated more attention to disaster planning.

In occupational health, the goals of a disaster plan are to prevent or minimize injuries and deaths of workers and residents, minimize property damage, provide effective triage, and facilitate necessary business activities. A disaster plan requires the cooperation of different personnel within the company and community. The nurse is often a key person on the disaster planning team, along with safety professionals, physicians, industrial hygienists, the fire chief, and company management. The potential for disaster (e.g., explosions, floods, fires, leaks) must be identified, and this is best achieved by completing an exhaustive chemical and hazard inventory of the workplace. The material safety data sheet and plant blueprints are critical for correctly identifying substances and work areas that may be hazardous. Worksite surveys are the first step to completing this inventory. The reader is also referred to [Chapter 23](#) on the PHN and disasters management.

Effective disaster plans are designed by those with knowledge of the work processes and materials, the workers and workplace, and the resources in the community. Specific steps must be detailed for actions to be put in place by specific individuals in the event of a disaster. The written plan must be shared with all who will be involved. Employees should be prepared in first aid, cardiopulmonary resuscitation, and fire brigade procedures. Plans must be clear, specific, and comprehensive (i.e., covering all shifts and all work areas) and must include activities to be conducted within the worksite and those that require community resources. Transportation plans, fire response, and emergency response services should be coordinated with the agencies that would be

involved in an actual disaster. The disaster plan, emergency and safety equipment, and the first response team's abilities should be tested at least annually with a drill. Practice results should be carefully evaluated, with changes made as needed.

Hospitals and other emergency services, such as fire departments, should be involved in developing the disaster plan and should receive a copy of the plan and a current hazard inventory. It is imperative that the plan and hazard inventory be periodically updated. The occupational health nurse or another company representative should provide emergency health care providers with updated clinical information on exposures and appropriate treatment. It should never be presumed that local services will have current information on substances used in industry. Representatives of these agencies should visit the worksite and accompany the nurse on a worksite walk-through so that they are familiar with the operations.

In disaster planning, the nurse is often assigned or assumes the responsibility for coordinating the planning and implementing efforts, working with appropriate key people within the company and in the community to develop a workable, comprehensive plan. Other tasks include providing ongoing communication to keep the plan current; planning the drills; educating the employees, management, and community providers; and assessing the equipment and services that may be used in a disaster.

In the event of a disaster, the nurse should play a key role in coordinating the response. Principles of triage may be used as the response team determines the extent of the disaster and the ability of the company and community to respond. Postdisaster nursing interventions are also critical. Examples include identifying the ongoing disaster-related health needs of workers and community residents, collecting epidemiologic data, and assessing the cause and the necessary steps to prevent a recurrence.

Occupational health nursing is a broad, dynamic specialty practice. The Public Health Foundation provides the basis for practice, supporting a health promotion and protection and prevention model. The occupational health nurse must have interprofessional skills and linkages to provide the most effective care and service. Occupational health nurses are involved in all levels of prevention in their practice.

PRACTICE APPLICATION

An insurance company recently renovated its claims processing office area and fitted the workstation with new computers. The company's occupational health nurse noticed an increase in visits to the health unit for complaints of headaches, stiff neck muscles, and visual disturbances consistent with computer usage.

To conduct a complete investigation of this problem, the nurse assessed the workers, the agent (computer), previously existing potential agents, and the work environment. Interventions focused on designing the health hazard out of the work process, if possible. In the present example, the first level of

PRACTICE APPLICATION—cont'd

intervention was to refit the workstation for better worker use of the computer.

Minimizing the possible hazards of the agent involved recommendations for desks, chairs, and lighting designs that would accommodate the individual worker and allow shielding of the monitor. The nursing interventions included strengthening the resistance of the host by prescribing appropriate rest breaks, eye exercises, and relaxation strategies. Recognizing that previous cervical neck injury or impaired vision may increase the risk of adverse effects from computer work, the nurse would include assessment for these factors in employees' preplacement and periodic health examinations.

For the environmental concerns, the nurse educated the manager about the health risks of paced, externally controlled work expectations and recommended alternatives.

This case is an example of which of the following?

- A. The application of the occupational health history
- B. A worksite assessment or walk-through
- C. A work–health interaction
- D. The use of the epidemiologic triangle in exploring occupational health problems

Answers can be found on the Evolve site.

KEY POINTS

- Occupational health nursing is an autonomous practice specialty.
- The scope of occupational health nursing practice is broad, including worker and workplace assessment and surveillance, case management, health promotion, primary care, management/administration, business and finance skills, and research.
- The workforce and workplace are changing dramatically, requiring new knowledge and new occupational health services.
- The type of work has shifted from primarily manufacturing to service and technological jobs.
- Workplace hazards include exposure to biological, chemical, enviromechanical, physical, and psychosocial agents.
- The Occupational Safety and Health Act of 1970 states that workers must have a safe and healthful work environment.
- The interprofessional occupational health team consists of the occupational health nurse, occupational medicine physician, industrial hygienist, and safety specialist.
- Work-related health problems must be investigated and control strategies implemented to reduce exposure.
- Control strategies include engineering, work practice, administration, and personal protective equipment.
- The Occupational Safety and Health Administration enforces workplace safety and health standards.
- The National Institute for Occupational Safety and Health is the education and research agency that provides grants to investigate the causes of workplace illness and injuries.
- Workers' compensation acts are important laws that govern financial compensation of employees who suffer work-related health problems.
- The occupational health nurse should play a key role in disaster planning and coordination.
- Academic education in occupational health nursing is generally at the graduate level.

CLINICAL DECISION-MAKING ACTIVITIES

1. Arrange to visit a local industry to observe work processes and discuss working conditions. See if you can identify the work-related hazards and make recommendations for eliminating them.
2. Interview the occupational health nurse in an industry setting and ask questions about scope of practice, job functions, and contributions to the business. Compare and contrast what you have learned about this nurse role to that of the school health nurse.
3. Contact the American Association of Occupational Health Nurses and ask what the most pressing trends are in the specialty. What are some of the complex issues related to these trends?
4. Obtain a proposed standard from the Occupational Safety and Health Administration, critique it, and submit your comments.
5. Attend a workers' compensation hearing, analyze the problem, and critique the outcome. How is your critique affected by what you thought the outcome should be?

Forensic Nursing in the Community*

Natalie McClain, PhD, RN, CPNP

Dr. McClain earned her bachelor and master's degrees from the University of Texas Health Sciences Center-Houston and the PhD from the University of Virginia. She has worked at the Children's Assessment Center, an advocacy center providing services for child victims of sexual abuse in Houston, Texas. At the Assessment Center and later in Charlottesville, Virginia, Dr. McClain performed medical forensic exams in cases of sexual assault, testified in both civil and criminal trials, and served as an expert witness for the FBI. Dr. McClain served on the 2012-2013 Committee on Commercial Sexual Exploitation and Sex Trafficking of Minors in the U.S. Dr. McClain is currently a Clinical Associate Professor at Boston College William F. Connell School of Nursing in Boston, MA.

Melissa Sutherland, PhD, FNP-BC

Dr. Sutherland earned the bachelor and master's degrees from Binghamton University in New York, and the PhD from the University of Virginia. She is a Board Certified Family Nurse Practitioner and an Associate Professor at the William F. Connell School of Nursing. Her major areas of research and practice are interpersonal violence and women's health. She serves as treasurer of the Nursing Network Violence Against Women, International and is a member of the International Association of Forensic Nurses. Most recently she was appointed a member of the Board Committee for Community Service at Boston Children's Hospital, Boston, MA.

OBJECTIVES

After reading this chapter, the student will be able to do the following:

1. Describe the specialized competencies and skills of the forensic nurse within the nursing process.
2. Discuss the relationship of the forensic nurse with public health professionals in addressing injury as a public health concern.
3. List the health risks that result from incidents of injury.
4. Identify how forensic nurses deal with injuries in the three levels of prevention.
5. Discuss the health disparities that contribute to the occurrence and poor outcomes in marginalized groups who experience injury.
6. Explain the contribution of theoretical underpinnings to current models of forensic nursing practice.
7. Identify client populations and clinical arenas in the community where forensic nurses practice.
8. Define the key terms and concepts within forensic nursing theory.
9. Identify professionals who commonly work in collaboration with the forensic nurse in addressing injury care and prevention.

PERSPECTIVES ON FORENSICS AND FORENSIC NURSING

Injuries resulting from crime and victimization cause pain and suffering and may cause disability, economic failure, and “distress of the human spirit” (Lynch, 2011, p. 15). However, such injuries have often taken a back seat to treatment of disease and infection. Today forensic nurses expertly care for victims of injuries, largely as a community-based specialty, from a medical as well as a legal perspective. Whether the injury is caused by intentional violence or unintentional accident, forensic nurses are involved with not only the treatment but also the prevention of what is the leading cause of death in the first four decades of life (CDC, 2011; CDC, 2013). The burden of injuries to individuals ranges from minimal and brief to debilitating or fatal. The economic burden worldwide is tremendous. Each year in the United States more than 2.8 million people are hospitalized and 31.7 million people receive treatment in emergency departments as a result of violence and injuries (CDC, 2011). The total costs, for both fatal and nonfatal injuries and violence, are estimated to be more than \$405 billion in medical care and lost productivity each year (Finkelstein et al, 2006). Because injuries result from a wide variety of physical, environmental, and behavioral causes, risk reduction comes from a variety of approaches. Forensic nurses have a unique set of skills for dealing with injury, and these skills will be discussed in this chapter.

Forensic means pertaining to the law. **Forensic nursing** synthesizes the biopsychosocial and spiritual aspects of nursing care with an expert understanding of forensic science and the criminal justice process (International Association of Forensic Nurses, 2014). Forensic nursing has a unique body of knowledge and set of skills. It also has unique practice arenas and the client population served. The skill set is defined by the scope and standards of practice, which includes skills such as collection, documentation, and preservation of evidence and other findings that may later be used in the prosecution of a crime. Practice standards also reflect care given to both the living and the dead, victims of trauma and perpetrators of crime, as well as individuals and groups within a community. Forensic nurses often have experience in emergency and trauma services and can provide an expert analysis of wounding patterns and physiological response to injury. They are able to compassionately care for individuals and families who experience emotional

reactions to trauma from a variety of causes. While the majority of forensic nurses in the United States are **sexual assault nurse examiners (SANEs)**, other roles exist to care for survivors of other crimes, liability-related injury, and deaths. These include the clinical forensic nurse, **forensic nurse examiner** or investigator, forensic psychiatric nurse, forensic correctional nurse, legal nurse consultant, nurse attorney, and nurse coroner or death investigator. Arenas of care include but are not limited to emergency departments and community-based urgent care clinics, offices of the medical examiner and coroner, investigative units of law enforcement and criminal justice agencies, and governmental programs of safety prevention.

Forensic nursing care largely occurs in collaboration with professionals, both within and outside of nursing, including but not limited to public health professionals including epidemiologists, law enforcement and corrections officers, emergency department providers, and psychiatric practitioners. Forensic nurses also work collaboratively with public health nurses who bring a population focus to injury prevention programs. As part of a public health approach to crime, forensic nurses serve as content experts, clinician advisors, and/or the clinical managers of care facilities that may contribute to a community response to injury prevention.

INJURY PREVENTION

Not surprisingly, the health determinants of injury, identified in *Healthy People 2020*, mirror disease occurrence in a community. The rate of injury and crime is lower in communities that promote good health. Where inequities of resources and education exist, health disparity, violence, and other crimes rise and accidental injuries occur more often. Trauma victims are overrepresented in minority, disenfranchised, and disadvantaged groups. Disparity can also be seen in the prosecution, conviction, and incarceration of individuals of minority groups in many countries. In the United States, one in three African American males and one in six Latinos will be incarcerated sometime in their lives (Mauer, 2009). Populations that experience more disease also experience more violent as well as accidental injury, and more events that lead to prosecution. The measures that improve overall health, lower risk, and reduce disparity also reduce physical and emotional injury. **Injury** now joins certain categories of disease, disability, and premature death as a major preventable health state. Reducing injury

reflects the goals of *Healthy People 2020* as well as goals of other organizations such as the U.S. Public Health Service, the Centers for Disease Control and Prevention (CDC), the World Health Organization (WHO), and the International Association of Forensic Nurses (IAFN).

The National Center for Injury Prevention and Control, within the CDC, was established in 1997 to coordinate prevention of injuries, violence, and their consequences. The work of this center includes providing grants that fund prevention programs, dissemination of research findings, and maintenance of a website, blogs, podcasts, and electronic newsletters. This funding helps to inform the public of the epidemiology of injury and to provide other resources for professionals. The Center's website includes a wide variety of information on injury prevention and violence prevention, home and recreational safety, traumatic brain injury, injury data and statistics, injury response, motor vehicle safety, and violence prevention (CDC, 2013). The database of the International Association of Forensic Nurses (<http://www.iafn.org>) lists over 700 sexual assault centers in the United States, Canada, and Australia. Forensic Nurse Death Investigators serve as trainers for the CDC's National Sudden Unexpected Infant Death Investigation program.

HEALTHY PEOPLE 2020 GOALS, PREVENTION, AND FORENSIC NURSING

The *Healthy People 2020* goals that deal with reducing injury and violence in the United States reflect the breadth of concerns and problems that result in injury, both intentional and unintentional, in communities. Objectives related to safety, violence, injury, and sexual assault are incorporated throughout the *Healthy People 2020* document. These objectives relate to injuries that are both intentional and unintentional. The box that follows lists selected objectives related to violence.

HEALTHY PEOPLE 2020

Objectives Pertaining to Injury

The following proposed objectives are examples that pertain to injury and are relevant in forensic nursing:

- IVP-29: Reduce homicides.
- IVP-30: Reduce firearm-related deaths.
- IVP-33: Reduce physical assaults.
- IVP-34: Reduce physical fighting among adolescents.
- IVP-36: Reduce weapon carrying by adolescents on school property.
- IVP-40: Reduce sexual violence (U.S. Department Health and Human Services, 2010).

U.S. Department of Health and Human Services: *Healthy People 2020*. Available at <http://www.healthypeople.gov/2020/default.aspx>. Accessed June 8, 2011.

Nurses who work in the area of forensics use all three levels of prevention. For example, forensic nurses (FNs) promote safety in their involvement with projects that aim to prevent domestic violence, sexual assault, child abuse, and accidental injuries before they occur (primary prevention) and in program development and management of care centers. Community

awareness of violent crimes is achieved in concert with certain programs and the community-based professionals who work there. Secondary prevention is practiced following the occurrence of injuries and crime. Forensic nurses provide direct care to both victims and perpetrators. Their expertise serves the individual as well as the community in the collection of evidence for the legal justice system. Goals of compassionate holistic care are to minimize the spiritual, psychological, physical, and social trauma, as well as the financial burden. Although the World Health Organization (WHO) guidelines recommend against routine intimate partner screening (WHO, 2013), the 2013 U.S. Preventive Services Task Force recommends “that clinicians screen women of childbearing age for intimate partner violence...” (Feder et al, 2013; Moyer, 2013). Worth noting is that the WHO does recommend that health care providers ask about IPV exposure in situations involving injuries or that may have been caused or complicated by IPV. FNs are often the first providers to assess a patient's medical situation and to have contact with victims.

If disability, incarceration, or death occurs, FNs provide tertiary care in settings appropriate to address rehabilitation or identify factors that have put individuals at risk. Evidence should be collected in such a way that the collection itself protects rather than destroys or alters the evidence.

LEVELS OF PREVENTION

Intentional Injury

Primary Prevention

Develop programs that promote safety and avoidance of violence, including both intentional violence and unintentional accidents.

Secondary Prevention

Provide timely, sensitive, direct care to both victims of injury and perpetrators of crime and violent behavior.

Tertiary Prevention

When injury has occurred, refer clients to appropriate community services for appropriate follow-up care and rehabilitation of the effects of trauma.

FORENSIC NURSING AS A SPECIALTY AREA THAT PROVIDES CARE IN THE COMMUNITY

Within communities, the growing prevalence of “criminal and negligence-based trauma” indicates a need for health professionals who can intercede with skills that address social justice as well as care for social offenders (Lynch, 2011, p. 17). Thus, forensic nurses respond to sexual assault, drug- and alcohol-related crimes, incidents of human trafficking, elder mistreatment, child abuse, gang violence, as well as mass disaster, automobile accidents, and work-related injuries. In each situation, forensic nurses look for historical, behavioral, and physical indicators that a crime has been committed and intentional injury has occurred. For example, children who are abused may have cigarette burns, bite marks, pressure sores, and other physical signs that parents may claim to be the result of accidents. Munchausen syndrome by proxy is a form of child abuse in

BOX 44-1 Emergency Response to Assault Victims

1. Use standardized medical treatment and forensic protocols.
2. Assess for sexual assault using "forced sex" terminology rather than "rape" or "sexual assault," and call a sexual assault nurse examiner if appropriate.
3. Support privacy of assault victim.
4. Explain procedures clearly to the assault victim.
5. Document location, date, and time of assault.
6. Collect evidence in a systematic format; take pictures if necessary.
7. Take care not to destroy evidence while giving care.
8. Maintain chain of evidence.
9. Maintain evidence integrity.
10. Document the following:
 - a. Injuries
 - b. Emotional state
 - c. Medical history
 - d. Victim's account of assault
11. Identify and refer to resources that can be used after the assault.

From U.S. Department of Justice, Office on Violence Against Women: A national protocol for sexual assault medical forensic examinations adults/adolescents, 2004. Available at <http://www.ncjrs.gov/pdffiles1/ovw/206554.pdf>. Accessed August 20, 2010.

which the primary caregiver uses the child as a mechanism to gain attention. The caregiver often causes illnesses and subsequent symptoms in the child (Finn, 2011).

A client who is admitted to a hospital with traumatic injuries should be evaluated as to the potentially forensic nature of the injuries (Sheridan and Nash, 2009). The response to victims of assault includes a number of steps, as outlined in Box 44-1. The nurse most often comes in contact with police, victims, and perpetrators of violence or crime in the emergency department. The nurse provides a vital link between the investigative process, health care, and the court (Sachs et al, 2008). Nurses should take specific actions when they come in contact with victims. It is important that evidence be carefully collected and that the person who is doing the collection be systematic in this process.

One example of appropriate forensic care is to avoid cutting through the bullet hole in the shirt when cutting a shirt off a victim who has been shot in the chest. Rather, it should be cut to the side of the hole to protect the point of origin of the bullet for later criminal investigation. The collection of DNA provides a significant role in criminal investigations. It is essential that DNA be collected correctly and that elimination samples of DNA be collected from authorized people at the crime scene and from the victim (USDOJ/Office on Violence Against Women, 2013).

The most common types of trace evidence of victims of violence, including those who are raped, are clothing, bullets, bloodstains, hairs, fibers, and small pieces of material such as fragments of metal, glass, paint, and wood. In the investigation of sexual assault, an evidence kit should be used within 72 hours of the assault with specimens collected and preserved according to state crime lab procedures. Only the victim or a nurse wearing protective gloves should handle the clothing. Throughout the collection process, the nurse takes every opportunity to show compassion to the victim of the assault while maintaining objectivity in recording observations (Houmes et al, 2003).

Laughon et al (2004) provide a useful guide to assessment of all forms of violence, including child abuse and neglect, elderly abuse, and intimate partner violence. The authors state that documentation should include written documentation as well as forensic photography. Written forms of documentation should be as verbatim as possible, with the use of declarative statements and body maps. When possible, use a 35-mm or digital camera to take the necessary photographs. The photographs should be taken in context, with two or more photos focusing clearly on the injury. Injuries should also be depicted on diagrams and recorded in the nurses' notes. The How To box describes how to label photographs taken after the injury.

HOW TO Label Photos

All photos should be clearly labeled with the following information:

- Client's name
- Client's medical identification number
- Client's date of birth
- The date and time of the photograph
- The name of the photographer
- The body location of the injury
- The forensic case number

From Sheridan DJ: *Legal and forensic nursing responses to family violence*. In Humphrey J, Campbell JC, editors: *Family violence and nursing practice*, Philadelphia, 2004, Lippincott Williams & Wilkins.

Forensic nurses may have alternative specialties that are combined for a special population. Advanced practice nurses (APNs) such as psychiatric, pediatric, geriatric, and acute care nurse practitioners bring to forensic nursing skills that allow them to provide advanced assessment and prescription of medications and treatments needed by forensic clients. Notably, forensic psychiatric nurses treat both victims of post-traumatic stress disorder and seriously emotionally disturbed clients incarcerated for violent crimes. APNs in correctional facilities may identify themselves as forensic nurses when they manage acute and chronic illness, promote wellness, and work in these systems to develop policies around legal and ethical issues.

The specialty also incorporates three subspecialties of nursing practice that are located within the criminal justice system: forensic nurse, nurse attorney, and legal nurse consultant. Forensic nurses employed in the criminal justice arena generally provide care to individuals who are either victims of injury or perpetrators of a crime that is under investigation. **Legal nurse consultants** provide expert consultation regarding health care to attorneys in either civil or criminal court but do not render direct client care in that setting. Some of these situations might include medical malpractice, personal injury, workers' compensation, and probate. Nurse attorneys hold a license from a state bar association in addition to a nursing license and generally use their nursing knowledge for adjudication. **Adjudication** refers to a judicial decision or a sentence.

Finally, forensic nurses are advocates for programs that prevent injuries, which occur as a result of both intentional injury and health hazards related to environments that create injury. Relying on an understanding of epidemiology, these nurses have knowledge of occurrence as well as the mechanisms of injury in a community. Forensic nurses partner with public

health professionals including nurses to design, implement, and evaluate projects and programs that have a forensic focus.

History of Forensic Nursing

Early writings about the evolution of modern nursing, particularly with regard to care given to victims of war, mental illness, and abuse, lay a foundation for the advent of forensic nurses in the twentieth century (Nutting and Dock, 1907). Chapter 2 discusses the history of public health nursing; this section emphasizes nursing history's linkages to forensic nursing. With public health nurses, forensic nurses celebrate the early pioneers working in communities that brought medical care to the most vulnerable and marginalized. They worked to develop national and international organizations such as the National Organization for Public Health Nursing (1912), National Society of Nurses (later the American Nurses Association [ANA], 1912), the International Congress of Nursing (1912), and the WHO (1948). These organizations were designed to give structure and standards for care and education regarding issues of violence and neglect. These issues pertain to public health, mental health, and forensic nurses who are experts in dealing with the effects of trauma, and who advocate for care of the wounded, both physically and emotionally.

Contemporary practice of forensic nursing in the United States was largely propelled by early efforts to identify and prevent child abuse and neglect and sexual assault of women. In the 1940s through the 1960s, radiologists identified fractures that they linked to assault and pediatricians began describing indicators of "battered child syndrome" (Gurevich, 2010). Subsequently, nurses became aware of their role in identifying indicators of assault. In emergency departments, forensic nurses assisted in "rape" kit collection. The nurses showed compassion and competence in preserving crucial evidence and had a strong understanding of the "rape trauma syndrome" first described by Burgess in 1973. Burgess and other advanced practice nurses initiated previously undescribed care with forensic clients. The first nurse-run sexual assault clinics opened in Memphis and Minneapolis in 1974 (Speck, n.d.) with subsequent development of the first protocols for sexual assault care (Ledray, 1998). In 1985 the U.S. Surgeon General identified violence as a health care issue, and health care providers such as nurses working with victims and perpetrators of crimes, as key agents in ameliorating the effects of violence in our communities (International Association of Forensic Nurses [IAFN], 2010). In 1990 Virginia Lynch published her dissertation on the role description and Integrated Model of Forensic Nursing care of both living and deceased victims of trauma and perpetrators of crime (Lynch, 1990). By 1992, The Joint Commission began to require hospitals to develop protocols for the treatment of victims of sexual assault. At the present time most victims of sexual assault go to emergency departments. The lack of availability of trained providers spurred the development of SANE programs.

Today, the Integrated Model of Forensic Nursing is recognized internationally as the basis for practice as well as education of forensic nurses. Following efforts to describe the unique contribution of forensic nursing (Lynch, 1986), the specialty was recognized by the American Academy of Forensic Science in 1991. The following year SANEs from the United States and

Canada established the International Association of Forensic Nurses (IAFN). In 1995 the ANA designated forensic nursing as a specialty, and it is now recognized as one of the fastest growing specialties in nursing. IAFN boasts a membership of over 3000 nurses worldwide and has members in over 22 countries (IAFN, 2012).

Educational Preparation

Historically, forensic nurses refined and developed their forensic skills through clinical practice and continuing education. Today, there are three primary routes for training in forensic nursing. First, nurses can gain additional skills and knowledge through continuing education courses or basic concepts introduced in generalist education. Second, certificate programs include specific content, entrance requirements, and many have clinical opportunities. Third, graduate nursing academic programs are offering minors or concentrations in forensic nursing.

Formal graduate course work on forensic nursing began at the University of Texas, Arlington in 1986. To begin a specialty by starting with graduate preparation is both uncommon and courageous; more often content is introduced in the undergraduate studies, and graduate study assists in refining and developing the content until it is formalized in courses and majors. By 2000 there were 12 graduate programs preparing clinical nurse specialists and nurse practitioners with a focus on forensic nursing. The development of the scope and standards of practice and a core curriculum for graduate study in 2004 facilitated the development of new programs of study and formed the basis for advanced practice credentialing of students and practicing clinicians. A forensic focus in research became more prevalent in both master's and doctoral studies, which facilitated the opening of the first doctor of nursing practice (DNP) program focused on forensic nursing in 2002 at the University of Tennessee Health Science Center in Memphis. Now, new DNP programs are opening based on this model of advanced nursing practice.

The inclusion of forensic nursing content into undergraduate generalist education remains controversial. The American Association of Nurse Attorneys (TAANA) and the IAFN have recommended coursework regarding public and private legal proceedings. Students need to develop a working understanding of laws and procedures applicable to nursing practice and certain client situations, such as mandated reporting of child abuse (Feng et al, 2012). In addition, nurses are prepared to care for families experiencing trauma. Many educators in the United States believe the complexity of forensic content has evolved so that the skills and competencies required to differentiate the specialty are not appropriate in a generalist educational curriculum.

Theoretical Foundations of Forensic Nursing

Humans seek stability; they seek safety from physical trauma and emotional wounding from violent relationships; and they seek protection of their finances and freedom from fears that threaten their very understanding of human existence. Theories that contribute to our understanding of what constitutes safety and well-being have been extrapolated from a variety of sources outside of nursing. Maslow, an American psychologist,

developed a hierarchy of needs and desires that are seen as influencing the development of an individual toward high levels of “self-actualization” and satisfaction (Maslow, 1943). Nursing has embraced his conceptualization of the hierarchy of human need attainment. Specifically for this chapter, it is important to consider the need for safety and the desire for security that may be threatened by injury. In examining methods to identify the risk of injury, William Haddon, a physician and expert on automobile injury, developed a matrix that looks at factors related to personal attributes, vector or agent attributes, and environmental attributes before, during, and after an injury or death. He demonstrated that by using this framework, a person can evaluate the relative importance of different factors and design interventions (Haddon, 1972; O'Neill, 2002). Subsequently, community-based nurses such as those who work in public health and forensic nursing and, increasingly, hospital-based nurses have used the matrix to develop programs to prevent a wide variety of injuries including burns, falls, firearm injuries, and, most recently, critical incidents from medical error. More recently, forensic science has informed and continues to inform forensic nursing practice. This is particularly true in terms of the intricacies of evidence collection and the growing body of knowledge within criminalistics (James and Nordby, 2009). In addition, the influence of law, including structure of the court system, federal rules of evidence, principles of witness testimony, expert opinions, and rights of citizens, has shaped the unique body of knowledge that guides the specialty from outside of nursing. Criminal justice principles and law inform practice and form the boundaries of many aspects of practice such as client consent, rules of evidence, and expert courtroom testimony.

Professional organizations outside of nursing that address large-scale health concerns such as the CDC and the WHO have contributed to nursing's understanding of injury. At the turn of the twenty-first century these organizations began a global campaign toward violence prevention that had a tremendous influence on developing a primary prevention approach within the forensic community (Krug et al, 2002; Brown et al, 2007; Peden et al, 2009). For example, in 2002 the CDC initiated efforts to develop a national state-based surveillance system, the National Violent Death Reporting System (NVDRS), that could identify the cause and manner of death leading to prevention efforts by pulling together data on violent deaths (including child maltreatment fatalities, intimate partner homicides, other homicides, suicides, and legal intervention deaths), unintentional firearm injury deaths, and deaths of undetermined intent (CDC, 2013). Subsequently, a task force was formed to uniformly prepare individuals to conduct sudden unexpected infant death investigations. Forensic nurses practicing as death investigators served in the development of training programs that are now used nationwide. Today, the NVDRS operates in 18 states pulling together data about violent deaths. The system is designed to provide states and agencies with valuable data that can be used to make decisions about violence intervention and prevention activities within their communities (CDC, 2011).

In nursing, the conceptualizations that have contributed the most to forensic nursing include holism through caring, ways

of knowing including intuition and suspicion, human reaction to trauma including the rape trauma syndrome, and models specific to forensic nursing. Hammer et al (2006) examined the connection between the construct of caring and the unique relationship between forensic nurses and their clients. Although caring was previously recognized as the “hallmark of professional nursing” by theorists in the 1980s, Hammer et al recognized that part of what makes forensic nursing a specialty is the manner in which caring is translated.

The caring component addresses caring for both clients and for one's self. A sense of self-worth must be cultivated and nurtured to the degree that caring is conscientious, objective, and demanding of the scientific truth. Caring must also be curious and questioning; it should be directed toward colleagues, and finally, caring should be about firm and valued concepts that inform practice (Hammer et al, 2006).

In that regard, questioning and ways of knowing, particularly intuition, are viewed as vital for a successful practice. Winfrey and Smith (1999) have described the concept of knowing as, more accurately, being suspicious in forensic nursing. Questioning also led to a greater understanding of what most would consider the unexplainable and the unimaginable: the manifestations of rape trauma syndrome (Burgess and Holmstrom, 1974), behaviors of the seriously emotionally disturbed offender (Mason and Mercer, 1998), and widespread occurrence of intimate partner violence (Campbell and Humphreys, 2003). Lynch's Integrated Model of Forensic Nursing, as previously discussed, depicts the biopsychosocial and spiritual dimensions of nursing care with the legal expertise needed when trauma results in court-related issues. Lynch and Duval (2011) have credited several nursing theorists—including Paterson and Zderad; Conway and Hardy; Leininger, Giger, and Davidhizar; Chinn and Kramer; and Brenner—in the development of forensic nursing theory and practice. Subsequent to Lynch's efforts, Hufft (2006) described forensic nursing within the domains of nursing and delineated the theoretical foundations for advanced forensic practice. Together, these role descriptions have informed the scope and standards of practice as well as the recent establishment of the Advanced Forensic Nursing Board Certification (AFN-BC) credentialing established by the International Association of Forensic Nursing (IAFN) and the American Nursing Credentialing Center (ANCC). Knowledge, observation, and intuition are aspects of forensic nursing.

Key Concepts in Forensic Nursing

The core concepts or conceptual metaphors that underlie forensic and other nursing models are not unique to nursing. Concepts when applied to the nursing process guide knowledge, skills, and attitudes found in practice. Concepts in forensic nursing theory include, but are not confined to, safety, injury, presence, perceptivity, victimization, truth, and justice.

Safety is among the five basic needs of humans identified by Maslow in his theory of self-actualization (Maslow, 1943). Maslow describes the first basic need as meeting one's physiological needs. This need is followed by safety needs, which can be affected by levels of security. The need for safety can become

acute during periods of emergent trauma or chronic during periods of collective violence or chronic abuse. Until an individual is safe and wounding has healed, he or she cannot move on to higher levels of understanding and satisfaction.

Injury involves trauma or damage that is physiological, emotional, financial, spiritual, intellectual, and societal. Injury may be intentional, often known as violence, or may be unintentional. The cause may be a single source or multifaceted; it may be of human etiology or of natural causes. Making the distinction between the causes of injury is key to forensic practice. **Justice** is the concept of moral rightness based on ethics, rationality, law, natural law, fairness, and equity. As such, justice is viewed in the context of bioethics of the health care professions and the prevailing law of a particular society and culture. Therefore, the fact that justice is an important goal in forensic nursing care must be viewed in the context of the environment in which the care is given.

Presence is used by nurses as a part of the humane, holistic approach to both victims of trauma and perpetrators of crime. **Lynch (2011)** has defined presence as “the invisible quality that commands and comforts while directing attention away from one’s self and into the being of another, instilling confidence and respect in the self of that being” (p. 12).

Perceptivity, as an element of intuitiveness, is one tool the forensic nurse uses to investigate injury. Perceptivity involves an increased awareness of human behavior and environment that is interpreted by knowledge and lived experience in making expert decisions.

Truth is conceptualized as an agreement with fact or reality but also reflects characteristics such as honesty and sincerity on the part of the truth teller. Conceptualization of truth is influenced by philosophies that view it as subjective, objective, relative, or absolute. Forensic nurses hold the ideal that the results of scientific inquiry form the basis for their interactions with clients, health care systems, and the judicial system, which interact with their care; they are not influenced by personal bias or outside influence.

Victimization occurs when individuals or groups are exploited or treated unfairly, generally when there is an imbalance of power. The harm may be systematic when groups are mistreated or witness violence or it may be the result of individual attacks. Psychological responses to victimization include heightened feelings of vulnerability, depression, and anger. Juxtaposed to victimization is client empowerment, often through advocacy.

Scope and Standards of Practice

The scope and standards of practice for forensic nursing were first published in 1995. Revisions based on the uniform template of the ANA with addition of advanced practice competencies were published in 2009. The standards are delineated in each of the recognized areas: Scientific Process, Quality of Practice, Education, Professional Practice, Evaluation, Collaboration, Ethics, Research, Resource Utilization, and Leadership. Although each of these parameters helps to differentiate forensic nursing from other specialties (**ANA, 2004**), competencies related to the scientific process, or nursing process, are perhaps

the most indicative of the specialized nature of the specialty. For example:

- Assessment includes the collection of forensic data, which may involve interviewing the client for evidentiary purposes, reviewing medical legal documents, and collecting trace evidence to be used in a criminal investigation.
- Formulating a diagnosis or impression regarding the differentiation of intentional and unintentional injury is a skill that involves a unique understanding of mechanisms of injury and correlation of this with the history of the event. The impression of the forensic clinician has extraordinary legal implications beyond the realm of the health-related diagnosis.
- The identification of realistic outcomes of care is most commonly performed in collaboration with a team that frequently consists of professionals outside of nursing, including law enforcement, criminal justice, community advocates, and social service agencies. Care may reflect a decision that is humane and ensures community safety, but may not necessarily be reflective of the client’s wishes.
- Formulation of the care plan involves collaboration with a team, and should support the integration of clinical, human, social, and financial resources with medical-legal parameters to complete the decision-making processes.
- Implementation of the plan involves skills and techniques that are derived from sound evidence related to the applied science of both nursing and forensics. Current knowledge of both is mandated.
- Coordination of care relevant to forensic outcomes often involves including education and other strategies to prevent injuries well after the occurrence, perhaps after the death of an individual who has been injured.
- Evaluation of outcomes, particularly when viewed in aggregate, may involve dissemination of the results to not only the client and others involved in the care or situation, but also to local, national, and international agencies as appropriate, for the development of laws and regulations to protect individuals in a community.

LINKING CONTENT TO PRACTICE

This chapter discusses the role of forensic nurses in the prevention and treatment of victims of violence. In addition to using the ANA competencies for practice, the forensic nurse includes the public health competencies as described in the **Council on Linkages Domains and Core Competencies (2012)**. For example, the analytic/assessment skills that discuss assessment, data collection, and use of ethical principles are integral to this nursing role. In regard to applying ethical principles, the nurse would use them in the collection, maintenance, use, and dissemination of data and information. Clearly this skill is a part of forensic nursing.

From Public Health Foundation, Council on Linkages: Core competencies for public health professionals, Washington, DC, 2009, PHF.

CURRENT PERSPECTIVES

Evidence-based Practice and Research

Evaluation of competency is required of all professions. Evaluation of nurses begins in school and continues through testing

for entry-level licensure, certification examination, peer review, and personal reflection. Reflection should be on practice as well as during practice. As part of professional expectations and standards, forensic nurses are encouraged to participate in continuous quality improvement using the best evidence for practice or promising practice methods under evaluation (Naydich and Fitzpatrick, 1999; Harkins, 2006). Scientific research in forensic nursing is in its infancy. Although a large majority of the published research consists of descriptive studies of the forensic nursing role and the client populations (Evans, 2000; Lewis-O'Connor, 2009; Shelton, 2009), there is a growing number of studies examining forensic practice and outcomes. For example, research on sexual assault response teams supports the use of these approaches to practice and recommends outcome measurement of both short-term outcomes such as client satisfaction and long-term outcomes such as prosecution rates (Campbell et al, 2006; Johnston, 2005; Speck, 2005; Campbell et al, 2005; Bechtel et al, 2008; Campbell et al, 2008). Studies in collaboration with other disciplines are currently underway to test the basis for distinctions among injuries such as bruising (Wiglesworth et al, 2009; Pierce et al, 2010). Forensic nurses are producing valuable information regarding DNA sampling (Maguire et al, 2008; Ledray, 2010). Scholarly contributions to forensic nursing practice have increased since professional journals such as the *Journal of Forensic Nursing* have increased publication of forensic specific content. The following Evidence-Based Practice example describes the ways in which DNA evidence can be accurately obtained.

EVIDENCE-BASED PRACTICE

An essential step in a forensic evaluation following an alleged sexual assault is the collection of trace evidence including DNA. In addition to the history of the assault, alternative light sources (ALS) have been used to assist examiners in identifying areas of potential DNA evidence. A common ALS used is the Wood's lamp. The goal of this project was to determine the best practice using an alternative light source (ALS) to aid in the identification of trace DNA evidence in sexual assault forensic exams.

The authors reviewed the limited data available on this topic (7 studies) and concluded that the Wood's lamp should no longer be used as the ALS. However, ALS with wavelengths able to detect DNA should be used. Most importantly, examiners must be educated about the advantages and disadvantages and proper use of the use of ALS. Further research is necessary on the use of ALS in forensic evaluations along with development of new techniques to assist in identification of semen in forensic exams.

Nurse Use

SANEs play a key role in providing care for victims of sexual assault. The training to become a SANE is specialized and growing in importance and the recognition of its value to victims, their families, and the criminal justice system (International Association of Forensic Nurses (IAFN) 2014.). Evidence-based practice ensures patients receive the highest quality of care supported by research.

Eldredge K, Huggins E, Pugh LC: Alternate light sources in sexual assault examinations: An evidence-based practice project. *J Forensic Nurs* 8:39-44, 2012.

Certification

The scope and standards of forensic nursing practice have been used for the development of the certification examination and

other credentials that are intended to demonstrate competence of the practitioner. Credentialing within forensic nursing, as with all new professional specialties, has become an increasingly important issue. Different types of credentials pertain to nursing, both within and outside the discipline. While all nurses should have an understanding of credentialing and the implications and responsibilities that accompany such a designation, it is uniquely important for FNs who maintain close relationships to both the medical and the legal communities. FNs provide care when health and the law intersect and must therefore have credentials that speak to their unique qualifications to give that specialized care (Patton, 2011).

Certification examination for pediatric, adolescent, and adult sexual assault nurse examiners (SANE A and SANE P) is available through the International Association of Forensic Nurses. This certification along with the Legal Nurse Consultant, Corrections Nurse, Death Investigators, and Forensic Examiner are offered by other organizations to registered nurses meeting entry criteria but generally do not require a graduate degree. Recognition of the Advanced Forensic Nurse (AFN) by the American Nurses Credentialing Center through a portfolio method of credentialing was used to establish a way to provide board certification for APNs specializing in forensic nursing (<http://www.nursecredentialing.org/ForensicNursing-Advanced>). Seen in light of the APRN Consensus Model for Regulation, forensic nursing is a specialty focus, beyond the role and population focus of the four categories of advanced practice (APRN Joint Dialogue Group et al, 2008). Although the AFN credential represents a specialty focus for APNs, it is currently not an avenue for advanced practice certification or advanced practice licensure. Forensic Nurse Examiners are most often referred to as Forensic Examiners, Medicolegal Death Investigators and Coroners, Sexual Assault Nurse Examiners, or Advanced Forensic Nurses.

ETHICAL ISSUES

Ethical considerations in the practice of forensic nursing are unique because of the implications to not only a client's health, but in some cases, his or her freedom. Practice outcomes affect individuals and families, as well as society as a whole. Ethics and law are closely tied but are not equivalent. Ethical nursing practice involves adherence to law in most cases, but also to the ethics of nursing and the dictates of one's conscience (Walsh, 2005). Nurses maintain a different code of conduct than do certain colleagues. For example, law enforcement personnel answer singly to the law for their standard. Knowledge and understanding of these considerations is core to the specialty of forensic nursing (International Association of Forensic Nurses Ethics Committee, 2008).

Olsen (2013) organized ethical principles into five categories: respect for person, beneficence, distributive justice, respect for community, and contextual caring. Each of these categories reflects examples of the tension that may arise when the forensic nurse faces a dilemma imposed by conflicting interests. An overriding consideration is the need to respect each person and to develop contextual caring within the art of nursing. Respect

for person means respect for autonomy while protecting vulnerable persons. The right of each human to self-determination is recognized within nursing but may not be respected by all societies. Therefore, respect for human rights may involve advocacy to some degree. Laws, cultural norms, and considerations of safety, which limit the liberty of an individual, may constrain the nurse's ability to fully exercise a therapeutic relationship. Questions raised pose dilemmas in a variety of medical and psychiatric settings.

Forensic environments include courtrooms, jails, prisons, and psychiatric facilities for the criminally insane. When criminal action or trauma to an individual requires care, the need for coercion is likely. Certain situations may make medical coercion necessary. These situations include incapacity (or inability) to make decisions and making decisions that could result in harm to self or harm to others in the absence of interventions. Paternalism has been defined as "the principle that allows one person to make decisions for another" (Williams, 2007, p. 93). This may be necessary in the case of minors or older adults. Paternalistic intervention was viewed by the U.S. Supreme Court as lawful in the case of *Washington v Harper* (1990), when it ruled that mentally ill inmates could be compelled to take psychotropic medications against their will if the mental disorder is serious, the inmate is dangerous to himself, and the medication prescribed is in the inmate's best medical interest. Therefore, the ability of a psychiatric forensic nurse practicing in an advanced role to make a determination of rational autonomy is crucial in questions of coercion: to make judgments without being judgmental (Rose, 2005).

This same principle may be applied to clients who refuse treatment of infectious disease, whether or not they are incarcerated, in much the same way that public health law is used to guide treatment in community settings. Instructive guidelines on involuntary treatment are available from the American Correctional Association, the CDC, and the American Public Health Association (Finkelstein et al, 2006).

Beneficence (care) and the complementary principle of non-maleficence (without harm) go beyond autonomy in the responsibility of the nurse to not only support an individual's choices but to perform actions that enhance the health of others. Nurses provide care without prejudice of the circumstance or individual characteristics. They provide care to the injured, marginalized, and poor whether the individuals are victims or offenders. Nurses who care for pregnant teens in a youth facility or collect evidence from drug addicts each hold the same ethical responsibility as described previously (Muster, 1992; Hufft and Peternej-Taylor, 2008). Questions may arise when the resources to achieve adequate health are not plentiful enough for all to receive adequate care. When economic restraints limit funds to process sexual assault evidentiary kits, treat victims of assault, and provide dental care to methamphetamine addicts in prison, where should the funds be applied? Principles of distributive justice address such questions in deciding what goods will be distributed to which persons in what proportions. Forensic nurses may find themselves in a policy-making position to answer such questions to ensure that their clients given similar circumstances are treated no better or

worse than others in the application of protection and medical care. Also, when there are questions of retribution, whether withholding provisions or threatening harm, forensic nurses never participate in the punishment, however subtle, of another being.

Ethical decisions can be exceedingly difficult when the safety of a society is at risk. One approach to making decisions with respect for the community is utilitarianism, which appeals exclusively to outcomes or consequences in determining which choice to make. Williams (2009) explains:

Utilitarianism, with its mandate for the general good, rather than a specific interest, would place the safety of the community above the rights of any one individual. The forensic nurse expert, hired by the court to evaluate a client, as an example, testifies on behalf of society, not the individual. To that end, it may be argued that the nurse expert uses a utilitarian perspective that may not serve the interests of the client but instead, serves the interests of society. Traditional nursing mandates that the correct focus (and therefore the right moral choice) be placed on the individual. However, the burden of responsibility often shifts in forensic nursing from the individual to the community, a correct moral choice under utilitarianism (p. 50).

During a forensic examination, the potential exists for withholding vital information in the investigation of wrongdoing. The temptation to "assist" the perceived victim's case may be justified by a desired outcome for that individual as well as the ultimate safety of a community. This dilemma of information can be carried to situations of privacy protection. The entitlement to privacy may be changed when someone's safety is at stake. If a specimen for DNA is collected during the investigation of a crime, should that information remain in the Combined DNA Index System (CODIS) for use in future crimes, regardless of the outcome of prosecution of that case and when there is the potential for repeat offense (Hackenschmidt, 2004)? Do hospitals have the right to videotape parents who are suspected of Munchausen syndrome, or is this a violation of Fourth Amendment rights (Morrison, 1999)? When victims give information to sexual assault examiners, are they informed that records may be released to law enforcement and attorneys? Should they consent to the release of photographs that depict intimate areas of their body for anyone in law enforcement, attorneys, and juries to see, even in the name of full disclosure (Ledray, 2008)?

Finally, there are always questions regarding the relationship between forensic clients and nurses. Caring is the essence and core value of nursing (Watson, 2008). Olsen (2013) recognized that caring as well as ethics is influenced in the context of relationships and that nurses' "emotion is inextricably bound to moral good" (p. 51). Contextual caring is not synonymous with beneficence but "entreats the forensic nurse to interact with each client, whether criminal or victim, as a person within an ethical relationship of caring concern grounded in the nurse's personal values" (Olsen, 2013, p. 51). The care goes beyond the "obligatory dictates" of client rights. Unique problems are posed when the client is in denial about the role he or she plays in the

problem or poses a safety risk to the nurse. In addition, forensic nurses must overcome the societal bias of establishing relationships with individuals believed to have injured another, perhaps intentionally. Finally, when personal bias or issues of conscience impair the ability to prescribe or participate in particular medical interventions, objections may be raised. Examples of situations at risk for bias in forensics include collection of trace evidence from individuals who have impaired consciousness or are coerced into consent, prescription of birth control following sexual assault, participation in capital punishment, and the use of unnecessary physical or medical restraint. Nurses and other health care professionals have well-established codes of ethics and other examined statements to guide practice and inform care (Walsh, 2005; Ferguson, 2006; Committee on Bioethics, 2009; Lynch and Duval, 2011). It is imperative to view these statements that guide practice as a basis for conduct as well as for reflective dialogue in real client situations. The following two case studies demonstrate some of the aspects of forensic nursing care.

Case #1: *Tamara Lynch is a 6-year-old child who lives in a busy household of four children, her grandmother, mother, and stepfather. She is a client of the local pediatric clinic and has an appointment today for a school-related examination. She has been very interested in school in the past but recently her grades have declined and her mother describes her behavior as withdrawn. Shirley Meres is the pediatric nurse practitioner who has seen Tamara for her most recent health care. She too has noted the change in Tamara's affect. Based on the health history, Ms. Meres uses developmentally appropriate questions to ask Tamara about situations in which she may not feel safe or situations with adults that have made her feel uncomfortable about her body. Tamara describes repeated episodes with her stepfather during which she was inappropriately touched and fondled. The nurse meets with Tamara's mother and explains her role as a forensic nurse. She explains that Tamara will need a specialized physical examination with collection of evidence, including laboratory specimens and photographs. After obtaining permission from the mother, the evaluation is performed using enhanced lighting and visualization equipment to collect photographic evidence, and body fluids for diagnostic and forensic testing. The nurse tells Tamara and her mother that the examination is normal for her age; no indications of trauma are noted. All evidence is packed for preservation according to crime lab protocols. Following the interview and examination, Ms. Meres counsels the child and mother about predictable psychological reactions to child sexual assault and disclosure even though no evidence of abuse was found in the nurse's examination. The mother is given information on advocacy, the legal process that follows a report to law enforcement agencies, and mental health counseling that is available locally. Tamara is given an appointment at the clinic in 2 weeks. The nurse makes contact with law enforcement to report the child's disclosure and make arrangements for transfer of all evidence. Ms. Meres continues to follow the health care of the family in*

the months to follow for evaluation and prevention of common problems that present to families who experience child abuse.

Case #2: *Mike Post is an 18-year-old male who is taken to the emergency department by ambulance for what appeared to be a motor vehicle collision. His condition is considered serious. Following resuscitative measures, he is pronounced dead. Staff members at the emergency department contact the medical examiner's office to report the death. Sean Miller is the forensic nurse investigator on duty who receives the call. When Mr. Miller arrives at the emergency department, he interviews paramedics and emergency department clinicians about the accident site and the appearance of the decedent on arrival. He photographs the body, clothing, and other sources of trace evidence, including items in the decedent's pockets. Mr. Miller performs a thorough examination of Mike Post and discovers a small bullet hole in the left postauricular tissue. All items are individually bagged, sealed, and labeled for further analysis by the crime laboratory. The nurse then meets with the family to explain the need for investigation of all sudden, unexpected deaths. He describes the process involved in the investigation and preparation of the body prior to transfer to a funeral home. Copies of the medical record and x-rays obtained at the facility are transported with the body for autopsy. Mr. Miller reports his findings to the forensic pathology team and law enforcement officers. The autopsy is performed and the ballistics analysis of the recovered bullet leads to the arrest of the alleged assailant. When the case goes to court, the nurse is subpoenaed to testify about the investigation and collection of evidence. The nurse maintains contact with the family to keep them informed of the progress of the case and the resources for legal and family grief counseling available in their community. See the Quality and Safety in Nursing Education box that follows to learn ways in which nurses partner with families to coordinate care.*

FUTURE PERSPECTIVES

Forensic nursing is predominantly a community-oriented specialty. Practice arenas are associated with health care facilities such as private clinics and emergency departments, criminal justice centers for victims of crime, medical examiner offices, police departments, correctional facilities, and mental health centers. What is consistent in each of these practice sites is the care of individuals who have experienced the effects of injury, either intentional or unintentional. Increasingly it is being recognized that hospitals need forensic nursing services. Clients routinely enter hospitals with conditions that have overlying legal implications (Markowitz et al, 2005). In addition, injuries occur as a result of medical incidents and errors. Forensic nurses use their expert understanding of cause and effects of trauma and are in a position to investigate the circumstances in order to design a plan of care for individual as well as special groups of clients. They serve as a liaison between the hospital and the medical-legal community to reduce the effects of trauma.

QSEN FOCUS ON QUALITY AND SAFETY EDUCATION FOR NURSES**Quality and Safety Focus****Targeted Competency: Client-Centered Care**

Recognize the client or designee as the source of control and full partner in providing compassionate and coordinated care based on respect for client's preferences, values, and needs.

Important aspects of client-centered care include:

- **Knowledge:** Describe strategies to empower clients or families in all aspects of the health care process.
- **Skills:** Assess level of client's decisional conflict and provide access to resources.
- **Attitudes:** Value active partnership with clients or designated surrogates in planning, implementation, and evaluation of care.

Client-Centered Care Question

You are an RN at a correctional facility, where system-focused updates have recently been implemented to ensure provider safety. A metal detector has been

implemented that all inmates must pass through before entering the clinic. A standardized frisk procedure has also been implemented. The presence of a security guard has been standardized for all clinic visits. The clinic environment has been modified so that all sharp objects or potentially dangerous objects have been locked up. Extra surveillance cameras have been added to each clinical examination room, and panic buttons have been added as extra security for providers in each exam room.

- Which system updates might impact patients' experience of care?
- Amidst all of the identified heightened security approaches, how do you communicate client-centered care to your clients?
- How do you address client safety in this new environment?
- How do you protect client confidentiality and privacy in this new environment?

Prepared by Gail Armstrong, PhD(c), DNP, ACNS-BC, CNE, Associate Professor, University of Colorado Denver College of Nursing.

PRACTICE APPLICATION

A 26-year-old woman arrived unaccompanied to the emergency department of an academic medical center with cuts on her face, hands, legs, and pelvic area. She was crying and said that she had been attacked and was afraid to have an examination or to provide the name of her attacker. What is the first action that the nurse should take?

1. Explain to her the importance of reporting this crime immediately.

2. Listen closely to her and reflect back to her the fear, anger, and other feelings you hear in her voice.
 3. Immediately call law enforcement officials yourself.
- Once you select the first action that you would take, explain your rationale and outline your exact actions.

Answers can be found on the Evolve site.

KEY POINTS

- Forensic nursing is a community-oriented specialty that addresses the prevention and treatment of accidental injury and violent crimes.
- The specialty reflects an integration of nursing, forensic science, and the law.
- Forensic nursing is needed whenever injury has legal implications.
- Forensic nurses need to maintain objectivity in rendering care to both victims of injury and perpetrators of crime.
- The scope and standards of forensic nursing practice guides forensic nurses with unique skills of the specialties such as

expert courtroom testimony and documentation and security of evidence.

- Forensic nurses work in cooperation with public health professionals, including nurses, in developing programs of prevention such as automobile safety and intimate partner violence prevention.
- Educational programs for forensic nurses are offered through continuing education offerings and formal graduate degree programs.
- Credentialing for forensic nurses include Sexual Assault Nurse Examiners and Advanced Practice Forensic Nurses.

CLINICAL DECISION-MAKING ACTIVITIES

1. Think about injuries you have experienced and answer the following questions:
 - A. How did the injury affect my ability to perform normal activities of my daily routine?
 - B. What injury patterns did I have that would lead me to conclude it was violent or accidental?

C. What could I have done to prevent the injury from occurring?

2. Discuss the effects of violence in your community with a fellow student. What situations exist that increase the risk that someone will be assaulted?

CLINICAL DECISION-MAKING ACTIVITIES—cont'd

3. Write a list of the types of evidence that can be collected at a crime scene or in an emergency room based on a scenario of crime involving a young woman who is the victim of sexual assault.
4. In a short paragraph, explore how you might feel toward someone who commits a crime and needs nursing care. What ethical standards of nursing will influence your treatment of this individual?

The Nurse in the Faith Community

Lisa M. Zerull, PhD, RN

Dr. Lisa M. Zerull provides leadership for faith-based services including faith community nursing and chaplaincy at Valley Health System in Winchester, Virginia, and serves as adjunct clinical faculty at Shenandoah University's School of Nursing. She teaches undergraduate clinical courses in addition to involvement with the educational preparation of faith community nurses since 1995. Dr. Zerull also has been a faith community nurse in her home congregation of Grace Evangelical Lutheran Church since 1996. Currently the editor for *Perspectives*, a newsletter for faith community nurses supported by the Church Health Center (Memphis, TN), Dr. Zerull is also an author and frequent conference presenter regionally, nationally, and internationally. Her research interests include nursing history, outcome measures of faith community nursing, and youth career exploration of the health professions.

OBJECTIVES

After reading this chapter, the student should be able to do the following:

1. Define faith community nursing and wholistic health promotion.
2. Examine the historical roots of nursing and healing ministries as well as professional issues and future development of faith community nursing.
3. Relate models of faith community nursing to the scope and standards of practice for faith community nursing.
4. Develop awareness of the nurse's role within faith communities for spiritual care, health promotion, and disease prevention.
5. Differentiate between spirituality and religiosity.
6. Use the nursing process in a faith community to assess, implement, and evaluate programs for healthy congregations using *Healthy People 2020* leading health indicators.

Conclusion

INTRODUCTION

Faith community nursing or **parish nursing** is a recognized nursing specialty practice in the community setting, yet is frequently overlooked when creative strategies are needed for improving the health of individuals and the larger community. According to Balboni et al (2013), only 12% to 14% of nurses report receiving spiritual care training as part of their nursing education. Nurses often confuse religious practice or religiosity, with spirituality and may neglect patients' spiritual needs (O'Brien, 2011). Whereas **religiosity** relates to "a person's beliefs and behaviors associated with a specific religious tradition or denomination" (O'Brien, 2011), **spirituality** is "an individual's attitudes and beliefs related to transcendence (God) or to the nonmaterial forces of life and nature" (O'Brien, 2011). Thus additional education in spiritual care to distinguish between the two and to provide an understanding of faith community nursing is needed.

Faith community nurses work in close relationship with individuals, families, and faith communities to coordinate programs and services that significantly affect health, healing, and wholeness (Dandridge, 2014; Sheehan et al, 2013; Bulechek et al, 2013, ANA/HMA, 2012; Solari-Twadell and Hackbarth, 2010). Faith community nurses balance knowledge and skill in their role to facilitate the faith community as it becomes a caring place—a place that is a source of health and **healing** for all members of the community. Many nurses are drawn to faith community nursing because it encourages the expression of spirituality as a part of health and healing. Others are drawn to this specialty practice out of vocational calling (Murphy and Walker, 2013; O'Brien, 2011).

Faith community nurses address health concerns of individuals, families, and groups of all ages. Like other communities, the members of faith communities experience birth and death; acute and chronic illness; growth and development; stress or dependency concerns; challenges from life transitions; and decisions regarding healthy lifestyle choices. Serving as good stewards of resources, faith community nurses encourage partnering with community health agencies as well as lay and professional church leaders to arrive at creative responses to

health issues and to develop health-promoting and spiritually healing activities. The nurse serves the faith community by focusing on the needs of the individual parishioner and the overall faith community with special attention given to spiritual needs.

RATIONALE FOR FAITH COMMUNITY NURSING
AS VIABLE COMMUNITY HEALTH MODEL

Early chapters in Parts 1 and 2 of this text familiarize the reader with the historical, economic, social, political, environmental, and ethical perspectives and influences on health care. The health care delivery system is challenged to work within parameters of tighter financial constraints while addressing patients' complex health concerns and also responding to federal mandates for expensive automated systems (i.e., electronic health records) that span the continuum of care. Current health care reform reflects a shift in health care delivery to a more comprehensive wellness-focused program. Faith community nurses are well positioned to provide lower cost and wholistic community-based care for vulnerable and underserved populations as well as collaborate with care providers (Horton et al, 2014; Sheehan et al, 2013; Shillam et al, 2013).

After major hospitalizations, clients may return to their homes very sick with few, if any, care providers available. Caregivers are faced with the multiple tasks of managing finances, maintaining family responsibilities, and learning care-giving skills. Fragmented care and inadequate caregiver training and availability are problems for the disenfranchised, underserved, and uninsured, as well as for economically well-situated and better-educated persons. Families are challenged to seek the best ways to meet the multiple demands of young children, teens, and aging parents whether living in metropolitan, suburban, or rural areas.

Consumer demand for involvement in health care decisions continues to increase, and society emphasizes individual responsibility for health. Simultaneously, consumers have increased interest in their own well-being and have expressed needs for health information to be available in a variety of formats (Beacom and Newman, 2010). In addition to consumer

interest and a heightened awareness of responsibility for one's own health, health care providers and managed care systems have found it financially advantageous for individuals to remain healthy and minimize unnecessary access to care. Consumers struggle to cope with the challenges of rising costs of care, decreasing reimbursement, and the complex health system demands on individuals and families.

The traditional health care delivery model will not meet the burgeoning needs of the future. The skills of professional nurses, such as faith community nurses, will become more important with the provision of health care services in nontraditional settings (Horton et al, 2014; O'Brien, 2011; Djupe, 1992). It is important to differentiate the unique practice of faith community nursing from other community-based specialty practices. Faith community nursing shares many similarities with home health, hospice, and public health nursing—promoting health in the community setting; however, it is set apart from other community-based nurses by its wholistic approach and care of the spirit. Nursing care is also shaped and guided by the faith community's traditions, rites, and rituals.

A primary focus of all nurses in the last few decades has been to coordinate care and to link health care providers, groups, and community resources as the client tries to understand diverse health plans. Negotiating with individuals, agencies, and community **partnerships** within the complex maze of the broader health care environment demands a knowledgeable and seasoned professional. Nurses are aware of the necessity of collaborative practices and the formation of partnerships to care for groups and individuals throughout the life span. These nurses recognize the need for diverse ways to address health promotion and disease prevention at all levels. They advocate for healthy lifestyle choices in exercise, nutrition, substance use, and stress management. Nurses realize that information and guidance must be available via media, in schools, workplaces, faith communities, and residential neighborhoods. Faith community nurses need to partner with others such as health care institutions and federal agencies as they serve populations in faith communities (Horton et al, 2014) to help improve health outcomes.

DEFINITIONS IN FAITH COMMUNITY NURSING

Faith community nursing is defined by the American Nurses Association as a specialized practice of professional nursing that focuses on the intentional care of the spirit as well as on the promotion of holistic health and prevention or minimization of illness within the context of a faith community (ANA/HMA, 2012). The ANA describes the development of a specialty practice in nursing as nurses expanding their practice to include the knowledge and skills necessary to meet the needs of patients requiring specialty care. **Specialization** involves focusing on nursing practice in a specific area, identified from within the whole field of professional nursing and in collaboration with specialty nursing organizations such as the Health Ministries Association (HMA), the membership organization for faith community nurses. Additionally, the ANA delineates the components of professional nursing practice that are essential for

any particular specialty. As the specialty evolves, the valuable contributions of nurses begin to distinguish them from other care providers (Hamric et al, 2013).

This has been true for the evolution of parish nursing. Early on, nurses involved with spiritual care struggled to find a workable definition for the role. Concerns were raised about nurses calling themselves parish nurses without any formal education—simply a nurse license and a willingness to serve their congregation. In order to validate the ministry of parish nurses to that of a recognized nursing specialty, all would need the foundation of a basic preparation with special focus on spiritual care. Following much dialogue and work to validate the specialty practice, parish nursing was recognized as a nursing specialty by the American Nurses Association (ANA/HMA, 2012).

With the 2005 revision of the *Scope and Standards of Practice*, the nurse title changed from parish nurse to faith community nurse. The new title was adopted to be more inclusive of diverse faith traditions and in response to international considerations (Patterson and Slutz, 2011). **Parish nurse** was the original title chosen by Granger Westberg in the 1980s as a theological choice because it connoted service to the **congregation** and also the wider community within a geographical area. The word "**parish**" can mean *congregation* and also *geographical area served by a congregation*. Additional titles for nurses working out of faith communities include parish nurse, congregational nurse, health ministry nurse, crescent nurse or health and wellness nurse (ANA/HMA, 2012, p. 7).

The **faith community nurse** is a licensed registered nurse "with well-developed clinical and interpersonal skills, a strong personal religious faith, and a desire or felt call to serve the needs of a faith community" (O'Brien, 2011, p. 335). With additional education in spiritual care of self, individuals, and groups, the faith community nurse works out of the congregational setting (Slutz and Wehling, 2013). It is expected that the professional registered nurse possesses competence in practice resulting from his/her application of knowledge, skills, and experience, functions with a deep understanding of the faith community's traditions, and fully integrates *care of the spirit* with care of the body and mind (ANA/HMA, 2012; O'Brien, 2011; Slutz and Wehling, 2013). The assumptions that underlie faith community nursing are as follows:

1. Health and illness are human experiences.
2. Health is the integration of the spiritual, physical, psychological, and social aspects of the health care consumer to create a sense of harmony with self, others, the environment, and a higher power.
3. Health may be experienced in the presence of disease or injury.
4. The presence of illness does not preclude health nor does optimal health preclude illness.
5. Healing is the process of integrating the body, mind, and spirit to create wholeness, health, and a sense of well-being when the health care consumer's illness is not cured.

While the majority of nurses serve Christian congregations in the United States, this specialty practice is found in many diverse faith traditions and has grown in its international outreach. Today, there are approximately 15,000 faith community

FIG 45-1 Parish nurse in rural Swaziland, Africa, making a home visit.

nurses serving in a variety of faith settings including synagogues, temples, and mosques across the United States and in 23 countries around the world such as Canada, Australia, New Zealand, Germany, Swaziland (see [Figure 45-1](#)), Ukraine, and Pakistan ([Daniels, 2014](#)). This number is a conservative estimate based on the number of nurses who report taking an IPNRC-affiliated foundations course in faith community nursing and does not reflect the individuals who have completed nonaffiliated IPNRC programs or who practice without additional education in the specialty area ([IPNRC, 2014](#)).

Faith communities, also referred to as congregations, are organizations of groups, families, and individuals who share common values, beliefs, religious doctrine, and faith practices that influence their lives, such as a church, homeless shelter, synagogue, temple, or mosque, and that function as a patient system, providing a setting for faith community nursing ([ANA/HMA, 2012](#), p. 108). Faith communities are found all over the world wherever individuals gather for the common purpose of worship, fellowship, the giving and receiving of love, grace, and hope, as well as the invitation, not obligation, to participate in the rites and rituals of a faith tradition ([Figure 45-2](#)). Some common examples include baptism, devotions, communion, reading of scripture, prayer, and singing. The important role of the faith community in a person's life is amplified with the recognition that it is one of the only institutions with a connection to an individual from birth through death. While many recognize and receive spiritual care support in the congregation, there may not be a conscious awareness of the church being an ideal place for health promotion of body and mind ([Mauk and Schmidt, 2004](#)).

FIG 45-2 Religious symbols, images, rituals, and sacred places are significant to ministry.

Health ministries are visible activities, programs, and rituals of faith organized around health and healing of the congregation's membership and offered by the faith community nurse, clergy, layperson, or community resource. Health ministries may be informal or more specifically planned and encompass a gamut of activities including home visitation, providing meals for families in crisis or upon return home after hospitalization, quilting circles, grief support groups, and prayers for healing services ([Figure 45-3](#)) to name a few ([Patterson, 2012](#); [Patterson, 2013](#); [Church Health Center, 2013](#); [Hale and Koenig, 2004](#)). Evidence suggests that health ministries potentially improve the health outcomes of all members of the faith community, including various ethnicities at higher risk for chronic disease ([Horton et al, 2014](#); [Asomugha et al, 2011](#)). As an active member of the health ministry team, the faith community nurse emphasizes health promotion and models a visible healing presence to members of the congregation.

Faith community nurses respond to health and wellness needs of individuals, groups, and populations and are partners with the faith community in fulfilling the mission of health ministry and intentional spiritual care of its members. The faith community serves persons across the life span, infants through older adults. This may include active and less-active members, as well as those confined to home or living in institutional settings. Individuals or groups may be found in a geographic area near the congregational setting, or in a common cultural community. These individuals or groups may not be affiliated members of the faith community; however, services may be extended to those beyond the congregational setting, such as a food pantry, blood pressure screenings, transportation, and warm meals for those in need ([Monay et al, 2010](#)).

According to the ANA Scope and Standards of Practice for all nurses ([ANA/HMA, 2012](#)), spiritual care is part of all nursing practice and acknowledges a person's sense of meaning and purpose in life, which may or may not be expressed through formal religious beliefs and practices. It is also described as a distinct type of care defined by acts of listening, compassionate presence, open-ended questions, prayer, use of religious objects, talking with clergy, guided visualization,

FIG 45-3 Prayers for healing service with ritual of laying on of hands.

contemplation, meditation, conveying a benevolent attitude, or instilling hope (Chan, 2010; Puchalski and Ferrell, 2010). Spiritual care is helping the patient make meaning out of his/her experience or find hope (Murphy and Walker, 2013). Unique to faith community nursing as a specialty nursing practice is the primary focus on care of the spirit, with *spirit* defined as the core of a person's being. Box 45-1 provides a detailed listing of the core interventions for care of the spirit performed by faith community nurses. The compassionate and intentional healing presence of a spiritually mature nurse with individuals or groups is vital to addressing spiritual care needs.

Spiritual care is much different from **religious care**. Whereas religious care stems from the doctrine, rites, and rituals of a specific denomination or set of beliefs, spiritual care is unique to the individual's purpose in life, the fulfilling of that purpose and living it wholeheartedly. In most denominations, religion creates a nurturing environment where groups gather for worship or defined activity and in which spirituality emerges and grows. Nurses in secular health care may not give priority to spiritual care due to lack of time (Chan, 2010) or a reluctance to address spiritual care for fear of "stirring things up that they will not know how to address" (Jackson, 2011, p. 4), or crossing professional boundaries (Carr, 2010). With faith community nursing, intentional spiritual care is expected and appreciated. One nurse differentiated her experiences in providing hospital care versus faith community nursing care: "I have always thought of my nursing care as being whole person in nature; however in secular settings, I had to *ask permission* to care for the spiritual needs of my patients, whereas in the congregational setting, spiritual care *is expected*. It is a rare interaction with a parishioner where prayer, a gentle touch or warm embrace are not a part of my nursing care!" (Erbach, 2005).

Holistic/wholistic care relates to the relationship between body, mind, and spirit in a constantly changing environment and involves caring for the soul in a special kind of engagement that goes beyond seeing the physical patient but includes observation of the entire patient (Dossey and Keegan, 2013). The

From Bulechek G, Dochterman J, Butcher H et al: Core interventions for nursing specialty areas: Faith community nursing. In *Nursing Interventions Classification (NIC)*, ed 6. St. Louis, 2013, Mosby, p. 429.

faith community nurse, supported by members of the congregation, assesses, plans, implements, and evaluates holistic care programs. The process of operationalizing holistic care is enhanced by an active **wellness committee** or **health cabinet** comprised of congregation members or congregants who may or may not be health professionals (e.g., doctors, therapists, social workers) and who are fully engaged in health ministry (Patterson, 2003; Chase-Ziolek, 2005; Westberg, 1990). The committee is most effective when members represent the broad spectrum of the life of the church. An active wellness committee provides leadership and influence throughout the faith community; ideas come not from one individual but are generated out of a committee structure (McNamara, 2006; Patterson, 2003; Westberg, 1990). The faith community nurse uses the collective knowledge and skills of this collaborative group to provide comprehensive and effective services. The outcome is a caring congregation that understands the strong link between faith and health and supports healthy, spiritually fulfilling lives. Resources for faith community nursing can be found on this book's Evolve website.

HISTORICAL PERSPECTIVES

Faith Communities

Throughout history, the church has been an integral part of the health, healing, and social well-being of a community. From its earliest days, churches have provided Christian nurturance and care of the marginalized: "At the core of every major faith

tradition stands an explicit commitment to be with the sick, the poor, the alienated, the marginal, the wounded, and the dying. The commitments are very old, but the implications are ever new” (Gunderson, 2006, p. 1).

In the roots of many faith traditions are concerns for justice, mercy, and the need for spiritual and physical healing (Zerull, 2010). The appeal for caring, the healing of diseases, and acknowledging periods of illness and wellness is universal. Religion plays an important role in the lives of many individuals. Research suggests that individuals and families are inclined to turn to religion or spiritual counsel during stressful life events such as illness, crisis or death (Koenig et al, 2012). Seventy percent of Americans identify with a personal God, and an additional 12% believe in a higher power (Kosmin and Keysar, 2008). The relationship between spirituality, religion, and health is an important topic for nursing research. An important aspect of living out one’s spirituality and religion is being a part of a community of faith from birth to death, throughout wellness and illness. Whether participating as individuals or as families, all benefit from association with a supportive faith community or congregation through enhanced happiness, peace, hope, and purpose (Koenig, 2009).

Dating back to apostolic times, the biblical reference to Phoebe (Romans 16:1-2) exemplifies the tradition of health and healing within a congregation as well as the important role of women serving in the church. In addition, many Old Testament accounts and healing stories in the New Testament provide additional faith foundations (Psalms 106, 107, 113; Mark; Luke; Acts). The charge of the early Christian church was to preach, teach, and heal. The church provided access to services such as shelter and food; the church tended to wounds and offered comfort and safety. Through the centuries, nuns, deacons, and deaconesses from the Christian tradition provide continuing examples of persons combining faith and health in the care of the sick. Although healing has been a primary mission, many churches have gotten away from that mission and relegated that mission to health care institutions. Somehow along the way, the body and soul got divided in our thinking. Medicine provides care to the physical body and the mind, whereas the church cares for the soul (Lounsbury, 1990).

The origins of wholeness and salvation are derived from similar concepts of *sodzo* (Greek) and *shalom*, or wholeness. These terms and harmony in health are common to most **faith communities**. Writings in Christian and Jewish sources address the individual and community relationships with God as the source for a wise use of resources of self, environment, and one’s community. Hygiene, health, and healing were a part of the Holiness Code of Leviticus. Throughout history, health existed at the center of the interaction between one’s creator and humankind. The integration of faith and health within the caring community results in beneficial outcomes (Brown et al, 2009). Persons who encounter physical and emotional illness and who are able to call upon their faith beliefs and religious traditions are able to increase coping skills and realize spiritual growth (O’Brien, 2011).

Individuals draw on their faith traditions and previous learning experiences, as well as accept support from family and

friends to interpret brokenness, disasters, joys, births, deaths, illness, and recovery. Encouraging growth in faith beliefs and honoring traditions and rituals of the faith community brings individuals, families, and congregations into closer connection with their creator. The consolation of sacred liturgies, religious rituals, sacred space, and communal events aids the grieving and the healing process; they also affirm transcendent life (O’Brien, 2011; Dossey et al, 2013).

Some of the major Christian faith communities in the late nineteenth and early twentieth centuries used missionaries to develop multipurpose activities in communities, which included health activities and education along with religious messages. Hospitals were built in the United States and abroad targeting underserved populations. As political and economic forces changed through the years, health ministry strategies of faith communities have altered their approaches. Some faith groups have identified with community development efforts to help empower people to meet their needs for food, education, a clean environment, social support, and primary health care. Congregations have also recognized the need to increase awareness in several areas, including one’s personal responsibility for healthy choices; the escalating cost of health care and the need for cost containment; the increasing numbers of the uninsured and underserved; the issues of domestic violence and substance abuse; childhood obesity; and the ever-increasing dilemma of interpreting the complex changes within the health care delivery system.

The governing bodies of various faith communities have supported health and wellness efforts by endorsing statements related to health and wellness (Evangelical Lutheran Church, 2014; LCMS, 2014). The Presbyterian Church (2012) is cited as an example of a long-standing tradition of encouraging members to be good stewards or responsible managers of body, mind, the environment, and total resources. In 2012 Presbyterian Church representatives met with key others and First Lady Michelle Obama at the White House to identify opportunities for faith groups to increase and promote wellness and healthy lifestyle options in their congregations, implement more health and fitness activities, and urge state-level policy changes (Presbyterian Church USA, 2012). Similar efforts exist in the Episcopal Church USA, the United Church of Christ, the Catholic Church, and other large denominations.

Parish/Faith Community Nursing

Nursing has had a long history of association with churches and denominations, namely the Catholic Sisters and Protestant Deaconesses who promoted health and cared for the sick, the poor, the fallen and the unbelieving (Fliedner, 1870; Doyle, 1929). Likewise, parish or faith community nurses have followed that same tradition for more than three decades by working out of the church setting to promote whole person health—ministering to body, mind and spirit of parishioners from the time of birth through the end of life.

In 1984, the concept of parish nursing was introduced to churches in the Chicago, Illinois area by Lutheran chaplain Granger Westberg (1913-1999) as way of expanding existing health ministries and providing another link between faith and

BOX 45-2 Timeline of Faith Community Nursing

- 1983 Pilot program with a nurse running a wellness clinic out of the congregation setting—Our Saviour Lutheran Church, Tucson, AZ
- 1984 Parish Nurse Program partnership begun with six congregations and Lutheran General Hospital, Park Ridge, IL
- 1986 Lutheran General Hospital establishes a Parish Nurse Resource Center to share information about health ministry and parish nursing with others.
- 1987 First Westberg Parish Nurse Symposium is held and Granger Westberg publishes book *The Parish Nurse*. Parish Nurse Resource Center becomes the *National* Parish Nurse Resource Center.
- 1989 Health Ministries Association began in Iowa.
- 1991 Marquette University offers eight-day parish nurse education program titled the *Wisconsin Model*, a curriculum later modified to become the *Foundations of Faith Community Nursing* course.
- 1995 Lutheran General merges with Evangelical Health Systems Corporation to create Advocate Health Care. National Parish Nurse Resource Center becomes the *International* Parish Nurse Resource Center.
- 1997 American Nurses Association recognizes parish nursing as a specialty practice.
- 1998 First Scope and Standards for parish nursing practice released. Parish Nurse Preparation Curriculum is published.
- 1999 Parish Nurse Coordinator Curriculum is published. Death of Granger Westberg (July 1913–February 1999).
- 2002 IPNRC transfers assets from Advocate Health System to the Deaconess Foundation, St. Louis, MO.
- 2004 World Forum for Faith Community Nursing is formed with 22 members from Australia, Canada, South Korea, Swaziland, and U.S.
- 2005 ANA partners with HMA for scope and standards revisions—title changed from parish nurse to faith community nurse.
- 2011 IPNRC transfers assets from Deaconess Foundation, St. Louis, MO to the Church Health Center, Memphis, TN. The 25th Annual Westberg International Parish Nurse Symposium is held.
- 2012 Faith community nurse scope and standards 2nd edition published.
- 2014 American Nurses Credentialing Center (ANCC) launches faith community nursing certification through portfolio. *Foundations of Faith Community Nursing* curriculum revised.

health. See [Box 45-2](#), Timeline of Faith Community Nursing. Westberg described parish nursing as a way for the church to reclaim its traditional role in healing (1990). Having previous experience with setting up [holistic health centers](#) out of churches, Westberg fully understood that hospitals and physicians deal with illness, yet there is a need for preventative medicine and wellness in the community and churches fit right in (1990). He also recognized that it was nurses who could have the largest impact on the delivery of whole person care within a congregation, using the nurse's broad background of health promotion, education spiritual care and social work ([Westberg, 1985](#)).

Westberg's rejuvenation of parish nursing in the 1980s built on the strengths of his previous work and focused on the nurse-clergy team working with individuals and their families. Nurses used their professional knowledge, skills, and experience to listen to the spoken and unspoken concerns of individuals resulting in whole person care provision with spiritual care

central to the relationship. By 1984, Westberg partnered with Lutheran General Hospital (Park Ridge, IL—now known as Advocate Health) on a pilot project with six Chicago-area congregations that included four Protestant and two Roman Catholic communities ([Solari-Twadell and McDermott, 2006](#)). These partnerships established the first institutionally-based paid parish nurse program between a health system and churches in the U.S. ([Westberg and McNamara, 1987](#)). Other historical, social, and economic factors contributed to the implementation and subsequent success of parish nursing. They included the timing of Westberg's parish nurse proposal to Lutheran General, the graying of America, the growing focus on partnerships in health care, empowerment of the consumer and the desire for a focus on whole person health care combined with obvious gaps in community follow-up care.

As the contemporary parish nurse movement grew, information was spread by advocates of whole person health. This resulted in the establishment of a Resource Center (IPNRC) in 1986 to provide information, printed literature, and news of emerging parish nurse programs across the U.S., both paid and unpaid. Basic education to prepare nurses and through the collaborative efforts of health system, educators, and the IPNRC, a foundational course was designed. As noted in the timeline, the IPNRC moved from Illinois, to Missouri and now its current home with the Church Health Center in Memphis, Tennessee. Throughout its tenure, the work of the IPNRC focused on the provision and promotion of education, research, and support through curriculum, resources and continuing education opportunities.

FAITH COMMUNITY NURSING PRACTICE

As in the early history of the development of public health nursing in the United States, faith community nurses found that health promotion services were needed for persons across the life span, particularly in underserved urban and rural areas. Nurses identified gaps in the delivery of service. They found that [congregants](#) residing in communities that offered access to adequate health services also requested and benefited from health counseling and health promotion services at all levels of prevention. The following [Levels of Prevention](#) box provides an overview of levels of prevention for older adult health.

Faith community nurse services emphasized health promotion and disease prevention and provided the benefits of holistic care through the supportive, caring faith community. Nurses acknowledged the inner strength and spirituality of persons and groups to increase healing. The nurses developed effective skills in negotiation, collaboration, and leadership. They also honed astute nonverbal and verbal communication skills. They embraced the vital role of families for healthy outcomes, and parish nurses knew that community support augmented the interventions chosen by individuals and families. Working with the congregation as the population group, faith community nurses attempt to include in the wellness programs those persons who are less vocal or visible in the community of faith. The spiritual dimension of health was and is optimized by complementing the nursing role with pastoral care.

LEVELS OF PREVENTION

Older Adult Health

Primary Prevention

- Hold classes for older adults on healthy eating including food selection, preparation, and increasing socialization opportunities at mealtimes for widows/widowers.
- Promote and encourage age-appropriate activities that include daily physical exercise with increased focus on improved balance related to muscle strength, proprioception, and coordination.
- Encourage a variety of activities of individual and group interest and discourage extended inactivity.
- Encourage healthy snacks and meals for older adult gatherings and activities.
- Write faith community newsletter articles targeting topics of interest to older adults (e.g., recommended annual screenings, signs and symptoms of heart attack and stroke, medication management, Medicare benefits, etc.).
- Provide an eyeglasses drive for missions reminding older adults to get vision checks by an eye doctor at least every 1 to 2 years, and update glasses or contact lenses when vision changes.
- Provide support groups based on needs and interests (e.g., grief support/bereavement; low vision; transitions to long-term care/retirement community; Alzheimer caregivers; adults living with disabilities; etc.).
- Coordinate medication management opportunities such as inviting a pharmacist to assist in a medication review after worship.
- Initiate a walk for fun program (e.g., Walk to Emmaus)
- Host a community health fair offering resources related to whole person health.

Secondary Prevention

- Provide health assessment and counseling during home visits for health promotion such as visits after a hospitalization.
- When making home visits, identify safety concerns and make suggestions such as eliminating throw rugs, decreasing clutter, decreasing use of extension cords, and moving heat sources from flammable products such as oxygen.
- Using an attitudinal/behavioral risk survey, identify factors influencing health behaviors.
- Be available for health counseling for older adults before and after activities.

Tertiary Prevention

- Collaborate closely with ministerial team about sessions that deal with healthy nutrition, exercise with injury prevention guidelines, health concerns related to being overweight, and advantages of maintaining a healthy weight, and support, stress management, and improved quality-of-life sessions.
- Follow up and monitor health care provider's plan of care for older adults challenged with chronic disease such as diabetes, hypertension, and depression; provide education, support, and spiritual care.
- Facilitate a faith-based activities program for aging in place.
- Discuss in older adult gatherings the need for loving, caring friends and the support needed for mental health and overall well-being.

From U.S. Department of Health and Human Services: *Healthy People 2020*. Washington, DC, 2013, USDHHS.

Profile of the Faith Community Nurse

The practice of the faith community nurse is governed by (1) the Nurse Practice Act of the state in which the nurse practices; (2) *Nursing: Scope and Standards of Practice* (ANA, 2010); (3) *Faith Community Nursing: Scope and Standards of Practice* (ANA/HMA 2012); and (4) *Code of Ethics with Interpretive Statements* (for nurses) (ANA, 2001). According to the International Parish/Faith Community Nurse Resource Center located in Memphis, Tennessee (Church Health Center, 2013), the suggested requirements to be a faith community nurse include the following:

- Active registered nurse license in the state of practice
- Baccalaureate degree or higher in nursing with experience in community nursing preferred
- Completion of a foundational education course in faith community nursing
- Specialized knowledge of the spiritual beliefs and practices of the faith community
- Personal spirituality maturity in practice
- Should be organized, flexible, self-started, and a good communicator

The majority of nurses choosing to become specialized in faith community nursing are experienced and have been in practice for several years. A large survey of faith community nurses ($n = 1161$) across the United States yielded the following description:

- Average age = 55 years
- 89% female

- 32% prepared at baccalaureate level in nursing, 24% prepared at the diploma level, 14% prepared at the associate's level, 12% hold a master's in nursing
- 68% serve as unpaid staff in towns (47%), cities (42%), and metro areas (11%)
- Majority are from Christian faith traditions with only 2% of the sample Jewish; 25%, Lutheran; 23%, Roman Catholic; 16%, Methodist
- 17% have membership in the American Nurses Association (Solari-Twadell, PA, 2006)

Because many faith community nurses practice within their own congregation, they are considered to be a known and trusted resource. By virtue of relationship, congregants access the services of the faith community nurse with a high comfort level and awareness that information shared will be kept confidential by the nurse professional. Faith community nurses are well aware of the beliefs, faith practices, and level of spiritual maturity of the members served, and they link these with health and healing (O'Brien, 2011).

Many faith community nurses function in a part-time capacity and serve as salaried or unpaid staff. Some nurses are responsible for services for several faith communities, whereas others engage in faith community nursing as part of a full-time commitment in other capacities. For example, a nurse might be employed part-time as a public health nurse and part-time as a faith community nurse in the same community. Alternatively, a nurse employed full-time in an acute care setting may spend

time serving in an unpaid capacity working in a faith community with a group of other nurses. Depending on the practice model, the nurse has a narrowly defined or a wider realm of responsibility. Faith community nurse practices may be integrated into a health care system or into practices that collaborate with related professional practice areas such as health departments or colleges of nursing. Health care systems employ **faith community nurse coordinators**, who facilitate different arrangements with several faith communities of varying backgrounds (Slutz and Wehling, 2013; Zerull and Solari-Twadell, 2006). Practices in which several faith community nurses are supervised by a coordinator have built-in opportunities for networking, partnering, and mentoring (Durbin et al, 2013).

As advanced practice nurse and faith community nurse practices increase in numbers and varieties of arrangements, evaluation of practice trends within the health care delivery system and the needs of society is necessary. Nursing must be accountable and responsive to those being served, as well as to those who provide opportunities to serve.

The goal of faith community nursing is to develop and sustain health ministries within faith communities. Faith community nursing is community-based and population-focused professional nursing practice with communities of faith to promote whole-person health. Faith community nurses must be fully aware of the beliefs, faith practices, and level of spiritual maturity of congregants served, and they link these with health and healing. Nurses work with a health cabinet or wellness committee to evaluate assets and areas of need in order to plan services that will attain outcomes congruent with goals established by the congregation and faith communities served (Patterson, 2003).

Characteristics of Faith Community Nurse Practice

Since the early 1990s, five characteristics have been identified as central to the philosophy of faith community nursing by nursing educators and practitioners (Solari-Twadell, 2006):

1. The spiritual dimension is central to the practice of parish nursing. Nursing embodies the physical, psychological, social, and spiritual dimensions of clients into professional practice. Although parish nursing includes all four, it focuses on intentional and compassionate care, which stems from the spiritual dimension of all humankind.
2. The roots of the role balance both knowledge and skills of nursing, using nursing sciences, the humanities, and theology. The nurse combines nursing functions with pastoral care functions. Visits in the office, home, hospital, or nursing home often involve prayer and may include a reference to scripture, symbols, sacraments, and liturgy of the faith community represented by the nurse. The values and beliefs of the faith community are integral to the supportive care given. Nurses also assist with worship services as appropriate within the faith community.
3. The focus of the specialty is the faith community and its ministry. The faith community is the source of health and healing partnerships, which result in creative responses to health and health-related concerns. Partnerships may be among individuals, groups, and health care professionals

within the congregation. They may also be among various congregations or community agencies, institutions, or individuals. Partnerships also evolve as the congregation visualizes its health-related mission beyond the walls, stones, and steeples of its own place of worship.

4. Parish nurse services emphasize the strengths of individuals, families, and communities. Parish nurses endorse this fourth characteristic in their practice. As congregations realize the need for care and care for one another, their individual and corporate relationship with their Creator is often enhanced. This provides additional coping strength for future crisis situations within the family and community.
5. Health, spiritual health, and healing are considered an ongoing, dynamic process. Because spiritual health is central to well-being, influences are evident in the total individual and noted in a healthy congregation. Well-being and illness may occur simultaneously; spiritual healing or well-being can exist in the absence of cure.

Faith Community Nurse Interventions and Programs

Faith community nurses provide care to individuals, families, congregations, and communities across the life span. The practice includes the full cultural and geographic community regardless of ethnicity, lifestyle, gender, sexual orientation, or creed. The nurse incorporates faith and health, uses the nursing process in providing services to the faith community, and facilitates collaborative health ministries as an important component of the practice. Although faith community nursing education stems from a Judeo-Christian theological framework, faith community nursing respects diverse traditions of faith communities and encourages adaptation of the programs to many faith traditions.

One of the first tasks of a new faith community nurse is to explore the social demographics and identify the health needs of the congregation (O'Brien, 2011, pp. 341-342). This is accomplished by selecting a congregational health needs survey available online or in print for public use (Durbin et al, 2013). In collaboration with the ministry team, the faith community nurse determines actionable priorities and then applies his/her knowledge, skills, and experience to plan health promotion and spiritual care initiatives. Often, due to limited congregational resources, the faith community nurse must conduct a resource assessment to determine feasibility when matching need with time and financial resources.

Since limited resources in faith communities often challenge program development, the faith community nurse must match need with available resources. The following set of questions helps determine what is possible to consider in advance of carrying out health promotion projects (Solari-Twadell and McDermott, 2006, p. 104):

1. What resources are needed?
2. What resources are available?
3. Which of the available resources are accessible to the nurse for the accomplishment of a specific effort or project?
4. Can the work of the project or program be accomplished with what is available and accessible?

As the faith community nurse plans and provides intentional holistic care he/she benefits from an awareness of the seven functions of the professional nurse role (Slutz and Wehling, 2013):

1. **Integrator of faith and health:** Assist others to improve spiritual and physical health; assess personal spirituality as well as that of clients. Interventions focus on providing presence, listening, and rituals such as prayer and scripture. *Example:* Use prayer, as appropriate, at the conclusion of each individual encounter or group gathering.
2. **Personal health counselor:** Discuss health problems and recommend interventions as necessary. Therapeutic communication strategies and techniques are utilized to discuss, explore, and guide clients through health concerns. *Example:* Offer blood pressure screenings one Sunday each month and discuss ways to reduce risk for high blood pressure (e.g., stress reduction, weight management, smoking cessation, healthy eating).
3. **Health educator:** Provide opportunities to learn about health; focus on the teaching role of the nurse; select resources; utilize strategies, and lead activities to promote health. Use a variety of formats including seminars, conferences, classes, workshops, individual or group sessions, newsletters, printed materials, bulletin inserts, and bulletin boards to empower others to be active partners in managing health. *Example:* Create a bulletin board display on whole-person health of body, mind, and spirit, including the connection between faith and health.
4. **Referral agent:** Provide information for referrals to appropriate agencies and services. Maintain an awareness of local agencies, services, and resources and how to make referrals. *Example:* Refer an adult female to a gynecologist for preventative women's care and mammogram.
5. **Health advocate:** Empower congregants to obtain needed health care services. Develop advocacy skills including expert communication techniques, facilitation and problem solving skills, and increase knowledge of the health care system, health policy, and access to care in order to assist others. *Example:* Interface with homeless persons accessing congregational resources of food or financial support.
6. **Coordinator of volunteers:** Recruit, train, and supervise volunteers to expand ministry and outreach. Organize a health ministry team to guide and direct faith and health initiatives. Utilize the gifts and talents of congregation and community members. *Example:* Plan an annual health fair with members of the congregational health ministry team, inviting other health care professionals and community agencies to participate and display health resources available in the community.
7. **Developer of support groups:** Establish and facilitate support groups. Increase knowledge of existing support groups to provide referrals as needed. *Example:* Organize a bereavement/grief support group for older adults including widows and widowers that may or may not be led by the faith community nurse.

Several images of the faith community nurse in practice highlight varying settings and professional activities. Central to

all interactions is intentional care of the spirit and the healing presence of the faith community nurse. Blood pressure screenings offer therapeutic touch as well as assessment for cardiac status, social health, and overall well-being as the parishioner spends time with the nurse (Figure 45-4). Informal pew-side consultations take place after worship when individuals ask health-related questions or request resource or referral information (Figure 45-5). Young families require comprehensive support with diverse needs related to age, supportive relationships, childcare support, and parenting (Figure 45-6). The health educator role requires creative and differing teaching strategies for the nurse based on the ages of individuals or groups being taught (Figure 45-7). Faith community nurses may organize an annual health fair inviting community partners and service agencies to share resources and promote health

FIG 45-4 Blood pressure screening in the faith community.

FIG 45-5 Faith community nurse provides informal pew-side health consultation.

FIG 45-6 Offering education and support to families.

FIG 45-7 Faith community nurse as educator using visual art as clothing for health education.

ministries to parishioners of all ages (Figure 45-8). Hospital and institutional care visits provide spiritual and emotional support when unexpected illness and health crisis may challenge coping skills and raise questions about faith and denominational theology (Figure 45-9). Other interventions, services, or programs

provided by the faith community nurse are determined by taking into consideration specific congregation needs; the mission, vision, and strategic plan of the congregation matched with the knowledge, skills, and experience as well as time availability of the faith community nurse (part-time versus full-time).

As one of the trusted members of the **pastoral care staff**, the faith community nurse will find it helpful to develop ease in inquiring about a person's spiritual journey. Assessments, whether physical or spiritual, are used to gather data for planning nursing care. Because care of the spirit is central to faith community nursing, spiritual assessment instruments are useful tools and applicable to diverse populations (Hodge and Limb, 2010; Puchalski and Ferrell, 2010; Koenig, 2002). One widely used spiritual assessment tool is constructed with sample questions and the acronym FICA:

F-Faith or beliefs: What are your spiritual beliefs? Do you consider yourself spiritual? What things do you believe in that give meaning to life?

I-Importance and influence: Is faith/spirituality important to you? How has your illness and/or hospitalization affected your personal practices/beliefs?

C-Community: Are you connected with a faith center in the community? Does it provide support/comfort for you during times of stress? Is there a person/group/leader who supports/assists you in your spirituality?

A-Address: What can I do for you? What support/guidance can health care provide to support your spiritual beliefs/practices? (Puchalski, 2014).

In addition to assessment data, history of family relationships and past association with faith communities provides background information. The nurse needs to be comfortable with questions that lead parishioners to expand on their faith beliefs. Compassionate, careful listening involves being still, reflecting, and being intentionally in the present. Being sensitive to the differing needs of personal spirituality during various points along life's journey is important to consider while guiding persons through the spiritual assessment. The nurse then also helps individuals share necessary information about spirituality needs with other health care providers and clergy as appropriate.

Faith Community Nurse Education

The International Parish Nurse Resource Center (IPNRC), now located in Memphis, Tennessee, supported by the Church Health Center, upholds its mission to promote and develop quality faith community nurse programs through research, education, and consultation (Patterson, 2003). The IPNRC guided the development of the philosophy, mission, assumptions, and strategic purpose of this nursing specialty. In addition, core curricula as standard preparation for faith community nurses and coordinators were developed and revised (Patterson, 2003; Solari-Twadell and McDermott, 2006; Jacob, 2013). Throughout the years, the IPNRC has been vigilant in addressing emerging issues such as documentation accountability, nurse preparation, and accreditation concerns (related to The Joint Commission, 2013) for faith community nurses connected with accredited hospitals or other health care

FIG 45-8 Health fair for the congregation and community.

FIG 45-9 Hospital visitations include care of the spirit.

institutions. Since 1985 the IPNRC has sponsored the annual Westberg Symposium for faith community nursing, which is an international forum to present the latest research and practice patterns in faith community nursing. Information about accessing the center can be found on this book's Evolve website.

The development of programs of study for the new specialty evolved from the initial adoption of the HMA and ANA's 1998 *Scope and Standards of Practice of Parish Nursing Practice* (ANA/HMA, 1998) and then the revised *Faith Community Nursing: Scope and Standards of Practice* (ANA/HMA, 2005). Faith community nurses active in the interfaith Health Ministries' Association (HMA) developed these documents. Professional and laypersons in faith and health ministries comprise the membership of HMA, which also holds an annual educational symposium. Members of the faith community nurse section include professional nurse members committed to improving the practice and developing statements of agreement related to faith community nursing. Information about accessing the HMA can be found on this book's Evolve website.

Appropriate and effective faith community nurse practice requires the ability to integrate current nursing, behavioral, environmental, and spiritual knowledge with the unique spiritual beliefs and religious practices of the faith community in a program of wholistic nursing care (ANA/HMA, 2012, p. 10). This can be achieved through education, mentoring, and collaborative practice with other nurses. As stated earlier in this chapter, what differentiates the faith community nurse is additional education in this specialty practice with intentional focus on care of the spirit.

For the nurse interested in faith community nursing, a variety of educational programs and curricula are available through health care institutions, colleges and universities, seminaries, or other congregation-based associations. Education offerings range from weekend to week-long curricula, which may or may not award contact hours, to academic courses awarding three to six credit hours of study, as well as online programs (Cassimere and Slutz, 2013; O'Brien, 2011). A list of available courses is online at <http://www.parishnurses.org/>.

Solari-Twadell and McDermott (2006) described the history of the development of faith community education through the IPNRC and the need to develop an evidence-based curriculum to adequately reflect current and anticipated parish nursing practice. The early work of Solari-Twadell (1999) was used to define the differentiation of the ministry of faith community nursing using nursing standardized language from the Nursing Intervention Classification System (NIC). Upon further review of documentation by faith community nurses, the standard language of NIC captured the spiritual dimension of care provided (Solari-Twadell and Hackbarth, 2010; Burkhart and Androwich, 2004; Weis and Schank, 2000). The results indicated that the basic preparation curriculum required major revision to better prepare nurses for specialty practice. The curriculum is now revised every five years by the IPNRC. To remain at the cutting edge of the profession and recognize competency among practitioners, the specialty must pursue ongoing research in evidence-based practice for the continued documentation of actual interventions. This enhances the development of standardized curricula for preparation and supports nurse specialty certification.

The multiplicity of faith community nursing education is developed by individual nurse educators or the more widely used curriculum endorsed by the IPNRC resulting from the work of a panel of experts including representatives from the ANA, the National League for Nursing, ministerial leaders, nurses, educators, and international partners. Each curriculum is intended to assure the quality and uniformity of basic preparation, not to limit the uniqueness of nurse practices or mandate restrictions on how the content is taught (Solari-Twadell et al, 1997). Most education programs are now offered through a partnership with the IPNRC out of more than 130 sites around the United States and abroad. The IPNRC continues to provide oversight for curriculum revisions.

Faith community nurse education builds upon the registered nurse's knowledge, skills and experience. Two courses are offered by the IPNRC—Foundations and Coordinator/Advanced (see Figure 45-10). Both courses are organized around

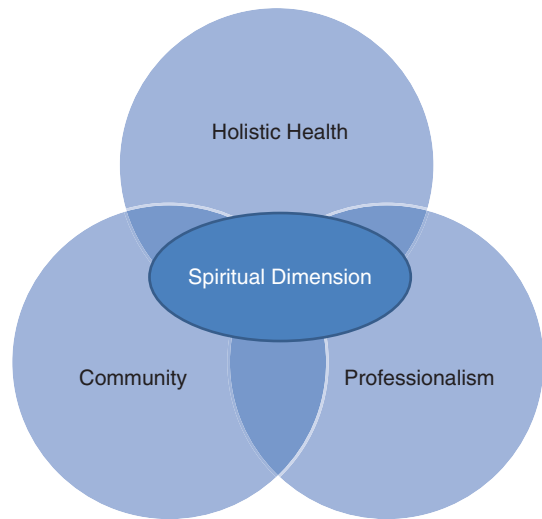

FIG 45-10 International Parish Nurse Resource Center Curriculum Model.

four content areas: (1) spirituality; (2) professionalism; (3) holistic health; and (4) community. The Foundations course offers topics within content areas to include theology of health and healing; the nurse's role in spiritual care; use of prayer; the history, philosophy, and models of faith community nursing; advocacy; assessment; beginning your ministry; working with a congregation; care coordination; communication and collaboration; documentation, ethical and legal issues; family violence; grief and loss; healing and wholeness; health promotion; and self-care (IPNRC, 2014). Depending on the location of the course or education sponsor, additional content may include grant writing, complementary therapies, research, community resources, and principles of adult learners (O'Brien, 2011).

The Coordinator/Advanced course is designed to build on the Foundations course and offers administrative and program management content: (1) coordinator self-care; (2) working with diverse faith traditions; (3) documentation; (4) the role of the coordinator; (5) human resource management; (6) utilizing research; (7) professional development; (8) emerging trends and issues; (9) new program development; (10) growing and sustaining; (11) marketing and promoting; (12) program funding and grant writing; and (13) working with faith communities. With this knowledge, the faith community nurse coordinator is equipped with the tools to coordinate a group of faith community nurses within a congregation or a larger regional or denomination-based network.

Ongoing education for faith community nurses may be obtained locally, regionally, or internationally. At the local level, education programs are often coordinated through established networks, and are institution or university sponsored. Regionally, networks of faith community nurses may gather annually for one day or weekend program retreats. The annual Westberg symposium sponsored by the IPNRC and the annual HMA meeting provide comprehensive sessions and forums for nurses to gain new knowledge, network with others, and stay abreast of current resources, trends, and issues in the specialty practice.

Other international faith community resource centers such as in Canada and Australia also offer educational programs. Information about accessing faith community nursing resource centers can be found on this book's Evolve website.

Advanced practice opportunities also enrich a specialty practice. Master's-prepared nurses (with specialization in congregational leadership, congregational health, public health nursing, or holistic nursing) and nurse practitioners have found niches in faith community nursing. Universities and seminaries have developed creative and unique partnerships to provide educational opportunities for faculty and students at the undergraduate and graduate levels.

Formal educational preparation and continuing education options must continue to include the basics and enrichment courses in nursing practice, research, theology, and pastoral care (see the following [How To](#) box). In addition, the nurse needs updates in areas of public health, medicine, sociology, cultural diversity, and human growth and development across the life span. Improving collaboration, negotiation, and coordination skills, as well as consultation, leadership, management, and research skills, is essential. Faith community nurses accept responsibility for ongoing professional education within nursing and ministry arenas (ANA/HMA, 2012; Solari-Twadell and McDermott, 2006).

MODELS OF FAITH COMMUNITY NURSING

When designing the preferred model of faith community nursing, consideration is given to organizational mission and the influencing factors of economics, infrastructure, available personnel, and willingness of stakeholders to take some risks. Four primary models for faith community nursing practice are used, with arguable benefits for each (Cassimere and Slutz, 2013; O'Brien, 2011). The models are differentiated by employer and remuneration wherein the nurse is paid or unpaid.

A paid **institutional model** is supported by a health care institution (e.g., hospital, health department or long-term care facility) where nurses are paid (salary or hourly) either by the institution or a shared salary with the congregation over time. Second is the unpaid institutional model where an institution provides soft support in the form of continuing education and spiritual development; however, the nurse is not paid a salary and is governed by the congregation who budgets for some expenses such as mileage and health education materials. Third is the paid **congregational model** where the nurse is governed and paid by the congregation with no contractual support from any sponsoring health care institution. Fourth is the unpaid congregational model where the nurse is governed by the congregation with no contractual support from any sponsoring health care institution. When unpaid, the nurse may negotiate financial support for expenses such as gas/mileage, postage, and health promotion literature. There are pros and cons for each model. Paid faith community nurses tend to work more hours, more fully develop the role, and provide a stronger presence within the congregation than the unpaid parish nurse. Often with outside health care organization sponsorship, faith community nurse initiatives typically disappear during

HOW TO Work with Baccalaureate Nursing Students and Nursing Faculty

Baccalaureate students benefit from the integration of whole person and spiritual care in courses throughout a curriculum (Johnson et al, 2014). Additionally, a clinical practicum experience in the faith community setting provides a greater understanding of community and population-focused care. Nursing students assess community needs, plan, implement, and assist in the evaluation of programs to promote health and wellness within faith communities. When exploring the possibility of using a faith community as a clinical site for nursing students, consider the following aspects:

- Curricular aspects: What is the academic level of the nursing student? How are content and methods for teaching spiritual care integrated throughout the program of study, specifically in courses of assessment, health promotion, community and public health, maternal-child health, and population management? What are the course objectives? Specific unit objectives? Student learning objectives?
- Understanding: Nursing faculty should explore the student's knowledge of faith community nursing. What specific information about the faith community denomination and the religious rites and rituals are needed prior to the start of the student experience? Has the student reviewed the scope and standards of practice for faith community nursing?
- Time/Students: Consider the number of hours available for this experience and the flexibility of the student's hours with the availability of the faith community nurse. Based on the faith tradition, when will worship services (e.g., Sunday or Saturday) and planned activities take place? Can the setting accommodate one or multiple students?
- Supervision and Evaluation: Who will provide overall supervision of the student's activities? In what ways will the faith community nurse have input in the evaluation of the student's activities? How will the student evaluate the faith community nurse and community experience?
- Guidelines: Consider the guidelines needed for student safety, in-home or institutional visitation, confidentiality, and documentation. What documentation from the student and academic institution is required by the faith community?
- Activities: Formulate activities that include all aspects of the nursing process for the student(s) to actively participate. Identify areas from various stages of the life cycle and with varying cultural backgrounds, if possible. If required for the clinical practicum, identify a project that is feasible and realistic for the student given his/her education level, course and student learning objectives matched with the needs of the faith community.

Johnson EJ, Testerman N, Hart D: Teaching spiritual care to nursing students: an integrated model. *J Christ Nurs* 31(2):94-199, 2014.

congregation transitions of transfer, retirement, or leave of absence. In all models, nurses work closely with health care professionals, pastoral care and health ministry staff, and lay volunteers.

The pursuit of faith community nursing as a specialty practice has been somewhat hindered by the number of unpaid nurses practicing in as few as two hours per week or by not wanting to be held accountable for a formal nursing practice. The ongoing question remains of “why pay for something when you can get it free of charge,” similar to the evolution of paid congregation staff for youth education and music ministry

(Durbin, 2006). The trend for older nurses to call themselves faith community nurses “after retirement” also sent the message of a “less than” nursing practice versus a dynamic and active professional practice carried out by an engaged and experienced nurse (Durbin, 2006). Yet as faith community nurses wanting to do more in their churches could attest, financial constraints of smaller churches often has prevented the creation of a paid position or has not allowed for increased hours from part-time to full-time status.

To promote healing, the nurse builds on strengths to encourage the connecting and integrating of inner spiritual knowing and healthy lifestyle choices to achieve optimal wellness in the many circumstances faced by individuals and families in life. Intentional and compassionate presence of a spiritually mature professional nurse in individual or group situations is vital. In this role, providing holistic care with congregation populations is important. Holistic care is concerned with the relationship between body, mind, and spirit in a constantly changing environment (Dossey et al, 2013). The nurse and members of the congregation assess, plan, implement, and evaluate programs. The process of realizing holistic care is enhanced by an active wellness committee or health cabinet with members who are fully engaged in health ministry (Chase-Ziolek, 2005). These committees are most effective when members represent the broad spectrum of the life of the church. An active wellness committee provides leadership and influence throughout the faith community; ideas are not from one individual but generated out of a committee structure (McNamara, 2006). The faith community nurse uses all the knowledge and skills of this specialty to provide effective services. The outcome is a truly caring congregation that supports healthy, spiritually fulfilling lives. Resources for faith community nursing can be found on this book's Evolve website.

Holistic Health Care

Holistic health practices emphasize nurses' and clients' commitment to optimal wellness. Such practices focus nurses and clients on seeking the meaning of wellness for the individual or situation, and on considering options from an array of therapies. Harmony between the physical, emotional, psychological, and spiritual self is sought. In addition to sharing backgrounds and functions similar to those of public health nursing, faith community nursing also parallels and benefits from commonalities and distinct practices of holistic nursing. Regardless of specialty or practice setting, nurses who practice in a holistic manner acknowledge wholeness as more than the sum of the individual parts (Dossey et al, 2013). The philosophy of holistic nursing practice (which is a subspecialty in nursing) embraces concepts of presence, healing, and holism. The interconnectedness of body, mind, and spirit is basic to holistic nursing and is embedded in the practice of faith community nurses. Like faith community nursing, holistic nursing emphasizes wholeness of persons across the life span.

The current standards of holistic nursing practice were approved by the American Holistic Nurses Association (AHNA, 2007) and contain five core values. These standards provide guidelines for practice, education, and research. The standards

are a guide for all professional nurses, as are the five assumptions that underlie faith community nursing as found in *Faith Community Nursing: Scope and Standards of Practice* (ANA/HMA, 2005). Faith community nurses will find them helpful in identifying more holistic practices and interventions. Faith community nurses have used some of the interventions commonly found in holistic nursing, and additional exploration by faith community nurses enhances practice possibilities to promote wellness and healing for practitioner and client (ANA, 2007). Both faith community nurses and holistic nurses share the skill of creating a healing environment (Dossey et al, 2013). Listening coupled with intentional compassion is basic to effective interventions. Selected interventions that are often used in both specialties of nursing are prayer, meditation, counseling, guided imagery, health promotion guidance, journaling, therapeutic touch, healing presence, and massage. Information about accessing AHNA can be found on this book's Evolve website.

ISSUES IN FAITH COMMUNITY NURSING PRACTICE

As a specialty practice of nursing, the faith community nurse must be alert to issues of accountability to populations served, as well as to those who entrust the nurse with the responsibility to serve a designated population. Because the role involves professional, legal, ethical, theological, and relational issues, the nurse will need to review, understand, and apply all professional parameters involved. The potential for conflicts can be reduced by the following:

- Negotiations with the pastoral staff, congregations, institutions, and the wider community must be involved in job description preparation and program planning.
- Provision of care for individuals and groups is documented and remains confidential.
- Issues such as privacy, confidentiality, group concerns, access, and record management must be discussed with the pastoral staff or the contracting agency at the outset of any program agreement.
- Discussions of health promotion activities must include the individual, the family, and the faith community leadership.

Professional Issues

A position description is a necessary tool for the development of the faith community nursing practice. The description should accurately reflect the qualifications, skills, accountabilities, and responsibilities of the position (Slutz and Wehling, 2013). Annual and periodic evaluations of faith community nurse practice, as well as assessments and evaluations of services needed, are certainly indicated. These evaluations should include self, peer, congregational, and/or institutional evaluations so that improvements can be made in practice if needed.

Professional appraisal, or a portfolio, is becoming a standard in nursing practice and therefore is needed within faith community nursing. The appraisals guide the nurse's professional development as well as program development. Because the scope of faith community nursing practice is broad and focuses on the independent practice, the nurse must consider a wide

variety of topics to be used in the appraisal, such as position description, professional liability, professional educational and experiential preparation, collaborative agreements, and the ability to work with lay volunteers as well as practicing and retired professionals (Cassimere and Slutz, 2013). Abiding by the professional nursing code is understood and must be reflected in the appraisal. The nurse must also be assessed in the application of skills related to the **polity**, expectations, and mission of the particular faith community.

It is important for the faith community nurse to serve in a collaborative relationship with the clergy to effectively implement programs (Catanzaro et al, 2006; Bokinskie and Kloster, 2008). The nurse must also be knowledgeable about lines of authority and channels of communication in the faith community as well as within collaborative institutions. Administrative personnel, such as clergy, or congregational committees provide guidance and contribute to the evaluation of faith community nurse programming. They also advocate for the nurse's services and raise awareness with the faith community's staff and membership.

Nurses advocate for the health and well-being of **parishioners**, and thus are in unique positions to highlight justice issues influencing local and national legislation. As the faith community reflects on the implications of legislation on their congregation and the larger denomination, the nurse contributes information to policy makers about the implications for health and well-being for the congregation, for the local community, and for the global community. Active participation in political activities contributes to health care policy changes and potential financial support for health promotion and health screening programs.

Faith community nurses face many of the same ethical issues as other nurses in different practice settings. The nurse must respect the parishioner's expectations for veracity and truth telling, advocacy, and privacy and confidentiality unless the client is in danger or laws mandate reporting of certain circumstances. However, the nurse must be keenly aware of the communal nature of the faith community—a setting where there is a commitment to pray for others, and a setting where joys and struggles are sometimes openly shared (Hickman, 2006).

Documentation Issues

An ongoing challenge for faith community nurses is documenting care provision and reporting trends and outcomes. Extracting meaningful data from traditional, handwritten notes is cumbersome and labor intensive, and paper records were not designed with the accountable care requirements of today's health care system (Mayernik, 2013). Technology offers an alternative option to paper records. With advances in electronic health records, both online and stand-alone databases are widely available, though often at considerable expense that prevents many smaller faith communities from using them. Several automated documentation systems allow faith community nurses and health ministers to document, analyze, and report individual interactions, group interactions, and perceived cost savings or avoidance of interventions. Automated documentation can be accessed from any Internet capable device, including

smartphones, tablets, and computers. Envision a faith community nurse visiting a parishioner at home with laptop in hand to document assessment, interventions, and plan of care or after worship service at the end of a pew looking up a medication or community resource via cell phone in answer to a health question. (See [Figure 45-5](#) on pew-side consultations.) As a nursing specialty practice, it is imperative that nurses document care to maintain and enhance quality of preparation and services offered, engage in evidence-based practice, network within professional organizations, and become involved in outcomes-oriented research.

According to the American Nurses Association scope and standards of practice for faith community nurses (2012), documentation should contribute to the quality of nursing practice, and be kept confidential and secure while also being easily retrievable for those with permission to access. One example of an automated documentation tool for faith-based care delivery is the Henry Ford Macomb Faith Community Nursing and Health Ministry Documentation and Reporting System. The system was initially developed in 2000 to address the sponsoring institution's (Henry Ford Macomb) goals: (1) provide network partners (congregations and FCNs) with an easy and efficient automated documentation system; (2) meet documentation standards for professional practice; (3) allow for aggregation of data; and (4) report outcomes of faith community and health ministry initiatives with anticipated demonstration of wise and appropriate stewardship of the institutions' resources ([Brown and Yore, 2013](#)). See [Box 45-3](#) for the benefits and challenges of automated documentation of faith community nurse practice.

Legal Issues

As consumers have become more knowledgeable about their rights and liabilities in health care, the number of legal cases naming nurses has increased. Although the provision of nursing care in the congregational setting carries lower risk for litigation than other settings, faith community nurses engage in autonomous practice and may be involved in a legal suit. Within the legal system, the courts find no difference in the actions of nurses working in a hospital versus an alternative setting because both must adhere to the same standards of practice ([Austin et al, 2004](#)). The faith community nurse must maintain an active nursing license, abide by the laws and regulations set forth by the state's nurse practice act, and adhere to the ANA's scope and standards for practice. Additional legal concerns are those of institutional contractual agreements, health records management, release of information, and volunteer liability. Resources to address legal issues of faith community practice include the faith community's legal consultant, the faith community's national position statements, and guidelines of any institutional partner, as well as resources from the HMA and IPNRC ([ANA/HMA, 2012](#); [Solari-Twadell and McDermott, 2006](#)). The faith community nurse is strongly encouraged to carry his/her own malpractice insurance.

As required by law, nurses advocate for individuals and groups. The nurse is also expected to identify and report cases of neglect, abuse, and illegal behaviors to the appropriate legal sources. The faith community nurse appropriately refers

BOX 45-3 Benefits and Challenges with Automated Documentation of Faith Community Nurse Practice

Benefits

- Easy access to parishioner information wherever Internet/Wi-Fi available
- Ease of collating and summarizing data into useable formats for tracking and reporting initiatives and outcomes
- Potential for greater accuracy with legibility and using standardized language
- Ease of benchmarking with other faith community nurses
- Less storage space than paper records
- Digital medical record storage helps prevent filing errors
- Link to care information across the continuum of care
- Built-in prompts to remind the nurse to ask a certain question or reminders to document necessary information
- Store information in one centralized place with potential for transferability from one location to another

Challenges

- High cost of many automated documentation systems
- Identifying the documentation system best for individual or group practice use
- Limitations in ability to customize an automated product
- Learning curve for transitioning from paper and pen to computer
- Automated documentation requires access to Internet where service may be limited
- Frequency of system upgrades—is the product kept current by vendor?
- Is technical support available when needed?
- Security of data may be questionable
- Planning for storage or transfer of data when the faith community nurse is no longer active

members to pastoral or community resources if the scope of the problem is not within the professional realm of the nurse. Referral is also indicated if conflict between nurse and parishioner is such that no further progress is possible. The faith community nurse who has a positive relationship that values open dialogue with the pastoral team will be supported in efforts to select the most appropriate community resource for clients.

Financial Issues

Expenses are associated with providing services and programs. The faith community nurse is accountable to the sponsoring institution and faith community for monies spent. Whether salaried or volunteer, the nurse must work from a defined budget and be creative in identifying sustainable financial support, particularly when congregational funds are limited ([Durbin et al, 2013](#)). Educational and promotional materials, equipment, travel expenses, postage, continuing education, and malpractice insurance are selected areas that need to be included in the budget. If the aforementioned items are not budgeted, services may be limited, and this needs to be conveyed to the leadership of the faith community. Money, time, and people are never sufficient to meet the needs of a faith community nurse program. It is up to the nurse to conduct a comprehensive resource assessment in advance of a project in order to have a

clear understanding of what is available given specific faith community resources (Solari-Twadell and McDermott, 2006).

Future Growth

Faith community nurses can develop comprehensive, population-focused practices. They may also implement programs at beginning levels of community-based practices to ensure comprehensive care for individuals and families. The continuing challenge for nurses, other health care providers, and the communities will be to garner government, foundation, and private funding and combine it with support from volunteer activities, family involvement, and community groups to create the unique mix needed for each community. Nurses are asked to partner with community members where they live, work, attend school, and gather for worship; to closely partner with these same members to advocate for those who are powerless; to identify health and health-related needs; to detect and address those needs to prevent costly use of the health care system; and to be closely aligned with those who can implement visionary policy that improves health care for community members across the life span.

Uncovering and understanding the intricacies of the work of faith community nurses is a difficult task because very little research on the outcomes of faith community nursing interventions has been conducted (Dandridge, 2014). The following **How To** box provides a general guide to program evaluation for faith community nurses. Comprehending the distinctiveness of the role of faith community nursing is important to the maturation of the specialty because it allows for a clear recognition of the work done (Solari-Twadell, 2006). Groundbreaking research was conducted in 2002 by Solari-Twadell using the Nursing Intervention Classification (NIC) system (McCloskey and Bulechek, 2000). With data from more than 1000 parish nurses, essential or core nursing interventions were named that help to differentiate the practice of parish nursing. This research confirmed that spiritual care is the hallmark of the faith community nurse's practice as the top interventions used daily and weekly include active listening, presence, spiritual support, emotional support, spiritual growth facilitation, humor, and hope instillation (Solari-Twadell, 2006).

NATIONAL HEALTH OBJECTIVES AND FAITH COMMUNITIES

Healthy People 2020 provides evidence-based national objectives for improving the health of all Americans. The *Healthy People 2020* indicators encourage communities to support individuals and families to make informed decisions, retain a high quality of life free of preventable diseases across the life span, reduce health disparities across groups, and create environments or access to settings that promote health. Faith communities offer an ideal setting for health promotion and have long held positions of esteem and influence in communities and where strong partnerships can be established with health care institutions and community agencies. For example, the Carter Center in Atlanta and the Park Ridge Center for Health, Faith and Ethics in Chicago collaborated with health care

HOW TO Evaluate Program Outcomes in Faith Communities

Faith community nurses plan and provide health-promotion and disease-prevention activities within faith communities. The nurses often must provide these services with limited resources of money, time, and equipment. The following model for program development and evaluation can help in the creation of high-quality and cost-effective programs:

- Step 1: *What problem or issue is the program designed to address? Be specific about the problem as it guides the search for evidence-based information.*
- Step 2: *Identify both short- and long-term goals. The goals help prioritize what needs to be documented, tracked, and reported.*
- Step 3: *Document the specific program outcomes. This may include numbers of attendees, participation rates, or desired changes in measurements.*
- Step 4: *Develop and implement the interventions for the program, as determined by best practices, to achieve the goals identified in Step 2.*
- Step 5: *Evaluate the short- and long-term goals and the specific program outcomes. Share the outcome results with individuals or in aggregate form to the faith community. Disseminate findings to other faith community nurses at local and national levels.*

Adapted from Timmons S: African American church health programs: what works? J Christ Nurs 1:100–106, 2010.

professionals and leaders of faith traditions to identify the key roles faith communities have in addressing national health objectives and approaches to improving overall public health.

On a national level, multiple partnerships have been established between faith communities and federal agencies as well as high profile not-for-profit organizations. The U.S. Department of Health and Human Services established a Center for Faith-based and Neighborhood Partnerships, recognizing that faith communities are an ideal setting for education and health promotion initiatives (CDC, 2014). A well-known organization, the National Heart, Lung and Blood Institute created a faith-based toolkit to promote heart health for women (see Box 45-4). Notably, the American Heart Association (2014) created the *EmPowered to Serve* program designed to bring organizations together in partnership to make a positive impact around health in the faith-based community with special focus on increased physical activity, increased consumption of fruits and vegetables, reduction or limitation of sodium and sugar sweetened beverages, and improving the health of the entire family leading to improved health of the overall community.

Recognizing that older adults are one of the fastest growing age groups in the community, including baby boomers (adults born between 1946 and 1964), a new goal was added to *Healthy People 2020*—*improve the health, function, and quality of life of older adults*. It is estimated that more than 37 million people in this older adult group (60%) will manage more than one chronic condition by 2030 (Robert Wood Johnson, 2010). Thus, older adults are at high risk for developing chronic illnesses and related disabilities such as diabetes mellitus, arthritis, congestive heart failure, and dementia. Infectious disease combined with chronic conditions is the leading cause of death among older

BOX 45-4 Example of Online Faith-Based Resources**National Heart, Lung and Blood Institute Faith-Based Toolkit**

This faith-based activities toolkit contains ideas and resources you can use to conduct activities to promote *The Heart Truth*® for women in your faith community. Campaign background information, faith-based resources, and other promotional and educational materials, as well as the activity ideas contained in this kit can help you formulate a plan for your own faith-based program.

Activity Ideas

Consider these ideas for planning an event to promote the heart health of women in your faith community.

- Organize a “Red Dress Sunday” or “Red Dress Sabbath” event for your place of worship. You can put a notice in the bulletin, hold an educational session, and distribute brochures and fact sheets. Also see the Ten Commandments for a Healthy Heart and Talking Points for Red Dress Sunday/Sabbath.
- Ask the female leader of your place of worship to become an ambassador for heart disease awareness for women in your congregation.
- Ask your ministry leader to deliver *The Heart Truth* messaging from the pulpit. Consider using Talking Points for Red Dress Sunday/Sabbath.
- Organize a session using *The Heart Truth for Women: A Speaker’s Kit*, during a women’s ministry or health ministry meeting.
- Organize a health-themed Bible study.
- Form partnerships with retail/clothing outlets to stage a Red Dress fashion show that donates a percentage of the profit for every red dress sold to a nonprofit heart disease organization. (Sample partner outreach letter available online.)
- Incorporate a Red Dress theme for your women’s ministry brunch or Mother’s Day event.
- Organize a heart health screening event and health fair for women at your place of worship.
- Distribute Red Dress pins.
- Place a link to *The Heart Truth* Web pages (www.hearttruth.gov) on your place of worship’s website.
- Include an article on heart disease and *The Heart Truth* in the church’s newsletter/magazine.
- Consider including Ten Commandments for a Healthy Heart.
- Organize a heart healthy meal for your community.

From National Heart, Lung and Blood Institute: *Faith-based Toolkit*, 2014. Available at <http://www.nhlbi.nih.gov/educational/hearttruth/materials/faith-based-toolkit.htm>. Accessed March 23, 2014.

adults (CDC, 2012). Often, acute exacerbations from one or more illnesses require hospitalizations, frequent access to health care services, and nursing home admissions. Ultimately, the older adult may lose the ability to live independently at home. Congregations with large numbers of older adults present special needs for the faith community nurse to address in order to improve the health and well-being of this vulnerable population (see *Healthy People 2020* box).

National health objectives from *Healthy People 2020* provide a framework for health education opportunities within a faith community. These objectives, coupled with a congregational health assessment, help to identify the specific health needs of a faith community. Additional considerations to determine health priorities include sociodemographic data of the

**HEALTHY PEOPLE 2020****Objectives Related to Older Adult Health in Faith Communities****Prevention**

- OA-1 Increase the proportion of older adults who use the Welcome to Medicare benefit
- OA-2 Increase the proportion of older adults who are up to date on a core set of clinical preventive services
- OA-3 (Developmental) Increase the proportion of older adults with one or more chronic health conditions who report confidence in managing their conditions
- OA-5 Reduce the proportion of older adults who have moderate to severe functional limitations
- OA-6 Increase the proportion of older adults with reduced physical or cognitive function who engage in light, moderate, or vigorous leisure-time physical activities

Long-Term Services and Supports

- OA-8 Reduce the proportion of non-institutionalized older adults with disabilities who have an unmet need for long-term services and supports
- OA-11 Reduce the rate of emergency department (ED) visits due to falls among older adults

From U.S. Department of Health and Human Services: *Healthy People 2020: Older Adult Objectives*. Washington, DC, 2013, USDHHS.

membership combined with the mission, vision, polity, and strategic plan for the faith community. Often there is a wellness committee or health cabinet established in the congregation with the faith community nurse as one member. Together the team can regularly review health status objectives, make comparisons with national and specific state objectives, and prioritize initiatives to promote health, reduce risk, and prevent illness. Some examples are as follows:

- Offer regular blood pressure screening and monitoring activities focused on heart disease and stroke prevention.
- Lead age-appropriate discussion of illness prevention activities (e.g., immunizations; breast and prostate self-exam; smoking cessation; accident-free living spaces).
- Teach signs and symptoms of heart attack and stroke through newsletters, flyers placed in bathroom areas for a captive audience, and bulletin board displays in prominent well-traveled hallways.
- Coordinate healthy low-fat meals at congregation functions.
- Encourage individuals to choose healthy fruit and vegetables as snacks.
- Coordinate a series of classes for families of adolescents on stress management and sessions on the use and misuse of alcohol, tobacco, and other drugs.
- Encourage or lead a faith-based exercise program for individuals as a part of ongoing faith community activity.

Faith Community Nursing Certification

Certification for faith community nursing was launched in 2014 by the American Nurses Credentialing Center Certification

Program (ANCC). Certification can be used for entry into practice, validation of competence, recognition of excellence, and/or for regulation (ANCC, 2014). It can be mandatory or voluntary based on the employer and the nurse's interest in obtaining certification. ANCC developed the certification through *portfolio assessment* as an alternative method for certifying individual registered nurses in specialties where the number of potential certificants is too limited to support a psychometrically sound and legally defensible certification examination (ANCC, 2014). Certification validates an individual's knowledge and skills in a defined role and clinical area of practice, based on standards developed by a Content Expert Panel (CEP) in the specialty. In 2013, ANCC recruited a panel of ten nurses with expertise in faith community nursing to develop the requirements for certification and also serve as appraisers.

Nurses seeking faith community nurse certification must meet eligibility criteria to apply: (1) a current, active RN license; (2) 1000 practice hours in the specialty area of faith community nursing over past 3 years; (3) 30 hours of continuing education over the past 3 years; and (4) fulfill two additional professional development categories to be selected from academic credits, publication or research, preceptor, presentations or professional service. The online certification application includes both narrative components and portfolio. The online portfolio requires (1) an application; (2) a resume with focus on specialty; (3) professional development record; (4) an exemplar—a narrative addressing specific criteria; and (5) performance evaluation with one self-evaluation and one supervisor or peer evaluation.

Once the nurse successfully passes the portfolio assessment, the ANCC certification credential is awarded and he/she may use RN/BC registered nurse-board certified, faith community nurse: for example, *Jane Doe, BSN, RN-BC Faith Community Nurse* (ANCC, 2014). This certification recognizes that faith community nursing is a nursing specialty and not an advanced

practice of nursing. International applicants must follow the same requirements for initial certification and renewal. Faith community nurses may also receive specialty certification in related areas such as community or public health nursing and holistic nursing or credentialed preparation from a specific denomination. Information for nurse certification is available at nursecredentialing.org.

CONCLUSION

In a span of 30 years, parish/faith community nursing went from pilot project to recognized nursing specialty practice complete with scope and standards. The role of the faith community nurse was clearly defined incorporating holistic health promotion and care of body, mind, and spirit to individuals and groups out of a congregational setting. A standardized curriculum for foundational and advanced preparation of faith community nurses was made widely available to help assure minimum knowledge and skills for practice. In addition, the ANCC now offers certification to further recognize this nursing specialty practice. Screening, monitoring, wellness education, and referrals to appropriate services are combined with a spiritual component of care to promote health and healing and fulfill the church's historic role in health and healing. Ongoing research has documented favorable outcomes associated with intentional holistic health promotion to individuals, groups, and faith communities. Successful faith community nurse networks, whether institutional or congregation-based models, continue to be established in the United States and around the world as evidenced by publications, reports, and presentations at the annual Westberg Symposium. Careful examination of faith community nursing provides the opportunity for leaders in nursing and health policy to identify successful strategies that could improve the health and well-being of a community.

LINKING CONTENT TO PRACTICE

This chapter described individual, group, and population health out of the faith community setting. In Christian traditions, the scriptural story of the Good Shepherd who cares for the whole flock, including the lost or vulnerable until they once again become a part of the flock, is an effective parallel to population focus. The faith community nurse follows this example of care and healing to assess the needs of parishioners and then act as a catalyst to address health indicators of the faith community. The larger faith community is instrumental in providing the structure, place, and resources, and may intentionally seek out the vulnerable and marginalized to receive support in healthy environments and become part of the efforts to promote healthy behaviors.

Faith communities often partner with other community or denominational organizations closely aligned with their mission and outreach activities for a common purpose. The organizations may include a health care institution, a childcare or adult daycare center, an immigrant community, a homeless shelter, a crisis center, a preschool, or local public schools. Depending on desired outcomes, the faith community nurse combines knowledge, skills, and experience in collaboration with others to make a difference for a larger population.

To illustrate, a faith community partners with a hospital, the local agency on aging, and a retirement community to promote older adult health. Key

stakeholders gather for discussions on priorities identified from a community needs assessment completed by the hospital. The stakeholders also review suggested prevention and services objectives for older adult health from *Healthy People 2020*. The group considers baseline data and identifies desired outcomes. From discussions, activities and programs are planned drawing from the collective human and financial resources. In this example, the faith community nurse works with hospital staff to coordinate screenings and health promotion programs held in the congregation setting and at various locations using a mobile health vehicle. Successful disease management programs for diabetes and congestive heart failure were extended beyond the walls of the hospital into the community to reach a larger population. Participating older adults requested additional services such as medication reviews and educational health talks on topics of depression, advance directives, and Medicare enrollment benefits. All services were evaluated for content and quality, as well as to track, trend, and report outcomes. As with most collaborative initiatives, more was accomplished through partnership with the congregation, and the faith community nurse was instrumental in bringing the partners together.

QSEN FOCUS ON QUALITY AND SAFETY EDUCATION FOR NURSES**The Nurse in the Faith Community****Targeted Competency: Quality Improvement**

Use data to monitor the outcomes of care processes and use improvement methods to design and test changes to continuously improve the quality and safety of health care systems.

Important aspects of safety include:

- **Knowledge:** Describe approaches for changing processes of care.
- **Skills:** Design a small test of change in daily work (using an experiential learning method such as Plan-Do-Study-Act).
- **Attitudes:** Value measurement and its role in good patient care.

Quality Improvement Question

You are a parish nurse at a busy, urban church. An alarmingly high percentage of your congregation over the age of 65 are diagnosed with type 2 diabetes. The national average of type 2 diabetes in this population is 26%. In your congregation, 30% of your parishioners over the age of 65 have been diagnosed with type 2 diabetes.

You have developed an online educational module for this population about the importance of glycemic control. You've also collaborated with a dietician to offer cooking classes every Sunday afternoon in the church's kitchen. You want to evaluate the effectiveness of these interventions.

Employ the Program Outcomes in Faith Communities content in the How To box to evaluate your diabetes program:

Step 1: What is the problem or issue that your diabetes program is designed to address?

Step 2: Identify both short-term and long-term goals for your diabetes program.

Step 3: How would you document the specific program outcomes?

Step 4: Are there best practices that might inform your educational module or your collaborative cooking class with the dietician?

Step 5: How would you evaluate the short-term and long-term goals of your program?

Prepared by Gail Armstrong, PhD(c), DNP, ACNS-BC, CNE, Associate Professor, University of Colorado Denver College of Nursing.

EVIDENCE-BASED PRACTICE

In this descriptive research project certified diabetic educators (CDEs) partnered with faith community nurses (FCNs) to mobilize communities to help prevent, identify, and manage diabetes in places where people live, work, and worship. Using an evidence-based Chronic Care Model to enhance positive health lifestyle practices over a 4-week program, CDEs and FCNs used a pre- and post-test evaluation (i.e., biologic measures of body mass index (BMI) and blood pressure with a questionnaire) to identify diabetes self-care activities following interventions of screening, education, and disease management. A convenience sample of 149 participants, primarily white married women over age 65 from low income urban areas, completed *Healthy Living* classes held at 16 different churches in 2008 and 2009. Significant was 38% of the sample had a diabetes diagnosis with most participants overweight (mean BMI 32.5) and prehypertensive (mean BP 136/79). Findings suggest that participants had increased awareness about diet, exercise, and motivation to adopt healthy behaviors based on post-test responses. In this demonstration project, faith community nurses extended the diabetes education, prevention, and management previously limited to two CDEs from a regional health system. Thus, a larger population was reached to promote

health through the use of churches as community setting. Additionally, partnering with congregations having faith community nurses is an invaluable and cost-effective strategy for screening and disease management.

Nurse Use

Faith community nurses are encouraged to partner with other care providers to offer screening and education for chronically ill persons in the community, particularly those with limited access to care and follow-up services. This community outreach project to low income communities in urban New York fostered a positive, trusting client-provider relationship that formed the basis of the clients' motivation to make positive lifestyle changes for better health. Assisting vulnerable individuals to decrease health risks and better manage chronic disease helps to empower people to care for themselves. As faith community nurses reach out to their surrounding community, creative strategies and collaboration with other care providers positively influence health attitudes and behaviors with resultant cost-effective and quality outcomes.

From Austin SA, Brennan-Jordan N, Frenn D, et al: Defy diabetes: a unique partnership with faith community/parish nurses to impact diabetes. *J Christ Nurs* 30:238-243, 2013.

PRACTICE APPLICATION

The nursing process is a method that can be used for program planning and evaluation in the faith community setting. Such an approach involves congregants and faith community nurses in a dynamic endeavor to jointly learn about the members' individual health status, as well as that of the faith community, local community, and broader geographic community. Faith community nurse programs are derived in various ways. Initially, the impetus for faith community nursing may stem from an unmet health need, from visions of lay or health professions' members concerned about caring for vulnerable groups within the congregation, or from the discussions of a committee dealing with health and wellness issues.

Which of the following activities is most likely to increase the interest and involvement of the faith community's members?

- Writing a contract for the services of the faith community nurse
- Exploring the faith community's environment
- Gathering information on leaders and valued activities in the congregation through focus groups of pastoral staff
- Assessing the needs of the congregational members through a survey
- Holding a health fair

Answers can be found on the Evolve site.

KEY POINTS

- Faith community nurse services respond to health, healing, and wholeness within the context of the faith community. Although the emphasis is on health promotion and disease prevention throughout the life span, the spiritual dimension of nursing is central to the practice. The focus of the practice is on the “intentional care of the spirit.”
- Spiritual care is different from religious care and is an expected component of nursing care in the faith community setting. Note that spiritual assessment and care can also be provided outside of a congregational setting.
- Faith community nursing evolved from the historical roots of healing traditions in faith communities; early public health nursing efforts with individuals, families, and populations in the community; and more recently the professional practice of nursing.
- The faith community nurse partners with the wellness committee and volunteers to plan programs that address health-related concerns within faith communities.
- The usual functions of the faith community nurse include health counseling and teaching for individuals and groups, facilitating linkages and referrals to congregation and community resources, advocating and encouraging support resources, and providing spiritual care.
- Faith community nurses collaborate to plan, implement, and evaluate health promotion activities considering the faith community's beliefs, rituals, and polity. *Healthy People 2020* objectives and health indicators offer effective frameworks for health ministry efforts of wellness committees and basic to partnering for programs.
- Nurses in congregational or institutional models enhance health ministry programs of faith communities when carefully chosen partnerships are formed within the congregation, with other faith communities, and with local health and social community organizations.
- Nurses working as faith community nurses must obtain foundational and ongoing educational and skill preparation to be accountable to those served.
- Faith community nurses document care interventions offered to individuals and groups, in addition to tracking and reporting program statistics and outcomes to validate and sustain the professional practice.
- Nurses are encouraged to consider innovative approaches to creating caring communities. These may be in individual faith communities; among several faith communities in a single locale, regionally or internationally; or in partnership with other organizations and institutions.
- To sustain oneself as a faith community nurse who provides spiritual care to support individuals, families, and communities in the healing and wholeness process, the nurse must be diligent to take time for self-care and renewal.

CLINICAL DECISION-MAKING ACTIVITIES

1. Contact the local organization of faith communities (such as the Council of Churches or health system) to see if there is faith community nursing in your area. If so, make contact and arrange to spend a day with a nurse.
 - A. Interview the nurse about the faith community nurse role functions. Contrast the nurse's answers to what you learned in this chapter.
 - B. Ask how the faith community nurse standards of practice are integrated into the practice. How can you verify the answer?
 - C. If possible, spend time in a variety of faith communities. Compare and contrast urban and rural settings, different faith traditions, and nontraditional settings.
2. Discuss with classmates the similarities and differences between home health care nursing, school nursing, public health nursing, and faith community nursing. Compare your answers.
3. Choose a *Healthy People 2020* indicator to implement in a faith community setting. Discuss plans for implementing the objective and evaluating the outcomes with the faith community nurse and wellness committee. What data did you use to develop a plan for implementation? How did you choose your population? How did you evaluate the outcomes of your goals and activities?
4. Interview a clergy member of a local church, temple, or mosque in your area (preferably with someone with a different background than your own). Ask the individual to elaborate on traditions of faith, health, and healing connections. Consider how you might be able to meet the unique needs of that faith community.
5. Visit a senior citizen daycare center and speak with participants about important events in their lives. Do they refer to rituals from faith traditions? Ask them about their connections to faith communities during their lives.
6. With classmates, interview a youth group leader and nurse in a local faith community about the concern of preventing risky behaviors among youths. What perspectives of this concern would the faith community staff need to consider?

Public Health Nursing at Local, State, and National Levels

Lois A. Davis, RN, MSN, MA

Lois A. Davis began her public health career in 1977 in Eastern Kentucky with the Breathitt County Health Department, where she worked with the Appalachian population in a variety of public health preventive programs. She expanded her role in public health as a school nurse and initiated a program to reduce teen pregnancy in the Breathitt County Schools. She worked in community mental health and understands the importance of community partnerships. Lois spent three years in South America and afterwards fulfilled a desire to assist migrant health populations and the underserved. She is currently the public health nursing manager at the Lexington–Fayette County Health Department in Lexington, Kentucky, where she serves as the Maternal–Child Health Coordinator, and directs several community services programs, including HANDS, school health, and health equity and education. She has functioned as incident commander for preparedness exercises and operations lead for real events, such as special needs shelters during ice storms. At the state level, Lois serves on the Nurse Executive Council, where she helps define public health protocols and public health nursing competencies for local health department nurses. Lois has served on the board of the Bluegrass Community Health Center, a HRSA Federally Qualified Health Center, for ten years. Additionally, she has served as an adjunct faculty member and on advisory boards for the University of Kentucky College of Nursing, Eastern Kentucky University, and Midway College. She has precepted numerous nursing students and is passionate about preventive health.

OBJECTIVES

After reading this chapter, the student should be able to do the following:

1. Define public health, public health system, public health nursing, and local, state, and national roles.
2. Identify trends in public health nursing.
3. Provide examples of public health nursing roles.
4. Differentiate the emerging public health issues that specifically affect public health nursing.
5. Describe the principles of partnerships.
6. Identify educational preparation of public health nurses and competencies necessary to practice.

CHAPTER OUTLINE

Roles of Local, State, and Federal Public Health Agencies
 History and Trends in Public Health
 Scope, Standards, and Roles of Public Health Nursing
 Issues and Trends in Public Health Nursing
 Models of Public Health Nursing Practice

Education and Knowledge Requirements for Public Health Nurses
 National Health Objectives
 Functions of Public Health Nurses

All of public health is built on **partnerships**. **Public health programs** are designed with the goal of improving a population's health status. They go beyond the administration of health care of individuals to a primary focus on the health of populations. Public health programs include community health assessment and interventions based on assessment results, analysis of health statistics, public education, outreach, case management, advocacy, professional education for providers, disease surveillance and investigation, emergency preparedness and response, compliance to regulations for some institutions/agencies and school systems, and follow-up of populations. Examples of follow-up care include communicating with persons with active, untreated tuberculosis, pregnant women who have not kept prenatal visits, and parents of under-immunized children. Public health programs are frequently implemented by the development of partnerships or coalitions with other providers, agencies, and groups in the location being served. Community-Campus Partnerships for Health (CCPH) defines partnerships as "a close mutual cooperation between parties having common interests, responsibilities, privileges and power" (CCPH Board of Directors, 2013). Partnerships are built on trust, mutual respect, and the sharing of power.

Box 46-1 presents principles of partnership within a public health system. Public health nurses are skilled at developing, sustaining, and evaluating community-wide partnerships. Public health nurses are involved in these activities in various ways depending on the public health agency (local, state, or federal) and the identified needs. Public health nurses may be the partnership facilitator or a member of the partnership representing their agency.

Public health is not a branch of medicine; it is an organized community approach designed to prevent disease, promote health, and protect populations. It works across many disciplines and is based on the scientific core of epidemiology (IOM, 1988, 2003). Governmental agencies at the local, state, and federal levels are partners in the public health system that must work together to develop and implement solutions that will improve a community's health. Figure 46-1 represents the diverse and complex network of individuals and agencies making up the public health system (CDC, 2005). This public health system may include public, private and voluntary entities such as the local health department, businesses, and civic associations. Public health nurses partner with interprofessional teams of people within the public health areas (Figure 46-2), in other human services and public safety agencies, and in community-based organizations. The health of communities is

BOX 46-1 Principles of Partnership

Community-Campus Partnerships for Health (CCPH) involved its members and partners in developing the following "principles of good practice" for community partnerships:

1. The Partnership forms to serve a specific purpose and may take on new goals over time.
2. The Partnership agrees upon mission, values, goals, measurable outcomes and processes for accountability.
3. The relationship between partners in the Partnership is characterized by mutual trust, respect, genuineness, and commitment.
4. The Partnership builds upon identified strengths and assets, but also works to address needs and increase capacity of all partners.
5. The Partnership balances power among partners and enables resources among partners to be shared.
6. Partners make clear and open communication an ongoing priority in the Partnership by striving to understand each other's needs and self-interests, and developing a common language.
7. Principles and processes for the Partnership are established with the input and agreement of all partners, especially for decision making and conflict resolution.
8. There is feedback among all stakeholders in the Partnership, with the goal of continuously improving the Partnership and its outcomes.
9. Partners share the benefits of the Partnership's accomplishments.
10. Partnerships can dissolve, and when they do, need to plan a process for closure.
11. Partnerships consider the nature of the environment within which they exist as a principle of their design, evaluation, and sustainability.
12. The Partnership values multiple kinds of knowledge and life experiences.

From Community-Campus Partnerships for Health (CCPH) Board of Directors: Position Statement of Authentic Partnerships. *Community-Campus Partnerships for Health*, 2013. Available at <https://ccph.memberclicks.net/principles-of-partnership>. Accessed May 13, 2015.

a shared responsibility that requires a variety of diverse and often nontraditional partnerships. A critical partnership that shapes **public health nursing** practice in the United States is the interaction of local, state, and federal public health agencies.

ROLES OF LOCAL, STATE, AND FEDERAL PUBLIC HEALTH AGENCIES

In the United States, the local-state-federal partnership includes federal agencies, the state, tribal and territorial public health

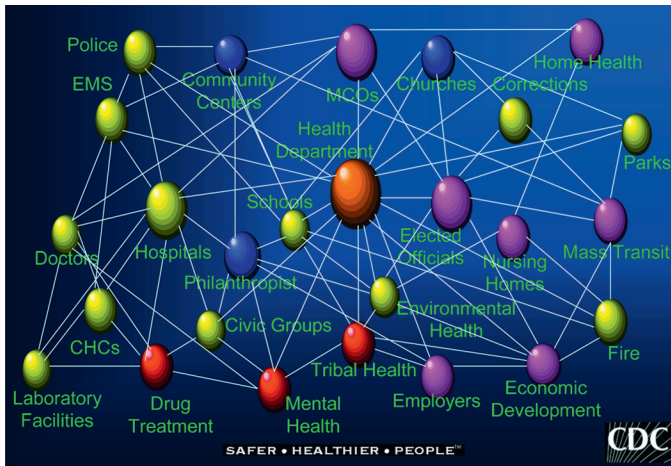

FIG 46-1 Centers for Disease Control and Prevention (CDC): *The National Public Health Performance Standards, An Overview, slide 9, 2005.* Available at <http://www.cdc.gov/od/ocph/nphpsp/Presentationlinks.htm>.

agencies, and the 2500 local public health agencies (ASTHO). The interaction of these agencies is critical to effectively leverage precious resources, both financial and personnel, and to protect and promote the health of populations. Public health nurses employed in all of these agencies work together to identify, develop, and implement interventions that will improve and maintain the nation's health.

Federal public health agencies develop regulations that implement policies formulated by Congress, provide a significant amount of funding to state and territorial health agencies for public health activities, survey the nation's health status and health needs, set practices and standards, provide expertise that

facilitates evidence-based practice, coordinate public health activities that cross state lines, and support health services research (IOM, 2003). The U.S. Department of Health and Human Services (USDHHS) and the Environmental Protection Agency (EPA) are the federal agencies that most influence public health activities at the state and local levels (see Chapter 3). The USDHHS includes the Centers for Disease Control and Prevention (CDC), the Health Resources and Services Administration (HRSA), the Agency for Healthcare Research and Quality (AHRQ), and the Food and Drug Administration (FDA). The USDHHS is the agency that facilitates development of the nation's *Healthy People* objectives (USDHHS, 2010).

In the United States, states hold primary responsibility for protecting the public's health. Each of the states and territories has a single identified official **state public health agency** that is managed by a state health commissioner. The structure of state public health agencies varies. Some states require that the state health commissioner be a physician. A growing number of states do not limit the position to physicians but rather require specific public health experience. California, Maryland, Iowa, Oregon, Washington, and Michigan are examples of states that focus on public health experience as a requirement for the state health commissioner position. Public health nurses have been appointed to the state health commissioner positions in a number of states: California, Oregon, Washington, and Michigan. The Association of State and Territorial Health Officials defines the state public health agency as the organizational unit of the state health officer, who works in partnership with other government agencies, private enterprises, and voluntary organizations to ensure that services essential to the public's health are provided for all populations. State public health agencies are responsible for monitoring health status and enforcing laws and regulations that protect and improve the public's health. In addition to state funds appropriated by state legislatures, these agencies receive funding from federal agencies for the implementation of public health interventions, such as communicable disease programs, maternal and child health programs, chronic disease prevention programs, and injury prevention programs. The agencies distribute federal and state funds to the local public health agencies to implement programs at the community level, and they provide oversight and consultation for local public health agencies. State health agencies also delegate some public health powers, such as the power to quarantine, to local health officers.

Local public health agencies have responsibilities that vary depending on the locality, but they are the agencies that are responsible for implementing and enforcing local, state, and federal public health codes and ordinances and providing essential public health programs to a community. The goal of the local public health department is to safeguard the public's health and to improve the community's health status. The health department's authority is delegated by the state for specific functions. The duties of local health departments vary depending on the state and local public health codes and ordinances and the responsibilities assigned by the state and local governments. Usually, the local public health department provides for the administration, regulatory oversight, public health,

and environmental services for a geographic area. The National Association of County and City Health Officials' (NACCHO) operational definition of a local health department provides a description of the basic public health protections people in any community, regardless of size, can expect from their local health department. The description of local health departments includes the systems, competencies, frameworks, relationships, and resources that enable public health agencies to perform their core functions and essential services. Infrastructure categories encompass human, organizational, informational, legal, policy, and fiscal resources (NACCHO, 2014). A sample of these standards can be found in Box 46-2. As with state health departments, some states require that local health directors be physicians, whereas other states focus on public health experience. For example, public health nurses in Maryland, Kentucky, Illinois, Washington, Wisconsin, and California have held local health director positions.

BOX 46-2 Local Public Health Agency Functions

The following are selected standards by selected essential public health service performed by local public health agencies:

Essential Public Health Service 1: Monitor Health Status to Identify Community Health Problems

- Obtain data that provide information on the community's health.
- Develop relationships with local providers and others in the community who have information on reportable diseases and other conditions of public health interest and facilitate information exchange.
- Conduct or contribute expertise to periodic community health assessments in order to develop a comprehensive picture of the public's health.
- Integrate data with other health assessment and data collection efforts conducted by the public health system.
- Analyze data to identify trends and population health risks.

Essential Public Health Service 4: Mobilize Community Partnerships to Identify and Solve Health Problems

- Engage the local public health system in an ongoing, strategic, community-driven, comprehensive planning process to identify, prioritize, and solve public health problems; establish public health goals; and evaluate success in meeting the goals.
- Promote the community's understanding of, and advocacy for, policies and activities that will improve the public's health.
- Develop partnerships to generate interest in and support for improved community health status, including new and emerging public health issues.

Essential Public Health Service 7: Link People to Needed Personal Health Services and Ensure the Provision of Health Care When Otherwise Unavailable

- Engage the community to identify gaps in culturally competent, appropriate, and equitable personal health services, including preventive and health promotion services, and develop strategies to close the gaps.
- Support and implement strategies to increase access to care and establish systems of personal health services, including preventive and health promotion services, in partnership with the community.
- Link individuals to available, accessible personal health care providers.

From National Association of County and City Health Officials: *Operational Definition of a Functional Local Health Department*, 2014. Available at <http://www.naccho.org>. Accessed August 23, 2014.

The majority of local, state, and federal public health agencies will be involved in the following:

- Collecting and analyzing vital statistics (Chapter 12)
- Providing health education and information to the population served (Chapter 16)
- Receiving reports about and investigating and controlling communicable diseases (Chapter 13)
- Planning for and responding to natural and man-made disasters and emergencies (Chapter 23)
- Protecting the environment to reduce the risk to health (Chapter 10)
- Providing some health services to particular populations at risk or with limited access to care (local public health agencies, guided by state and federal policies and goals and community needs) (Chapters 27-38).
- Conducting community assessments to identify community assets and gaps (Chapter 18)
- Identifying public health problems for at-risk and high-risk populations (Chapter 18)
- Partnering with other organizations to develop and implement responses to identified public health concerns (Chapters 17, 18, 20, and 25)

Public health nurses practice in partnership with each other at the local, state, and federal levels and with other public health staff, other governmental agencies, and the community to safeguard the public's health and to improve the community's health status. Public health agency staffs include physicians, nutritionists, environmental health professionals, health educators, various laboratory workers, epidemiologists, health planners, and paraprofessional home visitors and outreach workers. Community-based organizations include the American Red Cross, free clinics, Head Start programs, daycare centers, community health centers, hospitals, senior centers, advocacy groups, churches, academic institutions, and businesses. Other governmental agencies include the fire/emergency services department, law enforcement agencies, schools, parks and recreation departments, and elected officials. Changes in local, state, and federal governments affect public health services, and public health nursing has to develop strategies for dealing with these changes. Public health nurses facilitate community assessments to identify emerging public health concerns within communities and, based on results of community assessments, help develop programs to provide needed services.

HISTORY AND TRENDS IN PUBLIC HEALTH

A person born today can expect to live 30 years longer than a person born in 1900. Medical care accounts for 5 years of that increase. Public health practice, resulting in changes in social policies, community actions, and individual and group behavior, is responsible for the additional 25 years of that increase (USDHHS, 2010). Historically, public health nurses were valued by and important to society and functioned in an autonomous setting. They worked with populations and in settings that were not of interest to other health care disciplines or groups. Much public health service was delivered to the poor and to women and children, who did not have political power or voice. During

the course of the twentieth century, public health responsibilities expanded beyond communicable disease prevention, occupational health, and environmental health programs to include reproductive health, chronic disease prevention, and injury prevention activities. As a result of Medicaid-managed care, many public health agencies were no longer providing personal health care services. Public health agencies began to shift emphasis from a focus on primary health care services to a focus on core public health activities such as the investigation and control of diseases and injuries, community health assessment, community health planning, and involvement in environmental health activities. As the twentieth century came to a close, developments in genetic engineering, the emergence of new communicable diseases, prevention of bioterrorism and violence, and the management and disposal of hazardous waste were emerging as additional public health issues (CDC, 1999). The *Institute of Medicine (IOM, 2003)* identified the following seven priorities for public health in the twenty-first century:

- Understand and emphasize the broad determinants of health.
- Develop a policy focus on population health.
- Strengthen the public health infrastructure.
- Build partnerships.
- Develop systems of accountability.
- Emphasize evidence-based practice.
- Enhance communication.

Public health activities at the beginning of the twenty-first century were shaped by the September 11, 2001, terrorist attacks of the World Trade Center, the Pentagon, and a field in Pennsylvania, in which thousands were murdered. However, public health nursing activities at the federal, state, and local levels were even more dramatically affected by a series of anthrax exposures that occurred shortly after the terrorist attacks. In addition to anthrax exposures in Florida and New York, one month after the attacks of September 11, thousands of workers at the Brentwood Post Office and the Senate Building in Washington, DC, were exposed to an especially virulent strain of anthrax from a contaminated letter. These exposures required public health nurses to rapidly establish mass medication distribution clinics, while also responding to frightened calls from community members and requests for information from the media. The anthrax exposures alerted policy makers to the weakening public health infrastructure required to respond to bioterrorism events. As society grapples with the upheaval created by the reality of a bioterrorism event, public health nurses learn to leverage existing authority and expertise to ensure that all critical issues threatening the public's health are addressed. The shift of funding to support bioterrorism response efforts has the potential of weakening existing important public health programs. Nurses are well positioned to actively participate in policy decisions that will ensure that a public health infrastructure able to prevent and respond to bioterrorism will be strengthened and maintained within the context of general communicable disease surveillance and response. Public health nurses are facing issues such as unprecedented influenza, tetanus, and childhood vaccine shortages and emerging infections, such as SARS and the influenza A virus (H1N1)

pandemic, that compete with bioterrorism activities for resources. One of these issues presented itself in the fall of 2009 and spring of 2010 when the world grappled with the lack of enough vaccine to prevent the virus from spreading across the world. (See later discussion.)

During the twentieth century, public health nurses were a major force in the nation, achieving immunization rates that accounted for the dramatic decrease in measles. A policy brief issued by *All Kids Count (2000, p. 1)* stated, "in 1941, more than 894,000 cases of measles were reported in the U.S. In 2013, preliminary data indicated that just 159 cases were reported—a reduction of 99.9%." However, the general public is not well informed about how this immunization activity was accomplished or about its effect on improving health and lowering health care costs (CDC, 2013). Public health nurses' difficulty in explaining the value of ongoing prevention activities can result in a decrease in resources required to ensure adequate surveillance and containment of communicable disease outbreaks. For public health services to receive adequate funding, it is necessary for the public and the government to be aware of the benefits provided to a community by public health nurses. Public health nurses must be at the table, as advocates and experts, when issues are being discussed and decisions are being made to make certain that public health programs are provided for the populations at risk. For example, as the incidence of active tuberculosis (TB) cases decreases, officials will consider shifting funds for TB control to other efforts. Public health nurses at the national, state, and local levels work together to educate officials about the importance of continuing funding for surveillance and containment efforts if the lower TB incidence rates are to be maintained. A recent public health concern is the unaccompanied immigrant children crossing the Mexican borders with no medical records. Efforts are being made to provide TB tests and to start immunizations at clinics near the border before the children migrate to other states and enter school. Public health nurses working in schools are challenged with surveillance of the immigrant students to assure the health and safety of the indigenous students and the population of the community.

The twenty-first century public health nurse is working to develop a public health system able to monitor and detect suspicious trends and respond rapidly to prevent widespread exposure, whether the result of a deliberate or a natural epidemic. A prime example of emerging infectious diseases is severe acute respiratory syndrome (SARS), caused by a virus that brought illness and death to many in 2003. The disease spread quickly from China to other countries, being transported by airline passengers traveling internationally. The novel H1N1 influenza A virus pandemic provides another example of a natural epidemic that required a rapid, intensive, long-term response from public health nurses at the federal, state, and local levels. In 2009, the world was alerted to a new rapidly spreading influenza A virus (H1N1) when Mexico declared a state of emergency and closed schools and congregations in public settings in response to outbreaks of respiratory illness and increased reports of clients with influenza-like illness in several areas of the country (CDC, 2009). The first U.S. human cases of H1N1 were

identified in April 2009 in California and Texas. On October 24, 2009, President Barack Obama declared H1N1 a national emergency in the United States. Public health nurses throughout the country shifted their activities to support the response to H1N1. Public health nurses who usually worked in areas such as family health services or school health services rapidly had to shift their focus to the H1N1 response. Family health service clinics and home-visiting services were either cancelled or scaled back to free up public health nurse time to respond to the emerging pandemic. More recent examples of diseases that have been monitored closely by public health nurses and officials are Middle Eastern Respiratory Syndrome (MERS) and Ebola virus. In the spring of 2014, the United States confirmed its first case of MERS-CoV, a corona virus, first reported in Saudi Arabia in 2012 (CDC, 2014a). The Ebola virus epidemic in African countries is being watched carefully by the public health officials and preventive measures are being taken to protect populations (see Chapter 13 for more on the Ebola virus outbreak in the United States).

SCOPE, STANDARDS, AND ROLES OF PUBLIC HEALTH NURSING

In 1920 C. E. A. Winslow defined public health as “the science and art of preventing disease, prolonging life and promoting health and efficiency through organized community effort” (Turnock, 2010, p. 10). This definition is still used in public health textbooks because it focuses on the relationship between social conditions and health across all levels of society. The IOM defines public health practice as “what we as a society do collectively to assure the conditions in which people can be healthy” (IOM, 2003, p. 28). Reflecting these definitions, the Public Health Nursing Section of the American Public Health Association defined public health nursing as “the practice of promoting and protecting the health of populations using knowledge from nursing, social and public health sciences” (APHA, 2013, p. 1). The American Nurses Association (ANA) adds that public health nursing is a population-focused practice that works to promote health and prevent disease for the entire population. Public health nursing is a specialty practice of nursing defined by scope of practice and not by practice setting (APHA, 2013).

Additional knowledge, skills, and aptitudes are necessary for a nurse to go beyond focusing on the health needs of the individual to focusing on the health needs of populations (see Chapters 1 and 18). This additional knowledge distinguishes the public health nurse from other nurses who are practicing in the community setting. Public health nursing practices arise from knowledge gained from the physical and social sciences, psychological and spiritual fields, environmental areas, political arena, epidemiology, economics, community organization, public health ethics, community-based participatory research, and global health. The Quad Council of Public Health Nursing Organizations identified eight principles (Box 46-3) that distinguish the public health nursing specialty from other nursing specialties. Although other nurses may practice some or all of these eight principles, they are not incorporated as a core

BOX 46-3 Tenets of Public Health Nursing

The following eight tenets of public health nursing distinguish public health nursing from other nursing specialties, and are included in the *Scope and Standards of Public Health Nursing Practice* of the American Nurses Association (2013).

1. Population-based assessment, policy development, and assurance processes are systematic and comprehensive.
2. All processes must include partnering with representatives of the people.
3. Primary prevention is given priority.
4. Intervention strategies are selected to create healthy environmental, social, and economic conditions in which people can thrive.
5. Public health nursing practice includes an obligation to reach out to all who might benefit from an intervention or service.
6. The dominant concern and obligation is for the greater good of all the people or the population as a whole.
7. Stewardship and allocation of available resources supports the maximum population health benefit gain.
8. The health of the people is most effectively promoted and protected through collaboration with members of other professions and organizations.

From American Public Health Association, Public Health Nursing Section: *The Definition and Practice of Public Health Nursing: A Statement of Public Health Nursing Section*. Washington, DC, 2013, American Public Health Association.

foundation of the practice in other specialties. Public health nurses always adhere to all eight principles of public health nursing (APHA, 2013).

A variety of settings and a diversity of perspectives are available to nurses interested in developing a career in public health nursing. Public health nurses working at the federal, state, and local levels integrate community involvement and knowledge about the entire population with clinical understandings of the health and illness experiences of individuals and families in the population. They translate and articulate the health and illness needs of diverse, often vulnerable individuals and families in the population to planners and policy makers. As advocates, public health nurses help members of the community voice their problems and aspirations. Public health nurses are knowledgeable about multiple evidence-based strategies for intervention, from those applicable to the entire population, to those for the family and the individual. Public health nurses are directly engaged in the interprofessional activities of the core public health functions of assessment, assurance, and policy development. In any setting, the role of public health nurses focuses on the prevention of illness, injury, or disability, as well as the promotion and maintenance of the health of populations (APHA, 2013).

Public health nurses deliver services within the framework of ever-constricting resources coupled with emerging and complex public health issues. This requires the efficient, equitable, and evidence-based use of resources. The *Guide to Community Preventive Services* is a resource used by public health nurses to help determine which interventions to use (CDC, 2014b). This guide provides recommendations about the effectiveness of selected health promotion/disease prevention guidelines. Box 46-4 presents selected Task Group recommendations. The *National Public Health Performance Standards Program*

BOX 46-4 How To Use Evidence to Determine Interventions**Selected Task Force on Community Preventive Services Recommendations: Vaccine-Preventable Diseases**

Recommendation	Interventions
Enhancing Access to Vaccination Services	
Recommended (strong evidence)	Expanding access in medical offices or public health clinics
Recommended (strong evidence)	Reducing out-of-pocket expenses
Recommended (sufficient evidence)	Vaccination programs in WIC settings
Recommended (sufficient evidence)	Home visits
Recommended (sufficient evidence)	Vaccination programs in schools
Insufficient evidence to determine effectiveness	Vaccination in childcare centers
Increasing Community Demand for Vaccines	
Recommended (strong evidence)	Client reminder/recall systems
Recommended (strong evidence)	Multicomponent interventions that include education
Recommended (sufficient evidence)	Vaccination requirements for childcare, school, and college attendance
Insufficient evidence to determine effectiveness	Clinic-based education only
Insufficient evidence to determine effectiveness	Client or family incentives
Insufficient evidence to determine effectiveness	Client-held medical records
Insufficient evidence to determine effectiveness	Community-wide education only

From Centers for Disease Control and Prevention: *The Guide to Community Preventive Services*, 2014b. Available at <http://www.thecommunityguide.org/index.html>. Accessed May 24, 2014.

(CDC, 2015), a federal, state, and local partnership, has developed evaluation instruments that can be used to collect and analyze data on the programs provided through state and local public health systems. The instruments link with the 10 essential services of public health that define the core functions of public health (see Chapter 1) and help public health nurses at state and local health departments identify which essential services are met and which need additional resources.

Public health nurses make a significant difference in improving the health of a community by monitoring and assessing critical health status indicators such as immunization levels (Figure 46-3), infant mortality rates, and communicable diseases. On the basis of their assessment and in partnership with the community, public health nurses advocate for evidence-based interventions to respond to negative health status indicators. For example, a community assessment may indicate that a significant percentage of children have hemoglobin levels below 11 mg/dL. The public health nurse will know that additional information such as blood lead levels will be needed in order to implement an appropriate intervention. Public health accreditation is being encouraged at the federal level by the

FIG 46-3 Public health nurses protect the population's health by providing immunizations. (Courtesy Arlington County Department of Human Services/Public Health Division, Arlington, VA.)

Public Health Accreditation Board (PHAB, 2014), for local and state health departments to meet specific standards of practice. Community health assessments and community health improvement plans are required components for each local health department. Community partnerships are imperative for the community health assessment and plan to be a meaningful and effective tool. Public health nurses are knowledgeable about resources and agencies within the community that can be partners in the accreditation process. Public health nurses can lead the accreditation process in their communities.

Public health's shift from being the primary care provider of last resort to developing partnerships to meet the health promotion and disease prevention needs of populations has raised concerns about available health care for the uninsured and underinsured. The public health nurses' role in this ongoing shift in health care delivery is still being developed for many agencies. Public health nurses retain responsibility for assuring that all populations have access to affordable, quality health care services. They accomplish this by advocating for legislation that promotes universal health care, such as increased funding for community health centers and expansion of Medicaid eligibility criteria; and by forming partnerships with hospitals, free clinics, and other organizations to guarantee health care for all populations in the community. Case management at the community level is a renewed effort in public health nursing. Through case management activities, public health nurses link populations with needed health care providers, as well as social services providers (see Chapter 22).

Uninsured individuals seek services on a sliding payment scale from such sources as university or public hospital clinics, neighborhood health centers, nurse-managed clinics, or community-based free clinics. Public health nurses serve as a bridge between these populations and the resource needs for this at-risk group by approaching health care providers on behalf of individuals seeking medical/health services and by keeping the needs of this population on the political agenda. Frequently, low-income populations or populations with multiple chronic illnesses lack the knowledge and skills to negotiate the complex health care system. This population needs education and training in identifying their problems, approaches to self-care, and illness prevention strategies and lifestyle choices that will have an effect on their health. The public health nurse understands barriers these populations confront, such as transportation issues, language barriers, cultural differences, and difficulty understanding and following health care provider instructions.

Although vulnerable populations have always benefited from public health nursing services, the populations that are most acutely in need of public health nursing services have changed dramatically over the last couple of decades. Of particular concern are the number of young women and their partners who are substance abusers and have risky behaviors that put their pregnancy or children at high risk of injury or abuse. Public health nurses at the federal, state, and local levels have developed innovative, collaborative approaches to prepare staff to work effectively with this population. Public health nurses can cultivate community partnerships to help address the needs of this population.

EVIDENCE-BASED PRACTICE

The Nurse-Family Partnership home visitation program provides rigorously defined nurse home visits to first-time low-income mothers. It is an evidence-based public health program that has been rigorously evaluated in three randomized, controlled trials. Results demonstrated improvements in birth outcomes, prenatal health, child development, school readiness, and academic achievement, and reductions in child abuse and neglect and early childhood injuries. A recent study examined the effects of these nurse home visits on 594 urban mothers' birth spacing, partner relationships, and government spending. The study design was a randomized, controlled trial.

Results demonstrated that mothers receiving the nurse home visits, compared with the control group, experienced less role impairment from drug and alcohol use (0.0% vs 2.5%, $P = .04$) and longer partner relationships (59.58 vs 52.67 months, $P = .02$). It also demonstrated that over the 12-year study period, government spent less per year on Medicaid, food stamps, and Aid to Families with Dependent Children and Temporary Assistance for Needy Families for mothers receiving nurse home visits than the control group (\$8772 vs. \$9797, $P = .02$).

Nurse Use

On March 23, 2010, President Obama signed into law health care reform legislation that included \$1.5 billion in funding for evidence-based home visitation to states over 5 years. Nurses can change outcomes for first-time low-income mothers by rigorously implementing the Nurse-Family Partnership model.

From Olds DL, Kitzman HJ, Cole RE, et al: Enduring effects of prenatal and infancy home visiting by nurses on maternal life course and government spending: Follow-up of a randomized trial among children at age 12 years., *Arch Pediatr Adolesc Med* 164(5):419–424, 2010.

ISSUES AND TRENDS IN PUBLIC HEALTH NURSING

The discovery and development of antibiotics in the 1940s, coupled with immunization programs and improvements in sanitation, contributed to the decrease in infectious disease-related morbidity and mortality during the twentieth century (CDC, 1999). Twenty-first century issues facing public health nursing include increasing rates of drug resistance to community-acquired pathogens, societal issues such as health reform legislation, access to affordable housing, racial and ethnic disparities in health outcomes, behaviorally influenced issues (such as chronic diseases, violence in society, and substance abuse), emerging infections (such as SARS and H1N1 influenza), and unequal access to health care. Community assessments need to reflect the factors that affect the populations the public health nurse serves.

For example, a major twenty-first century public health challenge is emerging infections resulting from drug-resistant organisms. The widespread, often inappropriate, use of antimicrobial drugs has resulted in loss of effectiveness for some community-acquired infections such as gonorrhea, pneumococcal infections, and tuberculosis and in increasing rates of drug resistance in community-acquired pathogens such as *Streptococcus pneumoniae*, *Escherichia coli*, and *Salmonella* spp. The rise in antimicrobial resistance in community and health care settings is causing alarm among public health leaders, nurses, and infectious disease experts. "Staph" infections caused by methicillin-resistant *Staphylococcus aureus* (MRSA) have received increasing attention in recent years. MRSA is a type of staph bacteria that has developed resistance to certain antibiotics, including methicillin and other more common antibiotics such as oxacillin, penicillin, and amoxicillin (CDC, 2010a). Public health nurses are building partnerships, providing education, and making surveillance a top priority to prevent the spread of antimicrobial-resistant infections. Public health nurses can influence this trend by objecting to inappropriate use of antibiotics by providers and educating individuals, families, health care providers, elected officials, and the community about the dangers of misuse and overuse of antibiotics (CDC, 2010b).

Societal issues such as welfare and health insurance reform will influence a population's ability to obtain preventive health services either because of limited health care providers accepting government-sponsored health care coverage or because the low-wage jobs they take do not allow time off for health care. When child care is an issue for the welfare mother returning to work, consideration must be given to effects on the individual, family, community, and population. Public health nurses assess the problem and determine what is wrong with a system that forces parents to go to work so they can be removed from welfare roles but that does not provide for child care. The question to be answered by a nurse is "What will it take to change the system?"

Partnerships and collaboration among groups are much more powerful in making change than the individual client and public health nurse working alone. As another example, the depressed, nonfunctional mother in need of counseling is a

significant public health concern because the mother's, children's, and family's needs are not being met. Frequently, the problem may not be obvious to the health professional who sees this woman for the first time. Public health nurses have special preparation to help them both identify the individual's problem and look at its effects on the broader community. In this example, the children may grow to be adults with mental health problems, and the community mental health services will need to be able to handle the increase in this population. Children may become violent adults, resulting in a need for more correctional facilities. Mothers may need additional mental health services. Children may be absent from school often and may not be able to contribute to society. They may be nonproductive in the workplace because absence from school leads to lack of skills. One problem of the single individual can place great burdens on the community.

The IOM (2002) reported that disparities in health care treatment accounted for some of the gaps in health outcomes between racial and ethnic groups. This report found that minorities received lower-quality health care than white people, regardless of insurance status, income, and severity of the condition. Public health nurses work as case managers and at the policy level to promote equal access to health care, including health literature and spoken services that reflect the community in which the services are being delivered (see Chapter 8). The public health nurse working directly as a case manager or in a clinic setting or in the community can promote ethnicity-friendly services by partnering with other community agencies such as interpreter services. Identifying and alerting the community to gaps in available services can facilitate equal access to health care. For example, some communities may appear to have an adequate number of pediatricians to meet the community's needs. However, a community assessment may reveal that the community is home to a high number of children who rely on Medicaid as payment for services, or to families whose primary language is not English. Matching this information with the pediatrician population may reveal that none of the pediatricians accept Medicaid as payment for services, or they all deliver services in English only.

Population-focused public health nursing requires that public health nurses consider social determinants of health including social and environmental factors that influence the health of communities, families, and individuals. For example, a public health nurse providing communicable disease control services for the homeless population or the refugee population will also work for policies that ensure affordable housing. A public health nurse providing case management services for a new teen mother will include ensuring that the mother returns to school; has safe, affordable housing; and has safe child care available while she attends school. The Nurse-Family Partnership Program (2010) is an example of a model program that considers the social determinants of health.

MODELS OF PUBLIC HEALTH NURSING PRACTICE

In response to the IOM (1988) report that described public health in a state of disarray and the need for all federal public

HOW TO Educate Nurses for Roles in Public Health: Curriculum Objectives for Public Health Nursing

The nurse should be able to do the following:

- Articulate similarities and differences between individual-focused and population-focused nursing practice.
- Describe the history and current perspectives of public health nursing practice.
- Demonstrate skills used to apply key nursing contributions to public health practice (core functions and essential services) in a community.
- Apply principles and skills of population health to practice in the public health agency.
- Use current information and communication technology in all public health agencies.
- Communicate the benefits of public health and public health nursing practice.
- Develop community partnerships that will assist in meeting the health needs of the community.

Developed by Downing, Diane: Public Health Nursing at Local, State, and National Levels. In Stanhope and Lancaster: *Public Health Nursing: Population Centered Health Care in the Community*, ed. 8. St Louis, MO, 2012, Elsevier.

health agencies to work to identify core public health functions, public health nurses have worked to develop models of practice that will operationalize the role of public health nursing. This section presents examples of models developed by local and state departments of health. These models also serve as examples of the important work that can be accomplished by local, state, and federal partnerships.

In Virginia, a statewide committee led an examination of the role of public health nursing in the context of increasing public expectation of accountability and the shift of public health nursing emphasis from clinical services to population-focused services. Their work resulted in a document that identifies public health nursing roles within the framework of the core public health functions (see Chapter 1). The work identifies the educational needs of staff that would prepare them to function effectively in the changing public health arena. Essential elements of the role were identified. These essential elements are being implemented through multiprofessional public health teams. The document includes a matrix that demonstrates the relationship of the public health functions defined by the essential elements to the public health nursing roles at the local level, as well as the role of the state in this responsibility (see Appendix F.1).

The Public Health Nursing Section of the Minnesota Department of Health (2001) developed a framework called the Intervention Wheel that defines public health nursing interventions by level of practice (see Chapter 9). Public health nurses deliver services within a framework of core interventions. The three levels of public health nursing practice are systems, community, and individual/family. The model identifies 17 population-based public health interventions delivered by public health

nurses. It also identifies population-based interventions as those that do the following:

- Focus on entire populations possessing similar health concerns or characteristics
- Are guided by an assessment of health status
- Consider the broad determinants of health, such as housing, income, education, cultural values, and community capacity
- Consider all levels of prevention, with primary prevention a priority
- Consider all levels of practice (community, system, and individual/family) (see [Appendix F.1](#))

The public health nursing practice model of Los Angeles County Department of Health describes public health nursing practice as population based. It synthesizes the 10 essential services of public health practice, principles identified by the Quad Council of Public Health Nursing Organizations and the Minnesota Department of Health, PHN Section and tenets of the *ANA Scope and Standards of Public Health Nursing Practice*. It includes the following criteria:

- Focuses on entire populations possessing similar health concerns or characteristics
- Relies upon an assessment of population health status
- Considers the broad determinants of health
- Considers all levels of prevention, with a preference for primary prevention
- Considers all levels of practice: individual/family-focused practice, community-focused practice, and systems-focused practice
- Reaches out to all who might benefit, not focusing on just those who present themselves
- Demonstrates a dominant concern for the greater good of all the people (the interest of the whole taking priority over the best interest of the individual or group)
- Creates healthy environmental, social, and economic conditions in which people can thrive ([Los Angeles County Department of Public Health/Public Health Nursing, 2007](#))

EDUCATION AND KNOWLEDGE REQUIREMENTS FOR PUBLIC HEALTH NURSES

The [Council on Linkages Between Academia and Public Health Practice \(2014\)](#) examined a decade of work to identify a list of core public health competencies that represent a set of skills, knowledge, and attitudes necessary for the broad practice of public health. Initially adopted in 2001, the core competencies were revised and adopted unanimously by the Council in June 2009. The accomplishments of the Council on Linkages not only include developing the Core Competencies for Public Health Professionals to guide curriculum and workforce development, but also include promoting public health systems research to increase understanding of and improve public health infrastructure as well as focusing the field on evidence-based strategies to improve worker recruitment and retention and combat emerging worker shortages. The Council is located in Washington, DC, and is staffed by the Public Health Foundation. A list of

member organizations is located at <http://www.phf.org/link/membership.htm>.

The competencies are built around the Essential Public Health Services. This is the only consensus set of core competencies in public health that apply to all practicing public health professionals. They capture the cross-cutting competencies necessary for all disciplines that work in public health, including public health nurses, physicians, environmental health specialists, health educators, and epidemiologists. The competencies are applied to three tiers. A detailed list of core competencies by job category and skill level is available. The core public health competencies have been applied to public health nursing (see the web links on the Evolve website for both items).

LINKING CONTENT TO PRACTICE

The core public health competencies are divided into the following eight domains. The content related to the domains can be found in the chapters noted.

1. Analytic assessment skills: [Chapters 1, 9, 15, 17, 18, and 27 to 38](#)
2. Basic public health sciences' skills: [Chapters 3, 6, 8, 10, 12 to 14, 19, 23 to 26](#)
3. Cultural competency skills: [Chapters 4 and 7](#)
4. Communication skills: [Chapters 16 and 22](#)
5. Community dimensions of practice skills: [Chapters 18, 20, 21, and 41 to 45](#)
6. Financial planning and management skills: [Chapter 5](#)
7. Leadership and systems thinking skills: [Chapter 40](#)
8. Policy development/program planning skills: [Chapters 8 and 25](#)

In addition to being skilled in the areas of epidemiology, analytic assessment skills, environmental health, health services administration, cultural sensitivity, and social and behavioral science, the twenty-first century public health nurse must be competent in areas such as community mobilization, risk communication, genomics, informatics, community-based participatory research, policy and law, global health, and public health ethics ([ANA, 2007](#)).

Many of these core public health competencies are provided by public health nurses who have learned these skills in the workplace while gaining knowledge through years of practice. Rapid changes in public health are providing a challenge to public health nurses in that there is neither the time nor the staff to provide the on-the-job training needed to learn and upgrade skills and knowledge of staff. Nurses with baccalaureate or master's preparation are needed to provide a strong public health system (see [Chapter 1](#)). In 2007 and again in 2013 the ANA revised the 1999 *Scope and Standards of Public Health Nursing Practice* to reflect the increasing complexity and rapid changes faced by public health nurses. The revised standards include those that are expected of all baccalaureate degree nurses, the entry level into public health nursing practice, and the standards of the advanced practice public health nurse prepared at the master's level ([APHA, 2013](#)).

NATIONAL HEALTH OBJECTIVES

Since 1979 the U.S. Surgeon General has worked with local, state, and federal agencies; the private sector; and the U.S. population to develop objectives for preventing disease and promoting health for the nation. These objectives are revisited every 10 years. In 2009 proposed *Healthy People 2020* objectives were released for public comment (see the [Healthy People 2020](#) box).

HEALTHY PEOPLE 2020

Selected National Health Objectives Related to the Public Health Infrastructure

- PHI-1: Increase the proportion of federal, tribal, state, and local public health agencies that incorporate core competencies for public health professionals into job descriptions and performance evaluations.
- PHI-4: Increase the proportion of 4-year colleges and universities that offer public health or related majors and/or minors.
- PHI-13: Increase the proportion of tribal, state, and local public health agencies that provide or assure comprehensive epidemiology services to support essential public health services.
- PHI-14: Increase the proportion of state and local public health jurisdictions that conduct performance assessment and improvement activities in the public health system using national standards.
- PHI-15: Increase the proportion of tribal, state, and local public health agencies that have implemented a health improvement plan and increase the proportion of local health jurisdictions that have implemented a health improvement plan linked with their state plan.

From U.S. Department of Health and Human Services: *Healthy People 2020: National Health Promotion and Disease Prevention Objectives*, 2010. Available at <http://www.healthypeople.gov/hp2020/objectives/TopicAreas.aspx>. Accessed May 13, 2015.

State health departments help set local goals using the *Healthy People 2020* objectives as a framework. Knowing that public health departments do not have the resources to accomplish these goals independently, collaboration is essential to quality nursing practice and is encouraged at the local level with existing groups. New partnerships are developed related to specific goals. Communities develop coalitions to address selected objectives, based on community needs, to include all of the local community stakeholders such as social services, mental health, education, recreation, government, and businesses. Membership varies from community to community depending on that community's formal and informal structure. The groups join the coalition for a variety of reasons. For example, businesses see the value of developing a productive workforce that will be of importance to them and the community in the future.

Public health nurses help clients identify unhealthy behaviors and then help them develop strategies to improve their health. Some of the behaviors addressed by public health nurses

are tobacco use, physical activity, and obesity, all of which affect quality and years of healthy life. Public health nurses also organize the community to conduct community health assessments to identify where health disparities exist and to target interventions to address those disparities. For example, community health assessments may disclose that certain populations are at higher risk for asthma, diabetes, low immunization rates, high cigarette smoking behavior, or exposure to environmental hazards.

Some *Healthy People 2020* communicable disease areas of focus are vaccine-preventable infectious diseases, emerging antimicrobial resistance, tuberculosis infection and disease, and levels of human immunodeficiency virus (HIV), acquired immunodeficiency syndrome (AIDS), and sexually transmitted infections. To help clients reduce their risk of acquiring a communicable disease, public health nurses provide clients with instructions on the use of barrier methods of contraception and information on the hazards of multiple sexual partners and street drug use. Obtaining a complete sexual history on all clients coming to the health department for services takes special skills but is essential to determine the behaviors that have brought the client to the local health department. Education of young persons before they become sexually active has helped reduce the incidence of some sexually transmitted diseases in this population.

FUNCTIONS OF PUBLIC HEALTH NURSES

Public health nurses have many functions depending on the needs and resources of an area ([Figure 46-4](#)). Advocate is one of the many roles of the public health nurse. As an advocate, the public health nurse collects, monitors, and analyzes data and works with the client to identify and prioritize needed services, whether the client is an individual, a family, a community, or a population. The public health nurse and the client then develop the most effective plan and approach to take, and the nurse helps the client implement the plan so that the client can become more independent in making decisions and obtaining the services needed. At the community and population levels, public health nurses promote healthy behaviors, safe water and air, and sanitation. They advocate for healthy policies at the local, state, and federal levels that will develop healthy communities (see [Chapter 8](#)).

Legislation is a public health tool used to ensure the health of populations. Implemented with extreme concern for the balance between individual rights and community rights, public policy is a critical function for the public health nurse. Examples of legislation that has successfully improved the health of populations are required immunizations for school entry, seat belt use, smoke-free environments, and bicycle and motorcycle helmet use.

Case management is a major role for public health nurses (see [Chapter 22](#)). The 2010 health reform legislation will increase the importance of the case management role as newly insured clients attempt to link with health care providers and the [Nurse-Family Partnership program \(2010\)](#) is expanded.

Public Health Nursing Roles

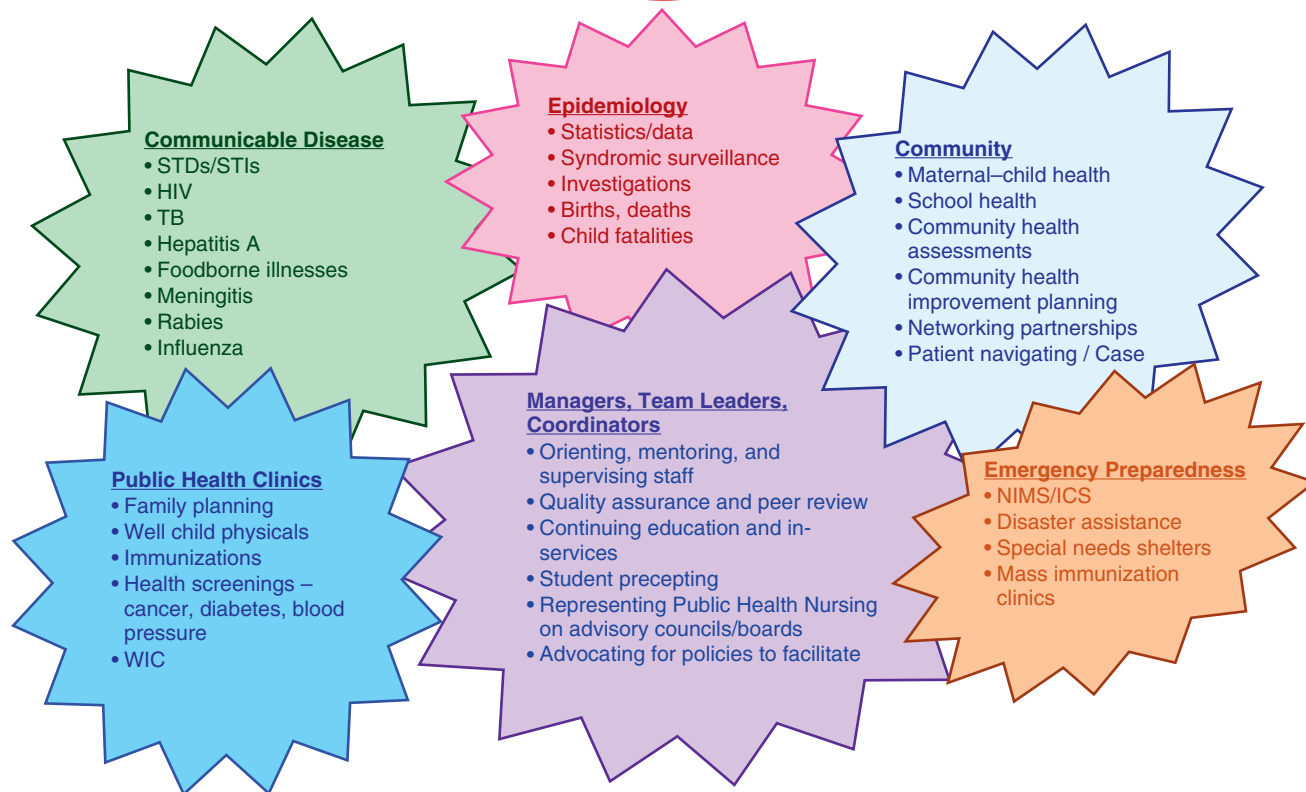

FIG 46-4 Public health nursing roles.

Public health nurses use the nursing process of assessing, planning, implementing, and evaluating outcomes to meet clients' needs. Clear and complex communications are frequently an important component of case management. Other health and social agency providers may not be familiar with the home and community living conditions that are known to the public health nurse. It is the nurse who sees the living conditions and who can tell the story for the client or assist the individual, family, or community with the telling of their story. Case managers assist clients in identifying the services they need the most at the least cost. They also assist communities and populations in identifying and linking with services that will increase the overall population health status.

Public health nurses are a major referral resource. They maintain current information about health and social services available within the community. They know what resources will be acceptable to the client within the social and cultural norms for that group. The nurse educates clients to enable them to use the resources and to learn self-care. Nurses refer to other services in the area, and other services refer to the public health nurse for care or follow-up. For example, the mother and new baby may be referred to the public health nurse for postnatal care with postpartum home visit follow-up.

Assessment of literacy is a large part of public health nursing. Many individuals are limited in their ability to read, write, and communicate clearly. The public health nurse has to be culturally sensitive and aware of the specific areas of unique problems of clients, such as financial limitations that may in turn limit educational opportunities. Frequently, when a person goes to a physician's office, clinic, or hospital, they are clean and neatly dressed. The assumption is made that when they nod at the health care provider it means that they understand what has been said. This is frequently not the case, but the client is embarrassed to admit that he or she does not understand what has been said. Being illiterate does not mean a person is mentally slow. It is important for the public health nurse to follow up on the many contacts the individual or family has with medical, social, and legal services to clarify what is understood and to find an answer to the questions that have not been asked by the client or answered by the services.

The public health nurse is an educator, teaching to the level of the client so that information received is information that can be used. Patience and repetitions over time are necessary to develop trust and to enable the client to use the relationship with the nurse for more information. As educator, the public health nurse identifies community needs (e.g., playground

safety, hand hygiene, pedestrian safety, safe-sex practices) and develops and implements educational activities aimed at changing behaviors over time.

Public health nurses are direct primary caregivers in many situations, both in the clinic and in the community. Where the public health nurse provides primary care is determined by community assessment and is usually in response to an identified gap to which the private sector is unable to respond, coupled with an assessment of the impact of the gap in services on the health of the population. Examples include prenatal services for uninsured women, free or low-cost immunization services for targeted populations, directly observed therapy for clients with active tuberculosis, and treatment for sexually transmitted infections.

Public health nurses ensure that direct care services are available in the community for at-risk populations by working with the community to develop programs that will meet the needs of those populations. Currently, no system of outreach service in the medical models of care addresses the multiple needs of high-risk populations. High-risk populations frequently do not understand the medical, social, educational, or judicial system and the professional languages, codes of behavior, or expected outcomes of these services. Clients need a case manager, a health educator, an advocate, and a role model to enable them to benefit from these services and to teach them how to avoid complex and expensive problems in the future. The local public health nurse fills these roles and many more for this population. These are examples of the difficult clinical issues that public health nurses face in making ethical and professional decisions.

The public health nurse's role is unique and essential in many situations. Access to homes gives the nurse information that usually cannot be gathered in the hospital or clinic setting. The public health nurse learns to ask intimate questions creatively and to seek information that will facilitate case management and provide the clinical and social care needed, including other community resources. Careful attention must be paid to privacy and confidentiality in delivering public health nursing services. The credibility of the nurse and the agency depends on the professional handling of the public health information of each and every staff member.

When a disaster (see [Chapter 23](#)) occurs, public health nurses at the local, state, and federal levels have multiple roles in assessing, planning, implementing, and evaluating needs and resources for the different populations being served. Whether the disaster is local or national, small or large, natural or man-made, public health nurses are skilled professionals essential to the team. As a health care facility, the local public health department has a disaster plan, as well as a role in the local, regional, and state disaster plans. Public health nurses' roles include providing education that will prepare communities to cope with disasters and professional triage for local shelters, conducting enhanced communicable disease surveillance, planning and implementing mass dispensing sites, working with environmental health specialists to ensure safe food and water for disaster victims and emergency workers, and serving on the local emergency planning committee. Their presence may be

required in other regions of the state or country to provide official public health nursing duties in a time of crisis, such as a hurricane, that requires a lengthy period of recovery. Each governmental jurisdiction has an emergency plan. The public health agency is expected to provide planning and staffing during a disaster. These local emergency preparedness plans may be multigovernmental, which requires coordination between communities. Public health nurses have a critical role in ensuring that emergency preparedness plans address the special needs of vulnerable populations such as those with disabilities, or low-income populations who lack the resources to maintain the recommended 3- to 5-day supply of food and medication.

Essential and unique roles for public health nurses exist in the area of communicable disease control. Public health nursing skills are necessary for education, prevention, surveillance, and outbreak investigation. Public health nurses can find infected individuals; notify contacts; refer; administer treatments; educate the individual, family, community, professionals, and populations; act as advocates; and in general be state-of-the-art resources to reduce the rate of communicable disease in the community (see [Chapters 13, 14, and 24](#)). The communicable disease role is one of the most important roles for public health nursing during disasters. During the terrorist attacks on September 11, 2001, the SARS outbreak, and the novel H1N1 pandemic, public health nurses at the federal, state, and local levels immediately implemented active enhanced surveillance activities and prepared for implementation of mass dispensing sites. Information about communicable diseases seen at the local level was passed on to the state public health agency and finally to the CDC. At each step, the data were analyzed for evidence of unusual disease trends.

When October 2001 alerts from the CDC began presenting information about a photo editor in Florida who had been hospitalized with inhalation anthrax, public health nurses and hospital infection control practitioners throughout the nation increased activity. Public health response to disasters requires that resources be redirected temporarily from other programs while maintaining programs that will prevent additional outbreaks. Therefore, public health nurses not normally involved in communicable disease activities can be shifted to this function. The exposures resulting from the anthrax-tainted letters presented unprecedented public health challenges. The Washington, DC, anthrax exposures resulted in thousands of possible work-related exposures, five cases of inhalation anthrax in the region, and two deaths over a period of months. Public health at the federal, state, and local levels was looked to for coordinated leadership and answers to a situation in which experience was limited and answers were uncertain.

With the first Ebola virus outbreak in the United States in Dallas, public health workers were case finding, that is, identifying contacts with the person presenting with Ebola virus. After contacts were identified, they were visited to assess them for symptoms of Ebola virus. In addition, public health workers were going door to door to see if anyone had been exposed to the virus through the identified contacts of the patient. The purpose in case finding is to be able to treat all who have

symptoms to reduce the risk of a massive outbreak of a disease (CDC, 2014c).

Although communicable disease control is a core public health service, the role of the public health nurse as **incident commander** in a widespread public health emergency is a new role (see Figure 46-5). Issues such as how to conduct mass treatment in response to a bioterrorism event, which jurisdiction is in charge, how to communicate uncertain information to the public, and who should take antibiotics for how long had to be rapidly resolved across jurisdictional and agency lines. The anthrax exposures are typical of the nature of public health emergencies. They unfold as the communicable disease moves through communities.

Public health nurses are essential partners in disaster drills. In Virginia, an electrical company has a nuclear plant that requires annual multijurisdictional disaster drills. These disaster planning and practice sessions are an opportunity for local public health nurses to get to know other agencies' representatives and to let them know what public health nursing can offer. Because public health nurses are out in the communities and have assessment skills, they are essential in evaluating how the disaster was handled and making suggestions about how future events might be managed. To be most effective as disaster responders, public health nurses have to be a part of the team *before* an emergency. Knowing what type of disaster is likely to occur in a community is essential for planning. Types of disasters vary from place to place, but there is a history of past events and how they were handled, as well as resources and training from regional, state, and federal agencies. Public health nurses can help educate the public about the individual responsibilities

FIG 46-5 Public health nurses respond to community-wide disease outbreaks within the framework of the incident command structure. (Courtesy Arlington County Department of Human Services/Public Health Division, Arlington, VA.)

and preparations that can be in place both for the person and for the community. The **Levels of Prevention** box presents additional examples of public health nurses' functions by level of prevention. Public health nurses at the local, state, and federal levels work in partnership to accomplish each function.

LEVELS OF PREVENTION

Public Health Nursing

Primary Prevention

- Partnering with the community to conduct a community health assessment to identify community assets and gaps
- Partnering with the community to develop primary prevention programs in response to identified gaps
- Providing information about safe-sex practices
- Providing individual and community-based education to increase knowledge and modify perceptions of risks
- Educating daycare centers and families about the dangers of lead-based paint
- Educating daycare centers, schools, and the general community about the importance of hand hygiene to prevent transmission of communicable diseases
- Inspecting daycare centers, nursing homes, and hospitals to ensure client safety and quality of care
- Providing immunizations
- Advocating for issues such as mandatory seat belt legislation, smoke-free environments, and universal access to health care
- Providing no-charge infant car seats accompanied by classes in use of safety seats
- Identifying environmental hazards such as housing quality, playground safety, pedestrian safety, and product safety hazards, and working with the community and policy makers to mitigate the identified hazards

- Developing social networking interventions to modify community norms related to sexual risk behaviors, condom use, and abstinence
- Larviciding against mosquitoes in areas frequented by populations 55 years of age and over
- Working with communities to develop citizen emergency preparedness plans

Secondary Prevention

- Identifying and treating clients in a sexually transmitted disease clinic
- Identifying and treating clients with TB infection and disease in a TB clinic
- Providing directly observed therapy (DOT) for clients with active TB
- Conducting lead screening activities for children
- Conducting contacting/tracing for individuals exposed to a client with an active case of TB or a sexually transmitted disease
- Conducting ongoing disease surveillance for communicable diseases and implementing control measures when an outbreak is identified
- Implementing screening programs for genetic disorders/metabolic deficiencies in newborns; breast, cervical, and testicular cancer; diabetes; hypertension; and sensory impairments in children, and ensuring follow-up services for clients with positive results
- Conducting syndromic surveillance to ensure early identification of victims of an influenza epidemic or bioterrorism event
- Providing low-cost antibiotics for treatment of Lyme disease

LEVELS OF PREVENTION—cont'd

Public Health Nursing

- Conducting enhanced surveillance for novel influenza virus infection among travelers with severe unexplained respiratory illness returning from affected countries
- Establishing mass dispensing clinics for antibiotic distribution in response to a bioterrorism event or influenza pandemic
- Providing case management services that link clients identified with serious mental illnesses to mental health and community support services
- Educating at rehabilitation centers to help clients with stroke optimize their functioning
- Establishing an alternative treatment site for victims of a smallpox epidemic

Tertiary Prevention

- Providing case management services that link clients with chronic illnesses to health care and community support services

From U.S. Department of Health and Human Services: *Healthy People 2020: National Health Promotion and Disease Prevention Objectives*, 2010. Available at <http://www.healthypeople.gov/hp2020/objectives/TopicAreas.aspx>. Accessed May 13, 2015.

FOCUS ON QUALITY AND SAFETY EDUCATION FOR NURSES

Public Health Nursing at Local, State, and National Levels

Targeted Competency

Teamwork and Collaboration – function effectively within nursing and inter-professional teams, fostering open communication, mutual respect, and shared decision making to achieve quality patient care.

Important aspects of teamwork and collaboration include:

- **Knowledge:** Describe scopes of practice and roles of health care team members.
- **Skills:** Integrate the contributions of others who play a role in helping patient/family achieve health goals.
- **Attitudes:** Respect the unique attributes that members bring to a team, including variations in professional orientations and accountabilities.

Teamwork and Collaboration Question

Your state has recently been awarded funding from the Centers for Disease Control and Prevention to prevent the spread of viral hepatitis through increased testing, improving access to care, and strengthening surveillance to detect viral hepatitis transmission and disease. You are the Director of Nursing for the State Public Health Department and currently serve on the Infectious Disease

Prevention (IDP) committee. The IDP committee has been given the responsibility to determine how to best utilize this new funding to effectively meet the objectives of the grant. Consider the following:

- As the Director of Nursing for the State Public Health Department, what is your role in addressing this initiative at the state level? How would your role change if you were a public health nurse working at the local health department?
- In addition to nursing, give examples of other professionals who likely serve on the IDP committee with you. Describe the role for each professional for this committee?
- Identify local and state organizations in your community that would you recommend that the IDP committee collaborate with to develop and implement a response to identified
- Through this grant, your state is addressing several objectives in the Healthy People 2020 focus area of Immunization and Infectious Diseases. Go to the Healthy People 2020 website and identify which specific objectives would apply to this initiative.

Prepared by Lisa Turner, PhD, RN, PHCNS-BC, Assistant Professor, Berea College Nursing Program, Berea, Kentucky.

PRACTICE APPLICATION

A retirement community in a small town reported to the local health department 24 cases of severe gastrointestinal illness that had occurred among residents and staff of the facility during the past 24 to 36 hours. It was determined that the ill clients became sick within a short, well-defined period, and most recovered within 24 hours without treatment. The communicable disease outbreak team, composed of public health nurses, public health physicians, and an environmental health specialist, was called to respond to this possible epidemic.

How should they respond to this situation? (Refer to [Chapter 12](#) for help in answering this question.)

- Call the Centers for Disease Control and Prevention and ask for help with surveillance.
- Send all the ill persons in the retirement community to the hospital.
- Evaluate the agent, host, and environmental relationships to determine the cause of the problem.
- Close the dining room and find another source to provide food to the residents.

Answers can be found on the Evolve site.

KEY POINTS

- Local public health departments are responsible for implementing and enforcing local, state, and federal public health codes and ordinances while providing essential public health services.
- The goal of the local health department is to safeguard the public's health and improve the community's health status.
- State health departments hold primary responsibility for promoting and protecting the public's health.

KEY POINTS—cont'd

- Public health nursing is the practice of promoting and protecting the health of populations using knowledge from nursing and social and public health sciences.
- Public health is based on the scientific core of epidemiology.
- Marketing of public health nursing is essential to inform both professionals and the public about the opportunities and challenges of populations in public health care.
- A driving force behind public health nursing changes is globalization that allows rapid transmission of emerging infections and the expectation that public health nurses will be active partners in emergency preparedness activities.
- Some of the roles public health nurses function in are advocate, case manager, referral source, counselor, educator, outreach worker, disease surveillance expert, community mobilizer, and disaster responder.
- Public health nurses have an important role in conducting community assessments including partnering with the community to collect and analyze data, developing community diagnosis, and implementing evidence-based interventions.
- Public health nurses base interventions on identified health status of populations and their related determinants of health.

CLINICAL DECISION-MAKING ACTIVITIES

1. What are some of the various roles of the public health nurse in the local, state, and federal public health systems? Contrast the roles. Explain why they may be different from one another.
2. How can public health nurses prepare themselves for change? Illustrate what you mean.
3. What can today's public health nurses learn from the past practice of public health nurses? How can you verify your answer?
4. Describe collaborative partnerships that public health nurses have developed. How do partnerships help solve public health problems?
5. What are some external factors that have an effect on public health nursing? How can you deal with the complexities of these factors?
6. What are core functions used by public health nurses as they plan interventions? Do these functions make sense to you? Explain.
7. If you were a public health nurse for a day, what would you like to accomplish? Why? Is your answer supported by evidence? Be specific.
8. How would you determine the most pressing public health issue in your community? Gather several points of view from key leaders in the community.
9. Give an example of a policy change or an effect from the work of public health nurses. How did this policy make a difference in client health outcomes?

Program Planning and Design

Program planning is a process of outlining, designing, contemplating, and deliberating to develop actions to accomplish desirable goals and attain desirable outcomes.

PLANNING PROCESS

The successful program requires a lot of planning before implementation. The following need to be considered:

1. Who is in charge?
2. Who should be involved?
3. When is the best time to plan?
4. What data are needed?
5. Where should planning occur?
6. Will there be resistance?
7. Where will resistance come from?
8. Who will be early adopters?

Failing to plan can result in the inability to have a program that is viable and that will attain the goals and outcomes.

TIMETABLE

Timetables are very important to the success of planning. Two methods often used by planners are the following:

- Program Evaluation and Review Techniques (PERT)
- GANTT

PERT

The PERT method requires the planner to do the following:

- State the goal.
- List in sequence all the steps and activities for each step to accomplish the goal.
- Target dates for accomplishing each step are set.
- Diagram the process for easy use.

Student Activity

1. Go to literature and find a PERT application and diagram.
2. Draw a diagram of your program plan or a hypothetical one.
3. Be prepared to submit with end of module assignment.

GANTT

A GANTT chart is also a flow diagram that can be used to map out the activities needed to be accomplished so that one can

maintain a timeline to achieve the goal. The GANTT chart looks much like a calendar.

Student Activity

1. Go to the literature and find a GANTT chart that has been applied to a project.
2. Complete a GANTT chart of the activities related to each objective in your project that are stated to meet the goal or do a hypothetical one.
3. Be prepared to submit at the end of the module.

PEOPLE PLANNING

To have a successful plan one needs to involve the clients who are to be served by the program. Others to be involved are the following:

- Administrators
- Staff (providers)
- Other key stakeholders

REASONS

- Develop ownership
- Develop commitment
- Develop pride
- Develop understanding of problems
- Brainstorm
- Generate ideas

DATA PLANNING

To have a successful program one must collect data on the following:

- Demographics of clients
- Disease statistics
- Vital statistics
- Existing similar programs
- Successes and barriers of similar programs
- Socioeconomic/environmental support
- Political issues

Student Activity

1. Find a source of data for one of the above categories.
2. Explain why it is a good data source for your program.

PERFORMANCE PLANNING

Some programs, called projects are planned for a one-time-only event. Most programs are planned to be ongoing.

1. Question: Are problems that programs address usually solved?
 - a. Explain your answer and give an example.
2. The following should be considered in planning for performance:
 - a. Staff is the most expensive resource in planning.
 - b. For efficiency, programs should be planned as ongoing activities.
 - c. A 6-month start-up and a 5-year budget should be developed.
 - d. Long-term commitment of resources to a program is essential.
 - e. Planners must develop marketing tools, policies and procedures, and job descriptions before implementation.
 - f. Organizational structures including committees need to be drafted.
 - g. Community partners and advisory board should be planned and contacted for agreement to serve.

Priority Planning

1. Plan programs for the greatest need and the best potential for making a difference.
2. Available resources to accomplish goal no. 1 must be sought. If resources are not available, the program plan is time wasted.
3. Be a comprehensive planner.
4. Complete ongoing needs assessments to determine community changes.
5. Prioritize the greatest needs.
6. Plan new programs or change existing ones for goal no. 5.

Plan for Measurable Outcomes

1. Collect baseline data on the problem and the target population.
2. Analyze needs assessment.
3. Look at incidence and prevalence of problems.
4. Look at available services currently addressing the problem.
5. Determine the impact of the current services, using SWOT.

Evaluation Planning

1. This must begin with the needs assessment.
2. Plan for process evaluation.
3. Plan for summative evaluation.
4. Develop a timeline for evaluation to occur.
5. Develop systems for records and data collection and choose evaluation instruments.

Questions to be Answered

1. Do you have the right people doing the planning?
2. Do you have the essential data for planning?
3. Is this the right time to plan this program?
4. Why should evaluation occur?
5. Who should do it?

6. What data should be gathered?
7. Should evaluation occur?

Planning Models

1. Choose a model for planning your program.
2. Two models developed for program planning by the Centers for Disease Control and Prevention are PATCH and APEX.

Student Activity

1. Read about these two models.
2. Briefly explain how these models can be applied to program planning.
3. Briefly explain the model you have chosen for planning. Include the following:
 - a. Definition
 - b. Goal
 - c. Model elements
 - d. Planning process

MISSION

All programs will want to have a Mission Statement. Elements of a Mission Statement should include the following:

- Name of agency
- Name of program
- Who program serves
- Purpose of program
- Program goal
- Services offered

Student Activity

Write a Mission Statement for your program.

VISION

A Vision Statement is a brief one- or two-sentence statement that expresses the impact this program will have.

Student Activity

Write a Vision Statement for your program.

WORKSHEET FOR WRITING THE PHILOSOPHY

Questions for Discussion

What are our community's values and beliefs about health?

What is the purpose of our program?

What is our position on community involvement and responsibility for health?

What is our role in providing leadership?

Worksheet for Finding and Overcoming Obstacles

Goal:

Forces working against reaching goal (barriers/obstacles/challenges):

Forces working for reaching goal (existing resources/strengths):

Approaches to overcome obstacles:

WORKSHEET FOR WRITING OBJECTIVES

Health Issue:

Goal:

Objectives (write the most important objectives first):

- 1.
 - 2.
 - 3.
 - 4.
2. Have you identified community needs and concerns by way of:
 - ☐ Surveys/questionnaires
 - ☐ Focus groups
 - ☐ Public meetings or forums
 - ☐ Interested party analysis
 3. Have you determined the community's priorities, taking into account:
 - ☐ Historical conditions
 - ☐ Traditional practices
 - ☐ Political and economic conditions
 4. Have you developed program goals and objectives?
 - ☐ Yes
 - ☐ No
 5. Have you decided on program strategies that:
 - ☐ Fit with the resources and needs of the community
 - ☐ Consider the beliefs, values, and practices of the community
 - ☐ Reflect field testing
 - ☐ Dispel health misconceptions
 - ☐ Change behavior
 - ☐ Change the environment
 6. To implement your program, have you:
 - ☐ Prepared a timeline for program implementation
 - ☐ Listed people to be involved, and resources needed
 - ☐ Hired staff (preferably from the community)
 - ☐ Developed linkages with other community agencies, as appropriate
 - ☐ Planned to carry out an evaluation
 7. Have you chosen appropriate methods and questions for:
 - ☐ Process evaluation
 - ☐ Outcome evaluation

CHECKLIST FOR PROGRAM PLANNING AND IMPLEMENTATION

1. Have you established a community advisory group with:
 - ☐ Representation of your targeted groups
 - ☐ The ability to provide valuable links with the community
 - ☐ Skills and resources that will be useful to the program

<div style="display: flex; justify-content: space-around;"> <div style="border: 1px solid black; width: 20px; height: 20px;"></div> <div style="border: 1px solid black; width: 20px; height: 20px;"></div> <div style="border: 1px solid black; width: 20px; height: 20px;"></div> <div style="border: 1px solid black; width: 20px; height: 20px;"></div> <div style="border: 1px solid black; width: 20px; height: 20px;"></div> <div style="border: 1px solid black; width: 20px; height: 20px;"></div> <div style="border: 1px solid black; width: 20px; height: 20px;"></div> <div style="border: 1px solid black; width: 20px; height: 20px;"></div> </div>	
<p>The health risk appraisal is an educational tool, showing you choices you can make to keep good health and avoid the most common causes of death (for a person of your age and sex). This health risk appraisal is not a substitute for a check-up or physical exam that you get from a doctor or nurse; however, it does provide some ideas for lowering your risk of getting sick or injured in the future. It is NOT designed for people who already have HEART DISEASE, CANCER, KIDNEY DISEASE, OR OTHER SERIOUS CONDITIONS; if you have any of these problems, please ask your health care provider to interpret the report for you.</p> <p><u>DIRECTIONS:</u> To get the most accurate results, answer as many questions as you can. If you do not know the answer leave it blank.</p> <p><i>The following questions <u>must</u> be completed or the computer program cannot process your questionnaire:</i></p> <p style="text-align: center;">1. SEX 2. AGE 3. HEIGHT 4. WEIGHT 15. CIGARETTE SMOKING</p>	
<p>Please write your answers in the boxes provided. ➡ (Examples: <input checked="" type="checkbox"/> or 98)</p>	
1. SEX	1 <input type="checkbox"/> Male 2 <input type="checkbox"/> Female
2. AGE	<div style="border: 1px solid black; width: 40px; height: 25px; display: inline-block;"></div> Years
3. HEIGHT (Without shoes) (No fractions)	<div style="border: 1px solid black; width: 40px; height: 25px; display: inline-block;"></div> Feet <div style="border: 1px solid black; width: 40px; height: 25px; display: inline-block;"></div> Inches
4. WEIGHT (Without shoes) (No fractions)	<div style="border: 1px solid black; width: 40px; height: 25px; display: inline-block;"></div> Pounds
5. Body frame size	1 <input type="checkbox"/> Small 2 <input type="checkbox"/> Medium 3 <input type="checkbox"/> Large
6. Have you ever been told that you have diabetes (or sugar diabetes)?	1 <input type="checkbox"/> Yes 2 <input type="checkbox"/> No
7. Are you now taking medicine for high blood pressure?	1 <input type="checkbox"/> Yes 2 <input type="checkbox"/> No
8. What is your blood pressure now?	<div style="border: 1px solid black; width: 60px; height: 25px; display: inline-block;"></div> / <div style="border: 1px solid black; width: 60px; height: 25px; display: inline-block;"></div> <small>Systolic (High Number)/Diastolic (Low Number)</small>
9. If you do not know the numbers, check the box that describes your blood pressure.	1 <input type="checkbox"/> High 2 <input type="checkbox"/> Normal or Low 3 <input type="checkbox"/> Don't Know

10. What is your TOTAL cholesterol level (based on a blood test)?	<input type="text"/> mg/dl
11. What is your HDL cholesterol (based on a blood test)?	<input type="text"/> mg/dl
12. How many cigars do you usually smoke per day?	<input type="text"/> cigars per day
13. How many pipes of tobacco do you usually smoke per day?	<input type="text"/> pipes per day
14. How many times per day do you usually use smokeless tobacco? (Chewing tobacco, snuff, pouches, etc.)	<input type="text"/> times per day
15. CIGARETTE SMOKING How would you describe your cigarette smoking habits?	1 <input type="checkbox"/> Never smoked ➤ Go to 18 2 <input type="checkbox"/> Used to smoke ➤ Go to 17 3 <input type="checkbox"/> Still smoke ➤ Go to 16
16. STILL SMOKE How many cigarettes a day do you smoke? ➤ GO TO QUESTION 18	<input type="text"/> cigarettes per day ➤ Go to 18
17. USED TO SMOKE a. How many years has it been since you smoked cigarettes fairly regularly? b. What was the average number of cigarettes per day that you smoked in the 2 years before you quit?	<input type="text"/> years <input type="text"/> cigarettes per day
18. In the next 12 months, how many thousands of miles will you probably travel by each of the following? (NOTE: U.S. average = 10,000 miles)	a. Car, truck, or van: <input type="text"/> ,000 miles b. Motorcycle: <input type="text"/> ,000 miles
19. On a typical day, how do you USUALLY travel? (Check one only)	1 <input type="checkbox"/> Walk 2 <input type="checkbox"/> Bicycle 3 <input type="checkbox"/> Motorcycle 4 <input type="checkbox"/> Sub-compact or compact car 5 <input type="checkbox"/> Mid-size or full-size car 6 <input type="checkbox"/> Truck or van 7 <input type="checkbox"/> Bus, subway, or train 8 <input type="checkbox"/> Mostly stay home
20. What percent of time do you usually buckle your safety belt when driving or riding?	<input type="text"/> %
21. On the average, how close to the speed limit do you usually drive?	1 <input type="checkbox"/> Within 5 mph of limit 2 <input type="checkbox"/> 6-10 mph over limit 3 <input type="checkbox"/> 11-15 mph over limit 4 <input type="checkbox"/> More than 15 mph over limit
22. How many times in the last month did you drive or ride when the driver had perhaps too much alcohol to drink?	<input type="text"/> times last month
23. How many drinks of an alcoholic beverage do you have in a typical week?	(Write the number of each type of drink) <input type="text"/> Bottles or cans of beer <input type="text"/> Glasses of wine <input type="text"/> Wine coolers <input type="text"/> Mixed drinks or shots of liquor

➤ MEN GO TO QUESTION 33

Form C

WOMEN ONLY	
24. At what age did you have your first menstrual period?	<input type="text"/> years old
25. How old were you when your first child was born?	<input type="text"/> years old (If no children, write 0)
26. How long has it been since your last breast x-ray (mammogram)?	1 <input type="checkbox"/> Less than 1 year ago 2 <input type="checkbox"/> 1 year ago 3 <input type="checkbox"/> 2 years ago 4 <input type="checkbox"/> 3 or more years ago 5 <input type="checkbox"/> Never
27. How many women in your natural family (mother and sisters only) have had breast cancer?	<input type="text"/> Women
28. Have you had a hysterectomy operation?	1 <input type="checkbox"/> Yes 2 <input type="checkbox"/> No 3 <input type="checkbox"/> Not sure
29. How long has it been since you had a pap smear test?	1 <input type="checkbox"/> Less than 1 year ago 2 <input type="checkbox"/> 1 year ago 3 <input type="checkbox"/> 2 years ago 4 <input type="checkbox"/> 3 or more years ago 5 <input type="checkbox"/> Never
★30. How often do you examine your breasts for lumps?	1 <input type="checkbox"/> Monthly 2 <input type="checkbox"/> Once every few months 3 <input type="checkbox"/> Rarely or never
★31. About how long has it been since you had your breasts examined by a physician or nurse?	1 <input type="checkbox"/> Less than 1 year ago 2 <input type="checkbox"/> 1 year ago 3 <input type="checkbox"/> 2 years ago 4 <input type="checkbox"/> 3 or more years ago 5 <input type="checkbox"/> Never
★32. About how long has it been since you had a rectal exam?	1 <input type="checkbox"/> Less than 1 year ago 2 <input type="checkbox"/> 1 year ago 3 <input type="checkbox"/> 2 years ago 4 <input type="checkbox"/> 3 or more years ago 5 <input type="checkbox"/> Never
WOMEN GO TO QUESTION 34	
MEN ONLY	
★33. About how long has it been since you had a rectal or prostate exam?	1 <input type="checkbox"/> Less than 1 year ago 2 <input type="checkbox"/> 1 year ago 3 <input type="checkbox"/> 2 years ago 4 <input type="checkbox"/> 3 or more years ago 5 <input type="checkbox"/> Never
MEN CONTINUE ON QUES. 34	
★34. How many times in the last year did you witness or become involved in a violent fight or attack where there was a good chance of a serious injury to someone?	1 <input type="checkbox"/> 4 or more times 2 <input type="checkbox"/> 2 or 3 times 3 <input type="checkbox"/> 1 time or never 4 <input type="checkbox"/> Not sure
★35. Considering your age, how would you describe your overall physical health?	1 <input type="checkbox"/> Excellent 2 <input type="checkbox"/> Good 3 <input type="checkbox"/> Fair 4 <input type="checkbox"/> Poor

★ Questions with a star symbol are not used by the computer to calculate your risks; however, answering these questions may help you plan a more healthy lifestyle.

Form C

★36. In an average week, how many times do you engage in physical activity (exercise or work which lasts at least 20 minutes without stopping and which is hard enough to make you breathe heavier and your heart beat faster)?	1 <input type="checkbox"/> Less than 1 time per week 2 <input type="checkbox"/> 1 or 2 times per week 3 <input type="checkbox"/> At least 3 times per week
★37. If you ride a motorcycle or all-terrain vehicle (ATV), what percent of the time do you wear a helmet?	1 <input type="checkbox"/> 75% to 100% 2 <input type="checkbox"/> 25% to 74 % 3 <input type="checkbox"/> Less than 25% 4 <input type="checkbox"/> Does not apply to me
★38. Do you eat some food every day that is high in fiber, such as whole grain bread, cereal, fresh fruits or vegetables?	1 <input type="checkbox"/> Yes 2 <input type="checkbox"/> No
★39. Do you eat foods every day that are high in cholesterol or fat, such as fatty meat, cheese, fried foods, or eggs?	1 <input type="checkbox"/> Yes 2 <input type="checkbox"/> No
★40. In general, how satisfied are you with your life?	1 <input type="checkbox"/> Mostly satisfied 2 <input type="checkbox"/> Partly satisfied 3 <input type="checkbox"/> Not satisfied
★41. Have you suffered a personal loss or misfortune in the past year that had a serious impact on your life? (For example, a job loss, disability, separation, jail term, or the death of someone close to you.)	1 <input type="checkbox"/> Yes, 1 serious loss or misfortune 2 <input type="checkbox"/> Yes, 2 or more 3 <input type="checkbox"/> No
★42a. Race	1 <input type="checkbox"/> Aleutian, Alaska native, Eskimo or American Indian 2 <input type="checkbox"/> Asian 3 <input type="checkbox"/> Black 4 <input type="checkbox"/> Pacific Islander 5 <input type="checkbox"/> White 6 <input type="checkbox"/> Other 7 <input type="checkbox"/> Don't know
★42b. Are you of Hispanic origin, such as Mexican-American, Puerto Rican, or Cuban?	1 <input type="checkbox"/> Yes 2 <input type="checkbox"/> No
★43. What is the highest grade you completed in school?	1 <input type="checkbox"/> Grade school or less 2 <input type="checkbox"/> Some high school 3 <input type="checkbox"/> High school graduate 4 <input type="checkbox"/> Some college 5 <input type="checkbox"/> College graduate 6 <input type="checkbox"/> Post graduate or professional degree

The HEALTHIER PEOPLE NETWORK, Inc.

Participant's Guide to Interpreting the HEALTH RISK APPRAISAL REPORT

Unhealthy habits lead to early death or chronic illness. Every year, 1.3 million people in the United States die prematurely from conditions which could be prevented or delayed. This Health Risk Appraisal may help you avoid becoming one of these statistics by giving you a picture of how your health risks relate to your particular characteristics and habits.

WHAT IS A HEALTH RISK APPRAISAL?

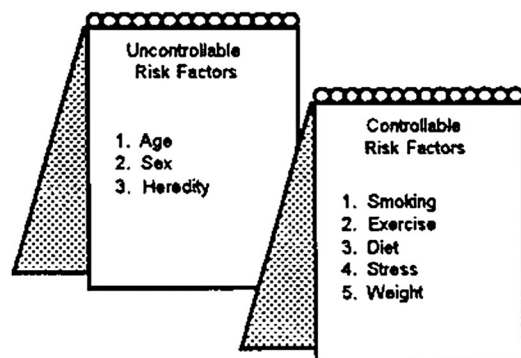

The Health Risk Appraisal is an estimation of your risk of dying in the next ten years from each of 42 causes of death. The twelve most important of these are printed individually on your report. The others are grouped together and printed as "All Other". These risks are calculated by a computer program which compares your characteristics to national mortality statistics using equations developed by epidemiologists. This Health Risk Appraisal does not tell you how long you will live, nor does it diagnose or treat disease.

RISK FACTORS

Most chronic diseases develop slowly in the presence of certain risk factors. Risk factors are either controllable or uncontrollable. Controllable risk factors include lifestyle habits that you can change such as smoking, exercise, diet, stress and weight. Uncontrollable risk factors include items such as your age and sex, and the health history of your family.

The Health Risk Appraisal uses both controllable and uncontrollable risk factors in calculating health risks. Your focus, however, should be on controllable risk factors.

To help you decide which controllable risk factors to concentrate on, the Health Risk Appraisal identifies your controllable risk factors for each cause of death. Your report gives you an idea of their relative importance by indicating the number of risk years you could gain by controlling these factors.

To identify your personal risks, to see what the numbers on your report mean, and to learn which risk factors you need to control, turn the page.

Participant's Guide to Interpreting the Health Risk Appraisal Report Form

An example using a 48 year old woman: 5'7", 250 mg/dl cholesterol, 160/95 BP, 30 cigarettes/day, 9 drinks/week, seat belt use 15%, drives 4,000 mi/yr, menarche 13 yrs, 1st child at 32

1	YOUR RISK AGE	NOW 68.91	TARGET 60.82	← Risks are elevated due to diabetes and family breast cancer
----------	------------------	--------------	-----------------	---------------------------------------------------------------

Mrs. Lopez **6**
Female Age 48

THIS REPORT CONTAINS ESTIMATES DUE TO MISSING ITEMS, INCLUDING THE FOLLOWING **7**
Cigars per day. Pipes smoked per day. Smokeless tobacco.

Many serious injuries and health problems can be prevented. Your Health Risk Appraisal lists factors you can change to lower your risk. For causes of death that are not directly computable, the report uses the average risk for a person of your age and sex.

MOST COMMON CAUSES OF DEATH	NUMBER OF DEATHS IN NEXT 10 YEARS FOR 1000 WOMEN AGE 48			MODIFIABLE RISK FACTORS
	2 YOUR GROUP	3 TARGET	4 POPULATION AVERAGE	
Heart Attack	104	22	5	Avoid Tobacco Use, Blood Pressure, Cholesterol Level, 8 HDL Level, Weight A Low-Fat Diet and Regular Exercise Might Reduce Risk Control Your Weight and Follow Your Doctor's Advice Avoid Tobacco Use, Blood Pressure Avoid Tobacco Use Avoid Tobacco Use " A High-Fiber and Low-Fat Diet Might Reduce Risk Get Regular Exams Avoid Tobacco Use Continue to Avoid Heavy Drinking * = Average Value Used
Breast Cancer	42	42	5	
Diabetes Mellitus	21	21	1	
Stroke	19	5	2	
Lung Cancer	13	7	5	
Emphysema/Bronchitis	2	<1	1	
Kidney Failure	2	2	<1	
Colon Cancer	1*	1*	1	
Ovary Cancer	1*	1*	1	
Pancreas Cancer	1	1	1	
Cirrhosis of Liver	1	1	1	
All Other	21	19	20	
TOTAL:	228	122	46	Deaths in Next 10 Years Per 1,000 Women, age 48

For Height 5'7" and Large Frame, 175 pounds is about 20% Overweight. Desirable Weight Range: 139-153 **9**

GOOD HABITS 5	TO IMPROVE YOUR RISK PROFILE:	RISK YEARS GAINED 10
+ Regular pap tests	- Quit smoking <estimate>	3.57
+ Safe driving speed	- Lower your blood pressure	1.88
	- Lower your cholesterol	1.56
	- Improve your HDL level	.92
	- Bring your weight to desirable range	.13
	- Always wear your seat belts	.03

Total Risk Years you could gain = 8.09 **11**

- 1 Your **RISK AGE** compares your total risk from all causes of death to the total risk of those who are your age and sex. It gives you an idea of your risks compared with the population average in terms of an age. Your **TARGET** risk age indicates what your risk age would be if you made the changes recommended below.
- 2 The numbers in the **YOUR GROUP** column refer to the number of predicted deaths for each cause of death in the next 10 years from among 1,000 people who have habits and characteristics just like you.
- 3 The numbers in the **TARGET** column refer to those predicted to die in the next 10 years from among 1,000 people who have characteristics just like you, but who have adopted the habits recommended below in the **TO IMPROVE YOUR RISK PROFILE** box.
- 4 The numbers in the **POPULATION AVERAGE** column refer to the national average of deaths in 10 years for people of your same sex and age.
- 5 This box lists your **GOOD HABITS**. Congratulations!
- 6 Your I.D., sex and actual age is here.
- 7 If you did not answer items on the questionnaire which are used for calculations, these missing items will be listed here. The computer substitutes national average values for the items you left blank and calculates your risks with these numbers.
- 8 Beside each cause of death are listed the modifiable risk factors which your questionnaire responses indicate you need to work on. The list is specific for you unless you have none of the risk factors or if there are no known risk factors for a cause of death. In this case, a short statement of general advice related to risk reduction is printed.
- 9 Your **DESIRABLE WEIGHT RANGE** is based on your height and frame size.

- 10 In this box is our prescription to lengthen your life and a prediction of how many **RISK YEARS** you can expect to gain by adopting these health habits.
- 11 The **TOTAL RISK YEARS** you could gain by making these habit changes are printed here. This is also the difference between your **Risk Age Now** and your **Target Age**. Also important are the recommendations on page 2.

Page 2 of your report lists some **ROUTINE PREVENTIVE SERVICES** that are specific for people of your age and sex. The report also lists some **GENERAL RECOMMENDATIONS FOR EVERYONE**. For the 48 year old woman used in this example, the following messages were printed:

ROUTINE PREVENTIVE SERVICES FOR WOMEN YOUR AGE Blood Pressure and Cholesterol test Pap Smear test Breast cancer screening (check with your doctor or clinic) Rectal exam (or Sigmoidoscopy) Eye exam for glaucoma Dental Exam Tetanus-Diphtheria booster shot (every 10 years)	GENERAL RECOMMENDATIONS FOR EVERYONE <ul style="list-style-type: none">• Exercise briskly for 15-30 minutes at least three times a week.• Use good eating habits by choosing a variety of foods that are low in fat and high in fiber.• Learn to recognize and handle stress - get help if you need it.
------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

The standard report can also print health education messages.

HEALTH RISK APPRAISAL LIMITS

Health Risk Appraisal is an educational tool. It does not take into consideration whether or not you already have a medical condition and it does not consider rare diseases and other health problems which are not fatal but can limit your enjoyment of life, such as arthritis.

Health Risk Appraisal does not predict when you will die or specifically what diseases you might get. It does tell you, however, your chances of getting a disease relative to a large group of people your age and sex, who answered the questionnaire just as you did.

Health Risk Appraisal does take into consideration lifestyle factors which account for a large number of premature deaths. When you become familiar with your particular risks, you can then do something about them!

CHOOSING A HABIT TO WORK ON

Health Risk Appraisal is intended to encourage you to work on habits you can change by showing you which behaviors should have top priority. If you can't change the behavior that is at the top of your list (the one that would give the largest number of **RISK YEARS GAINED**), try to concentrate on changing the next highest one. You don't have to change your entire lifestyle overnight. In fact, trying to change too many habits at once is probably the quickest way to become discouraged and fail.

MAKE A PLAN FOR CHANGING HABITS

Make a plan for changing the habit you choose as your first priority, write it down and keep it in sight. Be prepared for temptation! Observe the time, situation, or place that most often triggers your unhealthy habit and be ready to combat it when it appears. Let family and friends know of your goals and ask for their encouragement.

REWARD YOURSELF

Rewards are an important part of changing behavior. Give yourself a reasonable reward when you accomplish your goal. Don't eat half a gallon of ice cream after losing 10 pounds! Choose a healthy and enjoyable reward and you'll be on the road to good health!

2013 State and Local Youth Risk Behavior Survey

This survey is about health behavior. It has been developed so you can tell us what you do that may affect your health. The information you give will be used to improve health education for young people like yourself.

DO NOT write your name on this survey. The answers you give will be kept private. No one will know what you write. Answer the questions based on what you really do.

Completing the survey is voluntary. Whether or not you answer the questions will not affect your grade in this class. If you are not comfortable answering a question, just leave it blank.

The questions that ask about your background will be used only to describe the types of students completing this survey. The information will not be used to find out your name. No names will ever be reported.

Make sure to read every question. Fill in the ovals completely. When you are finished, follow the instructions of the person giving you the survey.

Thank you very much for your help.

DIRECTIONS

- Use a #2 pencil only.
- Make dark marks.
- Fill in a response like this: (A) (B) (C) (D)
- If you change your answer, erase your old answer completely.

1. How old are you?

- (A) 12 years old or younger
- (B) 13 years old
- (C) 14 years old
- (D) 15 years old
- (E) 16 years old
- (F) 17 years old
- (G) 18 years old or older

2. What is your sex?

- (A) Female
- (B) Male

3. In what grade are you?

- (A) 9th grade
- (B) 10th grade
- (C) 11th grade
- (D) 12th grade
- (E) Ungraded or other grade

4. Are you Hispanic or Latino?

- (A) Yes
- (B) No

5. What is your race? (Select one or more responses.)

- (A) American Indian or Alaska Native
- (B) Asian
- (C) Black or African American
- (D) Native Hawaiian or Other Pacific Islander
- (E) White

6. How tall are you without your shoes on?

Directions: Write your height in the shaded blank boxes. Fill in the matching oval below each number.

Example

Height		Height	
Feet	Inches	Feet	Inches
5	7		
(3)	(0)	(3)	(0)
(4)	(1)	(4)	(1)
	(2)	(5)	(2)
(6)	(3)	(6)	(3)
(7)	(4)	(7)	(4)
	(5)		(5)
	(6)		(6)
			(7)
	(8)		(8)
	(9)		(9)
	(10)		(10)
	(11)		(11)

7. How much do you weigh without your shoes on?

Directions: Write your weight in the shaded blank boxes.

Fill in the matching oval below each number.

Example

Weight			Weight		
Pounds			Pounds		
1	5	2			
<input type="radio"/> 0	<input type="radio"/> 0	<input type="radio"/> 0	<input type="radio"/> 0	<input type="radio"/> 0	<input type="radio"/> 0
<input checked="" type="radio"/> 1	<input type="radio"/> 1	<input type="radio"/> 1	<input type="radio"/> 1	<input type="radio"/> 1	<input type="radio"/> 1
<input type="radio"/> 2	<input type="radio"/> 2	<input checked="" type="radio"/> 2	<input type="radio"/> 2	<input type="radio"/> 2	<input type="radio"/> 2
<input type="radio"/> 3	<input type="radio"/> 3	<input type="radio"/> 3	<input type="radio"/> 3	<input type="radio"/> 3	<input type="radio"/> 3
	<input type="radio"/> 4	<input type="radio"/> 4		<input type="radio"/> 4	<input type="radio"/> 4
	<input checked="" type="radio"/> 5	<input type="radio"/> 5		<input type="radio"/> 5	<input type="radio"/> 5
	<input type="radio"/> 6	<input type="radio"/> 6		<input type="radio"/> 6	<input type="radio"/> 6
	<input type="radio"/> 7	<input type="radio"/> 7		<input type="radio"/> 7	<input type="radio"/> 7
	<input type="radio"/> 8	<input type="radio"/> 8		<input type="radio"/> 8	<input type="radio"/> 8
	<input type="radio"/> 9	<input type="radio"/> 9		<input type="radio"/> 9	<input type="radio"/> 9

The next 5 questions ask about safety.

8. When you rode a bicycle during the past 12 months, how often did you wear a helmet?
- (A) I did not ride a bicycle during the past 12 months
 (B) Never wore a helmet
 (C) Rarely wore a helmet
 (D) Sometimes wore a helmet
 (E) Most of the time wore a helmet
 (F) Always wore a helmet
9. How often do you wear a seat belt when riding in a car driven by someone else?
- (A) Never
 (B) Rarely
 (C) Sometimes
 (D) Most of the time
 (E) Always
10. During the past 30 days, how many times did you ride in a car or other vehicle driven by someone who had been drinking alcohol?
- (A) 0 times
 (B) 1 time
 (C) 2 or 3 times
 (D) 4 or 5 times
 (E) 6 or more times

11. During the past 30 days, how many times did you drive a car or other vehicle when you had been drinking alcohol?

(A) I did not drive a car or other vehicle during the past 30 days
 (B) 0 times
 (C) 1 time
 (D) 2 or 3 times
 (E) 4 or 5 times
 (F) 6 or more times

12. During the past 30 days, on how many days did you text or e-mail while driving a car or other vehicle?

(A) I did not drive a car or other vehicle during the past 30 days
 (B) 0 days
 (C) 1 or 2 days
 (D) 3 to 5 days
 (E) 6 to 9 days
 (F) 10 to 19 days
 (G) 20 to 29 days
 (H) All 30 days

The next 11 questions ask about violence-related behaviors.

13. During the past 30 days, on how many days did you carry a weapon such as a gun, knife, or club?

(A) 0 days
 (B) 1 day
 (C) 2 or 3 days
 (D) 4 or 5 days
 (E) 6 or more days

14. During the past 30 days, on how many days did you carry a gun?

(A) 0 days
 (B) 1 day
 (C) 2 or 3 days
 (D) 4 or 5 days
 (E) 6 or more days

15. During the past 30 days, on how many days did you carry a weapon such as a gun, knife, or club on school property?

(A) 0 days
 (B) 1 day
 (C) 2 or 3 days
 (D) 4 or 5 days
 (E) 6 or more days

16. During the past 30 days, on how many days did you not go to school because you felt you would be unsafe at school or on your way to or from school?

(A) 0 days
 (B) 1 day
 (C) 2 or 3 days
 (D) 4 or 5 days
 (E) 6 or more days

17. During the past 12 months, how many times has someone threatened or injured you with a weapon such as a gun, knife, or club **on school property**?
- (A) 0 times
(B) 1 time
(C) 2 or 3 times
(D) 4 or 5 times
(E) 6 or 7 times
(F) 8 or 9 times
(G) 10 or 11 times
(H) 12 or more times
18. During the past 12 months, how many times were you in a physical fight?
- (A) 0 times
(B) 1 time
(C) 2 or 3 times
(D) 4 or 5 times
(E) 6 or 7 times
(F) 8 or 9 times
(G) 10 or 11 times
(H) 12 or more times
19. During the past 12 months, how many times were you in a physical fight in which you were injured and had to be treated by a doctor or nurse?
- (A) 0 times
(B) 1 time
(C) 2 or 3 times
(D) 4 or 5 times
(E) 6 or more times
20. During the past 12 months, how many times were you in a physical fight **on school property**?
- (A) 0 times
(B) 1 time
(C) 2 or 3 times
(D) 4 or 5 times
(E) 6 or 7 times
(F) 8 or 9 times
(G) 10 or 11 times
(H) 12 or more times
21. Have you ever been physically forced to have sexual intercourse when you did not want to?
- (A) Yes
(B) No
22. During the past 12 months, how many times did someone you were dating or going out with physically hurt you on purpose? (Count such things as being hit, slammed into something, or injured with an object or weapon.)
- (A) I did not date or go out with anyone during the past 12 months
(B) 0 times
(C) 1 time
(D) 2 or 3 times
(E) 4 or 5 times
(F) 6 or more times
23. During the past 12 months, how many times did someone you were dating or going out with force you to do sexual things that you did not want to do? (Count such things as kissing, touching, or being physically forced to have sexual intercourse.)
- (A) I did not date or go out with anyone during the past 12 months
(B) 0 times
(C) 1 time
(D) 2 or 3 times
(E) 4 or 5 times
(F) 6 or more times
- The next 2 questions ask about bullying. Bullying is when 1 or more students tease, threaten, spread rumors about, hit, shove, or hurt another student over and over again. It is not bullying when 2 students of about the same strength or power argue or fight or tease each other in a friendly way.**
24. During the past 12 months, have you ever been bullied **on school property**?
- (A) Yes
(B) No
25. During the past 12 months, have you ever been **electronically** bullied? (Count being bullied through e-mail, chat rooms, instant messaging, websites, or texting.)
- (A) Yes
(B) No
- The next 5 questions ask about sad feelings and attempted suicide. Sometimes people feel so depressed about the future that they may consider attempting suicide, that is, taking some action to end their own life.**
26. During the past 12 months, did you ever feel so sad or hopeless almost every day for **two weeks or more in a row** that you stopped doing some usual activities?
- (A) Yes
(B) No
27. During the past 12 months, did you ever **seriously** consider attempting suicide?
- (A) Yes
(B) No
28. During the past 12 months, did you make a plan about how you would attempt suicide?
- (A) Yes
(B) No
29. During the past 12 months, how many times did you actually attempt suicide?
- (A) 0 times
(B) 1 time
(C) 2 or 3 times
(D) 4 or 5 times
(E) 6 or more times

30. **If you attempted suicide** during the past 12 months, did any attempt result in an injury, poisoning, or overdose that had to be treated by a doctor or nurse?

(A) **I did not attempt suicide** during the past 12 months
 (B) Yes
 (C) No

The next 10 questions ask about tobacco use.

31. Have you ever tried cigarette smoking, even one or two puffs?

(A) Yes
 (B) No

32. How old were you when you smoked a whole cigarette for the first time?

(A) I have never smoked a whole cigarette
 (B) 8 years old or younger
 (C) 9 or 10 years old
 (D) 11 or 12 years old
 (E) 13 or 14 years old
 (F) 15 or 16 years old
 (G) 17 years old or older

33. During the past 30 days, on how many days did you smoke cigarettes?

(A) 0 days
 (B) 1 or 2 days
 (C) 3 to 5 days
 (D) 6 to 9 days
 (E) 10 to 19 days
 (F) 20 to 29 days
 (G) All 30 days

34. During the past 30 days, on the days you smoked, how many cigarettes did you smoke **per day**?

(A) I did not smoke cigarettes during the past 30 days
 (B) Less than 1 cigarette per day
 (C) 1 cigarette per day
 (D) 2 to 5 cigarettes per day
 (E) 6 to 10 cigarettes per day
 (F) 11 to 20 cigarettes per day
 (G) More than 20 cigarettes per day

35. During the past 30 days, how did you **usually** get your own cigarettes? (Select only **one** response.)

(A) I did not smoke cigarettes during the past 30 days
 (B) I bought them in a store such as a convenience store, supermarket, discount store, or gas station
 (C) I bought them from a vending machine
 (D) I gave someone else money to buy them for me
 (E) I borrowed (or bummed) them from someone else
 (F) A person 18 years old or older gave them to me
 (G) I took them from a store or family member
 (H) I got them some other way

36. During the past 30 days, on how many days did you smoke cigarettes **on school property**?

(A) 0 days
 (B) 1 or 2 days
 (C) 3 to 5 days
 (D) 6 to 9 days
 (E) 10 to 19 days
 (F) 20 to 29 days
 (G) All 30 days

37. Have you ever smoked cigarettes daily, that is, at least one cigarette every day for 30 days?

(A) Yes
 (B) No

38. During the past 12 months, did you ever try **to quit** smoking cigarettes?

(A) I did not smoke during the past 12 months
 (B) Yes
 (C) No

39. During the past 30 days, on how many days did you use **chewing tobacco, snuff, or dip**, such as Redman, Levi Garrett, Beechnut, Skoal, Skoal Bandits, or Copenhagen?

(A) 0 days
 (B) 1 or 2 days
 (C) 3 to 5 days
 (D) 6 to 9 days
 (E) 10 to 19 days
 (F) 20 to 29 days
 (G) All 30 days

40. During the past 30 days, on how many days did you smoke **cigars, cigarillos, or little cigars**?

(A) 0 days
 (B) 1 or 2 days
 (C) 3 to 5 days
 (D) 6 to 9 days
 (E) 10 to 19 days
 (F) 20 to 29 days
 (G) All 30 days

The next 6 questions ask about drinking alcohol. This includes drinking beer, wine, wine coolers, and liquor such as rum, gin, vodka, or whiskey. For these questions, drinking alcohol does not include drinking a few sips of wine for religious purposes.

41. During your life, on how many days have you had at least one drink of alcohol?

(A) 0 days
 (B) 1 or 2 days
 (C) 3 to 9 days
 (D) 10 to 19 days
 (E) 20 to 39 days
 (F) 40 to 99 days
 (G) 100 or more days

42. How old were you when you had your first drink of alcohol other than a few sips?

(A) I have never had a drink of alcohol other than a few sips
 (B) 8 years old or younger
 (C) 9 or 10 years old
 (D) 11 or 12 years old
 (E) 13 or 14 years old
 (F) 15 or 16 years old
 (G) 17 years old or older

43. During the past 30 days, on how many days did you have at least one drink of alcohol?
- (A) 0 days
 - (B) 1 or 2 days
 - (C) 3 to 5 days
 - (D) 6 to 9 days
 - (E) 10 to 19 days
 - (F) 20 to 29 days
 - (G) All 30 days
44. During the past 30 days, on how many days did you have 5 or more drinks of alcohol in a row, that is, within a couple of hours?
- (A) 0 days
 - (B) 1 day
 - (C) 2 days
 - (D) 3 to 5 days
 - (E) 6 to 9 days
 - (F) 10 to 19 days
 - (G) 20 or more days
45. During the past 30 days, what is the largest number of alcoholic drinks you had in a row, that is, within a couple of hours?
- (A) I did not drink alcohol during the past 30 days
 - (B) 1 or 2 drinks
 - (C) 3 drinks
 - (D) 4 drinks
 - (E) 5 drinks
 - (F) 6 or 7 drinks
 - (G) 8 or 9 drinks
 - (H) 10 or more drinks
46. During the past 30 days, how did you **usually** get the alcohol you drank?
- (A) I did not drink alcohol during the past 30 days
 - (B) I bought it in a store such as a liquor store, convenience store, supermarket, discount store, or gas station
 - (C) I bought it at a restaurant, bar, or club
 - (D) I bought it at a public event such as a concert or sporting event
 - (E) I gave someone else money to buy it for me
 - (F) Someone gave it to me
 - (G) I took it from a store or family member
 - (H) I got it some other way
- The next 3 questions ask about marijuana use. Marijuana also is called grass or pot.**
47. During your life, how many times have you used marijuana?
- (A) 0 times
 - (B) 1 or 2 times
 - (C) 3 to 9 times
 - (D) 10 to 19 times
 - (E) 20 to 39 times
 - (F) 40 to 99 times
 - (G) 100 or more times
48. How old were you when you tried marijuana for the first time?
- (A) I have never tried marijuana
 - (B) 8 years old or younger
 - (C) 9 or 10 years old
 - (D) 11 or 12 years old
 - (E) 13 or 14 years old
 - (F) 15 or 16 years old
 - (G) 17 years old or older
49. During the past 30 days, how many times did you use marijuana?
- (A) 0 times
 - (B) 1 or 2 times
 - (C) 3 to 9 times
 - (D) 10 to 19 times
 - (E) 20 to 39 times
 - (F) 40 or more times
- The next 9 questions ask about other drugs.**
50. During your life, how many times have you used **any** form of cocaine, including powder, crack, or freebase?
- (A) 0 times
 - (B) 1 or 2 times
 - (C) 3 to 9 times
 - (D) 10 to 19 times
 - (E) 20 to 39 times
 - (F) 40 or more times
51. During your life, how many times have you sniffed glue, breathed the contents of aerosol spray cans, or inhaled any paints or sprays to get high?
- (A) 0 times
 - (B) 1 or 2 times
 - (C) 3 to 9 times
 - (D) 10 to 19 times
 - (E) 20 to 39 times
 - (F) 40 or more times
52. During your life, how many times have you used **heroin** (also called smack, junk, or China White)?
- (A) 0 times
 - (B) 1 or 2 times
 - (C) 3 to 9 times
 - (D) 10 to 19 times
 - (E) 20 to 39 times
 - (F) 40 or more times
53. During your life, how many times have you used **methamphetamines** (also called speed, crystal, crank, or ice)?
- (A) 0 times
 - (B) 1 or 2 times
 - (C) 3 to 9 times
 - (D) 10 to 19 times
 - (E) 20 to 39 times
 - (F) 40 or more times

54. During your life, how many times have you used **ecstasy** (also called MDMA)?
- (A) 0 times
 - (B) 1 or 2 times
 - (C) 3 to 9 times
 - (D) 10 to 19 times
 - (E) 20 to 39 times
 - (F) 40 or more times
55. During your life, how many times have you taken **steroid pills or shots** without a doctor's prescription?
- (A) 0 times
 - (B) 1 or 2 times
 - (C) 3 to 9 times
 - (D) 10 to 19 times
 - (E) 20 to 39 times
 - (F) 40 or more times
56. During your life, how many times have you taken a **prescription drug** (such as OxyContin, Percocet, Vicodin, codeine, Adderall, Ritalin, or Xanax) without a doctor's prescription?
- (A) 0 times
 - (B) 1 or 2 times
 - (C) 3 to 9 times
 - (D) 10 to 19 times
 - (E) 20 to 39 times
 - (F) 40 or more times
57. During your life, how many times have you used a needle to inject any **illegal** drug into your body?
- (A) 0 times
 - (B) 1 time
 - (C) 2 or more times
58. During the past 12 months, has anyone offered, sold, or given you an illegal drug **on school property**?
- (A) Yes
 - (B) No
- The next 7 questions ask about sexual behavior.**
59. Have you ever had sexual intercourse?
- (A) Yes
 - (B) No
60. How old were you when you had sexual intercourse for the first time?
- (A) I have never had sexual intercourse
 - (B) 11 years old or younger
 - (C) 12 years old
 - (D) 13 years old
 - (E) 14 years old
 - (F) 15 years old
 - (G) 16 years old
 - (H) 17 years old or older
61. During your life, with how many people have you had sexual intercourse?
- (A) I have never had sexual intercourse
 - (B) 1 person
 - (C) 2 people
 - (D) 3 people
 - (E) 4 people
 - (F) 5 people
 - (G) 6 or more people
62. During the past 3 months, with how many people did you have sexual intercourse?
- (A) I have never had sexual intercourse
 - (B) I have had sexual intercourse, but not during the past 3 months
 - (C) 1 person
 - (D) 2 people
 - (E) 3 people
 - (F) 4 people
 - (G) 5 people
 - (H) 6 or more people
63. Did you drink alcohol or use drugs before you had sexual intercourse the **last time**?
- (A) I have never had sexual intercourse
 - (B) Yes
 - (C) No
64. The **last time** you had sexual intercourse, did you or your partner use a condom?
- (A) I have never had sexual intercourse
 - (B) Yes
 - (C) No
65. The **last time** you had sexual intercourse, what **one** method did you or your partner use to **prevent pregnancy**? (Select only **one** response.)
- (A) I have never had sexual intercourse
 - (B) No method was used to prevent pregnancy
 - (C) Birth control pills
 - (D) Condoms
 - (E) An IUD (such as Mirena or ParaGard) or implant (such as Implanon or Nexplanon)
 - (F) A shot (such as Depo-Provera), patch (such as Ortho Evra), or birth control ring (such as NuvaRing)
 - (G) Withdrawal or some other method
 - (H) Not sure
- The next 5 questions ask about body weight.**
66. How do **you** describe your weight?
- (A) Very underweight
 - (B) Slightly underweight
 - (C) About the right weight
 - (D) Slightly overweight
 - (E) Very overweight
67. Which of the following are you trying to do about your weight?
- (A) **Lose** weight
 - (B) **Gain** weight
 - (C) **Stay** the same weight
 - (D) I am **not trying to do anything** about my weight
68. During the past 30 days, did you **go without eating for 24 hours or more** (also called fasting) to lose weight or to keep from gaining weight?
- (A) Yes
 - (B) No
69. During the past 30 days, did you **take any diet pills, powders, or liquids** without a doctor's advice to lose weight or to keep from gaining weight? (Do **not** count meal replacement products such as Slim Fast.)
- (A) Yes
 - (B) No

70. During the past 30 days, did you **vomit or take laxatives** to lose weight or to keep from gaining weight?
- (A) Yes
 - (B) No
- The next 9 questions ask about food you ate or drank during the past 7 days. Think about all the meals and snacks you had from the time you got up until you went to bed. Be sure to include food you ate at home, at school, at restaurants, or anywhere else.**
71. During the past 7 days, how many times did you drink **100% fruit juices** such as orange juice, apple juice, or grape juice? (Do **not** count punch, Kool-Aid, sports drinks, or other fruit-flavored drinks.)
- (A) I did not drink 100% fruit juice during the past 7 days
 - (B) 1 to 3 times during the past 7 days
 - (C) 4 to 6 times during the past 7 days
 - (D) 1 time per day
 - (E) 2 times per day
 - (F) 3 times per day
 - (G) 4 or more times per day
72. During the past 7 days, how many times did you eat **fruit**? (Do **not** count fruit juice.)
- (A) I did not eat fruit during the past 7 days
 - (B) 1 to 3 times during the past 7 days
 - (C) 4 to 6 times during the past 7 days
 - (D) 1 time per day
 - (E) 2 times per day
 - (F) 3 times per day
 - (G) 4 or more times per day
73. During the past 7 days, how many times did you eat **green salad**?
- (A) I did not eat green salad during the past 7 days
 - (B) 1 to 3 times during the past 7 days
 - (C) 4 to 6 times during the past 7 days
 - (D) 1 time per day
 - (E) 2 times per day
 - (F) 3 times per day
 - (G) 4 or more times per day
74. During the past 7 days, how many times did you eat **potatoes**? (Do **not** count french fries, fried potatoes, or potato chips.)
- (A) I did not eat potatoes during the past 7 days
 - (B) 1 to 3 times during the past 7 days
 - (C) 4 to 6 times during the past 7 days
 - (D) 1 time per day
 - (E) 2 times per day
 - (F) 3 times per day
 - (G) 4 or more times per day
75. During the past 7 days, how many times did you eat **carrots**?
- (A) I did not eat carrots during the past 7 days
 - (B) 1 to 3 times during the past 7 days
 - (C) 4 to 6 times during the past 7 days
 - (D) 1 time per day
 - (E) 2 times per day
 - (F) 3 times per day
 - (G) 4 or more times per day
76. During the past 7 days, how many times did you eat **other vegetables**? (Do **not** count green salad, potatoes, or carrots.)
- (A) I did not eat other vegetables during the past 7 days
 - (B) 1 to 3 times during the past 7 days
 - (C) 4 to 6 times during the past 7 days
 - (D) 1 time per day
 - (E) 2 times per day
 - (F) 3 times per day
 - (G) 4 or more times per day
77. During the past 7 days, how many times did you drink a **can, bottle, or glass of soda or pop**, such as Coke, Pepsi, or Sprite? (Do **not** count diet soda or diet pop.)
- (A) I did not drink soda or pop during the past 7 days
 - (B) 1 to 3 times during the past 7 days
 - (C) 4 to 6 times during the past 7 days
 - (D) 1 time per day
 - (E) 2 times per day
 - (F) 3 times per day
 - (G) 4 or more times per day
78. During the past 7 days, how many **glasses of milk** did you drink? (Count the milk you drank in a glass or cup, from a carton, or with cereal. Count the half pint of milk served at school as equal to one glass.)
- (A) I did not drink milk during the past 7 days
 - (B) 1 to 3 glasses during the past 7 days
 - (C) 4 to 6 glasses during the past 7 days
 - (D) 1 glass per day
 - (E) 2 glasses per day
 - (F) 3 glasses per day
 - (G) 4 or more glasses per day
79. During the past 7 days, on how many days did you eat **breakfast**?
- (A) 0 days
 - (B) 1 day
 - (C) 2 days
 - (D) 3 days
 - (E) 4 days
 - (F) 5 days
 - (G) 6 days
 - (H) 7 days
- The next 5 questions ask about physical activity.**
80. During the past 7 days, on how many days were you physically active for a total of **at least 60 minutes per day**? (Add up all the time you spent in any kind of physical activity that increased your heart rate and made you breathe hard some of the time.)
- (A) 0 days
 - (B) 1 day
 - (C) 2 days
 - (D) 3 days
 - (E) 4 days
 - (F) 5 days
 - (G) 6 days
 - (H) 7 days

81. On an average school day, how many hours do you watch TV?
- ☐ (A) I do not watch TV on an average school day
 - ☐ (B) Less than 1 hour per day
 - ☐ (C) 1 hour per day
 - ☐ (D) 2 hours per day
 - ☐ (E) 3 hours per day
 - ☐ (F) 4 hours per day
 - ☐ (G) 5 or more hours per day
82. On an average school day, how many hours do you play video or computer games or use a computer for something that is not school work? (Count time spent on things such as Xbox, PlayStation, an iPod, an iPad or other tablet, a smartphone, YouTube, Facebook or other social networking tools, and the Internet.)
- ☐ (A) I do not play video or computer games or use a computer for something that is not school work
 - ☐ (B) Less than 1 hour per day
 - ☐ (C) 1 hour per day
 - ☐ (D) 2 hours per day
 - ☐ (E) 3 hours per day
 - ☐ (F) 4 hours per day
 - ☐ (G) 5 or more hours per day
83. In an average week when you are in school, on how many days do you go to physical education (PE) classes?
- ☐ (A) 0 days
 - ☐ (B) 1 day
 - ☐ (C) 2 days
 - ☐ (D) 3 days
 - ☐ (E) 4 days
 - ☐ (F) 5 days
84. During the past 12 months, on how many sports teams did you play? (Count any teams run by your school or community groups.)
- ☐ (A) 0 teams
 - ☐ (B) 1 team
 - ☐ (C) 2 teams
 - ☐ (D) 3 or more teams
- The next 2 questions ask about other health-related topics.**
85. Have you ever been taught about AIDS or HIV infection in school?
- ☐ (A) Yes
 - ☐ (B) No
 - ☐ (C) Not sure
86. Has a doctor or nurse ever told you that you have asthma?
- ☐ (A) Yes
 - ☐ (B) No
 - ☐ (C) Not sure

This is the end of the survey.

Thank you very much for your help.

Flu Pandemics

A pandemic is a global disease outbreak. An influenza pandemic occurs when a new type of influenza virus emerges, for which there is little or no immunity in the human population, begins to cause serious illness and then spreads easily person-to-person worldwide. A pandemic is determined by spread of disease, not its ability to cause death.

NEW FLU VIRUSES

There are three types of flu viruses. Type A viruses are found in many kinds of animals, including ducks, chickens, pigs, and whales, as well as humans. The type B virus widely circulates in humans. Type C has been found in humans, pigs, and dogs and causes mild respiratory infections, but does not spark epidemics.

Influenza virus is one of the most changeable of viruses. Changes may be small and continuous or large and abrupt.

Small, continuous changes happen in type A and type B influenza as the virus makes copies of itself. The process is called *antigenic drift*. The drifting is frequent enough to make the new strain of virus often unrecognizable to the human immune system. For this reason, a new flu vaccine must be produced each year to combat that year's prevalent strains.

Type A influenza also undergoes infrequent and sudden changes, called *antigenic shift*. Antigenic shift occurs when two different flu strains infect the same cell and exchange genetic material. The novel assortment of HA or NA proteins in a shifted virus creates a new influenza A subtype. Because people have little or no immunity to such a new subtype, their appearance tends to coincide with a very severe flu epidemic or pandemic.

CHARACTERISTICS AND CHALLENGES OF A FLU PANDEMIC

1. Rapid Worldwide Spread

- When a pandemic influenza virus emerges, its global spread is considered inevitable.
- Preparedness activities should assume that the entire world population would be susceptible.
- Countries might, through measures such as border closures and travel restrictions, delay arrival of the virus, but cannot stop it.

2. Health Care Systems Overloaded

- Most people have little or no immunity to a pandemic virus. Infection and illness rates soar. A substantial

Seasonal Flu versus Pandemic Flu

Seasonal Flu	Pandemic Flu
Outbreaks follow predictable seasonal patterns; occur annually, usually in winter during the months of January and February, in temperate climates	Occurs rarely (three times in twentieth century)
Usually some immunity built up from previous exposure	No previous exposure; little or no pre-existing immunity
Healthy adults usually not at risk for serious complications; the very young, pregnant women, the elderly, and those with certain underlying health conditions at increased risk for serious complications	Healthy people may be at increased risk for serious complications
Health systems can usually meet public and patient needs	Health systems may be overwhelmed
Vaccine developed based on known flu strains and available for annual flu season	Vaccine probably would not be available in the early stages of a pandemic
Adequate supplies of antivirals are usually available	Effective antivirals may be in limited supply
Average U.S. deaths approximately 36,000/year	Number of deaths could be quite high (e.g., U.S. 1918 death toll approximately 675,000)
Symptoms: fever, cough, runny nose, muscle pain; deaths often caused by complications, such as pneumonia	Symptoms may be more severe and complications more frequent
Generally causes modest impact on society (e.g., some school closings, encouragement of people who are sick to stay home)	May cause major impact on society (e.g., widespread restrictions on travel, closings of schools and businesses, cancellation of large public gatherings)
Manageable impact on domestic and world economy	Potential for severe impact on domestic and world economy

percentage of the world's population will require some form of medical care.

- Nations unlikely to have the staff, facilities, equipment, and hospital beds needed to cope with large numbers of people who suddenly fall ill.
- Death rates are high, largely determined by four factors: the number of people who become infected, the virulence of the virus, the underlying characteristics and

vulnerability of affected populations, and the effectiveness of preventive measures.

- Past pandemics have spread globally in two and sometimes three waves.

3. Medical Supplies Inadequate

- The need for vaccine is likely to outstrip supply.
- The need for antiviral drugs is also likely to be inadequate early in a pandemic.
- A pandemic can create a shortage of hospital beds, ventilators, and other supplies. Surge capacity at non-traditional sites such as schools may be created to cope with demand.
- Difficult decisions will need to be made regarding who gets antiviral drugs and vaccines.

4. Economic and Social Disruption

- Travel bans, closings of schools and businesses, and cancellations of events could have major impact on communities and citizens.
- Care for sick family members and fear of exposure can result in significant worker absenteeism.

COMMUNICATIONS AND INFORMATION ARE CRITICAL COMPONENTS OF PANDEMIC RESPONSE

Education and outreach are critical to preparing for a pandemic. Understanding what a pandemic is, what needs to be done at all levels to prepare for pandemic influenza, and what could happen during a pandemic helps us make informed decisions both as individuals and as a nation. Should a pandemic occur, the public must be able to depend on its government to provide scientifically sound public health information quickly, openly, and dependably.

Commonly Abused Drugs

National Institute
on Drug Abuse

Most drugs of abuse are addictive. Addiction is a chronic, relapsing disease characterized by compulsive drug seeking and use despite negative consequences and by long-lasting changes in the brain. People who are addicted have strong cravings for the drug, making it difficult to stop using. Most drugs alter a person's thinking and judgment, which can increase the risk of injury or death from drugged driving or infectious diseases (e.g., HIV/AIDS, hepatitis) from unsafe sexual practices or needle sharing. Drug use during pregnancy can lead to neonatal abstinence syndrome, a condition in which a baby can suffer from dependence and withdrawal symptoms after birth. Pregnancy-related issues are listed in the chart below for drugs where there is enough scientific evidence to connect the drug use to negative effects. However, most drugs could potentially harm an unborn baby.

In the chart, the Drug Enforcement Agency (DEA) schedule indicates the drug's acceptable medical use and its potential for abuse or dependence. More information can be found on the DEA website. For more comprehensive information about treatment options for drug addiction, see NIDA's Principles of Drug Addiction Treatment: A Research-Based Guide (Third Edition).

The following drugs are included in this resource:

- Alcohol
- Ayahuasca
- Bath Salts (Synthetic Cathionics)
- Cocaine
- DMT
- GHB
- Hallucinogens
- Heroin
- Inhalants
- Ketamine
- LSD
- Marijuana (Cannabis)
- MDMA (Ecstasy/Molly)
- Mescaline (Peyote)
- Methamphetamine
- Over-the-counter Cough/Cold Medicines (Dextromethorphan or DMX)
- PCP
- Prescription Opioids
- Prescription Sedatives
- Prescription Stimulants
- Psilocybin
- Salvia
- Steroids (Anabolic)
- Synthetic Cannabinoids ("K2"/"Spice")
- Tobacco

Alcohol

People drink to socialize, celebrate, and relax. Alcohol often has a strong effect on people—and throughout history, people have struggled to understand and manage alcohol's power. Why does alcohol cause people to act and feel differently? How much is too much? Why do some people become addicted while others do not? The National Institute on Alcohol Abuse and Alcoholism is researching the answers to these, and many other questions about alcohol. Here's what is known:

Alcohol's effects vary from person to person, depending on a variety of factors, including:

- Your age
 - Your health status
 - Your family history
- While drinking alcohol is itself not necessarily a problem – drinking too much can cause a range of consequences, and increase your risk for a variety of problems. For more information on alcohol's effects on the body, please see the National Institute on Alcohol Abuse and Alcoholism's related web page describing alcohol's effects on the body.
- How much you drink
 - How often you drink

Ayahuasca

A hallucinogenic tea made in the Amazon from a DMT-containing plant (*Psychotria viridis* or *Diplopterys cabrerana* or other) along with another vine (*Banisteriopsis caapi*) that contains an MAO inhibitor preventing the natural breakdown of DMT in the digestive system, thereby facilitating a prolonged hallucinatory experience. It was used historically in Amazonian religious and healing rituals and is increasingly used by tourists. For more information, see the Hallucinogens and Dissociative Drugs Research Report.

Street Names	Commercial Names	Common Forms	Common Ways Taken	DEA Schedule
Aya, Yagé, Hoasca	No commercial uses	Brewed as tea	Swallowed as tea	DMT is Schedule I but plants containing it are not controlled

POSSIBLE HEALTH EFFECTS

Short-term	Strong hallucinations including perceptions of otherworldly imagery, altered visual and auditory perceptions; increased blood pressure, vomiting.
Long-term	Unknown.
Other Health-related Issues	Unknown.
In Combination with Alcohol	Unknown.
Withdrawal symptoms	Unknown.

TREATMENT OPTIONS

Medications	It is not known whether ayahuasca is addictive. There are no FDA-approved medications to treat addiction to ayahuasca or other hallucinogens.
Behavioral Therapies	More research is needed to find out if ayahuasca is addictive and, if so, whether behavioral therapies are effective.

Bath Salts (Synthetic Cathinones)

An emerging family of drugs containing one or more synthetic chemicals related to cathinone, a stimulant found naturally in the Khat plant. Examples of such chemicals include mephedrone, methylenedioxypyrovalerone (MDPV). For more information, see the Bath Salts Drug Facts.

Street Names	Commercial Names	Common Forms	Common Ways Taken	DEA Schedule
Bloom, Cloud Nine, Cosmic Blast, Ivory Wave, Lunar Wave, Scarface, Vanilla Sky, White Lightning	No commercial uses for ingested "bath salts"	White or brown crystalline powder sold in small plastic or foil packages labeled "not for human consumption" and sometimes sold as jewelry cleaner; tablet, capsule, liquid	Swallowed, snorted, injected	I Some formulations have been banned by the DEA

POSSIBLE HEALTH EFFECTS

Short-term	Increased heart rate and blood pressure; euphoria; increased sociability and sex drive; paranoia, agitation, and hallucinations; psychotic and violent behavior; nosebleeds; sweating; nausea, vomiting; insomnia; irritability; dizziness; depression; suicidal thoughts; panic attacks; reduced motor control; cloudy thinking.
Long-term	Breakdown of skeletal muscle tissue; kidney failure; death.
Other Health-related Issues	Risk of HIV, hepatitis, and other infectious diseases from shared needles.
In Combination with Alcohol	Unknown.
Withdrawal Symptoms	Depression, anxiety, problems sleeping, tremors, paranoia.

TREATMENT OPTIONS

Medications	There are no FDA-approved medications to treat addiction to bath salts.
Behavioral Therapies	<ul style="list-style-type: none"> • Cognitive-behavioral therapy (CBT) • Contingency management, or motivational incentives • Motivational Enhancement Therapy (MET) • Behavioral treatments geared to teens

Cocaine

A powerfully addictive stimulant drug made from the leaves of the coca plant native to South America. For more information, see the Cocaine Research Report.

Street Names	Commercial Names	Common Forms	Common Ways Taken	DEA Schedule
Blow, Bump, C, Candy, Charlie, Coke, Crack, Flake, Rock, Snow, Toot	Cocaine hydrochloride topical solution (anesthetic rarely used in medical procedures)	White powder, whitish rock crystal	Snorted, smoked, injected	II

POSSIBLE HEALTH EFFECTS

Short-term	Narrowed blood vessels; enlarged pupils; increased body temperature, heart rate, and blood pressure; headache; abdominal pain and nausea; euphoria; increased energy, alertness; insomnia, restlessness; anxiety; erratic and violent behavior, panic attacks, paranoia, psychosis; heart rhythm problems, heart attack; stroke, seizure, coma.
Long-term	Loss of sense of smell, nosebleeds, nasal damage and trouble swallowing from snorting; infection and death of bowel tissue from decreased blood flow; poor nutrition and weight loss from decreased appetite.
Other Health-related Issues	Pregnancy: premature delivery, low birth weight, neonatal abstinence syndrome. Risk of HIV, hepatitis, and other infectious diseases from shared needles.
In Combination with Alcohol	Greater risk of overdose and sudden death than from either drug alone.
Withdrawal Symptoms	Depression, tiredness, increased appetite, insomnia, vivid unpleasant dreams, slowed thinking and movement, restlessness.

TREATMENT OPTIONS

Medications	There are no FDA-approved medications to treat cocaine addiction.
Behavioral Therapies	<ul style="list-style-type: none"> • Cognitive-behavioral therapy (CBT) • Community reinforcement approach plus vouchers • Contingency management, or motivational incentives • The matrix model • 12-Step facilitation therapy

DMT

A synthetic drug producing intense but relatively short-lived hallucinogenic experiences; also naturally occurring in some South American plants (See Ayahuasca). For more information, see the Hallucinogens and Dissociative Drugs Research Report.

Street Names	Commercial Names	Common Forms	Common Ways Taken	DEA Schedule
DMT, Dimitri	No commercial uses	White or yellow crystalline powder	Smoked, injected	I

POSSIBLE HEALTH EFFECTS

Short-term	Intense visual hallucinations, depersonalization, auditory distortions, and an altered perception of time and body image, usually resolving in 30-45 minutes or less. Physical effects include hypertension, increased heart rate, agitation, seizures, dilated pupils, involuntary rapid eye movements, dizziness, incoordination.
Long-term	Unknown.
Other Health-related Issues	At high doses, coma and respiratory arrest have occurred.
In Combination with Alcohol	Unknown.
Withdrawal symptoms	Unknown.

TREATMENT OPTIONS

Medications	It is not known whether DMT is addictive. There are no FDA-approved medications to treat addiction to DMT or other hallucinogens.
Behavioral Therapies	More research is needed to find out if DMT is addictive and, if so, whether behavioral therapies are effective.

GHB

A depressant approved for use in the treatment of narcolepsy, a disorder that causes daytime “sleep attacks.” *For more information, see the Club Drugs Drug Facts.*

Street Names	Commercial Names	Common Forms	Common Ways Taken	DEA Schedule
G, Georgia Home Boy, Goop, Grievous Bodily Harm, Liquid Ecstasy, Liquid X, Soap, Scoop	Gamma-hydroxybutyrate or sodium oxybate (Xyrem®)	Colorless liquid, white powder	Swallowed (often combined with alcohol or other beverages)	I

POSSIBLE HEALTH EFFECTS

Short-term	Euphoria, drowsiness, decreased anxiety, confusion, memory loss, hallucinations, excited and aggressive behavior, nausea, vomiting, unconsciousness, seizures, slowed heart rate and breathing, lower body temperature, coma, death.
Long-term	Unknown.
Other Health-related Issues	Sometimes used as a date rape drug.
In Combination with Alcohol	Nausea, problems with breathing, greatly increased depressant effects.
Withdrawal Symptoms	Insomnia, anxiety, tremors, sweating, increased heart rate and blood pressure, psychotic thoughts.

TREATMENT OPTIONS

Medications	Benzodiazepines
Behavioral Therapies	More research is needed to find out if behavioral therapies can be used to treat GHB addiction.

Hallucinogens

Drugs that cause profound distortions in a person’s perceptions of reality, such as ketamine, LSD, mescaline (peyote), PCP, psilocybin, salvia, DMT, and ayahuasca. For more information, see the Hallucinogens and Dissociative Drugs Research Report.

Heroin

An opioid drug made from morphine, a natural substance extracted from the seed pod of the Asian opium poppy plant. For more information, see the Heroin Research Report.

Street Names	Commercial Names	Common Forms	Common Ways Taken	DEA Schedule
Brown sugar, China White, Dope, H, Horse, Junk, Skag, Skunk, Smack, White Horse; <i>With OTC cold medicine and antihistamine:</i> Cheese	No commercial uses	White or brownish powder, or black sticky substance known as “black tar heroin”	Injected, smoked, snorted	I

POSSIBLE HEALTH EFFECTS

Short-term	Euphoria; warm flushing of skin; dry mouth; heavy feeling in the hands and feet; clouded thinking; alternate wakeful and drowsy states; itching; nausea; vomiting; slowed breathing and heart rate.
Long-term	Collapsed veins; abscesses (swollen tissue with pus); infection of the lining and valves in the heart; constipation and stomach cramps; liver or kidney disease; pneumonia.
Other Health-related Issues	Pregnancy: miscarriage, low birth weight, neonatal abstinence syndrome. Risk of HIV, hepatitis, and other infectious diseases from shared needles.
In Combination with Alcohol	Dangerous slowdown of heart rate and breathing, coma, death.
Withdrawal Symptoms	Restlessness, muscle and bone pain, insomnia, diarrhea, vomiting, cold flashes with goose bumps (“cold turkey”), leg movements.

TREATMENT OPTIONS

Medications	<ul style="list-style-type: none"> • Methadone • Buprenorphine • Naltrexone (short and long-acting forms)
Behavioral Therapies	<ul style="list-style-type: none"> • Contingency management, or motivational incentives • 12-Step facilitation therapy

Inhalants

Solvents, aerosols, and gases found in household products such as spray paints, markers, glues, and cleaning fluids; also nitrites (e.g., amyl nitrite), which are prescription medications for chest pain. For more information, see the Inhalants Research Report.

Street Names	Commercial Names	Common Forms	Common Ways Taken	DEA Schedule
Poppers, snappers, whippets, laughing gas	Various	Paint thinners or removers, degreasers, dry-cleaning fluids, gasoline, lighter fluids, correction fluids, permanent markers, electronics cleaners and freeze sprays, glue, spray paint, hair or deodorant sprays, fabric protector sprays, aerosol computer cleaning products, vegetable oil sprays, butane lighters, propane tanks, whipped cream aerosol containers, refrigerant gases, ether, chloroform, halothane, nitrous oxide	Inhaled through the nose or mouth	Not scheduled
POSSIBLE HEALTH EFFECTS				
Short-term	Confusion; nausea; slurred speech; lack of coordination; euphoria; dizziness; drowsiness; disinhibition, light-headedness, hallucinations/delusions; headaches; sudden sniffing death due to heart failure (from butane, propane, and other chemicals in aerosols); death from asphyxiation, suffocation, convulsions or seizures, coma, or choking. Nitrites: enlarged blood vessels, enhanced sexual pleasure, increased heart rate, brief sensation of heat and excitement, dizziness, headache.			
Long-term	Liver and kidney damage; bone marrow damage; limb spasms due to nerve damage; brain damage from lack of oxygen that can cause problems with thinking, movement, vision, and hearing. Nitrites: increased risk of pneumonia.			
Other Health-related Issues	Pregnancy: low birth weight, bone problems, delayed behavioral development due to brain problems, altered metabolism and body composition.			
In Combination with Alcohol	Nitrites: dangerously low blood pressure.			
Withdrawal Symptoms	Nausea, loss of appetite, sweating, tics, problems sleeping, and mood changes.			
TREATMENT OPTIONS				
Medications	There are no FDA-approved medications to treat inhalant addiction.			
Behavioral Therapies	More research is needed to find out if behavioral therapies can be used to treat inhalant addiction.			

Ketamine

A dissociative drug used as an anesthetic in veterinary practice. Dissociative drugs are hallucinogens that cause the user to feel detached from reality. For more information, see the Hallucinogens and Dissociative Drugs Research Report.

Street Names	Commercial Names	Common Forms	Common Ways Taken	DEA Schedule
Cat Valium, K, Special K, Vitamin K	Ketalar®	Liquid, white powder	Injected, snorted, smoked (powder added to tobacco or marijuana cigarettes), swallowed	III
POSSIBLE HEALTH EFFECTS				
Short-term	Problems with attention, learning, and memory; dreamlike states, hallucinations; sedation; confusion and problems speaking; loss of memory; problems moving, to the point of being immobile; raised blood pressure; unconsciousness; slowed breathing that can lead to death.			
Long-term	Ulcers and pain in the bladder; kidney problems; stomach pain; depression; poor memory.			
Other Health-related Issues	Sometimes used as a date rape drug. Risk of HIV, hepatitis, and other infectious diseases from shared needles.			
In Combination with Alcohol	Increased risk of adverse effects.			
Withdrawal Symptoms	Unknown.			
TREATMENT OPTIONS				
Medications	There are no FDA-approved medications to treat addiction to ketamine or other dissociative drugs.			
Behavioral Therapies	More research is needed to find out if behavioral therapies can be used to treat addiction to dissociative drugs.			

LSD

A hallucinogen manufactured from lysergic acid, which is found in ergot, a fungus that grows on rye and other grains. LSD is an abbreviation of the scientific name, *lysergic acid diethylamide*. For more information, see the Hallucinogens and Dissociative Drugs Research Report.

Street Names	Commercial Names	Common Forms	Common Ways Taken	DEA Schedule
Acid, Blotter, Blue Heaven, Cubes, Microdot, Yellow Sunshine	No commercial uses	Tablet; capsule; clear liquid; small, decorated squares of absorbent paper that liquid has been added to	Swallowed, absorbed through mouth tissues (paper squares)	I

POSSIBLE HEALTH EFFECTS

Short-term	Rapid emotional swings; distortion of a person's ability to recognize reality, think rationally, or communicate with others; raised blood pressure, heart rate, body temperature; dizziness and insomnia; loss of appetite; dry mouth; sweating; numbness; weakness; tremors; enlarged pupils.
Long-term	Frightening flashbacks (called Hallucinogen Persisting Perception Disorder ([HPPD])); ongoing visual disturbances, disorganized thinking, paranoia, and mood swings.
Other Health-related Issues	Unknown.
In Combination with Alcohol	May decrease the perceived effects of alcohol.
Withdrawal Symptoms	Unknown.

TREATMENT OPTIONS

Medications	There are no FDA-approved medications to treat addiction to LSD or other hallucinogens.
Behavioral Therapies	More research is needed to find out if behavioral therapies can be used to treat addiction to hallucinogens.

Marijuana (Cannabis)

Marijuana is made from the hemp plant, *Cannabis sativa*. The main psychoactive (mind-altering) chemical in marijuana is delta-9-tetrahydrocannabinol, or THC. For more information, see the Marijuana Research Report.

Street Names	Commercial Names	Common Forms	Common Ways Taken	DEA Schedule
Blunt, Bud, Dope, Ganja, Grass, Green, Herb, Joint, Mary Jane, Pot, Reefer, Sinsemilla, Skunk, Smoke, Trees, Weed; Hashish: Boom, Gangster, Hash, Hemp	Various brand names in states where the sale of marijuana is legal	Greenish-gray mixture of dried, shredded leaves, stems, seeds, and/or flowers; resin (hashish) or sticky, black liquid (hash oil)	Smoked, eaten (mixed in food or brewed as tea)	I

POSSIBLE HEALTH EFFECTS

Short-term	Enhanced sensory perception and euphoria followed by drowsiness/relaxation; slowed reaction time; problems with balance and coordination; increased heart rate and appetite; problems with learning and memory; hallucinations; anxiety; panic attacks; psychosis.
Long-term	Mental health problems; chronic cough; frequent respiratory infections.
Other Health-related Issues	Youth: possible loss of IQ points when repeated use begins in adolescence. Pregnancy: babies born with problems with attention, memory, and problem solving.
In Combination with Alcohol	Increased heart rate, blood pressure; further slowing of mental processing and reaction time.
Withdrawal Symptoms	Irritability, trouble sleeping, decreased appetite, anxiety.

TREATMENT OPTIONS

Medications	There are no FDA-approved medications to treat marijuana addiction.
Behavioral Therapies	<ul style="list-style-type: none"> • Cognitive-behavioral therapy (CBT) • Contingency management, or motivational incentives • Motivational Enhancement Therapy (MET) • Behavioral treatments geared to adolescents

MDMA (Ecstasy/Molly)

A synthetic, psychoactive drug that has similarities to both the stimulant amphetamine and the hallucinogen mescaline. MDMA is an abbreviation of the scientific name, *3,4-methylenedioxy-methamphetamine*. For more information, see the MDMA (Ecstasy) Abuse Research Report.

Street Names	Commercial Names	Common Forms	Common Ways Taken	DEA Schedule
Adam, Clarity, Eve, Lover’s Speed, Peace, Uppers	No commercial uses	Colorful tablets with imprinted logos, capsules, powder, liquid	Swallowed, snorted	I
POSSIBLE HEALTH EFFECTS				
Short-term	Lowered inhibition; enhanced sensory perception; confusion; depression; sleep problems; anxiety; increased heart rate and blood pressure; muscle tension; teeth clenching; nausea; blurred vision; faintness; chills or sweating; sharp rise in body temperature leading to liver, kidney, or heart failure and death.			
Long-term	Long-lasting confusion, depression, problems with attention, memory, and sleep; increased anxiety, impulsiveness, aggression; loss of appetite; less interest in sex.			
Other Health-related Issues	Unknown.			
In Combination with Alcohol	May increase the risk of cell and organ damage.			
Withdrawal Symptoms	Fatigue, loss of appetite, depression, trouble concentrating.			
TREATMENT OPTIONS				
Medications	There is conflicting evidence about whether MDMA is addictive. There are no FDA-approved medications to treat MDMA addiction.			
Behavioral Therapies	More research is needed to find out if behavioral therapies can be used to treat MDMA addiction.			

Mescaline (Peyote)

A hallucinogen found in disk-shaped "buttons" in the crown of several cacti, including peyote. For more information, see the Hallucinogens – LSD, Peyote, Psilocybin, and PCP Drug Facts.

Street Names	Commercial Names	Common Forms	Common Ways Taken	DEA Schedule
Buttons, Cactus, Mesc	No commercial uses	Fresh or dried buttons, capsule	Swallowed (chewed or soaked in water and drunk)	I
POSSIBLE HEALTH EFFECTS				
Short-term	Enhanced perception and feeling; hallucinations; euphoria; anxiety; increased body temperature, heart rate, blood pressure; sweating; problems with movement.			
Long-term	Unknown.			
Other Health-related Issues	Unknown.			
In Combination with Alcohol	Unknown.			
Withdrawal Symptoms	Unknown.			
TREATMENT OPTIONS				
Medications	There are no FDA-approved medications to treat addiction to mescaline or other hallucinogens.			
Behavioral Therapies	More research is needed to find out if behavioral therapies can be used to treat addiction to hallucinogens.			

Methamphetamine

An extremely addictive stimulant amphetamine drug. For more information, see the Methamphetamine Research Report.

Street Names	Commercial Names	Common Forms	Common Ways Taken	DEA Schedule
Crank, Chalk, Crystal, Fire, Glass, Go Fast, Ice, Meth, Speed	Desoxyn®	White powder or pill; crystal meth looks like pieces of glass or shiny blue-white "rocks" of different sizes	Swallowed, snorted, smoked, injected	II

POSSIBLE HEALTH EFFECTS

Short-term	Increased wakefulness and physical activity; decreased appetite; increased breathing, heart rate, blood pressure, temperature; irregular heart beat.
Long-term	Anxiety, confusion, insomnia, mood problems, violent behavior; paranoia, hallucinations, delusions, weight loss, severe dental problems ("meth mouth"), intense itching leading to skin sores from scratching.
Other Health-related Issues	Pregnancy: premature delivery; separation of the placenta from the uterus; low birth weight; lethargy; heart and brain problems. Risk of HIV, hepatitis, and other infectious diseases from shared needles.
In Combination with Alcohol	Masks the depressant effect of alcohol, increasing risk of alcohol overdose; may increase blood pressure and jitters.
Withdrawal Symptoms	Depression, anxiety, tiredness.

TREATMENT OPTIONS

Medications	There are no FDA-approved medications to treat methamphetamine addiction.
Behavioral Therapies	<ul style="list-style-type: none"> • Cognitive-behavioral therapy (CBT) • Contingency management or motivational incentives • The matrix model • 12-Step facilitation therapy

Over-the-counter Cough/Cold Medicines (Dextromethorphan or DMX)

Psychoactive when taken in higher-than-recommended amounts. For more information, see the Cough and Cold Medicine Abuse Drug Facts.

Street Names	Commercial Names	Common Forms	Common Ways Taken	DEA Schedule
Robotripping, Robo, Triple C	Various (many brand names include "DM")	Syrup, capsule	Swallowed	Not scheduled

POSSIBLE HEALTH EFFECTS

Short-term	Euphoria; slurred speech; increased heart rate, blood pressure, temperature; numbness; dizziness; nausea; vomiting; confusion; paranoia; altered visual perceptions; problems with movement; buildup of excess acid in body fluids.
Long-term	Unknown.
Other Health-related Issues	Breathing problems, seizures, and increased heart rate may occur from other ingredients in cough/cold medicines.
In Combination with Alcohol	Increased risk of adverse effects.
Withdrawal Symptoms	Unknown.

TREATMENT OPTIONS

Medications	There are no FDA-approved medications to treat addiction to over-the-counter cough/cold medicines.
Behavioral Therapies	More research is needed to find out if behavioral therapies can be used to treat addiction to over-the-counter cough/cold medicines.

PCP

A dissociative drug developed as an intravenous anesthetic that has been discontinued due to serious adverse effects. Dissociative drugs are hallucinogens that cause the user to feel detached from reality. PCP is an abbreviation of the scientific name, *phencyclidine*. For more information, see the Hallucinogens and Dissociative Drugs Research Report.

Street Names	Commercial Names	Common Forms	Common Ways Taken	DEA Schedule
Angel Dust, Boat, Hog, Love Boat, Peace Pill	No commercial uses	White or colored powder, tablet, or capsule; clear liquid	Injected, snorted, swallowed, smoked (powder added to mint, parsley, oregano, or marijuana)	I, II
POSSIBLE HEALTH EFFECTS				
Short-term	Delusions, hallucinations, paranoia, problems thinking, a sense of distance from one’s environment, anxiety. Low doses: slight increase in breathing rate; increased blood pressure and heart rate; shallow breathing; face redness and sweating; numbness of the hands or feet; problems with movement. High doses: lowered blood pressure, pulse rate, breathing rate; nausea; vomiting, blurred vision; flicking up and down of the eyes; drooling; loss of balance; dizziness; violence; suicidal thoughts; seizures, coma, and death.			
Long-term	Memory loss, problems with speech and thinking, depression, weight loss, anxiety.			
Other Health-related Issues	PCP has been linked to self-injury. Risk of HIV, hepatitis, and other infectious diseases from shared needles.			
In Combination with Alcohol	Increased risk of coma.			
Withdrawal Symptoms	Headaches, sweating.			
TREATMENT OPTIONS				
Medications	There are no FDA-approved medications to treat addiction to PCP or other dissociative drugs.			
Behavioral Therapies	More research is needed to find out if behavioral therapies can be used to treat addiction to dissociative drugs.			

Prescription Opioids

Pain relievers with an origin similar to that of heroin. Opioids can cause euphoria and are often used nonmedically, leading to overdose deaths. For more information, see the Prescription Drug Abuse Research Report.

Street Names	Commercial Names (Common)	Common Forms	Common Ways Taken	DEA Schedule
Captain Cody, Cody, Lean, Schoolboy, Sizzurp, Purple Drank; <i>With glutethimide</i> : Doors & Fours, Loads, Pancakes and Syrup	Codeine (various brand names)	Tablet, capsule, liquid	Injected, swallowed (often mixed with soda and flavorings)	II, III, V
Apache, China Girl, China White, Dance Fever, Friend, Goodfella, Jackpot, Murder 8, Tango and Cash, TNT	Fentanyl (Actiq®, Duragesic®, Sublimaze®)	Lozenge, sublingual tablet, film, buccal tablet	Injected, smoked, snorted	II
Vike, Watson-387	Hydrocodone or dihydrocodeinone (Vicodin®, Lortab®, Lorcet®, and others)	Capsule, liquid, tablet	Swallowed, snorted, injected	II
D, Dillies, Footballs, Juice, Smack	Hydromorphone (Dilaudid®)	Liquid, suppository	Injected, rectal	II
Demmies, Pain Killer	Meperidine (Demerol®)	Tablet, liquid	Swallowed, snorted, injected	II
Amidone, Fizzies With MDMA: Chocolate Chip Cookies	Methadone (Dolophine®, Methadose®)	Tablet, dispersible tablet, liquid	Swallowed, injected	II
M, Miss Emma, Monkey, White Stuff	Morphine (Duramorph®, Roxanol®)	Tablet, liquid, capsule, suppository	Injected, swallowed, smoked	II, III
O.C., Oxycet, Oxycotton, Oxy, Hillbilly Heroin, Percs	Oxycodone (OxyContin®, Percodan®, Percocet®, and others)	Capsule, liquid, tablet	Swallowed, snorted, injected	II
Biscuits, Blue Heaven, Blues, Mrs. O, O Bomb, Octagons, Stop Signs	Oxymorphone (Opana®)	Tablet	Swallowed, snorted, injected	II

Continued

Prescription Opioids—cont'd

POSSIBLE HEALTH EFFECTS	
Short-term	Pain relief, drowsiness, nausea, constipation, euphoria, confusion, slowed breathing, death.
Long-term	Unknown.
Other Health-related Issues	Pregnancy: Miscarriage; low birth weight; neonatal abstinence syndrome. Older Adults: Higher risk of accidental misuse or abuse because many older adults have multiple prescriptions, increasing the risk of drug-drug interactions, and breakdown of drugs slows with age; also, many older adults are treated with prescription medications for pain.
In Combination with Alcohol	Risk of HIV, hepatitis, and other infectious diseases from shared needles. Dangerous slowing of heart rate and breathing leading to coma or death.
Withdrawal Symptoms	Restlessness, muscle and bone pain, insomnia, diarrhea, vomiting, cold flashes with goose bumps ("cold turkey"), leg movements.
TREATMENT OPTIONS	
Medications	<ul style="list-style-type: none"> • Methadone • Buprenorphine • Naltrexone (short- and long-acting)
Behavioral Therapies	Behavioral therapies that have helped treat addiction to heroin may be useful in treating prescription opioid addiction.

Prescription Sedatives (tranquilizers, depressants)

Medications that slow brain activity, which makes them useful for treating anxiety and sleep problems. For more information, see the Prescription Drug Abuse Research Report.

Street Names	Commercial Names (Common)	Common Forms	Common Ways Taken	DEA Schedule
Barbs, Phennies, Red Birds, Reds, Tooies, Yellow Jackets, Yellows	Barbiturates: pentobarbital (Nembutal®), phenobarbital (Luminal®)	Pill, capsule, liquid	Swallowed, injected	II, III, IV
Candy, Downers, Sleeping Pills, Tranks	Benzodiazepines: alprazolam (Xanax®), chlorodiazepoxide (Limbital®), diazepam (Valium®), lorazepam (Ativan®), triazolam (Halcion®)	Pill, capsule, liquid	Swallowed, snorted	IV
Forget-me Pill, Mexican Valium, R2, Roche, Roofies, Roofinol, Rope, Rophies	Sleep Medications: eszopiclone (Lunesta®), zaleplon (Sonata®), zolpidem (Ambien®)	Pill, capsule, liquid	Swallowed, snorted	IV
POSSIBLE HEALTH EFFECTS				
Short-term	Drowsiness, slurred speech, poor concentration, confusion, dizziness, problems with movement and memory, lowered blood pressure, slowed breathing.			
Long-term	Unknown.			
Other Health-related Issues	Sleep medications are sometimes used as date rape drugs. Risk of HIV, hepatitis, and other infectious diseases from shared needles.			
In Combination with Alcohol	Further slows heart rate and breathing, which can lead to death.			
Withdrawal Symptoms	Must be discussed with a health care provider; barbiturate withdrawal can cause a serious abstinence syndrome that may even include seizures.			
TREATMENT OPTIONS				
Medications	There are no FDA-approved medications to treat addiction to prescription sedatives; lowering the dose over time must be done with the help of a health care provider.			
Behavioral Therapies	More research is needed to find out if behavioral therapies can be used to treat addiction to prescription sedatives.			

Prescription Stimulants

Medications that increase alertness, attention, energy, blood pressure, heart rate, and breathing rate. For more information, see the Prescription Drug Abuse Research Report.

Street Names	Commercial Names (Common)	Common Forms	Common Ways Taken	DEA Schedule
Bennies, Black Beauties, Crosses, Hearts, LA Turnaround, Speed, Truck Drivers, Uppers	Amphetamine (Adderall®, Bensedrine®)	Tablet, capsule	Swallowed, snorted, smoked, injected	II
JIF, MPH, R-ball, Skippy, The Smart Drug, Vitamin R	Methylphenidate (Concerta®, Ritalin®)	Liquid, tablet, chewable tablet, capsule	Swallowed, snorted, smoked, injected, chewed	II

POSSIBLE HEALTH EFFECTS

Short-term	Increased alertness, attention, energy; increased blood pressure and heart rate; narrowed blood vessels; increased blood sugar; opened-up breathing passages.
Long-term	High doses: dangerously high body temperature and irregular heartbeat; heart failure; seizures.
Other Health-related Issues	Heart problems, psychosis, anger, paranoia.
In Combination with Alcohol	Risk of HIV, hepatitis, and other infectious diseases from shared needles.
Withdrawal Symptoms	Masks the depressant action of alcohol, increasing risk of alcohol overdose; may increase blood pressure and jitters. Depression, tiredness, sleep problems.

TREATMENT OPTIONS

Medications	There are no FDA-approved medications to treat stimulant addiction.
Behavioral Therapies	Behavioral therapies that have helped treat addiction to cocaine or methamphetamine may be useful in treating prescription stimulant addiction.

Psilocybin

A hallucinogen in certain types of mushrooms that grow in parts of South America, Mexico, and the United States. For more information, see the Hallucinogens and Dissociative Drugs Research Report.

Street Names	Commercial Names	Common Forms	Common Ways Taken	DEA Schedule
Little Smoke, Magic Mushrooms, Purple Passion, Shrooms	No commercial uses	Fresh or dried mushrooms with long, slender stems topped by caps with dark gills	Swallowed (eaten, brewed as tea, or added to other foods)	I

POSSIBLE HEALTH EFFECTS

Short-term	Hallucinations, altered perception of time, inability to tell fantasy from reality, panic, muscle relaxation or weakness, problems with movement, enlarged pupils, nausea, vomiting, drowsiness.
Long-term	Risk of flashbacks and memory problems.
Other Health-related Issues	Risk of poisoning if a poisonous mushroom is accidentally used.
In Combination with Alcohol	May decrease the perceived effects of alcohol.
Withdrawal symptoms	Unknown.

TREATMENT OPTIONS

Medications	It is not known whether psilocybin is addictive. There are no FDA-approved medications to treat addiction to psilocybin or other hallucinogens.
Behavioral Therapies	More research is needed to find out if psilocybin is addictive and whether behavioral therapies can be used to treat addiction to this or other hallucinogens.

Salvia

A dissociative drug that is an herb in the mint family native to southern Mexico, *Salvia divinorum*. Dissociative drugs are hallucinogens that cause the user to feel detached from reality. For more information, see the Hallucinogens and Dissociative Drugs Research Report.

Street Names	Commercial Names	Common Forms	Common Ways Taken	DEA Schedule
Magic mint, Maria Pastora, Sally-D, Shepherdess's Herb, Diviner's Sage	Sold legally in most states as <i>Salvia divinorum</i> .	Fresh or dried leaves	Smoked, chewed, or brewed as tea	Not Scheduled (but labeled drug of concern by DEA and illegal in some states)

POSSIBLE HEALTH EFFECTS

Short-term	Short-lived but intense hallucinations; altered visual perception, mood, body sensations; mood swings, feelings of detachment from one's body; sweating.
Long-term	Unknown.
Other Health-related Issues	Unknown.
In Combination with Alcohol	Unknown.
Withdrawal Symptoms	Unknown.

TREATMENT OPTIONS

Medications	It is not known whether salvia is addictive. There are no FDA-approved medications to treat addiction to salvia or other dissociative drugs.
Behavioral Therapies	More research is needed to find out if salvia is addictive, but behavioral therapies can be used to treat addiction to dissociative drugs.

Steroids (Anabolic)

Man-made substances used to treat conditions caused by low levels of steroid hormones in the body and abused to enhance athletic and sexual performance and physical appearance. For more information, see the Anabolic Steroid Abuse Research Report.

Street Names	Commercial Names (Common)	Common Forms	Common Ways Taken	DEA Schedule
Juice, Gym Candy, Pumpers, Roids	Nandrolone (Oxandrin®), oxandrolone (Anadrol®), oxymetholone (Winstrol®), stanozolol (Durabolin®), testosterone cypionate (Depo-testosterone®)	Tablet, capsule, liquid drops, gel, cream, patch, injectable solution	Injected, swallowed, applied to skin	III

POSSIBLE HEALTH EFFECTS

Short-term	Headache, acne, fluid retention (especially in the hands and feet), oily skin, yellowing of the skin and whites of the eyes, infection at the injection site.
Long-term	Kidney damage or failure; liver damage; high blood pressure, enlarged heart, or changes in cholesterol leading to increased risk of stroke or heart attack, even in young people; aggression; extreme mood swings; anger ("roid rage"); paranoid jealousy; extreme irritability; delusions; impaired judgment.
Other Health-related Issues	Males: shrunken testicles, lowered sperm count, infertility, baldness, development of breasts, increased risk for prostate cancer. Females: Facial hair, male-pattern baldness, menstrual cycle changes, enlargement of the clitoris, deepened voice. Adolescents: Stunted growth.
In Combination with Alcohol	Risk of HIV, hepatitis, and other infectious diseases from shared needles.
Withdrawal Symptoms	Increased risk of violent behavior. Mood swings; tiredness; restlessness; loss of appetite; insomnia; lowered sex drive; depression, sometimes leading to suicide attempts.

TREATMENT OPTIONS

Medications	Hormone therapy
Behavioral Therapies	More research is needed to find out if behavioral therapies can be used to treat steroid addiction.

Synthetic Cannabinoids ("K2"/"Spice")

A wide variety of herbal mixtures containing man-made cannabinoid chemicals related to THC in marijuana but often much stronger and more dangerous. Sometimes misleadingly called "synthetic marijuana" and marketed as a "natural," "safe," legal alternative to marijuana. For more information, see the Spice ("Synthetic Marijuana") Drug Facts.

Street Names	Commercial Names	Common Forms	Common Ways Taken	DEA Schedule
K2, Spice, Black Mamba, Bliss, Bombay Blue, Fake Weed, Fire, Genie, Moon Rocks, Skunk, Smacked, Yucatan, Zohai	No commercial uses	Dried, shredded plant material that looks like potpourri and is sometimes sold as “incense”	Smoked, swallowed (brewed as tea)	I
POSSIBLE HEALTH EFFECTS				
Short-term	Increased heart rate; vomiting; agitation; confusion; hallucinations, anxiety, paranoia; increased blood pressure and reduced blood supply to the heart; heart attack.			
Long-term	Unknown.			
Other Health-related Issues	Use of synthetic cannabinoids has led to an increase in emergency room visits in certain areas.			
In Combination with Alcohol	Unknown.			
Withdrawal Symptoms	Headaches, anxiety, depression, irritability.			
TREATMENT OPTIONS				
Medications	There are no FDA-approved medications to treat K2/spice addiction.			
Behavioral Therapies	More research is needed to find out if behavioral therapies can be used to treat synthetic cannabinoid addiction.			

Tobacco

Plant grown for its leaves, which are dried and fermented before use. For more information, see the Tobacco/Nicotine Research Report.

Street Names	Commercial Names	Common Forms	Common Ways Taken	DEA Schedule
None	Multiple brand names	cigarettes, cigars, bidis, hookahs, smokeless tobacco (snuff, spit tobacco, chew)	Smoked, snorted, chewed, vaporized	Not Scheduled
POSSIBLE HEALTH EFFECTS				
Short-term	Increased blood pressure, breathing, and heart rate.			
Long-term	Greatly increased risk of cancer, especially lung cancer when smoked and oral cancers when chewed; chronic bronchitis; emphysema; heart disease; leukemia; cataracts; pneumonia.			
Other Health-related Issues	Pregnancy: miscarriage, low birth weight, premature delivery, stillbirth, learning and behavior problems.			
In Combination with Alcohol	Unknown.			
Withdrawal symptoms	Irritability, attention and sleep problems, increased appetite.			
TREATMENT OPTIONS				
Medications	<ul style="list-style-type: none">• Bupropion (Zyban®)• Varenicline (Chantix®)• Nicotine replacement (gum, patch, lozenge)			
Behavioral Therapies	<ul style="list-style-type: none">• Cognitive-behavioral therapy (CBT)• Self-help materials• Mail, phone, and Internet quit resources			

Friedman Family Assessment Model (Short Form)

Before using the following guidelines in completing family assessments, two words of caution. First, not all areas included below will be germane for each of the families visited. The guidelines are comprehensive and allow depth when probing is necessary. The student should not feel that every sub-area needs to be covered when the broad area of inquiry poses no problems to the family or concern to the health worker. Second, by virtue of the interdependence of the family system, one will find unavoidable redundancy. For the sake of efficiency, the assessor should try not to repeat data, but to refer the reader back to sections where this information has already been described.

IDENTIFYING DATA

1. Family Name
2. Address and Phone
3. Family Composition (see table)
4. Type of Family Form
5. Cultural (Ethnic) Background
6. Religious Identification
7. Social Class Status
8. Family's Recreational or Leisure-Time Activities

DEVELOPMENTAL STAGE AND HISTORY OF FAMILY

9. Family's Present Developmental Stage
10. Extent of Developmental Tasks Fulfillment
11. Nuclear Family History
12. History of Family of Origin of Both Parents

ENVIRONMENTAL DATA

13. Characteristics of Home
14. Characteristics of Neighborhood and Larger Community
15. Family's Geographic Mobility
16. Family's Associations and Transactions with Community
17. Family's Social Support Network (Ecomap)

FAMILY STRUCTURE

18. Communication Patterns
 - Extent of Functional and Dysfunctional Communication (Types of recurring patterns)
 - Extent of Emotional (Affective) Messages and How Expressed

Characteristics of Communication within Family Subsystems
 Extent of Congruent and Incongruent Messages
 Types of Dysfunctional Communication Processes Seen in Family
 Areas of Open and Closed Communication
 Familial and External Variables Affecting Communication

19. Power Structure
 - Power Outcomes
 - Decision-Making Process
 - Power Bases
 - Variables Affecting Family Power
 - Overall Family System and Subsystem Power
20. Role Structure
 - Formal Role Structure
 - Informal Role Structure
 - Analysis of Role Models (Optional)
 - Variables Affecting Role Structure
21. Family Values
 - Compare the Family to American or Family's Reference Group Values and/or Identify Important Family Values and Their Importance (Priority) in Family
 - Congruence Between the Family's Values and the Family's Reference Group or Wider Community
 - Congruence Between the Family's Values and Family Member's Values
 - Variables Influencing Family Values
 - Values Consciously or Unconsciously Held
 - Presence of Value Conflicts in Family
 - Effect of the Above Values and Value Conflicts on Health Status of Family

FAMILY FUNCTIONS

22. Affective Function
 - Family's Need-Response Patterns
 - Mutual Nurturance, Closeness, and Identification
 - Separateness and Connectedness
23. Socialization Function
 - Family Child-Rearing Practices
 - Adaptability of Child-Rearing Practices for Family Form and Family's Situation
 - Who Is (Are) Socializing Agent(s) for Child(ren)?
 - Value of Children in Family
 - Cultural Beliefs That Influence Family's Child-Rearing Patterns

- Social Class Influence on Child-Rearing Patterns
 Estimation About Whether Family Is At Risk for Child-Rearing Problems and, if so, Indication of High-Risk Factors
 Adequacy of Home Environment for Children's Needs to Play
24. Health Care Function
 Family's Health Beliefs, Values, and Behavior
 Family's Definitions of Health-Illness and Their Level of Knowledge
 Family's Perceived Health Status and Illness Susceptibility
 Family's Dietary Practices
 Adequacy of Family Diet (Recommended 24-hour food history record)
 Function of Mealtimes and Attitudes Toward Food and Mealtimes
 Shopping (and its planning) Practices
 Person(s) Responsible for Planning, Shopping, and Preparation of Meals
 Sleep and Rest Habits
 Physical Activity and Recreation Practices (not covered earlier)
 Family's Drug Habits

- Family's Role in Self-Care Practices
 Medically Based Preventive Measures (Physicals, eye and hearing tests, and immunizations)
 Dental Health Practices
 Family Health History (Both general and specific diseases—environmentally and genetically related)
 Health Care Services Received
 Feelings and Perceptions Regarding Health Services
 Emergency Health Services
 Source of Payments for Health and Other Services
 Logistics of Receiving Care

FAMILY STRESS AND COPING

25. Short- and Long-Term Familial Stressors and Strengths
 26. Extent of Family's Ability to Respond, Based on Objective Appraisal of Stress-Producing Situations
 27. Coping Strategies Utilized (Present/past)
 Differences in Family Members' Ways of Coping
 Family's Inner Coping Strategies
 Family's External Coping Strategies
 28. Dysfunctional Adaptive Strategies Utilized (Present/past; extent of usage)

FAMILY COMPOSITION FORM

Name (Last, First)	Gender	Relationship	Date and Place of Birth	Occupation	Education
1. (Father)					
2. (Mother)					
3. (Oldest child)					
4.					
5.					
6.					
7.					
8.					

From Friedman MM, Bowden VR, Jones EG: *Family nursing: research, theory, and practice*, ed. 5. Stamford, CT, 2003, Prentice Hall.

Instrumental Activities of Daily Living (IADL) Scale

Name _____	Rated by _____	Date _____
1. Can you use the telephone		
without help,	3	
with some help, or	2	
are you completely unable to use the telephone?	1	
2. Can you get to places beyond walking distance		
without help,	3	
with some help, or	2	
are you completely unable to travel unless special arrangements are made?	1	
3. Can you go shopping for groceries		
without help,	3	
with some help, or	2	
are you completely unable to do any shopping?	1	
4. Can you prepare your own meals		
without help,	3	
with some help, or	2	
are you completely unable to prepare any meals?	1	
5. Can you do your own housework		
without help,	3	
with some help, or	2	
are you completely unable to do any housework?	1	
6. Can you do your own handyman work		
without help,	3	
with some help, or	2	
are you completely unable to do any handyman work?	1	
7. Can you do your own laundry		
without help,	3	
with some help, or	2	
are you completely unable to do any laundry at all?	1	
8a. Do you take medicines or use any medications?		
Yes (If yes, answer Question 8b.)	1	
No (If no, answer Question 8c.)	2	
8b. Do you take your own medicine		
without help (in the right doses at the right time),	3	
with some help (if someone prepares it for you and/or reminds you to take it), or	2	
are you completely unable to take your own medicine?	1	
8c. If you had to take medicine, could you do it		
without help (in the right doses at the right time),	3	
with some help (if someone prepared it for you and/or reminded you to take it), or	2	
would you be completely unable to take your own medicine?	1	
9. Can you manage your own money		
without help,	3	
with some help, or	2	
are you completely unable to manage money?	1

Would you like one?</p> <div style="margin-left: 20px;"> <p>a. no</p> <p>b. has functioning legal guardian for sole purpose of managing money—describe: _____</p> <p>c. has legal guardian</p> <p>d. yes</p> </div> </div> </div>	

From Pearlman R: Development of a functional assessment questionnaire for geriatric patients: the comprehensive older persons evaluation, *J Chronic Disease* 40(56): 85S–94S, 1987.

Comprehensive Older Persons' Evaluation—cont'd

Demographic Section:

1. Patient's race or ethnic background—record: _____
2. Patient's gender (circle) male female
3. How far did you go in school?
 - a. post-graduate education
 - b. four-year degree
 - c. college or technical school
 - d. high school complete
 - e. high school incomplete
 - f. 0-8 years

Social Support Section: Now there are a few questions about your family and friends.

4. Are you married, widowed, separated, divorced, or have you never been married?
 - a. now married
 - b. widowed
 - c. separated
 - d. divorced
 - e. never married
5. Who lives with you? (circle all responses)
 - a. spouse
 - b. other relative or friend—specify: _____
 - c. group living situation (non-health)
 - d. lives alone
 - e. nursing home, number of years: _____
6. Have you talked to any friends or relatives by phone during the last week?
 - a. yes
 - b. no
7. Are you satisfied by seeing your relatives and friends as often as you want to, or are you somewhat dissatisfied about how little you see them?
 - a. satisfied—skip to #8
 - b. dissatisfied—ask A
 - A. Do you feel you would like to be involved in a Senior Citizens Center for social events, or perhaps meals?
 1. no
 2. is involved—describe: _____
 3. yes
8. Is there someone who would take care of you for as long as you needed if you were sick or disabled?
 - a. yes—Skip to C
 - b. no—Ask A
 - A. Is there someone who would take care of you for a short time?
 1. yes—Skip to C
 2. no—Ask B
 - B. Is there someone who could help you now and then?
 1. yes—Ask C
 2. no—Ask C
 - C. Who would we call in case of an emergency?
 - Record name and telephone: _____

Financial Section: The next few questions are about your finances and any problems you might have.

9. Do you own, or are you buying, your own home?
 - a. yes—skip to #10
 - b. no—ask A
 - A. Do you feel you need assistance with housing?
 1. no
 2. has subsidized or other housing assistance
 3. yes—describe: _____
 - B. What type of housing did you have prior to coming here?

10. Are you covered by private medical insurance, Medicare, Medicaid, or some disability plan? (Circle all that apply)
 - a. private insurance—specify and skip to #11: _____
 - b. Medicare
 - c. Medicaid
 - d. disability—specify and ask A: _____
 - e. none
 - f. other—specify: _____
 - A. Do you feel you need additional assistance with your medical bills?
 1. no
 2. yes
11. Which of these statements best describes your financial situation?
 - a. my bills are no problem to me—skip to #12
 - b. my expenses make it difficult to meet my bills—ask A
 - c. my expenses are so heavy that I cannot meet my bills—ask A
 - A. Do you feel you need financial assistance such as: (circle all that apply)
 1. food stamps
 2. social security or disability payments
 3. assistance in paying your heating or electrical bills
 4. other financial assistance?
 - describe: _____

Psychological Health Section: The next few questions are about how you feel about your life in general. There are no right or wrong answers, only what best applies to you.

Please answer yes or no to each question.

12. Is your daily life full of things that keep you interested? _____
13. Have you, at times, very much wanted to leave home? _____
14. Does it seem that no one understands you? _____
15. Are you happy most of the time? _____
16. Do you feel weak all over much of the time? _____
17. Is your sleep fitful and disturbed? _____
18. Taking everything into consideration, how would you describe your satisfaction with your life in general at the present time?
 - a. good
 - b. fair
 - c. poor
19. Do you feel you now need help with your mental health; for example, a counselor or psychiatrist?
 - a. no
 - b. has—specify: _____
 - c. yes

Physical Health Section: The next few questions are about your health.

20. During the past month (30 days), how many days were you so sick that you couldn't do your usual activities, such as working around the house or visiting with friends? _____
21. Relative to other people your age, how would you rate your overall health at the present time?
 - a. excellent—skip to #22
 - b. very good—skip to #22
 - c. good—ask A
 - d. fair—ask A
 - e. poor—ask A
 - A. Do you feel you need additional medical services such as a doctor, nurse, visiting nurse or physical therapy?
 1. doctor
 2. nurse
 3. visiting nurse

Comprehensive Older Persons' Evaluation—cont'd

4. physical therapy
5. none

22. Do you use an aid for walking, such as a wheelchair, walker, cane or anything else? (circle aid usually used)

- a. wheelchair
b. other—specify: _____
c. visiting nurse
d. walker
e. none

23. How much do your health troubles stand in the way of your doing things you want to do?

- a. not at all—skip to #24
b. a little—ask A
c. a great deal—ask A
A. Do you think you need assistance to do your daily activities; for example, do you need a live-in aide or choreworker?
1. live-in aide
2. choreworker
3. has aide, choreworker or other assistance—describe: _____

4. none needed

24. Have you had, or do you currently have, any of the following health problems? (if yes, place an "X" in appropriate box and describe; medical record information may be used to help complete this section.)

	HX	Current	Describe
a. Arthritis or rheumatism?			
b. Lung or breathing problem?			
c. Hypertension?			
d. Heart trouble?			
e. Phlebitis or poor circulation problems in arms or legs?			
f. Diabetes or low blood sugar?			
g. Digestive ulcers?			
h. Other digestive problem?			
i. Cancer?			
j. Anemia?			
k. Effects of stroke?			
l. Other neurological problem?			
specify: _____			
m. Thyroid or other glandular problem?			
specify: _____			
n. Skin disorders such as pressure sores, leg ulcers, burns?			
o. Speech problem?			
p. Hearing problem?			
q. Vision or eye problem?			
r. Kidney or bladder problems, or incontinence?			
s. A problem of falls?			
t. Problem with eating or your weight?			
specify: _____			
u. Problem with depression?			
specify: _____			
v. Problem with your behavior?			
specify: _____			
w. Problem with your sexual activity?			
x. Problem with alcohol?			
y. Problem with pain?			
z. Other health problems?			
specify: _____			

Immunizations: _____

25. What medications are you currently taking, or have been taking, in the last month? (May I see your medication bottles?) (If patient cannot list, ask categories a-r and note dosage and schedule, or obtain information from medical or pharmacy records and verify accuracy with the patient.)

Allergies: _____

	Rx (Dosage and Schedule)
a. Arthritis medication	_____
b. Pain medication	_____
c. Blood pressure medication	_____
d. Water pills or pills for fluid	_____
e. Medication for your heart	_____
f. Medication for your lungs	_____
g. Blood thinners	_____
h. Medication for your circulation	_____
i. Insulin or diabetes medication	_____
j. Seizure medication	_____
k. Thyroid pills	_____
l. Steroids	_____

r. Other nonprescription drugs	_____

26. Many people have problems remembering to take their medications, especially ones they need to take on a regular basis. How often do you forget to take your medications? Would you say you forget often, sometimes, rarely, or never?

- a. never
b. rarely
c. sometimes
d. often

Activities of Daily Living: The next set of questions asks whether you need help with any of the following activities of daily living.

27. I would like to know whether you can do these activities without any help at all, or if you need assistance to do them. Do you need help to: (If yes, describe, including patient needs.)

	Yes	No	Describe (include needs)
a. Use the telephone?			
b. Get to places out of walking distance? (using transportation)			
c. Shop for clothes and food?			
d. Do your housework?			
e. Handle your money?			
f. Feed yourself?			
g. Dress and undress yourself?			
h. Take care of your appearance?			
i. Get in and out of bed?			
j. Take a bath or shower?			
k. Prepare your meals?			
l. Do you have any problem getting to the bathroom on time?			

28. During the past six months, have you had any help with such things as shopping, housework, bathing, dressing and getting around?

- a. yes—specify: _____
b. no

Signature of person completing the form: _____

Comprehensive Occupational and Environmental Health History

WORK HISTORY

1. List your current and past longest held jobs, including the military:

Company	Dates Employed	Job Title	Known Exposures

2. Do you work full-time? NO ☐ YES ☐ How many hours per week?

3. Do you work part-time? NO ☐ YES ☐ How many hours per week?

4. Please describe any health problems or injuries that you have experienced in connection with your present or past jobs:

5. Have you ever had to change jobs because of health problems or injuries? YES ☐ NO ☐
If yes, describe: Did any of your co-workers experience similar problems?

6. In what type of business do you currently work?

7. Describe your work (what you actually do):

8. Have you had any current or past exposure (through breathing or touching) to any of the following?

<input type="checkbox"/> acids	<input type="checkbox"/> alkalis	<input type="checkbox"/> coal dust	<input type="checkbox"/> mercury	<input type="checkbox"/> silica powder
<input type="checkbox"/> chlorinated	<input type="checkbox"/> chloroprene	<input type="checkbox"/> lead	<input type="checkbox"/> radiation	<input type="checkbox"/> welding fumes
<input type="checkbox"/> naphthalenes	<input type="checkbox"/> isocyanates	<input type="checkbox"/> phenol	<input type="checkbox"/> vibration	<input type="checkbox"/> carbon tetrachloride
<input type="checkbox"/> halothane	<input type="checkbox"/> perchloroethylene	<input type="checkbox"/> trichloroethylene	<input type="checkbox"/> beryllium	<input type="checkbox"/> fiberglass
<input type="checkbox"/> PBBs	<input type="checkbox"/> TDI or MDI	<input type="checkbox"/> asbestos	<input type="checkbox"/> ethylene dibromide	<input type="checkbox"/> noise (loud)
<input type="checkbox"/> styrene	<input type="checkbox"/> ammonia	<input type="checkbox"/> cold (severe)	<input type="checkbox"/> methylene chloride	<input type="checkbox"/> solvents
<input type="checkbox"/> alcohols	<input type="checkbox"/> chromates	<input type="checkbox"/> manganese	<input type="checkbox"/> rock dust	<input type="checkbox"/> x-rays
<input type="checkbox"/> chloroform	<input type="checkbox"/> ketones	<input type="checkbox"/> phosgene	<input type="checkbox"/> vinyl chloride	
<input type="checkbox"/> heat (severe)	<input type="checkbox"/> pesticides	<input type="checkbox"/> trinitrotoluene	<input type="checkbox"/> cadmium	
<input type="checkbox"/> PCBs	<input type="checkbox"/> toluene	<input type="checkbox"/> benzene	<input type="checkbox"/> ethylene dichloride	
<input type="checkbox"/> talc	<input type="checkbox"/> arsenic	<input type="checkbox"/> dichlorobenzene	<input type="checkbox"/> nickel	

9. Did you receive any safety training about these agents? YES ☐ NO ☐
Explain:

10. Are you involved in any work processes such as grinding, welding, soldering, or polishing that create dust, mists, or fumes?
YES ☐ NO ☐
If yes, describe:

11. Did you use any of the following personal protective equipment when exposed?

<input type="checkbox"/> boots	<input type="checkbox"/> respirator	<input type="checkbox"/> welding mask
<input type="checkbox"/> gloves	<input type="checkbox"/> sleeves	<input type="checkbox"/> glasses/goggles
<input type="checkbox"/> shield	<input type="checkbox"/> earplugs/muffs	
<input type="checkbox"/> coveralls	<input type="checkbox"/> safety shoes	

12. Is your work environment generally clean? YES ____ NO ____
If no, describe:
13. What ventilation systems are used in your workplace?
14. Do they seem to work? Are you aware of any chemical odors in your environment (if so, explain)?
15. Where do you eat, smoke, and take your breaks when you are on the job?
16. Do you use a uniform or have clothing that you wear only to work? YES ____ NO ____
17. How is your work clothing laundered (at home, by employer, etc.)?
18. How often do you wash your hands at work and how do you wash them (running water, special soaps, etc.)?
19. Do you shower before leaving the worksite? YES ____ NO ____
20. Do you have any physical symptoms associated with work? YES ____ NO ____
If yes, describe:
21. Are other workers similarly affected? YES ____ NO ____

HOME EXPOSURES

1. Which of the following do you have in your home?
__air conditioner __fireplace __electric stove
__central heating (gas or oil) __air purifier __woodstove
2. In approximately what year was your home built?
3. Have there been any recent renovations? YES ____ NO ____
If yes, describe:
4. Have you recently installed new carpet, purchased new furniture, or refinished existing furniture? YES ____ NO ____
If yes, explain:
5. Do you use pesticides around your home or garden? YES ____ NO ____
If yes, describe:
6. What household cleaners do you use? (List most common and any new products you use.)
7. List all hobbies done at your home:
8. Are any of the agents listed earlier for work exposures encountered in hobbies or recreational activities?
YES ____ NO ____
9. Is any special protective equipment or ventilation used during hobbies? YES ____ NO ____
Explain:
10. What are the occupations of other household members?
11. Do other household members have contact with any form of chemicals at work or during leisure activities?
YES ____ NO ____
If yes, explain:
12. Is anyone else in your home environment having symptoms similar to yours? YES ____ NO ____
If yes, explain briefly:

COMMUNITY EXPOSURES

1. Are any of the following located in your community?
☐ industrial plant ☐ major source of air pollution ☐ waste site
☐ landfill ☐ toxic spill ☐ other _____
2. What is your source of drinking water?
☐ private well ☐ public water source ☐ other
3. Are neighbors experiencing any health problems similar to yours? YES ____ NO ____
If yes, explain:

KEY OCCUPATIONAL AND ENVIRONMENTAL HEALTH QUESTIONS TO BE ASKED WITH ALL HISTORIES

1. What are your current and past longest held jobs?
2. Have you been exposed to any radiation or chemical liquids, dusts, mists, or fumes? YES ____ NO ____
3. Is there any relationship between current symptoms and activities at work or at home? YES ____ NO ____

From Pope AM, Snyder MA, Mood LH, editors: *Nursing, health, and environment: strengthening the relationship to improve the public's health*, Washington, DC, 1995, National Academy Press.

Motivational Interviewing

Motivational interviewing (MI) is a collaborative strategy to promote behavioral change in clients and families. Clients and families are encouraged to set goals for making health changes, and the process allows the nurse to address ambivalence toward change and strengthen the client or family's commitment to behavioral change.

The core tenets of MI recognize the client and family as the experts who have the ability to make a change based on personal choices. The nurse provides a **collaborative** environment that supports change and has the client or family **share** their perceptions and knowledge about the behavior under discussion. The nurse then affirms the client or family's **autonomy** to make choices for change about the behavior.

There are four principles central to the spirit of MI to guide the nurse:

- *Expressing empathy* to communicate an understanding of the client or family's perspective
- *Rolling with resistance* and avoiding arguing with the client or family when ambivalence or unwillingness to change occurs
- *Supporting self-efficacy*, which is supporting the client's or family's confidence that change can be made
- *Developing discrepancy* is guiding the client or family when inconsistencies occur between current behavior and desired behavioral goals

The key components to interactions with clients and families during MI are guided by the acronym OARS:

- *Open-ended questions*: these questions allow the client or family to express their thoughts and share their personal experiences. It allows the nurse to develop a fuller understanding of barriers to change and individual values.
- *Affirmations of what the client and/or family says*: the nurse affirms the client or family's ability to change and

how the behavior change is congruent with their values and goals.

- *Reflective listening*: this is the hallmark of MI. The nurse restates what the client or family shares and allows for clarifying what the client or family means to say or feels. This is an opportunity to focus on moving the client or family closer to behavioral change.
- *Summaries of the conversation and decisions made*: the nurse summarizes the MI session and the goals set by the client or family and reinforces the plan for change.

"Change" in health behavior is the overall goal of MI, and using strategies that promote movement toward change is important within the context of MI. This includes supporting statements expressing a desire for change, addressing perceived barriers to change, and having the confidence to make behavioral changes. Focus on linking the desired behavioral change to the client's or family's personal values, abilities, and goals. Developing small, achievable goals may be more attainable and less overwhelming for some clients and families in the beginning. Nurses can then continue to use MI in future interactions to promote progression in healthy behaviors.

Essential Elements of Public Health Nursing

EXAMPLES OF PUBLIC HEALTH NURSING ROLES AND IMPLEMENTING PUBLIC HEALTH FUNCTIONS

This document is intended to clearly present the role of public health nurses in Virginia as members of the multidisciplinary public health team in a changing health care environment. The following matrices present the role of public health nursing in Virginia. The following definitions were used to develop these matrices.

Essential Element is taken from the National Association of City and County Health Officials' (NACCHO's) document *Blueprint for a Healthy Community*. The following public health essential elements are used as a framework to present the role of public health nursing in Virginia:

- Conducting Community Assessments
- Preventing and Controlling Epidemics
- Providing a Safe and Healthy Environment
- Measuring Performance, Effectiveness, and Outcomes of Health Services
- Promoting Healthy Lifestyles
- Providing Targeted Outreach and Forming Partnerships

- Providing Personal Health Care Services
- Conducting Research and Innovation
- Mobilizing the Community for Action

Public Health Function is defined as a broad public health activity needed to ensure a strong, flexible, accountable public health structure. It may require a multidisciplinary team to carry out.

Public Health Nurse Role is the activity the public health nurse is responsible for, either alone or as a member of a team, to accomplish the stated public health function. This can be the public health nurse at the local level or at the state level.

State Role is what public health nurses need from the state level to do their jobs (e.g., policy, aggregate data, training). This refers to any Central Office program or staff, not just nurses.

A process was implemented that would involve all public health nurses in Virginia. Although this lengthened the timeline to completion, it will ensure that the final document represents a consensus developed through creative open dialogue.

From National Association of City and County Health Officials: *Blueprint for a healthy community: a guide for local health departments*, Washington, DC, 1994, The Association.

ESSENTIAL ELEMENT 1: Conduct Community Assessment: Systematically collecting, assembling, analyzing, and making available health-related data for the purpose of identifying and responding to community- and state-level public health concerns and conducting epidemiologic and other population-based studies.

Public Health Function

Develop frameworks, methodologies, and tools for standardizing data collection and analysis and reporting across all jurisdictions and providers.

Collect and analyze data.

PHN Roles

- Provide, review, and comment on proposed methodologies and tools for data collection.
- Field-test tools and methods.
- Collaborate with the community to identify population-based needs and gaps in service.
- Analyze data and needs, knowledge, attitudes, and practices of specific populations.
- Identify patterns of diseases, illness, and injury and develop or stimulate development of programs to respond to identified trends.

State Roles

- Collaborate with professional organizations and academic and governmental institutions to develop and test tools and methods.
- Provide educational opportunities in areas of and use of tools.
- Work with local-level agencies to standardize definitions, data collected, etc., across jurisdictions and among all stakeholders (schools, community-based organizations, and private providers).
- Provide aggregated data to the local level in a timely and accurate manner.
- Provide census tract-level aggregated data to the local level.
- Provide national and state comparisons to be used with local data to obtain trends and assist localities in documenting need, progress, etc., to attain standard outcomes.

ESSENTIAL ELEMENT 2: Preventing and Controlling Epidemics: Monitoring disease trends and investigating and containing diseases and injuries.

Public Health Function

Develop programs that prevent, contain, and control the transmission of diseases and danger of injuries (including violence).

Develop regulatory guidelines for the prevention of targeted diseases.

PHN Roles

- Provide community-wide preventive measures in the form of health education and mobilization of community resources.
- Ensure isolation/containment measures when necessary.
- Ensure adequate preventive immunizations.
- Implement programs that control the transmission of diseases and danger of injuries during disasters.
- Implement regulatory measures.
- Implement OSHA Guidelines for Blood Borne Pathogens and the Prevention of the Transmission of TB in Health Care Settings.

State Roles

- Work with local jurisdictions to develop tools such as videos, PSAs, and/or posters that local jurisdictions can use.
- Work with local jurisdictions to develop disaster plans for the control of the transmission of diseases and danger of injuries during disasters.
- Facilitate state-level partnerships that promote health, healthy lifestyles, and wellness (individual and family).
- In partnership with localities, develop regulatory guidelines.
- Serve as clearinghouse or source of information.

ESSENTIAL ELEMENT 3: Providing a Safe and Healthy Environment: Maintaining clean and safe air, water, food, and facilities both in the community and in the home environment.

Public Health Function

Develop methods/tools for collection and analysis of health-related data (occurrence of mortality and morbidity relating to both communicable and chronic diseases, injury registries, sentinel event establishment, environmental quality, etc.).

Develop programs that promote a safe environment in the home.

Develop programs that promote a safe environment in the workplace.

PHN Roles

- Provide reporting guidelines and consultation regarding disease prevention, diagnosis, treatment, and follow-up of cases/contacts to physicians and institutions (emergency department, university and secondary school student health, prisons, industries, etc.).
- Conduct/participate in community needs assessments to determine customer/provider knowledge deficits and perceptions of need.
- Provide education to individuals, providers, targeted populations, etc., in response to knowledge deficits, disease outbreaks, toxic waste emissions, etc.
- Provide individual follow-up/case management of communicable diseases that are transmitted by air, water, food, and fomites (TB, hepatitis A, salmonella, staphylococcus, etc.).
- Provide childhood lead poisoning screenings and follow-up.
- Teach clients to inspect homes for safety violations and toxic substances and to practice safe behaviors; assist families to access/use available resources/safety devices.
- Assess/teach regarding safe food selection, preparation, and storage.
- Train/supervise volunteers/auxiliary personnel in performance of the above tasks.
- Teach families that all men, women, and children have a right to a safe environment free of physical or mental abuse.
- Provide consultation in implementation of OSHA regulations relating to occupational exposure to diseases.
- Provide educational program related to healthy lifestyles (smoking cessation, back protection, etc.).
- Ensure provision of screenings for individuals to determine baselines and occurrence of infectious diseases and preventable deterioration of health and function: hearing, back soundness, lung capacity, RMS indicators, PPDs, etc.
- Assist in policy/practice development to address prevention of the above.
- Provide immunizations.

State Roles

- Develop standard methodology and tools for collection and analysis of health-related data.
- Provide training in area of data collection and analysis.
- Evaluate activities and outcomes of interactions.
- Work in partnership with localities to develop program based on data analysis needs.
- Provide consultation and technical assistance to state/local organizations regarding laws and regulations that protect health and ensure safety.
- In partnership with localities, develop and evaluate educational programs.
- Monitor and assist localities to implement prevention activities.
- Assist localities in developing and evaluating educational programs.
- Monitor outcomes of screening activities and evaluate interventions.

ESSENTIAL ELEMENT 3: Providing a Safe and Healthy Environment—cont'd**Public Health Function****PHN Roles****State Roles**

Develop programs that promote a safe environment in the school setting.

- Provide consultation on implementation of OSHA regulations relating to occupational exposure to diseases.
- Provide educational programs related to healthy lifestyles (smoking cessation, etc.).
- Ensure provision of screenings for students to determine baselines and occurrence of infectious disease and preventable deterioration of health and function.
- Assist in policy/practice development to address prevention of the above.
- Provide immunizations.

- Develop guidelines that ensure accountability in meeting standards set forth.
- Ensure that policy is developed to protect children in the school environment.
- Monitor immunization status of children and provide immunizations during outbreaks and evaluate activities.

Develop programs that promote a safe environment in the community.

- Identify population clusters exhibiting an unhealthy environment; provide consultation/group education regarding preventive measures.
- Participate in development of local disaster plans to ensure provision of safe water, food, air, and facilities.
- Respond in time of natural disasters such as floods, tornadoes, and hurricanes.
- Participate in developing plans for shelter management during disasters, especially “Special Needs” shelters that may require nursing staff.

- In times of disaster, facilitate availability of resources across jurisdictions.
- Have a statewide plan.
- Ensure that localities have developed plans to protect the public in time of national and/or other disasters.

Develop and issue standards that guide regulations and mandate policy and program development.

- Survey worksites, schools, institutions, etc., for compliance to regulations that protect health and ensure safety.

- Coordinate efforts statewide.
- Assist localities in responding.
- Evaluate efforts.
- Develop a systematic evaluation tool for collection of data to measure trends.

Develop protocols to ensure accountability of all health care providers, public and private.

- Provide technical assistance (i.e., interpretation, implementation, and evaluation processes).

- Assist localities in developing standards to mandate accountability.

Provide inservice to all providers of health care services.

- Share and implement knowledge gained in inservices.

- Provide consultation/technical assistance to localities.

ESSENTIAL ELEMENT 4: Measuring Performance, Effectiveness, and Outcomes of Health Services: Monitoring health care providers and the health care system to identify gaps in service, deteriorating health status indicators, effectiveness of interventions, and accessibility and quality of personal and population-wide health services.

Public Health Function**PHN Roles****State Roles**

Promote competency in public health issues throughout the health delivery system.

- Provide educational and technical assistance in areas such as case management and appropriate treatment and control of communicable diseases to the community.

- Develop appropriate regulatory, educational, and technical assistance programs.
- Provide technical assistance and training to local health department for local forecasting and interpretation of data.

Collect data.

- Participate in data collection with a target population.
- Ensure that the data collection system supports the objectives of programs serving the community by participating in the design and operation of data collection systems.
- Collect data via surveys, polls, interviews, focus groups that will enable assessment of the community's perception of health status and understanding how the system works and how to obtain service needs.

- Work with localities (health districts, private providers, other state and local agencies) to develop standard data elements and definitions across jurisdictions and among all stakeholders, especially for consistency in coding of population-based data.
- Identify data collection and analytic issues related to monitoring the impact of health system changes such as costs and benefits of record linkage, strategies for ensuring confidentiality, and strategies for analyzing trends in health within a broader social and economic context.
- Advocate for uniform data collection from all managed care plans so that outcomes and health trends can be analyzed and tracked and sentinel events reported.

ESSENTIAL ELEMENT 4: Measuring Performance, Effectiveness, and Outcomes of Health Services—cont'd**Public Health Function**

Analyze data to ensure accurate diagnosis of health status, identification of threats to health, and assessment of health service needs.

Monitor health status indicators for the entire population and for specific population groups and/or geographic areas.

Monitor and assess availability, cost-effectiveness, and outcomes of personal and population-based health services.

Disseminate information.

PHN Roles

- Participate in a systematic approach to convert data into information that will identify gaps in service at the local and state level and will lead to action.
- Monitor health status indicators to identify emerging problems and facilitate community-wide response to identified problems.
- Facilitate data analysis as part of a local collaborative effort.

- Identify target populations that may be at risk for public health problems such as communicable diseases, unidentified and untreated chronic diseases.
- Conduct surveys or observe targeted populations such as preschools, childcare centers, and high-risk census tracts to identify health status.
- Monitor health care utilization of vulnerable populations at the local and regional level.
- Identify gaps in services (e.g., a neighborhood with deteriorating immunization rates may indicate lack of available primary care services).
- Ensure that all receive the same quality of care, including comprehensive preventive services.
- Monitor the impact of health system reforms on vulnerable populations.
- Evaluate the effectiveness and outcomes of care.
- Plan interventions based on the health of the overall population, not just for those in the health care system.
- Identify interventions that are effective and replicable.
- Disseminate information to the public on community health status, including how to access and use services appropriately.
- Disseminate information to other health care providers regarding gaps in services or deteriorating health status indicators.

State Roles

- Develop a systematic, integrated statewide approach to converting data into information that directs action.
- Ensure that resources, such as hardware and software, to analyze data are available at the local level.
- Work with localities (health districts, private providers, other state and local agencies) to address issues related to variable access to technology, confidentiality issues.
- Educate and train currently employed public health nurses in areas of epidemiology and population-based services.
- Develop methodology for identification, measurement, and analysis of key indicators of health care utilization of vulnerable populations.
- Develop analyses that demonstrate the cost-effectiveness of investment in public health services.
- Develop protocols and technical assistance for ensuring accountability of Medicaid managed care plans and other government-funded plans for service delivery and overall health status of their covered populations.
- Identify standard theoretical, methodological, and measurement issues that are specific to population subgroups for monitoring the impact of health system changes on vulnerable populations.
- Ensure a mechanism for public accountability of performance and outcomes through public dissemination of information and in particular ensure that underservice, a risk inherent in capitated plans, is measurable through available data.
- Ensure that information is provided to communities, local health departments, managed care plans, and other appropriate state agencies.

ESSENTIAL ELEMENT 5: Promoting Healthy Lifestyles: Providing health education to individuals, families, and communities.**Public Health Function**

Promote informed decision making of residents about things that influence their health on a daily basis.

Promote effective use of media to encourage both personal and community responsibility for informed decision making.

Develop a public awareness/marketing campaign to demonstrate the importance of public health to overall health improvement and its proper place in the health delivery system.

Develop public information and education systems/programs through partnerships.

PHN Roles

- Exert influence through contact with individuals and community groups.
- Accept and issue challenge of healthy lifestyles to all contacts.
- Reinforce and reward positive informed decisions made for healthy lifestyles.
- Be a resource for the community.
- Gather data and address findings as appropriate.
- Work with community groups to promote accurate information for healthy lifestyle through the media.
- Use current information and other agency's resources to maximize information accessible to the public.
- Provide education to special groups (e.g., local politicians, school boards, PTAs, churches, civic groups, news media) regarding the benefits of preventive health.
- Provide educational sessions/programs to public regarding components of healthy lifestyles.
- Access grants/other funding sources to promote healthy lifestyle decisions (e.g., cervical and breast cancer prevention, bike helmets, hypertension).
- Provide/promote teaching for individuals and families at every opportunity (home, clinic, community settings).

State Roles

- Develop and monitor standards for the changes to determine changes in behavior.
- Assist localities to provide current information to community organizations and other state organizations.
- Serve as a resource for localities and work with media.
- Develop training activities to assist localities in marketing.
- Assist localities in developing and evaluating educational programs.
- Assist localities in funding.
- Hold regional/state training sessions.
- Evaluate outcomes and plan ongoing educational systems/programs.

ESSENTIAL ELEMENT 6: Providing Targeted Outreach and Forming Partnerships: Ensuring access to services, including those that lead to self-sufficiency, for all vulnerable populations and ensuring the development of culturally appropriate care.**Public Health Function**

Ensure accessibility to health services that will improve morbidity, decrease mortality, and improve health status outcomes.

PHN Roles

- Provide family-centered case management services for high-risk and hard-to-reach populations that focus on linking families with needed services.
- Improve access to care by forming partnerships with appropriate community individuals and entities.
- Increase influence of cultural diversity on system design and on access to care, as well as on individual services rendered.
- Ensure that translation services are available for the non-English-speaking population.
- Participate in ongoing community assessment to identify areas of concern and above needs for rules.
- Provide outreach services that focus on preventing epidemics and the spread of disease, such as tuberculosis and sexually transmitted diseases.

State Roles

- Provide funds in cooperation with locality.
- Ensure policy development that includes case management and is culturally sensitive.
- Provide adequate ongoing continuing education for staff (especially in areas common to all localities).
- Participate in state-level contract development to ensure that contracts with health plans require and include incentives for health plans to offer and deliver preventive health services in the minimum benefits package.
- Educate financing officials about the roles of public health both in performing core public health services and in ensuring access to personal health services.

ESSENTIAL ELEMENT 7: Providing Personal Health Care Services: Providing targeted direct services to high-risk populations.**Public Health Function**

Provide direct services for specific diseases that threaten the health of the community and develop programs that prevent, contain, and control the transmission of infectious diseases.

Provide health services, including preventive health services, to high-risk and vulnerable populations (e.g., the uninsured working poor), and in geographic areas where primary health care services are not readily accessible or available in a privatized setting.

PHN Roles

- Plan, develop, implement, and evaluate:
- Sexually transmitted disease services
- Communicable disease services
- HIV/AIDS services
- Tuberculosis control services
- Develop and implement guidelines for the prevention of the above targeted diseases.
- Provide coordination, follow-up, referral, and case management as indicated.
- Integrate supportive services (such as counseling, social work, nutrition) into primary care services.
- Assess existing community medical capacity for referral and follow-up.

State Roles

- Establish standards/criteria for personal health care.
- Work with local health departments to assist in developing infrastructure and management techniques to facilitate record-keeping and appropriate financial monitoring and tracking systems, which enable local health departments to enter into contractual arrangements for preventive health and primary care services.
- Continue to work at the state and local level to build capacity of primary and preventive health services, particularly in traditionally underserved areas, to ensure availability to providers and primary care sites essential to primary care access.

ESSENTIAL ELEMENT 8: Conducting Research and Innovation: Discovering and applying improved health care delivery mechanisms and clinical interventions.**Public Health Function**

Ensure ongoing prevention research relating to biomedical and behavioral aspects of health promotion and prevention of disease and injury.

Implement pilot or demonstration projects.

PHN Roles

- Develop outcome measures.
- Identify research priorities for target communities and develop and conduct scientific and operations research for health promotion and disease/injury prevention.
- Develop and implement linkages with academic centers, ensuring that clients and populations who participate in research projects benefit as a result of the research.

State Roles

- Provide training in area of measuring program effectiveness.
- Support evaluations and research that demonstrate the benefits of public health, as well as the consequences of failure to support public health interventions.

ESSENTIAL ELEMENT 9: Mobilizing the Community for Action: Providing leadership and initiating collaboration.**Public Health Function**

Provide leadership to stimulate development of networks or partnerships that will ensure the availability of comprehensive primary health care services to all, regardless of ability to pay.

Initiate collaboration with other community organizations to ensure the leadership role in resolving a public health issue.

PHN Roles

- Advocate for improved health.
- Disseminate health information.
- Build coalitions.
- Make recommendations for policy implementation or revision.
- Facilitate resources that manage environmental risk and maintain and improve community health.
- Provide information for a community group working on impacting policy at the local, state, or federal level.
- Use results of community health assessments to stimulate the community to develop a plan to respond to identified gaps in service.

State Roles

- Facilitate the establishment and enhancement of statewide high-quality, needed health services.
- Administer quality improvement programs.
- Use information-gathering techniques of assessment to assist policy/legislature activities to develop needed health services and functions that require statewide action or standards.
- Recommend programs to carry out policies.

American Public Health Association Definition of Public Health Nursing

THE DEFINITION AND PRACTICE OF PUBLIC HEALTH NURSING

2013

Acknowledgments

This statement was developed by the Public Health Nursing Definition Document Task Force under the direction of the leadership of the Public Health Nursing Section of the American Public Health Association. The statement was adopted by the Public Health Nursing Section Council at the American Public Health Association Annual Meeting on November 5, 2013. The Task Force gratefully acknowledges the valuable assistance of individuals who contributed comments and recommendations throughout the development of this document.

THE DEFINITION AND PRACTICE OF PUBLIC HEALTH NURSING

A Statement of the APHA Public Health Nursing Section

2013

This document updates the 1996 American Public Health Association Public Health Nursing Section definition statement and affirms the original definition.¹ This statement addresses some of the evolving economic, health, political, and societal trends that shape the context of public health nursing practice.

Definition

Public health nursing is the practice of promoting and protecting the health of populations using knowledge from nursing, social, and public health sciences.

Public health nursing is a specialty practice within nursing and public health. It focuses on improving population health by emphasizing prevention, and attending to multiple determinants of health. Often used interchangeably with community health nursing, this nursing practice includes advocacy, policy development, and planning, which addresses issues of social justice. With a multi-level view of health, public health nursing action occurs through community applications of theory, evidence, and a commitment to health equity. In addition to what is put forward in this definition, public health nursing practice is guided by the American Nurses Association *Public Health Nursing: Scope & Standards of Practice*² and the Quad Council of Public Health Nursing Organizations' *Core Competencies for Public Health Nurses*.³

Elements of Practice

Key characteristics of practice include 1) a focus on the health needs of an entire population, including inequities and the unique needs of sub-populations; 2) assessment of population health using a comprehensive, systematic approach; 3) attention to multiple determinants of health; 4) an emphasis on primary prevention; and 5) application of interventions at all levels—individuals, families, communities, and the systems that impact their health.⁴

Public Health Nursing Perspective

Public health nursing aims to improve the health outcomes of all populations. Applying their clinical knowledge and expertise in health care from an ecological perspective, public health nurses acknowledge the complexity of public health problems and the contextual nature of health—including cultural, environmental, historical, physical, and social factors. Public health nurses apply systems-level thinking^{5,6} to assess the potential or actual assets, needs, opportunities, and inequities of individuals, families, and populations and translate this assessment into action for public good.

Public Health Nursing Activities and Practice Settings

Public health nursing activities comprise the domains depicted by the *Public Health Intervention Wheel* and the *10 Essential Public Health Services*.^{7,8} These activities include community collaboration, health teaching, and policy development, in response to priorities derived from ongoing, comprehensive population focused assessment. Public health nurses are members and leaders of interprofessional teams in diverse settings and in many different types of agencies and organizations including all levels of

November 11, 2013

government, community-based and other nongovernmental service organizations, foundations, policy think tanks, academic institutions and other research settings. Increasing numbers of public health nurses work in global health in an effort to promote global responsibility and connectivity. Public health nurses that work with individuals and families do so within the context of a population focus—applying a systems perspective to factors that impact health.

Determinants of Health

Eliminating population health disparities by addressing multiple determinants that lead to poor health is a national goal.⁹ Public health nurses are in a position to provide leadership through public policy reform efforts, community-building, and system-level change.¹⁰ Environmental, physical, and social determinants explain most health disparities in the United States.^{11,12,13,14,15} Socioeconomic disadvantages such as poverty, low levels of education, and belonging to a racial or ethnic minority group, are more robust risk factors of poor health than a lack of access to health care or predominantly genetic factors of disease.^{16,17,18} While the discipline of nursing was founded on improving environmental conditions to facilitate health at the bedside,¹⁹ public health nurses focus on improving population health in the environments where people live, work, learn, and play.

Opportunities & Challenges

Adherence to public health nursing's key characteristics requires that the practice must evolve to address current societal needs. Public health nursing has faced multiple challenges over its history while engaging in leadership opportunities that have shaped nursing practice, addressing environmental and social justice issues, affecting population health, and exploring health promotion concepts. One example is the Patient Protection and Affordable Care Act (ACA).²⁰ The ACA has greatly altered the landscape for health care and health improvement in the U.S., creating the potential for new public health nursing roles and responsibilities. The ACA includes goals to 1) improve the individual health care experience; 2) reduce the cost of health care; and 3) improve the health of populations. With their positions embedded within communities, public health nurses are vital to the interprofessional teams needed to assure that all people have equitable access to high quality care and healthy environments through health system reform.²¹ Their assessment skills, primary prevention focus, and system-level perspectives can assure that local and state needs are met, services and programs are coordinated, and communities are engaged.

Public health nurses are prepared to lead efforts that align emerging systems of care for population health improvement, health promotion, risk reduction, and disease prevention efforts that are within the nucleus of a reformed health system. Fewer public health nursing positions and decreased public health funding influence leadership roles and access to health care in communities.²² Within the context of health care reform these challenges offer opportunities to emphasize a strong, well-educated public health nursing workforce to lead and carry out system coordination and change at local, state, national, and international levels.²³

An emerging health care model that requires public health nursing leadership is the integration of primary care and public health.²⁴ Primary care and public health share a focus on prevention, population health, transitional care, and care coordination across settings to promote health through collaboration. With a unique focus from individuals and families to populations and systems, public health nurses are well

positioned to integrate new health system models and meet the demands of an ever-changing health system.²⁵

Public Health Nursing Education

The baccalaureate degree in nursing (BSN) is recommended for entry-level public health nurses.²⁶ *The Essentials of Baccalaureate Education for Professional Nursing Practice* emphasize fundamental concepts for public health nursing practice such as clinical prevention, population health, health care policy, finance, and regulatory environments, and interprofessional collaboration.²⁷ The graduate is prepared to conduct community assessments and apply the principles of epidemiology among other competencies.

Nurses with a master's degree or higher, and with specialization in population health, demonstrate the knowledge and skills required for leadership positions. Competencies include mastery of interprofessional collaboration, health policy and advocacy, population assessment, prevention strategies, and program planning and evaluation.²⁸ The doctor of nursing practice (DNP) degree, with a public health emphasis, has emerged in the last decade, and provides the foundation for advanced practice in executive leadership, systems development, and the translation of research into practice. The doctor of philosophy (PhD) and other research-focused doctoral degrees remain the preparation for public health nurses to develop the science relevant to public health nursing and to generate the evidence needed to guide practice. In some states a public health nursing certification is needed to signify a nurse's specific competence and expertise in public health nursing. National advanced public health nursing certification is available via portfolio assessment through American Nurses Credentialing Center.

Summary

Public health nurses provide leadership for emerging advances in population health and health care—particularly in terms of addressing health inequities. Equipped with a baccalaureate degree or higher, public health nurses are prepared to address multiple determinants of health and participate fully in the challenges of attaining and maintaining population health. With a scope of practice that includes community-building, health promotion, policy reform, and system-level changes to promote and protect the health of populations; public health nurses have an essential role and responsibility as leaders in health improvement and promoting health equity.

American Nurses Association Scope and Standards of Practice for Public Health Nursing

STANDARDS OF CARE

Standard 1. Assessment

The public health nurse collects comprehensive data pertinent to the health status of populations.

Standard 2. Population Diagnosis and Priorities

The public health nurse analyses the assessment data to determine the diagnoses or issues.

Standard 3. Outcomes Identification

The public health nurse identifies expected outcomes for a plan specific to the population or situation.

Standard 4. Planning

The public health nurse develops a plan that prescribes strategies and alternatives to attain expected outcomes.

Standard 5. Implementation

The public health nurse implements the identified plan.

Standard 5A: Coordination of Care

The public health nurse coordinates care delivery.

Standard 5B. Health Teaching and Health Promotion

The public health nurse employs multiple strategies to promote health and a safe environment.

Standard 5C: Consultation

The public health nurse provides consultation to influence the identified plan, enhance the abilities of others, and effect change.

Standard 5D. Prescriptive Authority

Not applicable

Standard 5D. Regulatory Activities

The public health nurse participates in applications of public health laws, regulations, and policies.

Standard 6. Evaluation

The public health nurse evaluates progress toward the attainment of outcomes.

STANDARDS OF PROFESSIONAL PERFORMANCE

Standard 7. Ethics

The public health nurse practices ethically.

Standard 8. Education

The public health nurse attains knowledge and competency that reflect current practice.

Standard 9. Evidence-Based Practice and Research

The public health nurse integrates evidence and research findings into practice.

Standard 10. Quality of Practice

The public health nurse contributes to quality nursing practice.

Standard 11. Communication

The public health nurse communicates effectively in a variety of formats in all areas of practice.

Standard 12. Leadership

The public health nurse demonstrates leadership in the professional practice setting and the profession.

Standard 13. Collaboration

The public health nurse collaborates with the population and others in the conduct of nursing practice.

Standard 14. Professional Practice Evaluation

The public health nurse evaluates her or his own nursing practice in relation to professional practice standards and guidelines, relevant statutes, rules, and regulations.

Standard 15. Resource Utilization

The public health nurse utilizes appropriate resources to plan and provide nursing and public health services that are safe, effective, and financially responsible.

Standard 16. Environmental Health

The public health nurse practices in an environmentally safe, fair, and just manner.

Standard 17. Advocacy

The public health nurse advocates for the protection of the health, safety, and rights of the population.

From American Nurses Association: *Public health nursing: Scope and standards of practice*, Washington, DC, 2013, American Nurses Publishing.

The Health Insurance Portability and Accountability Act (HIPAA): What Does It Mean for Public Health Nurses?

Public Health Nursing Practice—definition: a specialty practice within nursing and public health. Practice focuses on improving population health by emphasizing prevention, and attending to multiple determinants of health. Practice includes advocacy, policy development, and planning, which addresses issues of social justice. With a multi-level view of health, public health nursing action occurs through community applications of theory, evidence, and a commitment to health equity. The goal is to prevent disease and disability and promote and protect the health of the community as a whole.

EXPLANATION

- Federal privacy standards were created by the Department of Health and Human Services (USDHHS) to protect patients' medical records and other health information provided to health plans, doctors, hospitals, and other health care providers.
- These standards took effect on April 14, 2003.
- Standardization of electronic transactions, and the elimination of inefficient paper forms, will save the health care industry more than \$29 billion in the next 10 years.

PRIVACY RULE

- Protects the confidentiality of individually identifiable health information, whether it is on paper, in computers, or communicated orally.
- Protected health information (PHI) is the name for this individually identifiable health information.
- Limits the ways that health plans, pharmacies, hospitals, and other covered entities can use patients' personal medical information.

PATIENT PROTECTIONS

- Patients should be able to see, obtain copies, and make corrections to their medical records.
- Patients should receive a notice from health care providers regarding how their personal medical information may be used by them and their rights under the privacy regulation. Patients can restrict this use.
- Limits have been set on how health care providers can use individually identifiable health information. Doctors, nurses, and other providers can share information needed to treat a

patient. For purposes other than medical care, personal health information generally may not be used.

- Pharmacies, health plans, and other covered entities must obtain an individual's authorization before disclosing patient information for marketing purposes.

PUBLIC HEALTH SERVICES AND PHI

Overview: Although protection of health information is important, PHI is used for the public good by health officials to identify, monitor, and respond to disease, death, and disability among populations. Examples of ways PHI is used include public health surveillance, program evaluation, terrorism preparedness, outbreak investigations, direct health services, and public health research. Public health authorities have taken precautions in the past to protect the privacy of individuals and will continue to do so under HIPAA. The privacy rule, however, still permits PHI to be shared for important public health purposes.

PERMITTED PHI DISCLOSURES TO A PUBLIC HEALTH AUTHORITY

Without Authorization

- Reporting of disease, injury, and vital events
- Conducting public health surveillance, investigations, and interventions
- Reporting child abuse or neglect to a public health or other government authority legally authorized to receive such reports
- To a person subject to jurisdiction of the Food and Drug Administration (FDA) concerning the quality, safety, or effectiveness of an FDA-related product or activity for which that person has responsibility
- To a person who may have been exposed to a communicable disease or may be at risk for contracting or spreading a disease or condition, when legally authorized to notify the person as necessary to conduct a public health intervention or investigation
- To an individual's employer, under certain circumstances and conditions, as needed for the employer to meet the requirements of the Occupational Safety and Health Administration, Mine Safety and Health Administration, or similar state law

HIPAA AND NURSING RESEARCH

Definitions

Covered entity: a health plan, a health care clearinghouse, or a health care provider who transmits any health information in electronic form.

Individually Identifiable Health Information (IIHI): information about an individual regarding his or her physical or mental health; the provision of health care; or the payment for the provision of health care; and which identifies the individual.

It is the covered entity's obligation not to disclose the information improperly when a researcher seeks data that includes PHI.

A covered entity can disclose IIHI for research purposes under any of the following conditions:

1. The IIHI pertains only to deceased persons.
2. The IIHI can be examined for reviews preparatory to research if it is not removed from the covered entity.
3. Information that has been de-identified can be disclosed; this information is no longer considered IIHI and thus not covered by HIPAA.
4. Data must be disclosed as part of a limited data set if the researcher has a data use agreement with the covered entity.
5. The researcher has a valid authorization from the research subject to disclose IIHI.
6. An IRB or privacy board has waived the authorization requirement.

Creating Data

Researchers may also be creating IIHI. If the researcher is part of a covered entity, any PHI obtained by any means is covered by HIPAA, and the researcher and his or her institution are bound by HIPAA regulations. Most universities with nursing schools will be hybrid entities (i.e., some parts of the university are a covered entity and some are not). Researchers should check their institution's policies.

Disclosing Data

Nurse researchers should be aware that sharing data with colleagues and students may constitute disclosures of IIHI and they should conform to HIPAA regulations. In this case, the researcher is the holder of the IIHI and can disclose it only under appropriate conditions:

1. Patients agree to specific disclosures in the initial authorization.
2. Former patients sign an additional authorization.
3. An IRB or privacy board waives the need for authorization.
4. The holder allows the colleague to review the data to prepare a research protocol if the colleague takes no information away.
5. A holder enters the data in a limited data set and signs a data use agreement with the recipient.
6. A holder de-identifies the data and shares it freely.

Guidance is also provided on how to implement *Healthy People 2020* in the community via MAP-IT, which refers to the steps of: mobilize, assess, plan, implement, and track. In the *MAP-IT Guide to Using Healthy People 2020 in Your Community*, instructions are provided for ways to implement each of the five steps. See <http://www.healthypeople.gov/2020/default.aspx> for details about *Healthy People 2020*.

HEALTHY PEOPLE 2020: OVERVIEW

Healthy People is a national initiative to set and monitor national health objectives with the goal of improving the health of citizens. The process began in 1979, and the current objectives are called *Healthy People 2020*. The most recent prior objectives, *Healthy People 2010*, aimed to increase the quality of health care and the years of healthy life and to eliminate health disparities. The process of developing the national health objectives is inclusive with many points of input from the public and stakeholders. Specifically, *Healthy People* is a product that has resulted from input from many different people both from within and outside the federal government. The Secretary of Health and Human Services' Advisory Committee on National Health Promotion and Disease Prevention Objectives for 2020 and the Federal Interagency Workgroup on Healthy People 2020 are guiding a two-phased approach to the development of *Healthy People 2020*. Phase I—the *Healthy People 2020* framework—occurred in 2007 through 2008. The framework consists of a vision, mission, and overarching goals. The process used a risk factors-and-determinants-of-health approach to inform and guide improvements in health and build on past iterations of *Healthy People*. The framework provided the foundation for Phase II, the development of specific objectives and strategies to achieve them. The development process culminated in 2010 with the launch of the objectives and their baselines and targets in December 2010.

The intent is that *Healthy People 2020* will “provide a framework to address risk factors and determinants of health and the

diseases and disorders that affect our communities” (www.healthypeople2020.gov). The vision for *Healthy People 2020* is to have a society in which people live long, healthy lives. The mission follows:

- Identify nationwide health improvement priorities
- Increase public awareness and understanding of the determinants of health, disease, and disability and the opportunities for progress
- Provide measurable objectives and goals that are applicable at the national, state, and local levels
- Engage multiple sectors to take actions to strengthen policies and improve practices that are driven by the best available evidence and knowledge
- Identify critical research, evaluation, and data collection needs.

In the overarching goals of *Healthy People 2020*, there is both a foundation measures category and a list of ways in which progress will be measured in the aim of attaining the goals.

The document contains 42 topic areas, and each topic area has objectives that are to be attained. Some of the objectives were retained from *Healthy People 2010* since they had not been met; others were retained and modified from the version in *Healthy People 2010*; and other objectives were new ones added to *Healthy People 2020*. The table on the preceding page summarizes the vision, overarching goals, and foundation measures that will measure progress toward attaining the goals and the topic areas of *Healthy People 2020*.
