and Ross (1980) found that marketing managers whose scenarios revealed a persistence in the same strategy as situations changed were evaluated more favorably by practicing administrators than managers whose scenarios showed that they tended to shift strategies to try to accommodate transient changes in conditions. Nevertheless, by 2006, the persistence of President G. W. Bush to “stay the course” in Iraq and his continuing support for many of his policy advisors despite their many mistakes had lost him much of his popularity with his party and the public.

### ***The Behavior of Newly Appointed CEOs***

The political behavior of newly appointed CEOs and how they restructure control within the organization, protect their own position, and implement strategy reflected their leadership in previous positions (House & Singh, 1987). Helmich (1974b) established that the origin and style of successors to 140 presidents of manufacturing firms influenced the changes and improvements that occurred in the organization. The task-oriented leadership behavior of the successors was greater than that of the predecessors, particularly during the early days of the successors’ tenure. Zhang and Rajagopalan (2003) observed that strategic change was less likely in manufacturing organizations led by CEOs with long tenure in office. Some began by holding meetings with their new people; others did not. Some were more aware of the social dynamics involved in the succession; others were not. Some might bring allies and assistants with them; others entered the new post alone (Grusky, 1969). Some utilized the formal system and depended on their own authority, with a resulting increase in tension; others relied more on informal contacts to learn about what was needed to guide future actions (Gordon & Rosen, 1981). The personal learning opportunities for the successors were also likely to be of consequence (Hall, 1986). Some failed to consider individual, group, and organizational dynamics, which resulted in conflict, defensiveness, and organizational regression (Oskarsson & Klein, 1982). In a study of 227 successions over a 25-year period (Vancil, 1987) noted that the CEO served also as board chair, shared leadership with the future successor or board chair in a dual arrangement, or was a member of a team of executives. Or else the new CEO was a symbolic figurehead without real power.

### ***Effects of the Ages of Leaders and Followers***

Although there is persistence in leadership, systematic changes occur as a function of age. That is, the requirements for success as a leader are likely to mirror the developmental stages of the leaders and the led. Early on, immaturity, raucousness, and playfulness are required. Later, these characteristics are replaced by demonstrated task and interpersonal competence. The playboy Prince Hal turned into the persuasive and determined King Henry V.

These changes have been demonstrated in studies of children at various ages. For example, observations of the spontaneous play of nursery school children by a one-minute sampling procedure indicated the existence of two approaches to leading others: persuasion and coercion. Such authoritative leadership behavior continued to be seen among three-to-five-year-olds by Barner-Berry (1982) in the ongoing informal leadership of a child even after the succession of a new formal leader. The emerging leader was also readily observed in primary school at an early age (Mey, 1936). At this age, children attempt to become leaders to satisfy their desire to influence others. Such emergent leaders tend to be tyrants or stimulators. But later, attempts to organize become more common. With continuing maturation, consistency in attempts and successful leadership increase, while rivalry decreases among would-be leaders (Toki, 1935). Increasing age brings further changes in the behavior that contributes to the success of a leader. Tryon (1939) found that among 12-year-old girls, the leaders were daring and humorous, but among 15-year-old girls, the friendly, enthusiastic, happy ones were

more successful leaders. Among European adolescents, the emphasis on coercion was observed to change with maturation to a persuasive appeal to ideals (Winkler-Hermaden, 1927). Horrocks and Thompson (1946) studied the friendship choices of boys and girls aged 10 to 17 by administering sociometric tests two weeks apart. They discovered that the fluctuation in the choices of boys and girls of the same age did not differ. However, older boys and girls tended to name the same individual both times as friends, while younger children showed less overlap on the two lists. These results suggested that socio-metric choices tended to stabilize in later adolescence.<sup>1</sup>

### ***Persistence in School and Onward***

I. J. Levi (1930) obtained a correlation of .19 in the leadership activity of the same group of students in elementary school and later in high school. But the correlation was .52 when these children's leadership performance in junior high school was compared with their performance in high school. And D. P. Page (1935) found that the first-year leadership rank of cadets at West Point correlated .67 with fourth-year leadership rank.

Several early studies also determined that leadership in elementary school, high school, and college was predictive of later leadership in adult business and social activities. Courtenay (1938), for example, found that leadership in extracurricular activities as an adolescent was more highly related to various criteria of success as an adult than was scholarship or academic achievement. In other words, leadership, rather than scholarship, was the best predictor of later leadership.<sup>2</sup> Williams and Harrell (1964) reported a significant correlation of .24 between leadership in undergraduate activities and later success in business five years later, as measured by the salary level achieved. Roskens (1958) found significant correlations, ranging from .37 to .63, between college leadership and postcollege leadership. At the same time, postcollege leadership was not highly related to grades in college or to parents' occupational status.

Russell, Mattson, Devlin, and Atwater (1986) obtained a correlation of .18 between high school leadership, as measured by a self-report biodata questionnaire, and subsequent peer ratings as a midshipman leader at the U.S. Naval Academy. Similarly, Yammarino and Bass (1989) found that grades for military proficiency of students at the U.S. Naval Academy correlated with the successful patterns of leadership behavior of the same personnel as shipboard lieutenants as much as eight years later, but their academic grades at the academy were not correlated with their subsequent leadership performance.

### ***Persistence of Leadership in Experimental Groups***

As early as 1904, Terman (1904) reported an experimental verification of the consistency of leadership behavior in schoolchildren from one problem to the next. Borgatta, Couch, and Bales (1954) observed that new experimental groups were more effective if they contained "great men" who had been identified in former groups for their ability, assertiveness, and social success. The "great men" continued to be influential in the new groups. Highly esteemed, active, able individuals continued to succeed as leaders in groups with different members that were faced with similar tasks. Blake, Mouton, and Fruchter (1954) reported that the leaders' contribution to the groups' decisions and dominance, as rated by different observers in different situations, yielded consistent individual differences among raters, despite the variation in the situation and the groups' composition. They also noted that as the task and groups were altered, self-ratings and others' ratings were most consistent when they were concerned with leadership and interest. They were less consistent when they were concerned with the rated effectiveness and satisfaction of others.

Borgatta, Couch, and Bales (1954) found that initially effective leaders tended to emerge as leaders in group after group to which they were assigned. Bass and Norton (1951) analyzed test-retest performance in initially leaderless discussions held a week apart. The test-retest measure of successful leadership was .90. Carter, Haythorn, and Howell (1950) studied the emergence of leaders in groups of college students who were performing the same task again after about four months. The test-retest correlations depended on the nature of the task. They ranged from .39 for discussion tasks to .88 for motor coordination tasks.

Rosenberg, Erlick, and Berkowitz (1955) studied small experimental groups that were required to cooperate in tilting an apparatus in such a manner as to move a small ball up a ramp. The persistence of leadership was highly significant among the various regroupings of members. Gordon and Medland (1965a) obtained peer nominations and ratings in small military units before and eight weeks after the reconstitution of the units. Peer nominations for leadership correlated .80 to .90 between the two situations.

Attempted leadership also showed consistencies across different task conditions. Hemphill, Pepinsky, Shevitz, et al. (1954) found an average correlation of .45 between assessments of attempted leadership by the same members of experimental groups engaged in four different tasks: reasoning, instruction, assembly, and strategy. This consistency across tasks depended on the similarity of the tasks. For example, as groups developed, the same successful leaders reemerged as the same developmental tasks needed to be completed. Sterling and Rosenthal (1950) reported that when leaders and followers changed roles in different phases of their groups' development, the same leaders tended to emerge as similar phases of development recurred.

### ***Persistence of Leadership in Industry and Elsewhere***

The consistencies in leadership behavior found among developing individuals and groups and in small experimental groups were also observed among supervisors, managers, and other institutional leaders across times and places. Furthermore, those who were more effective in one situation and time were likely to be more effective at other times and in similar kinds of locations.

*Consistency of Leadership Behavior.* Holloway and Wolleat (1981) examined the interaction styles and supervisory behavior of trainees and concluded that individual preferences for different kinds of supervisory interactions were stable. Over a three-month period, Greene (1976a) reported rate-rater coefficients of .60 and above for contingent reward behavior and for contingent punitive behavior by supervisors. Similar results were found for contingent reward by Szilagyi (1980b) and Sims (1977) over 3-, 6-, and 12-month intervals. Sakamaki (1974) studied the descriptions of 339 Japanese first-level bank supervisors and second-level bank managers by their more than 1,800 subordinates and colleagues. The managers remained in the same positions in the two successive years. Rate-rater correlations of .35 and .74, respectively, were found for their leaders' orientation toward performance. The corresponding correlations for orientation toward maintenance leadership were .53 and .59.

Similar evidence about the consistency of transformational and transactional leadership was obtained for a small sample of executives with a six-month test-retest analysis of their subordinates' descriptions of their behavior (Bass & Avolio, 1989). The mass of case and anecdotal evidence available on world-class leaders also supported the contention that leadership behavior is consistent across times and similar situations.

*Persistence of Effective Leadership.* Considerable evidence is available concerning the tendency of the same leaders to be effective, given the same task requirements with new work groups. The impressive set of field studies of first-line supervisors is illustrative. H. Feldman (1937) studied 22 work groups that shared in savings on operating costs. One year after the project began, supervisors of groups with high savings in operations were assigned to groups with low savings, and vice versa. The order of merit of the supervisors remained practically the same despite the change in assignments. Many of the differences among groups were

associated with the leaders—not with the groups they were leading. The supervisors' assignments were then shifted by chance, and the same results occurred. The relative order of performance of the groups depended on who led the groups. The groups with previously weak savings records that were subsequently led by high-savings leaders later had strong savings, while those with previous strong savings that were subsequently led by low-savings leaders later had weak savings. In the same way, J. M. Jackson (1953b) arranged for the supervisors of telephone line crews with high morale to change places with the supervisors of crews with low morale. A retest of the crews four months later showed a significant shift in the scores for morale, with the previously low groups scoring high and the previously high groups scoring low. Each supervisor tended to receive a score in his second group that was similar to that obtained in his first group. No such significant changes occurred in a set of control groups. Wyndham and Cooke (1964) also studied work groups in which the supervisors exchanged places. They found that the performance of previously ineffective groups improved under previously effective supervisors, but the performance of previously effective groups declined under supervisors of previously ineffective groups.

F. L. W. Richardson (1961) studied work groups in which the only way found to improve productivity and morale was by transferring troublesome leaders out of their groups. N. A. Rosen (1969) obtained ratings of workers' preferences for eight supervisors in an upholstering shop. Supervisors who were high and low in preference then changed places. The greater the workers' consensus in the first and tenth weeks that the new supervisor "is our leader," the greater was the increase in productivity and cohesiveness in the eleventh and sixteenth weeks. The findings suggested that the new supervisors were evaluated in terms of their ability to help the group. In another experiment by N. A. Rosen (1970b), large changes in the preference for supervisors were associated with large gains in productivity following reassignment. Small changes in preference were associated with small gains or losses in productivity.

## Transfer of Leadership

---

Borrowing from the general psychology of transfer, Bass (1960) developed a model to account for the conditions in which the positive and negative transfer of leadership behavior occurs. Among the major propositions were that *positive transfer* (transfer that facilitates performance) from an old to a new situation will be greater the more the new situation is similar to the old one and the more the new situation calls for the same leadership behavior as the old one to attain goals. *Negative transfer* (transfer that is detrimental to performance) will be greater the more the new situation, different from the old one and requiring new modes of leadership, is responded to with the old ways of behaving to achieve goals. The new situation is responded to as if it were similar to the old, when it actually is not. It is perceived as requiring the old ways of leadership behavior, when actually new ways are necessary.

The transfer of leadership and management at lower levels becomes increasingly difficult from one situation to another as the positions call for different technical knowledge, different human relations skills, and different required participation in planned change. Successful positive transfer requires recognition of the differences in the organizational norms. Positive transfer is easier at higher levels but may have ineffective results if the new situation turns out to have different requirements from the old one. A senior executive with the needed conceptual and organizational skills is able to transfer leadership from one organization to another but may still suffer from negative transfer effects due to differences in markets, products, traditions, and technologies (Yukl, 1998).

### ***Military-to-Civilian Transfer***

As many as 70 U.S. Army generals retire annually to enter civilian life at an age and with the skills and experience commensurate with the civilian executive levels into which they move. Ordinarily, the transfers are successful, despite the failure to prepare adequately for the transfer by careful self-analysis and an analysis of the situation into which they transfer (Whelan, 1981).

Like George Marshall before him, Colin Powell, who retired as a general and Chief of Staff, was appointed civilian Secretary of State in 2001. Starting with George Washington, many generals have been elected president. Like many military leaders before him such as Douglas MacArthur, retired general Wesley Clark sought the presidential nomination in 2004. Considerable experimental evidence confirms the positive transfer of leadership.

What transfers positively, say, if one examines the move from high-level military leadership to civilian leadership? Hill (1984) mentioned these characteristics: (1) contacts with top government and foreign officials and specialists; (2) relevant experience in dealing with boards and staffs; (3) effective skills in presentation, persuasion, and communication; (4) experience in strategic planning and decision making; (5) emphasis on clear definitions of authority and responsibility; and (6) experience with integrating operations, such as planning with research and development. Dwight D. Eisenhower illustrated the transfer that is possible from a successful military career to performance as university president and president of the United States.

But military-civilian differences may also be a source of negative transfer effects for military officers taking senior civilian executive positions.

1. A less authoritarian and more collegial style is required.
2. Civilian employees have a great deal more latitude (say, to strike) than do military personnel.
3. Delegation and coordination in civilian business and industry require much more than giving orders and expecting unqualified compliance.
4. The lack of cost control in the military and the profit orientation of civilian firms may be problems for ex-military leaders.
5. The ex-military leader may lack experience in assessing and making calculated marketing risks.

The career of Ulysses S. Grant illustrated this negative transfer. Grant was successful as the commander of the victorious wartime Union Army, although he had previously been a repeated failure in business. Later, he was also a failure as U.S. president (McFeely, 1981).

### ***Transfer of Specialists***

Administrators in one specialty readily transfer to another position in the same specialty area. For example, deans of medical schools who change jobs move into other dean-ships or vice presidencies at their own or other medical schools. A few return to faculty positions, retire, or take up administrative posts outside medical schools (Wilson & McLaughlin, 2001). Some scientists and technologists who wanted to transfer eventually into management positions revealed that they were motivated by needs for upward mobility, power, influence, dominance, security, and respect.

What is learned about leadership of sports teams can be transferred to leading work teams. Healthy competition among members may contribute to overall team performance if they work together effectively and do not try to undermine each other (as candidates frequently did while seeking the 2004 Democratic Party nomination for U.S. president). As shown by professional hockey teams, early experiences of success are encouraging and predictive of better subsequent performance. Taking time out in team sports for feedback, learning, and review benefits subsequent performance. The more time team members have together, learning about one another's roles and team processes and how to anticipate one another's actions, the more team

performance is benefited (Katz, 2001).

However, specialization may result in negative transfer effects. Kotter (1982b) noted that when general managers adapt themselves to one specific context, they will find it difficult to transfer to a different context. For a general manager in one organization and industry to become a general manager in another organization and industry requires the ability to learn new things rapidly and to establish new relationships.

Experience as a manager, per se, is not what is important. Rather, whether the transfer of experience will be positive or negative depends on the relevance of the experience of the old position to the new position. Kennedy (1985) found that while time in service and the number of previous positions held added less than 1% to the accuracy of predicting successful leadership performance as a military officer, the assessed *relevance* of the previous positions added 20% to the accuracy in predicting successful leadership performance.

### ***Evidence of the Effects of Positive Transfer***

Positive transfer of attempted and successful leadership has been seen when groups move from one similar situation to another and if the issues they face are similar. Even if the membership changes, the same leadership may persist.

*Effects of Similar Tasks.* Katz, Blau, Brown, and Strodbeck (1957) reported that groups exhibited a tendency to return to the same leader when the task performed in time 2 was similar to that performed in time 1. As reported in [Chapter 6](#), Bass and Norton (1951) reported a correlation of .90 between successful leadership displayed by members of leaderless group discussions held a week apart. The composition of the groups and the problems discussed were the same. When one discussion was an examination and the other was not, the correlation remained as high as .86 (Bass, 1954a), but the correlation dropped to .75 when two members of each group of seven were coached between the test and retest situations on how to lead (Klubeck & Bass, 1954).

An examination of situational data collected in the screening of candidates for the Office of Strategic Services (OSS, 1948)<sup>3</sup> further illustrated the effects of similar tasks. Positive transfer was evidenced by the increasing correlation of leadership ratings of candidates' performance on other situational tests with their rated performance in leaderless discussions as the other situational tests became more similar to open discussions. The correlation with leadership in discussions was .30 with leadership in cooperatively constructing a giant toy, .47 with leadership in solving a problem of crossing a brook, .48 with leadership in a personal interview; and .56 with leadership displayed in a debate.

As posited by the transfer model, the transfer of leadership behavior decreases when tasks differ from an old to a new situation, especially when a change from a purely intellectual activity to purely manual-mechanical activities is involved. Thus, Carter, Haythorn, and Howell (1950) found that although leaders in reasoning tasks also tended to emerge as leaders in intellectual and clerical tasks, they did not do so in mechanical tasks. Leaders in mechanical tasks tended to emerge as leaders in motor coordination tasks, but not in intellectual tasks. In an earlier study, Carter and Nixon (1949a) found a tendency for the same person to emerge as leader in clerical and intellectual tasks, but not in mechanical tasks. Thus, no transfer or even a negative transfer seems most likely when the transfer of leadership is from group tasks of the "head" to tasks of the "hand."

*Effects of Similarity of Issues.* The positive transfer of successful opinion leadership was reported by Jacoby (1974), who found that opinion leaders' influence overlapped in different areas. The degree of overlap of influence increased with the increase in the similarity of issues about which opinions were sought.

*Effects of Changes in Membership.* As long as the task stays the same in a new situation, recomposing the group membership does not seem to reduce the positive transfer effects greatly. Various experimental attempts have been made to determine whether the same individuals will emerge as leaders when members are

reassigned to new groups with different combinations of leaders and followers. Bass (1949) found a correlation of .72 between the initial leadership status attained by group members in leaderless discussion groups and leadership status attained in reassembled discussion groups. Bass and Wurster (1953a) obtained correlations ranging from .51 to .66 between measures of leadership status in groups that differed in the composition of members and the problems to be discussed. Even when, in addition to changing the groups' composition, a year instead of a week intervened between the test and retest, the tendency to emerge as a discussion leader on the test and the retest correlated .53 (Bass & Coates, 1952). Arbous and Maree (1951) obtained a median correlation of .67 between the extent to which administrative candidates displayed successful leadership when they were appointed discussion leaders and the extent to which they displayed successful leadership in initially leaderless discussions. Similar research by Carter, Haythorn, Meirowitz, and Lanzetta (1951) yielded a correlation of .55. When, in addition to changing the composition of the membership, the type of discussion problem was varied systematically, the correlation in consistency of success was still .58 (Bass & Coates, 1953). Nevertheless, subtle effects can be seen when the composition of the members of a group is changed. Cloyd (1964) found that the same members tended to perform the same function in successive groups but that different functions, if needed, could be performed by the same members. An analysis of leaders' comments in discussions that had different purposes indicated to J. T. Wood (1977) that the same leaders can be successful in a variety of discussion situations with divergent goals, members, and constraints if they adapt their oral behaviors to meet varying goals and compensate for failures at previous meetings. Other members also readjust.

Members adjust for each other's behavior when they find themselves in new groups. For example, Haythorn (1952) combined and recombined the members of experimental groups. Members were rated on aggressiveness, initiative, confidence, submissiveness, sociability, leadership, and the like. Haythorn found that when one member in a group was rated high on one of these variables, other members were all rated low. It appeared that when one member exhibited a high degree of a given behavior, the other members attempted to adapt to the situation by reducing their behaviors in the same area of role performance. Similarly, Bernstein (1964) removed the dominant male from a group of rhesus monkeys. During the month he was away, the remaining males increased their dominance and social activities. Upon his return, the dominant male assumed his former position and the social activities of the other males were reduced.

*Effects of Changing Task and Organizational Location.* Bass (1960) analyzed the results of eight studies that reported 18 correlations between successful performance in initially leaderless group discussions and successful performance as a leader in real life. Although the median correlation was .38, the 18 correlations ranged from  $-.25$  to  $.68$ . Correlations were higher, the more similar the real-life situation was to a leaderless group discussion. In the study mentioned earlier, Sakamaki (1974) found that the performance (P) orientation scores (according to subordinates) of 121 first-line Japanese supervisors who were not transferred correlated .35 from one year to the next. For maintenance (M) orientation, the rate-rater correlation was .53. For nontransferred second-line supervisors, the respective correlations were .74 and .59. But for 133 transferred first-line supervisors, the corresponding correlations dropped to .03 and to  $-.07$ ; and for 19 transferred second-line managers, the corresponding correlations dropped to .29 and  $-.08$ . The lack of consistency in leadership orientation for the transferred supervisors compared with those who did not transfer could be attributed to a change in the composition of the subordinates who rated them, as well as to a change in their position and social context. Misumi and Mannari (1982) clarified the importance of the similarity or difference between the old and new situations of transferred supervisors. When 67 Japanese bank managers were transferred to jobs with similar work content and social context, they tended to exhibit the same P and M orientations, as revealed in rate-rater correlations by subordinates of .56 and .42, respectively. But when 23 other bank managers were transferred to different kinds of departments in different branches, the rate-rater correlations dropped to .10 and  $-.06$ , respectively.

## *Evidence of the Effects of Negative Transfer*

For Henry Ford, the automobiles he produced could be any color as long as they were black. The very successful Model T was black, but the public finally turned to his competitors for cars in different colors. Early success in situation fixates the behavior of the rigid, stubborn leader, making him or her less effective in a new, different situation that requires a new approach to problems. For example, a technical supervisor who has been a successful leader in a situation that demands precision exactness may fail to deal with the challenge of decision making in the absence of complete information when promoted to the position of general manager (Pearse, Worthington, & Flaherty, 1954). Similarly, many examples can be found of a business executive transferring his successful profit-making practices to running a government agency with disastrous results (e.g., Fishman, 1952). The political appointees of the Environmental Protection Agency (EPA) and the Federal Emergency Management Agency (FEMA) provide illustrations.

Negative transfer can also occur for the career bureaucrat. Measures are adopted in keeping with past training. Under new conditions, not recognized as significantly different, the very soundness of the training leads to the bureaucrat's adoption of the wrong procedures. Furthermore, continued success in day-to-day routines makes the bureaucrat unable to change or see the need to change when the conditions under which the bureaucracy was organized change (Merton, 1940). Negative transfer may explain the ill-fated attempt at administrative reform in Zaire in 1973, in which the local chieftaincies were changed by rotating the chiefs outside their areas of origin. The failure of the policy was attributed by Schatzberg (1982) to the lack of timely consultation. Nonetheless, it would seem that there must have been considerable negative transfer because of the loss of legitimacy, understanding, and applicability of a chief's approach when he was moved from his home area to another.

*Maladaptation.* As might be inferred from Fiedler's (1967) Contingency Theory,<sup>4</sup> shifting leaders from situations that are favorable to them and in which they have experienced effectiveness to situations that are unfavorable to them is likely to produce negative transfer. The leaders' earlier success can result in their continuing to attempt the same leadership in the new situation, with a consequential decrement in effective outcomes. The garrison commander may not do as well when in a front-line command. The effective leader in emergencies may be unsuccessful and ineffective elsewhere. Elkin, Halpern, and Cooper (1962) observed that individuals who emerged as leaders in experimentally created mobs were not popular under other circumstances. Likewise, what is likely to make a leader effective in the early stage of development of a sensitivity training group seems to reverse in later stages of development. Data from 158 members and leaders of 20 such groups showed that trainers who were considered to have little need for control and affection tended to elicit the most favorable reactions during an early period of a group and the most negative reactions at a later time (Schutz & Allen, 1966).

Negative transfer occurs when a new situation requires values different from or opposite to those fitting the old situation. Thus, the political appointments of conservative private sector executives to administer public housing programs to which they were ideologically opposed resulted in their corrupt and wasteful violations of the barest minimum standards of public service (Montgomery, 1989). A well-documented case of negative transfer of leadership was that of a school district superintendent in a midwestern suburban community. She gained a statewide reputation in educational and business circles as an energetic, innovative, and visionary leader who had converted the threat of a budgetary crisis into an opportunity to make improvements in the district. Her transformational leadership had a dramatic impact on the district. Her charisma resulted in some of her followers becoming cultlike. However, when she subsequently served for two years as state commissioner of education, none of the successful transformational leadership was seen. No cult-like following developed. No attributions of extraordinary talents and abilities were heard; no strong bonds of affection were forged with

constituents. Instead, there was strong criticism of her leadership style and actions. What had worked well in a school district in crisis was counterproductive in the larger state system (Roberts & Bradley, 1987). Lombardo, Ruderman, and McCauley (1987) examined what “derailed” the promising careers of junior executives who had failed after promotion to senior levels. Derailment occurred for some who liked to work alone and couldn’t build a staff if placed in a senior position. Some lacked a strategic perspective, were too controlling and results-oriented, and had trouble starting in new and more complex situations. Some who were conceptually strong and creative lacked sufficient attention to detail and follow-through.

## Succession

---

The process of succession is an examination of the transfer process from another vantage point. Antecedents that promote the more effective replacement of one leader by another and the consequences of replacing one leader with another provide a further opportunity to see how the positive and negative transfer of leadership may occur (Gordon & Rosen, 1981). This implies that leaders make a difference to the performance of their groups and organizations, although as was noted in earlier chapters, organizational variables may be more important (Pfeffer, 1977). Meindl and Ehrlich (1987) argued that the effects of leadership on organizations were a romantic fiction, a misperception of cause and effect, which attributed the success or failure of organizations to their leaders. Nevertheless, who succeeds as leader is important to group and organizational performance, even though other variables may be more important (Thomas, 1988). Succession planning has been a major strategy for many boards, CEOs, and their organizations since before the 1970s. Some new practices are emerging (Beeson, 1998) to form an effective pipeline of potential CEOs. At each successive career stage, each potential successor needs to develop skills, use time effectively, and adjust values in meeting different leadership challenges and managing others. At each transition, fewer old tasks and more new ones need to be handled (Charan, Drotter, & Noel, 2001).

House and Singh (1987) pointed to the importance of the executive succession process—a phenomenon in all groups and organizations that survive. In the succession process, much power is transferred, along with control of the organization’s relationship with its outside environment. A change of executives is often associated with major changes in the organization (Virany, Tushman, & Romanelli, 1985). The succession is a focal point of political processes within the organization (Zald, 1965). Decisions about the succession express the particular political preferences of the organization’s constituencies (Pfeffer & Salancik, 1974; Salancik & Pfeffer, 1974). The change of leaders is often accompanied by a change in the political environment that casts the replaced leader in an unfavorable light (Rockman, 1984). It is no wonder that most incumbent chief executives give top priority to the question of succession (Bruce, 1986). Except for a major reorganization, the retirement of the chief executive probably causes more job changes down the line than does any other event.

The average tenure in office of chief operating executives in industry appears similar to that in higher education and hospital administration. The *median* tends to be little more than five years, but the *mean* is much longer (weighted by those in office for a lifetime). The expected mean term of office often used to be close to 10 years (Wilson & McLaughlin, 2001). The median was shortened to seven years in the 1990s and in 2005 was closer to four to five years. If the successor comes from within the organization, there may be a wave of other promotions at lower levels. If the successor comes from outside, the organization that supplied the successor must find a replacement, so it, too, will be engaged in a succession process. The rate of succession increases with the rate of organizational acquisitions, expansion, mergers, takeovers, and bankruptcies.

### ***Purposes Served by the Succession Process***

There has been increased concern about the need for accountability of top executives for corporate performance and ethics and their appropriate selection and compensation in alignment with stakeholder interests. Replacing a CEO of a poorly performing firm is an effort to regain stakeholder confidence (Puffer & Weintrop, 1995). A survey of 711 Australian human resource business professionals indicated that the purposes of succession management programs were to improve business results and to meet new skill requirements. Efforts were linked, to a considerable degree, with strategic business plans, a broader management strategy, and unique organizational needs (Taylor & Ross-Smith, 2003). Each organization needs to tailor-make the process to fit its culture and support its systems and resources (Berke, 2002).

Some CEOs, like many political leaders, refuse to retire. Their “personal identity is so intertwined with ... [their] role that retirement represents a personal void.” They will have to give up power, status, and perquisites (Sonnenfeld, 1988, p. 264). Term limit rules have to be enforced, or countervailing power will be required for the succession. Saddam Hussein was removed by military force. Coalitions of revolutionaries force resignations. Castro overthrew Batista. In the United States, following the institutionalized rules, the electors from each state choose the next president. Boards of directors, representing the shareholders, legally choose the next CEO, although as will be discussed later, corporate succession in the United States has to be seen as matters of politics, power, shareholder interests, governance rules, government regulations, and laws. In Japan, organizational rules represent the interests of the employees and institutionalized changes in CEOs are more frequent (Kim, 2000).

Although Flament (1956) and Pryor, Flint, and Bass (1962) reported that experimental groups tended to remain effective as long as they did not change leaders, in the political arena, in particular, the choosing of new leaders is an occasion for renewal. In both capitalist and socialist countries, innovations, new policies, new priorities, and revised budgets usually accompany the succession of new leadership. Some leaders may be chosen as caretakers. When a change of leaders is mandated, such as at the end of four or eight years for a U.S. president, the successor may be chosen to provide continuity. Thus, Blake and Mouton (1985b) showed that four twentieth-century U.S. presidents who chose their successors tended to choose a leader similar to themselves in management style. But the styles of the nine successors who were not chosen by the previous president tended to be different from those of their predecessors.

A change in management because of poor organizational performance is a way in which the organization attempts to be adaptive (Helmich & Brown, 1972). Failure to change the leadership will reduce such adaptivity. Failing firms have lower rates of succession than do non-failing firms (Schwartz & Menon, 1985).

In choosing the top managing successors of an organization, one is likely to be contributing to changes in the organization's strategies and to what is to be valued by the organization. In searching for successors for the chief executive, organizational renewal is sought. There may be a need to dip down into the next generation of managers with less seniority to find the leadership required for such changes. The organization's structure is likely to be affected by the succession. For example, Hambrick and Mason (1984) hypothesized that if the successors are highly educated professional managers, the organization is likely to see them introduce more thorough planning systems, complex coordination devices, budgeting details, and complex incentive-compensation schemes.

Succession is an opportunity for organizational members to participate in a process that may significantly shift the organization's direction. The expenditure of time and effort in the process reaffirms the importance of the position to the organization and adds to the power of the position (Pfeffer, 1981b). Succession offers opportunities for coalitions of interests within organizations to communicate, exercise preferences, and negotiate the organization's future (Gephart, 1978). According to Boeker's (1997) study of 67 semiconductor producers, the movement of senior management from one organization to another brings managers into the new firm with prior experience with different products and strategies, reflected in the new firm's market entry

decisions.

### *Antecedents of the Succession*

Between 1957 and 1981, corporations tended to concentrate on choosing successor CEOs with the same career specialization as before. However, between 1981 and 1997, they were more likely to choose successors from different career specializations, probably to help reduce organizational inertia and to reflect the need for change (White, Smith, & Barnett, 1997). As Trow (1960) noted, it is difficult to sort out the antecedents from the consequences of the succession in leadership. Many successions are routine, due to rules regarding retirement or disability. From an examination of 13 CEO successions in the 1990s in firms such as Corning and Glaxo Wellcome, Spitzer and Evans (1998) inferred that successions worked well if thinking about the succession began with the accession of the previously selected executive, the process was well defined and articulated, the board of directors was involved early, the field of candidates was not narrowed too quickly, and the candidate was first placed and observed for style, values, and vision in a chief operating role for a period. At Ameritech, formerly part of Bell Telephone, the installation of the new CEO was accompanied by the creation of four planning teams of younger executives to assist in the necessary organizational and personnel developments (Tichy, 1996).

In the 1980s, the average CEO could expect to be in office for a decade. But in the 1990s and 2000s, succession events due to dismissals increased substantially as a consequence of poor organizational performance. Increasingly, CEOs were held accountable for an organization's performance; although the evidence is not always supportive, the disruption caused by the succession may outweigh its benefits (Wiersema, 2002). Repetitive executive turnover and leadership discontinuity often result (Krug & Nigh, 2001, 2002). Poor profitability is likely to result in the selection of an outsider as the successor (Cannella & Lubatkin, 1993).

Numerous events affect the succession (Kesner & Sebra, 1994). For instance, product completion and new financing from outside investors may be the reason for a change at the top (Wasserman, 2002). Or the change may be induced by mergers or when one firm acquires another in a takeover. Senior managers in the acquired firm leave at higher-than-normal rates in the years following the acquisition (Hambrick & Cannella, 1993). On the other hand, internal reorganization and organic expansion reduce turnover of CEOs (Vermeulen & Berkema, 2003). There are other reasons that CEOs leave acquired firms and require successors. They may feel their status has been lost and want to avoid conflicts with the acquirers. Their age, tenure, and specific knowledge and skills may be of importance in the decision to be retained or dismissed (Buchholtz, Ribbens, & Houle, 2003).

The turnover of senior executives may be due to disabling ill health, death, or unexpected voluntary retirements and resignations for other personal reasons. When Campion and Mitchell (1986) compared 140 former executives and managers with 143 current ones in the same organization, the leavers reported less satisfying job characteristics, more problems of adjustment and socialization, unmet job expectations, and more job stress than did those currently in the organization. House and Singh (1987) listed personal traits that help to reduce such turnover: psychological hardiness, optimism, vigorous involvement, commitment, the need for achievement, and the ability to cope with stressful conditions. Particularly important contributors to voluntary resignations are the executives' perceptions of their own lack of power to influence their organization and their felt need for such power. Firms that lack internal consensus exhibit more internal conflict, resulting in higher rates of executive turnover than in organizations with internal consensus. Turbulent environments are antecedents of executive turnover. Such turbulence doubled annual voluntary resignations of chief executives between 1974 and 1984 (Wescher, 1984).

*Rules of Succession.* Herrity (2003) looked at the institutionalized rules in the largest publicly traded U.S.

firms between 1975 and 1994 and concluded that the rules were determined by the power and competing interests of the executives, board members, owners, and other stakeholders. But based on an analysis of 216 insider and outsider successions in 108 firms between 1960 and 1990, Ocasio (1999) noted that the boards of directors were both enabled and constrained in their selection process by the institutionalized rules for succession. They relied on the rules as well as past precedents and the availability of internal candidates in choosing a successor.

*Determinants of Choice.* Santora and Sorros (1995) observed that longevity, specialized competence, and loyalty determined the choice of the successor of a charismatic leader of 24 years. Campbell, Sessa, and Taylor (1995) reported that according to interviews with 327 executives about the succession process, candidates external to the organization were more prevalent but less likely to be appointed. Compared to rejectees, selected candidates were seen to fit the positions and the organizational culture better. They also were more likely to have better interpersonal skills and compatible values. However, they did not have more business or technical experience. They were more likely to be selected for political reasons.

Politics was also seen by Cannella and Lubatkin (2003) in 472 CEO successions in a Forbes list of 800 large publicly traded firms. The results indicated that between 1971 and 1985, poor organizational performance brought on a selection of an outsider successor mainly if there was no heir apparent and the incumbent lacked the ability to influence the selection of the successor. According to an analysis of 220 successions in industry by Zhang and Rajagopalan (2003), an insider was more likely to be chosen if there was an heir apparent. Welsh and Dehler (1988) observed the lobbying, bargaining, forming of coalitions, and other organizational politicking that was present in 36 colleges that were searching for a new dean. Deshpande, Schoderbek, and Joseph (1994) analyzed the promotion decisions of 197 managers and found that subordinates could influence the recommendation process favorably if they had organizational connections known to the manager.

*The Search Committee.* The particular representation of organizational members on the search committee for the successor enhances the status of their various constituencies in the organization. The quality of the committee's search process adds legitimacy to the chosen successor's leadership (Hollander, 1985). The search committee is an important source of information to the successor about the organization's current normative expectations, values, and distribution of power (Birnbaum, 1987a). Less recognized is that meeting with outside prospects can provide new objectives, values, information, and methods.

Powerful boards of directors tend to favor a successor CEO who is an external candidate and more like them than like the incumbent CEO (Zajac & Westphal, 1996). More outside directors have been appointed to the search committee, presumably so the selection decision will be less influenced by identification with management (Sherman, 1992).

*The Founder's Influence.* Compared to successions at later stages in a firm's history, the first succession after the retirement of the founder is likely to be strongly affected by the incumbent founder. A founder is more likely to have a strong attachment to the firm, as well as large equity holdings that may control the firm. A founder's values and ideology can exert strong influence on the succession, according to Wasserman's (2001) event-history analysis of successions in 202 Internet firms. But successors may not cling to the same goals as tenaciously as the founders (DiMaggio & Anheier, 1990). Compared with the founders, the successors are more likely to have functional backgrounds in administration rather than technology (Drazin & Kazanjian, 1993).

*The Predecessor.* According to Sonnenfeld and Ward (1995), the self-concept of the departing chief executive could make the succession process easy or difficult for the organization and the successor. Departing executives varied in whether they saw themselves as having a heroic stature and heroic mission with a unique commanding role that could not be carried out by anyone else. Four types of departing executives were recognized: monarch, general, ambassador, and governor. The *monarch*, with both heroic stature and mission—such as Edwin Land of Polaroid—has to be forced out of office; a palace revolt may be required to replace

the monarch. The *general*, with heroic stature but not mission—such as William Paley of CBS—leaves office reluctantly but might return as organizational savior to rescue it from the successor. The *ambassador*—such as Thomas Watson, Jr., of IBM—is heroic neither in stature nor in mission, leaves office gracefully, mentors the successor, and subsequently serves on the board of directors. The *governor*, like the ambassador—such as Stanley Gault of Goodyear—is not heroic, serves a limited term, takes other positions of senior leadership elsewhere afterward, and does not maintain continuing contact with the organization. Successors have many difficulties replacing monarchs and generals. On the other hand, ambassadors remain a source of advice and service to the organization, while governors often develop strong internal successors. Ambassadors who serve as mentors for their successors may obtain vicarious satisfaction and a sense of achievement from their successors' successful performance (Lipman-Blumen, 1996).

Musteen, Barker, and Baeten (2003) surveyed 280 chief executives of nonprofit organizations. They found that long-tenured CEOs were likely to have less favorable attitudes toward organizational change.

*The Heir Apparent.* This is a future successor who has already been identified but not installed. The wait for the succession to occur depends on the power of the predecessor, the outside board members, and the *heir apparent*. Cannella and Shen (2001) studied what happened to 152 such heirs to the incumbent CEO's position. A powerful incumbent CEO might stall the selection process indefinitely. If the firm is doing poorly, the heir might leave for another position elsewhere. On the other hand, powerful outside directors may try to keep the discouraged heir from leaving, or force the succession to occur. If the firm is doing well, the heir is likely to wait longer. Forty-three percent were actually elevated to CEO, but 20% left the firm. The traditional model of succession that is likely to be favored starts grooming a manager identified early on as a potential heir apparent. Years before succeeding as CEO of Exxon, one young plant superintendent was already being called the crown prince.

*Grooming the Successor.* Except when seeking to seriously refocus the organization, as when Lou Gerstner, a former marketing executive from American Express, was chosen as CEO of IBM, firms pursue traditional succession strategy and promote most of their chief executives from within the firm. Potential successors are assessed, developed, and coached for numerous senior leadership positions with opportunities for internal and external training. Individual career plans are matched with succession plans and monitored by top management (Gratton & Syrett, 1990). The traditional succession strategy has been increasingly jeopardized by societal and technological change, corporate mergers and acquisitions, globalization, flattening of hierarchies, early retirements, work family considerations, and the effects of the glass ceiling (the numbers of women matching those of men in middle and lower management but not in senior management).

*Family Firms.* Family-controlled firms are common throughout the world and almost the rule in many developing countries. Family members are crucial in the succession process and, as successors to top executive positions, must be committed to the business. The next generation of family members must be assessed by the family entrepreneurs for their interest in the firm. Some are committed through desire for the top posts, some out of a sense of obligation, some based on the opportunity costs of doing otherwise, and some based on need (Sharma & Rao, 2000).

*Involuntary Change.* Forced departures were seen by Sonnenfeld (1988) as due to organizational effects ranging from political scheming to mandatory retirement. Phan (1995) and Lee obtained mixed results when examining the forced exits of 26 CEOs in 255 successions reported between 1975 and 1991. CEOs who had to resign were in one or more of the following circumstances: (1) they were entrenched in social networks; (2) they were insiders rather than outsiders; (3) they had more personal prestige; (4) their board of directors was larger; and (5) they owned substantial blocks of the firm's shares. The antecedent condition that most often precipitated an involuntary change of leadership was failure by the organization attributed to the leadership. Sometimes the attribution was accurate, but other times, the CEO was the scapegoat for the organization's shortcomings. Considerable evidence supported the contention that an organization's failure stimulated a

change of its leaders. This was found in 172 top management successions in China in companies that also had fewer insiders on the board and had a dominant shareholder. The dominant shareholder was also likely to have a heavy influence on who was chosen as successor (Yue, 2003).

*Effects of Poor Corporate Performance.* According to an analysis of 240 firms by Puffer and Weintrop (1995), the poor performance of a firm's securities resulted in forced retirement of a CEO and replacement with an external successor. Firms with solvency problems (increased debt-to-equity ratios) changed leadership more frequently than did firms without such problems (Pfeffer & Leblebici, 1973). The high turnover of 576 top managers in 31 Fortune 500 firms was associated with the firms' poor financial performance (Wagner, Pfeffer, & O'Reilly, 1984). Osborn, Jauch, Martin, et al. (1981) demonstrated that the rate of executive succession increased with the firms' volatility in profitability and unstable financial strategies. As with turbulent economic environments, the rate of succession was greater for organizations in more turbulent ownership, supplier relationships, and socioeconomic environments. While 45% of bankrupt firms changed chief executives, only 19% of a comparable sample of healthy firms did so (Schwartz & Menon, 1985). Increasingly, CEOs are held accountable for the poor performance of their firms. The rate of dismissals of CEOs of Fortune 500 firms doubled in the 1990s from what it had been in the 1980s. Such dismissals were signals to the stock market (Moliterno & Wiersema, 2003). Corporate raiders were a source of change in corporate control of firms with a history of poor financial performance. Hostile takeover activity by a raider was followed by changes in corporate officers and directors (Walsh & Kosnick, 1993). When persistent organizational problems remain unmanaged and when there is a failure to cope with critical contingencies, the chief executive loses support and is likely to be replaced (Thompson, 1967). Along with the declining performance of CEO's and their organizations, increasing difficulties in management increase the rate of succession (James & Soref, 1981). Thus Helmich (1978), in a study of 54 petrochemical firms, found that the rate of presidents' turnover was increased with mergers, acquisitions, and the increased dispersal of operations.

*Strategic Influences.* Virany, Tushman, and Romanelli (1985) concluded, from an analysis of the succession events of corporate-level executives in 37 firms, that although performance was most important in generating the change of executives, such changes were actually driven by strategic reorientations in high-performance firms. Consistent with this finding, Smith and White's (1987) analysis of the succession of 370 chief executive officers in the 25-year history of 173 Fortune 1000 firms showed that the current strategy of the firm tended to dictate the career specialty from which the new chief executive was drawn. Graham and Richards (1979) reached similar conclusions for the railroad industry. It is not surprising that the increased movement of marketing executives into top management coincides with the firms' increased focus on marketing. When there is increased emphasis on cost containment, accountants come to the fore. Increased strategic concern for production and the quality of products brings engineers into top management. The efforts to flatten and downsize organizations have led to more loss of jobs of managers proportionately than of employees in general and have been a major source of turnover of managers (Capelli, 1992). They transfer into staff positions, become consultants, start new businesses, find employment elsewhere, take early retirement, and/or join the ranks of the unemployed.

*Other Institutions.* The heads of educational institutions are less likely to be ousted because of the institutions' poor financial performance. Instead, a change of president may more likely be a consequence of mismanagement of resources or extreme dissatisfaction of powerful political officials, trustees, alumni, or faculties. Financial failures may play a role in private profit-making educational institutions. Replacements of presidents, deans, and directors also may be initiated as a consequence of disability, competitive job offers, and changes in mission and programs (Cohen & March, 1986). The extent to which managers of baseball teams with the poorest season's records are most likely to be changed is well known (Grusky, 1963a). Path analyses by Allen, Panian, and Lotz (1979) confirmed that poor records, rather than other related elements, resulted in the replacement of managers of baseball teams. In the same way, Hamblin (1958b) demonstrated that groups

change leaders informally if the leaders do not have a way of helping the groups out of crises. Such changes in leaders will be accelerated if the members have complex rather than simple personalities (Schroder, Streufert, & Welden, 1964). Conversely, Goldman, and Fraas (1965) found that subordinates were more likely to choose leaders who had been more successful earlier with the group's task. But Daum (1975) failed to find such results.

*Organizational Influences.* Among the possible antecedents of the rate of executive succession is the size of the organization. Grusky (1961) reported that the rate of succession of chief executive officers was directly related to the firm's size. But when Salancik and Pfeffer (1980) examined the tenure of the chief executives of 84 U.S. corporations, the executives' tenure was unrelated to the corporations' size. Gordon and Becker (1964) suggested that the relationship of organizational size to the rate of executive succession was complicated by other factors. For instance, larger firms have more ready inside replacements and would be expected to exhibit higher rates of succession as a consequence. However, insiders who reach the top serve longer terms in their positions (Helmich, 1976). Kriesberg (1962, 1964) further suggested that the differences among industries and in technology have to be taken into account.

Salancik, Staw, and Pondy (1980) examined the turnover of the heads of 20 university departments. They found that turnover increased with a department's size but was lower if the department had been more successful in receiving outside grants. Turnover was also lower in departments in which there was agreement about how knowledge in one area was relevant in another area, as reflected in the departments' ability to organize long lists of courses in their curricula. Zhang and Rajagopalan (2003) completed an analysis of 206 manufacturing executives who left their positions between 1993 and 1997 and showed that turnover was lower if organizational sales growth and short-term profitability were greater. In another study, Pfeffer and Moore (1980) also found that the size of a department was of consequence. They also obtained positive associations between the length of tenure of its heads, departmental consensus, and the seniority of its faculty. Datta and Rajagopalan (1997) showed that for 134 CEO succession events in manufacturing, there was a modest association between their industry's product differentiation and the length of successor CEOs' organizational tenure. Industry growth rate had the reverse effect on CEO tenure.

Succession in higher education appears to be followed by similar stages in taking charge by the successor (Gmelch, 2000) as in industry (Gabarro, 1985): taking hold, immersion, reshaping, consolidating, and refining. Similarly, the choice of successor university presidents for their previous effective financial performance seems to be becoming closer to the choice of new CEOs in industry.

*Effects of Age.* Differences in the age of top managers and others in a firm contributed to more rapid turnover of top management (Wagner, Pfeffer, & O'Reilly, 1984). Evidently, the increasing age gap, presumably due to older-than-ordinary senior managers, creates pressure to accelerate the succession process. Older CEOs who were turned out of office were more likely to take on advisory roles or to retire from any active role in the firm. Younger CEOs were more like to take on new active roles (Ward, Sonnenfeld, & Kimberly, 1995).

*Concentration of Ownership.* Although tenure was related to changes in profit margins, Salancik and Pfeffer (1980) found that it depended on the concentration of stock ownership. Tenure was unrelated to the corporation's performance for owner-managed firms but was related positively to profit margins for externally controlled firms and to stock market rates of return for management-controlled firms. According to McEachern (1975) and Allen and Panian (1982), in general, the rate of succession was likely to be greater if the management was under external control than if it was freewheeling and in control of itself.

*Effects of the Succession of Insiders or Outsiders.* While bureaucratic maintenance is thought to be favored by the succession of an insider, more organizational change may be obtained by the succession of an outsider. A progression of insider successors is seen to slow adaptation (Carlson, 1961) and organizational growth (Helmich, 1974a). After bankruptcies, outside successors appointed as both CEOs and chairs of the

board induce more strategic change, according to an analysis of 47 organizations (Dawley, Hoffman & Brockman, 2003).

Conflict inside the organization may be reduced by choosing an outsider. For example, upon winning their independence from Turkey in the nineteenth century, the Balkan countries—Greece, Bulgaria, and Romania—chose petty German princes as their new kings to avoid conflict among the leading indigenous noble families, as well as to obtain support from the great powers of Britain, Austria-Hungary, France, and Russia. Similarly, Birnbaum (1971) showed that state universities tend to recruit their presidents from the lower administrative levels of other state universities, rather than from their own universities or from nearby colleges in the state, thus both promoting the transfer of knowledge from elsewhere and restricting conflict inside their own universities. (At the same time, the main source of lower-level administrators was promotion from within the universities.)

Nevertheless, Lubatkin and Chung (1985) found no particular differences in the subsequent performance of successors who were insiders or outsiders. Likewise, Chung, Lubatkin, Rogers, et al. (1987) concluded, after comparing 80 appointments of insiders to 19 appointments of outsiders as chief executive officers, that although long-term profitability after a succession depended mainly on the firm's profitability before the succession, rather than on the change of leaders, stock prices went up when outsiders but not insiders were hired by high-performing firms. However, only the exceptional new leader from the outside could successfully turn around the poorly performing firm.

Clearly, contextual moderating variables must be examined before one can reach conclusions about the extent to which better organizational performance results from a choice of an insider or an outsider. One needs to know if the outsider has a mandate for change, particularly to change top management and its strategies. One needs to know whether inside successors have been chosen by default because desired outsiders could not be recruited in the face of the organization's poor history of conflict and performance (House & Singh, 1987).

The succession of insiders provides for the continuity of existing programs, management practices, and organizational stability (House & Singh, 1987). Lack of continuity is seen when outsiders are appointed to senior leadership posts in a new presidential administration. Its effects on the U.S. State Department were a loss of coherence in policy making (Bloomfield, 1984). A change of administration in the Environmental Protection Agency likewise promoted greater distrust between career employees and political appointees, less effective communication, and the inability to handle routine business or to improve the agency's performance over time (Gaertner, Gaertner, & Devine, 1983).

In their survey of senior-ranking human resources officers in 235 Fortune 500 firms, Friedman and Saul (1988) confirmed that the appointment of outside successors to the post of chief executive officer resulted in more post-succession disruption and turnover of lower-level executives than did the appointment of inside successors. However, overall, outside and inside successors did not appear to have different effects on morale.

In an analysis of the impact of 477 successions, Lubatkin, Chung, Rogers, and Owers (1989) concluded that share price is generally depressed by the occurrence of a succession. However, the price of the stock is enhanced (indicating that investors are favorably impressed) when the successor is an outsider and the firm is above average in its performance. For the 15% of 136 successors in Friedman and Singh's (1986) analysis who were outsiders, the market value of the parent firm's shares increased. But the value of shares was unaffected if the successor was an insider. Insider-outsider effects of the predecessor were more complex. The forced resignation of a predecessor who was an insider had a more positive effect than forced resignation of a predecessor who was an outsider, although both events had positive effects. The voluntary resignation of an executive who originally was an outsider resulted in a much greater increase in the market value of the parent firm's shares than did the voluntary resignation of one who was originally from the inside. Although the expected retirement of an insider had no effect, the expected retirement of an outsider did have a positive effect on the market value of the parent firm's shares.

Welsh and Dehler (1986) questioned a random stratified sample of 960 faculty members from 40 professional colleges of business, education, agriculture, and engineering. They followed up the survey with telephone interviews and questionnaires three years later. They found that when consensus about issues was low among the faculty of a college, those colleges that selected a dean from the inside experienced greater turnover of deans. Conversely, when consensus was high among the faculty, colleges that chose a dean from the outside experienced greater turnover. The lowest turnover of deans occurred in colleges with high faculty consensus who selected a dean from the inside.

Management and Organizations *Reasons for Choosing an Insider or Outsider*. Insiders are expected to already know the organization well. Outsiders, chosen from elsewhere, are expected to bring in new ideas, knowledge, attitudes, and changes (Vancil, 1987). Some investigators have concluded that poor organizational performance moves an organization to choose an outsider more often. Other investigators have concluded the opposite. Still others have found middle-range organizational success to be most conducive to choosing an outsider. The differences may be explained partly by the nature of the organizations involved and the measures of financial success or failure (Puffer & Weintrop, 1995). In 85 firms, Schwartz and Menon (1985) found that external successors were appointed in 65% of those that were failing and 44% that remained in business. Allen, Panian, and Lotz (1979) found that outside succession was more disruptive to the performance of a baseball team than was bringing up a new manager from the inside. Nonetheless, there was a greater tendency to go outside for a new manager when the previous year's performance had been poor. In the same way, Virany and Tushman (1986) showed that of the 59 minicomputer firms that were performing poorly tended to make more senior management appointments from the outside than did those firms whose performance was better. Likewise, Otten and Teulings (1970) found, in an analysis of the succession histories of 34 department heads in various Dutch organizations, that poor departmental performance was an incentive to select outsiders as successors. D. R. Dalton and Kesner (1985) observed that outside successors were most often chosen by companies that were middle-range in performance. However, for a sample of 166 large firms, Lubatkin and Chung (1985) noted that in a crisis of falling profits, fewer outsiders were chosen as successors. Chung, Lubatkin, Rogers, et al. (1987) obtained results indicating that in 99 firms, outsiders were chosen in the highly performing firms but in only 14% of the poorly performing ones. These results were explained partly by the nature of the organizations involved and the measures of financial success or failure (Puffer & Weintrop, 1995). Perhaps there was more willingness by outsiders to accept a senior appointment in a prosperous firm than a failing one. Nonetheless, when corporate performance has been good, Brady and Helmich (1984) reported, insiders were more likely to be chosen as they represented stability, continuity, and experience with policies and practices. As mentioned earlier, outsiders are more likely to be chosen when there is no heir apparent and the incumbent is unable to influence the selection (Cannella & Lubatkin, 1993).

In some firms of sufficient age, long-standing policies, management development, and manpower planning, inside heirs are identified early and groomed for the succession. Larger and older firms develop their own chief executives who rise from the ranks and are familiar with the firms' people, markets, and products (Pfeffer & Moore, 1980; Tsurumi, 1983b). Appointment of insiders signals continuity and stability. Appointment of outsiders signals change (Pfeffer & Salancik, 1978).

In the political arena, outsiders are chosen to exemplify the "new broom sweeping clean." Best (1981) contrasted the original appointments of cabinet members and their replacements for the U.S. presidential administrations between 1952 and 1976 in terms of whether they came from inside or outside the government. Only 35% were original appointments at the beginning of a presidential term of office; 65% were replacements during a term of office. The original appointees were chosen to generate legitimacy and to form a cabinet that the president could trust. They were mainly outsiders to the Washington bureaucracy. However, their replacements later in the same presidents' administrations were more often insiders with Washington experience and managerial ability.

## *Consequences of Succession*

Can the benefits of change in executive leadership outweigh the disruptions caused by the change? The answer depends on a variety of considerations. Just as poor organizational performance may be an antecedent of succession, so succession is often associated with greater organizational mortality.

*On Organizational Performance.* Turnover of key executives can disrupt work routines, interrupt command, diffuse authority, and increase employees' feelings of insecurity (Haveman, 1993). Gordon and Rosen (1981) proposed a model for the dynamics of succession that takes into account variables antedating the arrival and entry of the new leader into the organization, postarrival variables of consequence, and the interaction between the two sets of variables. Included in the prearrival variables are: (1) the successor's background, competence, motivation, and orientation; (2) whether the successor came from inside or outside the organization; (3) how well the successor was known in advance by the organization; (4) the organization's previous general experience with the succession process; and (5) how much the organization was specifically involved in selecting the new leader. The new leader's mandate is also important. Post-arrival variables include much of what was identified in preceding chapters about the factors that influence leader-follower relationships and how they, in turn, affect productivity and satisfaction. Ziller (1965b) obtained results suggesting that the rapid replacement of small-group leaders provides a means of creating new ideas that lead to the continued success of the group. But changing leaders can result in a group's decreased performance and high personnel turnover costs (Rogers, Ford, & Tassone, 1961). However, the change in leaders need not be disruptive, especially when it is planned and expected. It may actually result in the improved performance of a group or organization in some instances and no change or reduced performance in others. Boal and Hooijberg (2000) suggested that succession might result in a number of different possibilities: (1) a honeymoon early on due to novelty and temporarily looser reins; (2) an early decline in organizational performance due to the successor's need for time to learn; (3) a reinforcement of the same positive or negative effects over time; (4) effects on organizational performance depending mainly on the personalities and situations involved; (5) eventual declines in performance due to the inability of the successor to adapt to changing environments; and (6) no real effects of the successor on organizational performance, only a fictional "romance of leadership." Different dynamics may be involved in the short-term and long-term consequences of a succession (Zaheer, Albert, & Zaheer, 1999). Jeffrey and Lee (1996) analyzed the consequences of succession and CEOs' tenure in 2,780 community hospitals between 1984 and 1991. They found that failure declined initially with the tenure of the successor, but after six years in office, failure increased steadily with tenure. A meta-analysis of succession outcomes explained the effects as due to differences in measurement, operationalization, and organizations (Tzabbar, 2003).

*On Board Members.* Ward, Bishop, and Sonnefeld (1999) looked at the consequences to members of the boards of directors in 144 companies between 1988 and 1992 when the CEO was dismissed, retired, or remained in office. With successions, peripheral directors left the board. The board became more involved in the succession when the dismissal was due to strategic disagreement, but directors who were CEOs elsewhere became more involved regardless of the reasons for the dismissal. Ward, Sonnenfeld, and Kimberly (1995) followed up dismissed CEOs and noted that older ones were likely to take advisory roles rather than new executive positions, but this did not affect their various board memberships.

*On Personnel.* Friedman and Saul (1988) surveyed respondents from 235 Fortune 500 firms. They showed that the morale of a firm's personnel decreased with the succession of a new chief executive officer. Taking into account the successor's age, origin, and position, morale was lower particularly if the predecessor had been in office for many years. But shareholder reactions were usually positive when successions were announced (Davidson, Worrell, & Cheng, 1990). However, Lieberman and O'Connor (1972) found that

changes in the corporate sales, profit, and profit margins of 167 corporations in 13 industries over a 20-year period (1946 to 1965) were not closely related to changes in their corporate presidents or chairmen of the boards.

*On Managerial and Organizational Performance.* The results were different when the effects of changes elsewhere in management were analyzed. Lieberman and O'Connor concluded that the succession of new presidents or board chairmen accounted for less variance in sales, earnings, and profits than differences in either industry or company. But Day and Lord (1986) pointed out that the effects of the change of these top executives increased with time, accounting for 15.2% to 31.7% of the profit margins when the time lag between the change of management and its subsequent effects was increased to three years. Changes in top business management did have important, practical effects on the firms' performance. Thomas (1988) reported in a study of large retail firms in Britain. Changes in the alignment of executives and organizational strategies were seen to have positive effects on organizational performance (Thomas, Litschert, & Ramaswamy, 1991). Friedman and Saul (1991) surveyed the consequences of changes at the top of the Fortune 500 firms from about 170 replies. If the board initiated the succession, morale was enhanced ( $r = .24$ ) although greater also were disruption ( $r = .38$ ) and executive turnover ( $r = .26$ ). However, if the succession was initiated by the incumbent CEO, there was little effect on disruption, turnover, or morale. When other variables were taken into account, disruption was particularly greater when the successor was an outsider and the incumbent was disabled. Eitzen and Yetman (1972) and Trow (1961) thought that there was an optimal rate of turnover of leaders. Nevertheless, Schendel, Patton, and Riggs (1976) found that 80% of turnaround strategies were associated with the replacement of top managers. Similar results were reported by Graham and Richards (1979) for the railroad industry.

*On Sports Teams.* Gamson and Scotch (1964) concluded that the impact of the change in managers of a baseball team was minimal; the firing of a baseball manager was only a ritual for, as noted before, Grusky (1963) had found that baseball teams with the highest rates of change in managers had the poorest performance records. Allen, Panian, and Lotz (1979) confirmed that the higher rates of change *subsequently* resulted in poorer performance by the teams. Additionally, their path-analytic examination of managerial succession for 54 seasons showed that baseball teams that replaced a manager during the season subsequently performed worse. According to Smart and Wolfe (2003) winning baseball games was accounted for primarily by individual players' pitching and batting records, not team leadership. Nevertheless, particularly in a circumstance of high rivalry, a baseball team manager with a record of competence and experience could increase a team's successful performance (Cannella & Rowe, 1995).

While Eitzen and Yetman (1972) found no relation between the turnover of coaches of basketball teams and the teams' performance records over 40 years, Giambatista (2004) reported that with National Basketball Association teams from 1980 to 1989, the disruption of in-season replacement of coaches compared to out-of-season successions did result in poorer performance. Brown (1982) concluded that in the case of 26 National Football League teams from 1970 to 1978, there was no difference in the recovery of teams that had steep declines in performance to better winning records when coaches were replaced in midseason because of the teams' poor performance than when the same coaches were retained. Brown inferred that the changing of coaches in midseason was a scapegoating mechanism that had little subsequent effect on the teams' performance.

*On Other Entities.* Salancik and Pfeffer (1977) studied the influence of 172 successive mayors on the revenues, debt, and expenditures of 30 U.S. cities from 1951 to 1968. As Day and Lord (1986) noted, an adjustment had to be made for the size of the cities to reveal the effect of the succeeding mayors on expenditures and indebtedness. Changes in mayors accounted for about 19% of the variance in financial outcomes. The succession of a new pope, such as John XXIII, brought much change and liberalization worldwide in the Roman Catholic Church. John Paul II returned to a more conservative stance in the

Church's teachings on sex, became a bridge for political democracy into Eastern Europe, and brought an increase in the recognition of the importance of Catholicism in Latin America, Africa, and elsewhere in the developing world. Benedict XVI is so far maintaining the changes instituted by his predecessors.

### ***Moderators of the Effects of Succession***

As already noted, whether replacing the leader will contribute to a team's or organization's subsequent performance is affected by a variety of moderating variables (Gephart, 1978). The reasons for the succession make a difference in its effects on future performance, as does the mode of analysis, whether the succession is voluntary or forced, and whether the departing chief executive is the firm's founder (Reinganum, 1985). The effects of succession are moderated by whether the successor brings more specialized competence to the position and what changes occur in the style and power of the leadership. The suddenness of the succession, whether the successor is an insider or outsider, and whether there is a consensus in the group or organization will affect whether the change of leadership is beneficial to the group, team, or organization. The industry in which the succession occurs also moderates its effects.

*In Business.* In an analysis of 136 successions, Friedman and Singh (1986) compared the stock market value of shares of firms from 300 days before the announcement of each succession to 100 days after it. The market value declined when the announced reason for the departure of the chief executive was an unexpected disability. The market value was unaffected if the retirement was expected. It increased if the departure was voluntary or forced because of poor performance. The market value of shares of subsidiary firms that performed poorly for 300 days before the succession increased during the next 100 days with announcement of a new chief executive. But the succession had no effect on the parent firm's shares if they had already been doing well. Ndofor and Rathburn (2003) reported that the effectiveness of the succession in making changes depended on the executive's timing and experience in formulating and implementing change. Shetty and Perry (1976) found that executives had more of a postsuccession effect on their organizations in a new industry if they possessed the necessary knowledge and relevant influence. The succession of executives with prior experience with different products and strategies made for greater success in the entry of these products into the market by their new employers (Boeker, 1997). Day and Lord (1986) noted that it was necessary to take monetary inflation and the size of the organization into account, in addition to allowing sufficient lag-time for the effects of the new management on the firm's performance to be seen. But the effects of changes in management have been most understated by analyses such as those of Lieberman and O'Connor (1972), because the best predictor of future performance is past performance. When the effect of the company's past performance on its future performance is added first in the multiple regression analysis, it takes with it much of the effect of the changes in management on future performance. However, as Weiner and Mahoney (1981) demonstrated for a comparable sample of firms, when the management succession variable is entered into the equation first, it accounts for 75% to 95% of the explained variance. The same is true for studies of the performance of baseball teams.

*In Sports Teams.* Pfeffer and Davis-Blake (1986) showed, for 22 teams in the National Basketball Association, that when prior performance is controlled, replacing the coach, in general, had no effect on a team's subsequent performance. However, the new coach's greater competence did make a positive contribution to improving the team's performance. A team that replaced its coach with one who had a good prior record and relevant experience or who had brought about improved performance in other teams performed better than did a team whose new coach lacked experience or had performed less adequately in his previous assignments. The succession of coaches of National Hockey League teams from 1942 to 2002 was found by Rowe and Rankin (2003) to be consistent with findings from other professional sports: midseason

changes of leaders worsened team performance in that season. However, successions that had occurred in the previous season had a positive consequence on current season performance.

*In Religious and Educational Institutions.* Smith, Carson, and Alexander (1984) found comparable results with their sample of Methodist ministers. Incoming ministers with a previous record of competence had more positive effects on their new church's performance than did those without such a record. In the same vein, controversial new professional programs were likely to be adopted by liberal arts colleges when incoming college presidents had had previous experience in professional schools (Kraatz & Moore, 2002). In examining the performance of newly appointed deans in 36 colleges, Welsh and Dehler (1988) found that if a lot of preselection politicking occurred among college faculty, in a college with abundant resources, as would be expected, the new successor expended much less effort to acquire resources than did a successor in a college with scarce resources. But unexpectedly, if political activity was low, there were no differences in the activities of the successor. If there was a lot of political activity among the faculty, the successor was expected to engage in more administrative activity if resources were scarce than if they were abundant. However, if resources were abundant, nonadministrative activity was required of the successor if there was little politicking among the faculty.

## ***The Transition***

How the transition is handled by organizations and successors is also important. For instance, an organization may resort to an acting appointee before selecting a permanent successor (Gordon & Rosen, 1981). The transition process itself has become an important subject of study to determine whether it foreshadows things to come. From the November election through the first day following the inauguration of the new president on January 20, the transition is carefully watched by journalists for signs of what lies ahead during the new administration. Gilmore (1988) pointed out that the successor, whether in government or in industry, needs to consider the past leader's performance, entrenched interests, and the resistance to change in the agency or firm. A new team has to be assembled, agendas changed, a new vision of the organization created, and a reorganization accomplished that is consistent with the new vision. Change must be realistic and balanced. Productive working alliances need to be negotiated to provide for the organization's effective management.

*Abruptness of the Succession.* In this regard, Friedman and Singh's (1986) demonstration of the negative impact of an unexpected succession on stock prices was already mentioned. Jackson (1953b) reported finding a work group emotionally disturbed by the unexpected replacement of its valued supervisor. Top management was excoriated, and the new supervisor was overly devalued. Gordon and Rosen (1981) also noted that changes in leadership that come with little advance notice are especially detrimental to the effectiveness of factory work groups.

The sudden death of an executive—particularly one who is highly visible to the public—that forces an unexpected succession, results in a decline in the market value of the firm (Worrell, Davidson, Chandy, & Garrison, 1986). Trow (1961) concluded that the effects of executive succession on organizational performance will be more positive if the succession is orderly and planned than if the succession is unexpected and the selection of the new chief executive has to be made under time pressure. Sorcher (1985) agreed that careful succession planning is needed at each organizational level and must be encouraged by boards of directors (Carey, 1997). Betts and Huntington (1986) noted that long-term instability follows the death of an authoritarian leader if a country is already unstable, if the authoritarian ruler was in office for a long period, and if there is strong social organization to facilitate antigovernment actions following the death of the ruler. The continuing instability and insurgency in Iraq in 2007 following the termination in 2003 of the 24 years of dictatorship of Saddam Hussein was thus to be expected.

*Differences among Industries.* Durbrow (1971) analyzed the biographical sketches of some 5,300 executives in 429 organizations in 10 major industries. Mobility rates were highest in the aerospace, electronics, and office equipment industries and lowest in the gas utility, electric utility, and chemical industries. Durbrow found that firms with low rates of executive turnover made the highest profits in high-mobility industries and those with high rates of executive turnover made the highest profits in low-mobility industries. Thus, for instance, utility firms were more profitable if they had high rates of succession, but aerospace firms did best if there was a low turnover among their executives.

## Summary and Conclusions

---

Given its consistency and personal antecedents, it is not surprising that leadership is persistent to some degree among children and more so among adolescents and adults. Both logic and empirical results attest to the persistence of leadership behavior and its effects from childhood onward. However, such persistence depends, to some extent, on the occurrence of leadership in past, present, and future situations that are similar in leadership requirements. It transfers from one situation to another if the new situation is similar in relations and task requirements to the old one. But transfer can be negative if the responses to the old situation are contraindicated. The nature of the demands of the task determines whether the effects of the transfer will be positive or negative. But, in all, there is a tendency for the leader of one group to emerge as the leader when placed in other groups.

Leadership in high school and college tends to be predictive of leadership in adult life. When members of experimental groups are successively reassigned to new groups, the same individuals tend to emerge as leaders. This effect is enhanced when the task is similar from group to group.

When effective and ineffective leaders change places, the performance and morale of formerly ineffective groups tend to improve under effective leaders, but the formerly effective groups suffer from such a change in leaders. The productivity of groups that change leaders frequently or experience high rates of succession of new leaders tend to decline. But such reductions may be the cause rather than the effect of the rapid turnover of leaders. Antecedents affecting the succession of senior executives and CEOs include the composition of the succession committee, the board of directors, the size of the organization, and family ownership. Moderators of the effect include preselection politics, whether successors are insiders or outsiders, how abruptly the changes are made, and the chosen successor's agenda. Another moderator is whether the successor is of the same or opposite sex.

<sup>1</sup> The specific traits that are important to leadership are likely to change with changes in society. The pattern has to be rechecked for each generation. Therefore, the results reported here are valid only for the generation in which the data were collected; they may not apply to other generations.

## PART VII

---

# Diversity and Cultural Effects

### Women as Leaders and Followers

Prominent leaders in previous centuries included Cleopatra; Joan of Arc; Eleanor of Aquitaine; Margaret of Denmark, Norway, and Sweden; Isabella of Spain; Elizabeth I of England; Catherine the Great of Russia; Sacajawea of the Lewis and Clark expedition; Harriet Tubman of the Underground Railroad; Susan B. Anthony of the women's suffrage movement; and Carrie Nation of the temperance movement. Earlier in the twentieth century, prominent female leaders included Jane Addams, Emily Pankhurst, Marie Curie, Rosa Luxemburg, Aimee Semple McPherson, and Eleanor Roosevelt, the wife of President Franklin Delano Roosevelt. Mrs. Roosevelt acted as an extension of FDR at times when it was politically difficult for him to operate directly. For example, among her many assignments by the president was her role as unofficial adviser, investigator, and publicist for the National Youth Administration (Abramowitz, 1984). After her husband's death, she became an early ambassador to the United Nations, which she helped shape.

### Two Examples

---

#### *Margaret Thatcher*

The most prominent modern British woman leader was Prime Minister Margaret Thatcher, who assumed office in 1979 when the British economy, dominated by nationalized industries, was in poor shape. She turned it around. She had strong convictions. She inspired her middle-class constituents and opposed nationalization of industry and strong unions, promising fair wages for a fair day's work, reduction of taxes, privatization of national industries, support for the police, and reduction in the size of government. Her determined effort to turn Britain back to a market-driven economy succeeded. She followed three principles that seeped into the national consciousness; you can only spend what you earn; keep your guard up—it's a dangerous world; actions have consequences. She had a commanding presence in Parliament. The "Iron Lady" and her party were reelected three times, and she remained in office until 1991, a record in modern times. Britain's economy in the 1980s became the fastest-growing among the industrialized nations. Unlike her predecessors, she made a dent in the British class system, coming as she did from the lower middle class. She showed her resolve in the national coal strike and the Falklands War, when a more ordinary prime minister might have continued to negotiate a settlement with Argentina rather than strive for total victory (Elliot, 1990). She helped in the liberalization of the Soviet Union when she established good relations with Mikhail Gorbachev in 1984, before he became that country's head. She restored the power of the upper and middle classes at the expense of the labor unions, gave Britons a greater sense of purpose, and was willing to make unpopular decisions such as instituting a poll tax. Just as her father had set high standards for her, she set high standards for herself and her country. For her, leaders did not have to be popular, but they did have to be respected for what they stood for and what they could accomplish. Leadership provided direction and purpose. Decisions were based on principles, supported by the majority who empower the leader to carry out decisions. She was willing to compromise, but only up to a certain point (Holmes, 1993).

In the early twenty-first century, the most prominent woman political leader in the United States is Senator Hillary Clinton, the wife of former president Bill Clinton. Currently a senator from New York, she had the potential in 2008 to be nominated by the Democrats for election as the first woman president. She has already sought and wielded power as first lady in the Clinton administration. Although generally liberal in outlook, she endorses elements of a conservative outlook. She comes from an activist religious background. And she thinks the public good would be best served by marrying the best of liberalism with the best of conservatism. For instance, she sees room for compromise on abortion, between women's right to choose and the right to life position. For Clinton, politics is about how people should behave, as well as how the government should behave. Hers is a message combining values from the nineteenth-century social gospel and from women reformers like Jane Addams; the Methodism of the early twentieth century; liberation theology; and "multiculturally correct" religious leftism (Kelly, 1993). Clinton has an international reputation for speaking out on the rights of minorities and women, religious values, and democratic approaches to solving the problems of health, poverty, and ethnic and national conflicts.

## Interest in Woman Leaders

---

Accompanying the rise of women leaders, owners, and managers in the last quarter of the twentieth century was the expansion of research, studies, and commentary on the gender<sup>1</sup> and biological sex of leaders. Gender was hardly discussed in Stogdill's (1948) review and in the first edition of this handbook (Stogdill, 1974). Many popular books that first appeared during this period argued that women leaders were different from their male counterparts but that to succeed as managers they had to behave like men. Brenner (1982) could report that women managers adopted a masculine orientation. Likewise, McBroom (1987) reported that women learned to act like men as they advanced their careers in management. Without such adjustment, women managers and leaders were seen as more nurturing, considerate, cooperative, and participative. Male managers and leaders were seen as more competitive, controlling, impersonal, and analytic. The traditional hierarchical organization required both female and male managers to act like men. But the accumulated research evidence suggests some merit for a distinct woman's leadership style in the less hierarchical twenty-first-century organization.

Men and women are two clearly different biological types, distinguished by a variety of physical and physiological differences. They are the two—the only two—different sexes. Their social and behavioral similarities and differences are looked at in terms of their membership in one sex rather than the other.

Until it was incorrectly applied by social scientists, "gender" was only a grammatical term. In English, there are three grammatical genders: masculine, feminine, and neuter. Nonetheless, by the 1980s, "gender differences," a term that probably originated as a Victorian euphemism, had supplanted "sex differences" in the social sciences. Although differences between the two sexes are now most often relabeled differences between two genders and the social and behavioral blends are *androgynous*, not *neuter*, I have chosen to remain in the minority and continue to call male-female differences differences between the sexes rather than differences between the genders.

## Then and Now

---

In 1972, women held 17% of managerial positions; in 1995, nearly 43% (U.S. Department of Labor, 1996).

In 2005, the numbers reflected the proportion of women in the workforce (46%). Nonetheless, women managers remain concentrated in lower and middle management. A female university vice president who had recently attended several executive management sessions afterward wrote that she “was amused to discover that much of what they were teaching were things that women automatically pay attention to” (Swain, 1993). In education, women dominate positions as schoolteachers and school principals, although not superintendents of schools. In the U.S. military, leadership positions have opened for women at all levels from corporal to general. Fifteen percent of all U.S. military officers are women (Kantrowitz & Juarez, 2005). Women have been appointed chiefs of police, a role traditionally reserved for men, in the cities of Detroit, Milwaukee, San Francisco, and Boston (Paul, 2004). Currently, in San Francisco, the three most senior police officials are women (Breslau, 2005a). In the 50 states, women make up approximately 23% of state legislators and 26% of executive officers. In 1999, they were serving as 18 lieutenant governors, 14 secretaries of state, 10 attorneys general, 10 treasurers, and 10 chief state education officers (Anonymous, 1999). In 2005, in Washington state, the governor, the state’s two U.S. senators, and four of its nine State Supreme Court justices were women (Breslau, 2005b). In 2000, Mississippi had a state low in the proportion of women elected to political office: 22 women were in the state legislature, 32 were justice court judges, 44 were mayors, and 339 were elected members of city councils (Kimmel, 2002). Significant numbers of women now play important leadership roles in U.S. business, health care, and government agencies. In the mid-1980s, two of the 100 members of the U.S. Senate were women. But by 2005, 14 were women and 81 of the 435 members of the U.S. House of Representatives were women. In 1999, women held at least one statewide office in 42 of the 50 states. In future we should expect to see more women in chief political roles in the United States, as we now see in the parliamentary democracies abroad. Elizabeth Dole was a candidate for president in 2000, and Senator Hillary Clinton was campaigning to become the Democratic candidate in 2008. The gender distribution among office holders has become more equitable in local governments. Women city mayors, county council members, and judges at all levels are now commonplace. One effect of the increasing numbers of women in political office has been the increasing advocacy of and consideration for the welfare of women, family, and children. “Women in Congress have different priorities, raise different issues, and operate differently than their male colleagues” (Walsh, 2002, p. 6).

As of 2007, even larger percentages of women are serving in many other countries as heads of state, prime ministers, and other positions of government leadership. By the mid-1990s, women prime ministers or presidents had been chosen in Britain, France, Ireland, Canada, Portugal, Iceland, Norway, Argentina, Nicaragua, Bolivia, Haiti, Dominica, the Dutch Antilles, Turkey, Israel, India, Pakistan, Bangladesh, Sri Lanka, and the Philippines (Harwood & Brooks, 1993). In 2005, Germany joined the many countries abroad by electing its first women chancellor, Angela Merkel, as head of government.

Women who rose to the top of their political systems in developing countries tended to have a close attachment to their fathers and did not challenge their patriarchal society. They came from elite political families and were widows, sisters, or daughters of male political leaders. But the best-known women who led democracies in the developed world were Golda Meir and Margaret Thatcher, who came from more humble beginnings. They shared deep convictions about their causes. They were known for their determination and self-confidence and were driven by ideology. They had a low tolerance for disagreement (Genovese, 1995). Women are serving in increasing numbers in the cabinets and ministries of the world’s democracies. The first to do so in the United States was Frances Perkins, who served in F. D. Roosevelt’s cabinet starting in 1933. Thirteen women served in Bill Clinton’s cabinet between 1992 and 2000. By 2002, 37% of the Norwegian Parliament and 42% in ministerial posts were women (Goldsmith, 2002). Women leaders of sociopolitical movements, such as Margaret Sanger, Emma Goldman, Simone de Beauvoir, and Betty Friedan have been but a small number in comparison with the men who have sparked and organized social revolutions and reforms (Apfelbaum & Hadley, 1986). Nonetheless, a substantial number of leaders of nonprofit and volunteer

## Increase in Management and Administration

---

Early on, women worked as supervisors mainly of other women in offices, in hospitals, or in the telephone industry (Northouse, 2001). However, these women were only a small percentage of all the women in the population and a small percentage in contrast to men in leadership positions in general. There was a marked increase in the proportion of women in managerial and leadership positions after 1970. Although women made up less than 5% of middle managers and less than 2% of executives in business in the early 1970s (M. W. Meyer, 1975), between 1970 and 1980, gains for women in top leadership roles were apparent, especially in the mass media, universities, private foundations, and cultural institutions (Dye & Strickland, 1982). Between 1970 and 1980, the total number of women managers and administrators in the U.S. workforce increased by more than 100%. Between 1972 and 1986, the percentage of women in managerial positions rose from 19% to over 30% (Hymowitz & Schellhardt, 1986). In the military, 10% of the U.S. naval officers by 1987 were women, and by 1980, a woman was serving as the commanding general of a large U.S. army post (Beck, 1980). But by and large, more women in proportion to men were concentrated in the lower levels of management. No women entered AT&T in 1960, for instance, as first-level managers. But by 1985—while only .7% of the top executives and directors of AT&T were women, and 8.3% and 15% were division and district managers, respectively—22% were second-level supervisors and 38.7% were first-level supervisors (Hymowitz & Schellhardt, 1986). Proportionately more women than men had attained management jobs in service firms, such as AT&T, rather than in industrial firms, such as DuPont, Exxon, and General Motors, where the percentage hovered around 8%.

The percentages were generally much higher in re-tail and trade. For instance, in 1985, the proportion of women managers reached 61% in Federated Stores and 64% in Bank of America. Nonetheless, overall Northouse (2001) estimated that in 1998, in the Fortune 1000 firms, women occupied only 11% of managerial and administrative positions, 6% of line positions, and approximately 11% as corporate officers and members of the boards of directors.

By 1981, firms in consumer-related industries were most likely (5 of 10) to have a woman on the board of directors, while holding companies and firms in the extraction industries had none. Also, women had more opportunities to become insider directors (managers elevated to the board of directors in the same firm) in small than in large firms (Harrigan, 1981). By 1990, women managers had reached parity in numbers with men in finance, insurance, real estate, and services but were much less present in manufacturing, mining, and construction (Women's Bureau, 1991). Women CEOs like Carly Fiorina of Hewlett-Packard were still rare in 2004 in America's largest firms. In 2002 only 9% of CEOs, 14% of board members, and 16% of corporate officers of Fortune 500 firms were women (Kantrowitz & Juarez, 2005). But there was a sharp increase in the number of women who owned their own business. In the United States by 1992, 6.4 million women were business owners, mainly of small businesses. During the preceding five years, nationally, 43% of firms were owned by women; and there was an almost 95% increase in women owners of construction companies and an almost 78% increase in women owners of transportation firms (Department of Commerce, 1996). Between 1990 and 2000, women started businesses at twice the rate of men (Northouse, 2001).

## Increase in MBAs

---

In 1964, the first woman enrolled in the MBA program at the University of Pittsburgh. In 1974, Michigan State University reported twice the proportion of women students in business as it had had in 1969. Stanford

University noted a similar doubling in the three-year period 1971–1974 (Chambers, 1974). From 1971 to 1976, the number of women enrolled in MBA programs in American universities tripled (L. Werner, 1979). There was a sharp rise in the absolute and proportional numbers of women who received MBA degrees or the equivalent between 1956 and 2000. By the 1990s, parity of the sexes had been reached in many business schools. Today, many programs contain more women than men. The same trend has occurred for undergraduate business majors as well as in law schools, whose graduates ultimately become business, government, and political leaders.

A law degree is a route into political leadership and another preparation for organizational management. Women increased from 10% of first-year law students in 1970 to 49.4% in 2000. Women now form the majority in many law schools. By 2005, 65% of law school deans and administrators were women.

## Society in Transition

---

Except when such male-favored characteristics as upper body strength are required, the roles of women in society are primarily culturally determined. Biology has some effects; women live longer. And childbearing has its obvious universal effects; but most of what women can do is culture-based. In a survey of 224 mainly subsistence-level societies, Murdock (1937) showed that although men generally hunted and trapped and women usually gathered and prepared food, few occupations were entirely relegated anywhere to only one sex. (An exception was hunting sea mammals, which would be hard on pregnant women.) More than 99% of positions in the U.S. Air Force can be filled by women, who by 2000 made up 18% of its personnel.

We are in a period of transition. Much cultural support for maintaining sex differences in leadership and, more important, different attitudes, beliefs, and values about women leaders is diminishing. The need for a family to have two wage earners to maintain a desired standard of living, as well as equal employment legislation and U.S. Supreme Court decisions, have had dramatic effects. Almost all adult women have been moved to seek part-or full-time employment. Women today constitute 48% of the U.S. workforce. More women than men are applying to, entering, and graduating from college. But some jobs are still seen as more male-relevant and others as more female-relevant, and in many firms the sexes are still segregated according to their positions. Nonetheless, by 1977, more than 75% of women disagreed that some work is meant for men and other work is meant for women—an increase of 21 percentage points from 1962. Younger women in 1977 were even more likely to disagree, which suggests that even more extreme rejection by women of the duality of work roles is becoming the norm (Thornton & Freedman, 1979). In a 1950 Gallup poll, the top recommendations for young women seeking to prepare for careers were nursing, teaching, secretarial or clerical work or the roles of dietician, home economist, and social worker. In 2001, the Gallup poll response to the same question was that women were preparing for careers in the field of computers or medicine (Gallup Tuesday Briefing, 2001).

Early research by Hall and Locke (1938) and E. Livingstone (1953) found that women, particularly in industry, were often reluctant to assume supervisory responsibilities. The times, indeed, are “a-changing.” The rise to parity came after years of social turbulence, the women’s liberation movement, cultural changes, and legislation prohibiting sex discrimination in employment practices (Title VII of the Civil Rights Act of 1964 and the affirmative action program of the Equal Employment Opportunity Commission). Along with the increase in the proportion of women in the work world, the issue of women as leaders now looms large in research and policy considerations. One indication of the change in attitudes toward women has been steadily increasing percentage of people between 1937 and 1978 in Gallup polls who were willing to vote for a woman for president—in 1937, 31%; in 1949, 48%; in 1958, 52%; in 1967, 57%; and in 1978, 76% (Anonymous, 1983). The upward trend continues.

Attitudes and sex-related stereotypes about women as managers among both women (Kravetz, 1976) and men (Tavris, 1977) have changed. M. M. Wood's (1976) survey of approximately 100 male and female managers found that most managers thought that women were winning increased acceptance in the business environment. A comparison of 1965 and 1985 studies of executives' attitudes about women in business showed that executives' perceptions had changed greatly. In the 1985 survey, executives were more likely to think that women wanted positions of authority and felt more comfortable about working for a female boss (Sutton & Moore, 1985). Many commentators saw the need for more women managers as a consequence of the need for organizations to adapt to new technologies. Women managers were seen as more cooperative and participatory in leading efforts to make changes (Morris, 1988). By 2001, Vinkenbut, Johannesen-Schmidt, and Eagley (2001) could report that, compared to behavioral norms for transformational leadership—usually found at slightly higher levels in women and correlated with successful and effective leadership (Bass, 1998)—effects were exaggerated when participants estimated how frequently male and female managers displayed transformational leadership.

Data from Powell, Posner, and Schmidt (1984) illustrate the changes that have occurred. In contrast to stereotypic expectations, they found that the 130 women managers in their sample placed a greater emphasis on their careers than on their family life and had a greater concern for production than for social relationships. Furthermore, the women managers rated ambition, ability, and skill as more important than did the 130 male managers in the sample. Nevertheless, in many instances, women still face disadvantages in opportunities for managerial and leadership positions.

## Constraints on Opportunities for Leadership

---

Leadership opportunities for women in the past tended to be limited to women's issues and jobs in particular institutions such as sororities, convents, all-girl schools, and telephone operations. Even presidents of women's colleges were often men. Although the vast majority of public school teachers were women, they remained a minority among top-level school administrators (Estler, 1975). According to Sutton and Moore's (1985) survey of executives' attitudes about women as leaders in business, most respondents in 1985, male or female, still believed that women had to be exceptional to succeed in business. Moreover, the women in the poll were less optimistic about their opportunities than were the men queried. The women thought they still had to struggle more to rise in the business world and were likely to earn less than their male counterparts. Nevertheless, despite Litterer's (1976) finding that in almost all samples, women executives reported that they had suffered from discrimination, women who were managers (as well as men who were managers) had a higher degree of job satisfaction than their nonsupervisory counterparts (Keaveny, Jackson, & Fossum, 1976). These women appeared to enjoy their positions and to hold the same job expectations as male supervisors (Brief & Oliver, 1976). Many other studies have found little or no difference in the job satisfaction of female vs. male leaders.<sup>2</sup>

### ***Obstacles and Conflicts***

Even when women are promoted to managerial positions, they continue to face a variety of barriers to their upward mobility. Almost half of respondents to a Gallup poll said they would prefer to work for a man, compared to 22% who preferred to work for a woman (Gallup Poll, 2001, January 11). Salaries for women tended to be less than those for men in comparable positions. In 2001, women executives earned a median of \$188,000; men, \$257,000. Affirmative action laws calling for equity in hiring men and women have had both

positive and negative effects. The numbers of women in leadership positions have increased as women have had to be considered for selection and promotion instead of being excluded. But even if their merit justifies their selection and promotion, their merit may be questioned by others in the organization. They may be seen as having gained their positions as a consequence of legally required preferences for women over men to correct past injustices (Singer, 1994). When 150 undergraduate women were asked whether they had benefited because of legal preference rather than merit, they felt they would be seen as less competent and would produce timid, performance-limiting task decisions. Their self-regard would be lowered. Nevertheless, if they knew they were highly competent and wanted to make a good impression, they would make the best possible task decision (Heilman & Alcott, 2001). The obstacle of discrimination is greater in male-dominated industries, according to an Australian study (Gardiner & Tiggemann, 1999). In some jobs, the obstacle may be the reluctance to send women on business trips with men (Donnelly, 1976). The rotation of jobs for managerial development may require a woman and her family to relocate, which means that either her husband must also relocate or the couple must live apart in a "commuter marriage." Family relocation may be less necessary when husbands are rotated.

*Work/Family Balance.* Carroll (1987) argued that the biggest obstacle married women leaders face is coping with the conflict between career and family. It is not surprising that among the few sex differences found by Morrison, White, and Van Velsor (1987), women executives felt less equal than did their male counterparts to the demands placed on their time and energy in their daily lives. In 1989, 83% of working women reported conflicts between their job and the well-being of their children. One of the fastest-growing segments in the workforce is mothers with preschool-age children (Hewlett, 1998).

Many companies and agencies have developed family support policies. When the directors of a large hospital discovered that the primary reason for employees' absenteeism was to take care of ill children, they created an infirmary to care for the children. Supportive husbands may be especially important. Husbands now share homemaking duties. Househusbands and working wives are no longer rare. Among 657 Israeli managers and human service professionals, 57% of whom were women, the burn-out and exhaustion from stress at work for the women were ameliorated by the amount of support they received in their lives in general; but for the men, it was support at work that helped prevent burnout from stress. (Etzioni, 1984). Compared to their male counterparts, women professionals in a Swedish insurance company were equally satisfied with their work situations but not their life situations. They reported spending twice as much time on household chores as their spouses and were less able to relax after work. Children added to the work overload and impeded career opportunities. Both men and women at work showed physiological symptoms of stress, yet at home, only the women, especially those with children, continued to show elevated stress levels of epinephrine and norepinephrine (Lundberg & Frankenhaeuser, 1999). A majority of Hollywood TV women executives have eliminated work/family conflict by rejecting the norm of typical family life, marriage, and children (Ensher, Murphy, & Sullivan, 2002).

The success of married managers in foreign assignments depends strongly on the support and satisfaction of the manager's spouse, who is usually female (Brett & Stroh, 1995). Her adjustment to the foreign culture is critical (Black & Gregersen, 1991). A survey of 427 international managers and their 167 spouses found in multiple regression analysis that a manager's willingness to assume a foreign assignment long-term correlated .55 with the spouse's willingness. This, in turn, correlated .44 with the spouse's adventurousness and correlated negatively (–.22) with lack of career support for the spouse (Konopaske, Robie, & Ivancevich, undated).

*Comparable Pay.* Even in Norway, a country with a high degree of political equality and an egalitarian culture (Goldsmith, 2002), women earned 75% to 76.6% of men doing the same work in investment, banking, insurance, and business services. In central government and municipal government, women working in the same jobs earned 88% and 89%, respectively, of their male counterparts (Moen, 1995).

*Fewer Opportunities for Necessary Experience and Contacts.* In 2000, only 13% of men and

30% of women said in a representative sample that women who do the same job were paid less than their male counterparts (Gallup, 2000). But Lyness and Thompson (1997) found that even when 51 women made the same pay and bonuses as their male counterparts in similar executive positions, the women managed fewer people and received fewer overseas assignments. Women's lesser experience with team sports in the past limited their ability to participate effectively in management teams (Hennig & Jardim, 1977). Women did not know the rules (Harragan, 1977). "Old boy" networks made it more difficult for women executives to obtain the information necessary to fulfill the manager's monitoring role effectively.

Women do not frequent men's athletic clubs, they may be excluded from some social clubs, and they may be unable to entertain visitors there. These are all situations in which important information may be gathered and important decisions may be made. In Finland, for example, male executives may gather in a sauna to negotiate with male union leaders. Above and beyond this social exclusion, women may remain outsiders in a male-dominated organization. In a survey of 76 men and 64 women in a newspaper publishing firm, Brass (1985) found that on the average, women were rated as less influential than the men, though they did not differ in the number of others whom they had to contact at work or in their centrality to the formal networks. However, they were not well integrated into the men's networks, including the organization's dominant coalition. According to Symons (1986), who interviewed 67 women professionals and managers in France and Canada, gaining entry, establishing credibility, and managing sex identification in the "corporate tribe" is a process of being continuously retested. (The situation is different for men, who need to pass their test of admission and acceptance only once.) Such testing is particularly salient for the token woman middle manager when feminist issues surface in the organization (Rose, 1980).

Fraker (1984) noted a number of other more subtle obstacles for women trying to move up the corporate ladder. Women may be seen as unable to "fit in" with the small informal, all-male group that constitutes upper management. In addition, they may be delegated less authority than are their male counterparts for assigned responsibilities, according to a survey by Sherman, Ezell, and Odewahn (1987). They may not receive the same constructive feedback from their male superiors as their male counterparts. And they may feel uncomfortable and reluctant to discuss personal matters. Furthermore, Bayes and Newton (1978) observed that a woman leader and her subordinates ordinarily have little social experience regarding a woman's possession of the legitimate power to control and protect the boundaries of an adult group, to stand alone as a figure of authority, and to evaluate the output of other adults.

*Naiveté.* A survey by Radin (1980) of 100 women in upper-, middle-, and entry-level positions in state and local government agencies found that the women over-rated education and hard work as prerequisites for advancement and underestimated political awareness. The women tended to be ignorant of the political games played within an organization. Yet a woman's success as a manager, argued Hermig and Jardim (1977) and Trahey (1977), requires competing with men in a system that the men understand better and in which they are more familiar and comfortable.

## Conflicting Stereotypes of Women and Managers

---

Sixty-eight percent of a representative sample of Americans in a 2001 Gallup poll viewed men as more aggressive than women; 90% viewed women as more emotional than men. Women were seen as more affectionate, talkative, patient, and creative; men were regarded as more courageous (Gallup, 2001, February 21). The men's traits better fit those of the traditional manager and leader. Among 101 male bank managers in India, satisfaction with their interaction with women managers depended on their attitude toward women as managers (Bhatnagar & Swamy, 1995).

Seifert (1984) illustrated the pervasive stereotyping of the inadequacy of females for leadership. Seifert led

male and female participants to believe they were working with male and female leaders, when they were all receiving the same standardized communications from the experimenter. The male and female participants who received the notes from the supposed male leaders rated the notes as clearer than did participants who received notes from the supposed female leaders. Carpeno (1976) found that for 100 professional staff members of a regional high school system, statements about female leaders indicated doubt and uneasiness about their future. Frank and Katcher (1977) concluded, from a survey of 104 male and 44 female medical students, that the men tended to stereotype the women's behavior and to exclude them from positions of leadership in dissection groups in anatomy courses. Among 1,000 male executives who were surveyed by Bowman, Worthy, and Greyser (1965), 44% expressed mildly unfavorable to strongly unfavorable attitudes toward women in management. In general, these men believed that women were temperamentally ill-suited for leadership positions. In the same way, a survey of 2,000 executive readers of the *Harvard Business Review* (Bowman, Worthy, & Greyser, 1965) reported that 41% of the men were opposed to women in executive roles. Many readers thought that women were not suitable. Both men and women in the sample believed that women's opportunities for advancement were limited. Similarly, a 1971 Louis Harris poll of representative working women showed a strong preference for a male boss over a female boss (White, 1981). Brenner (1970) found, in a nationwide survey of managers, that the four traits regarded as most important for an upper-management position were deemed more likely to be found in men than in women. Consistent with both these results, in a study of German students, Kruse and Wintermantel (1986) found that in describing male leaders, the students took it for granted that the leaders would be dominant and competitive, take risks, and be able to make decisions on their own; but for women leaders, these traits had to be stated explicitly. The male leader was the normative one; the female leader had to fit the male schematic. In a second study, Kruse and Wintermantel (1986) found that for male students, the concept of man correlated .9 with the concept of manager and .8 with the concept of leadership. The concept of woman correlated  $-.4$  with the concept of manager and  $-.5$  with the concept of leadership. The results for the female students were similar.

When they completed self-reports, both male and female managers showed a preference for stereotypic male (task-oriented) management behaviors (Brenner & Bromer, 1981). Similarly, 1,161 students, using the Bem Sex-Role Inventory (Bem, 1970), chose masculine rather than feminine traits to be sought in the good manager, the good president, and even the female political activist. There was a lack of *stereotype fit* between the stereotypical feminine role and the stereotypical role of leader. It is suggested that male leaders are "in role" and women leaders are "out of role" and therefore, compared to men, women are likely to receive lower leadership ratings from those susceptible to stereotypical thinking (Atwater & Roush, 1994).<sup>3</sup>

A survey of 320 college students found that the successful leader was perceived to have a masculine orientation (Linimon, Barron, & Falbo, 1984). Four beliefs that reinforce unfavorable attitudes toward women as prospects for managerial positions were revealed in a factor analysis of 176 male managers' responses to a survey of their attitudes toward women in the world of work. The factors extracted about women were: (1) lack of career orientation, (2) lack of leadership potential, (3) lack of dependability, and (4) lack of emotional stability (Bass, Krusell, & Alexander, 1971). The perceived lack of career orientation is linked to the stereotype that women are less concerned about their jobs. The other stereotypes are built around a mixture of fact and fancy. According to Heilman, Block, Simon, et al. (1989), men perceive the successful manager as a man. Male cadets regarded their own success as leaders as due to their own abilities, but they attributed the successful leadership of women cadets to the efforts of their followers (Rice, Instone, & Adams, 1984). Male stereotyping of women was singled out by 52% of 461 women executives as an important reason for blocking women's advancement in corporate leadership (Catalyst, 1996).

Although women may benefit from some positive stereotyping, such as being expected to be more considerate than their male counterparts (Pearson & Serafini, 1984), Heller (1982) found that female leaders are stereotyped negatively at two ends of a continuum. At one extreme, as mother, pet, or sex object, women

are considered too submissive or emotional to be effective leaders. At the other extreme, women violate what is expected of them as women and are seen as “iron maidens,” aggressive workaholics, and domineering and manipulative.

Women are likely to have more difficulty than men in obtaining the same role legitimacy as leaders. For instance, unlike their male counterparts, new female professors have to establish their legitimacy among students (Richardson & Cook, 1980). Women are faced with the conflict between the stereotypic expectations of them as women and the stereotypic expectations of them as leaders—the latter identified more with maleness. Maleness is associated with the initiation of structure (Pearson & Serafini, 1984).

The female sex-role stereotype labels women as less competent but emotionally warmer than men. The stereotype of the effective manager matches the masculine stereotype of the effective manager: competent, tough, and emotionally cold. Miner (1965) reflected the accepted stereotype that there are parallel role requirements for being a manager and being a man.<sup>4</sup> Both a manager and a man need to be able to take charge, make decisions, be assertive, and take disciplinary action, but women managers in hierarchical organizations must follow masculine behavior patterns. During the early years of their managerial experience, women tend to identify with the masculine stereotype of a successful manager to overcome their perceived female inadequacies (Hennig, 1971).

The stereotypic concepts of being a woman and of being a leader were viewed as incompatible (V. E. Schein, 1973, 1975). Surveys tended to report large differences in the traits attributed to women and to successful middle managers. Survey data also indicated the popular belief that women make inferior leaders (Bowman, Worthy, & Greyser, 1965). Women themselves tended to subscribe early on to the different stereotypes of managers and of women. O’Leary (1974) and McClelland (1965b) both found that women as a group described themselves as different from or even opposite to men as a group on traits that are supposedly required for management. As confirmation, Frantz (1979) found a positive relation between masculinity scores on the Bem Sex-Role Inventory and the tendency to emerge as a leader in 49 initially leaderless discussions in groups of men and women. Again, Brenner and Bromer (1981) found, in self-reports by 66 male and 66 female managers in metropolitan New York, that both sexes had a significant preference for behaviors reflecting the male stereotype. By 1989, however, female managers’, but not male managers’, views had changed. Thus, 420 male middle managers surveyed by Brenner, Tomkiewicz, and Schein (1989) still clung to the male managerial stereotype reported 15 years earlier by Schein (1973, 1975), while 173 female counterparts no longer equated management with masculine traits.

Broverman, Vogel, Broverman, et al. (1972) asked 100 college students to indicate the characteristics, attitudes, and behaviors in which men and women differed. A second group then rated the extent to which the traits mentioned most frequently by the first group were typical of adult men or women. The female role stereotype that emerged did not fit with what is usually deemed important for effective leadership and management. A woman was regarded as less aggressive, more dependent, and more emotional. She did not hide her emotions and was subjective, easily influenced, and submissive. She enjoyed art and literature, but not mathematics and science. She was excitable in minor crises, passive, uncompetitive, illogical, home-oriented, unskilled in business, sneaky, and unfamiliar with the ways of the world. Her feelings were easily hurt. She was unadventurous and indecisive, cried easily, rarely acted like a leader, and lacked self-confidence. She was uncomfortable about being aggressive, unambitious, unable to separate feelings from ideas, conceited about her appearance, talkative, tactful, gentle, aware of others’ feelings, religious, interested in her own appearance, neat, and quiet and had a strong need for security. She also easily expressed tender feelings.

Such stereotypes resulted in self-imposed attitudinal barriers to women’s entrance into positions of leadership. They also caused women to be reluctant to: (1) assert themselves out of fear of being seen as aggressive; or (2) to display their ambition to achieve out of fear of failure (Heller, 1982). *Stereotype threats* also affected women, who felt that the evaluation of their behavior might be used to confirm the negative

stereotypes of women as a whole (Steele & Aronson, 1995).

Female leaders were supposedly more attentive to upward communications from their subordinates; males were expected to be more effective in downward directiveness. Stereotyped female leaders were expected to be more indirect and nonconfrontational and to use influence tactics such as helplessness, personal reward, and hints, whereas leaders were expected more often to use direct, forthright influence strategies based on expertise, authority, and logic. Generally, these stereotypes did not necessarily reflect reality (Hall & Donnell, 1979; Rice, Instone, & Adams, 1984; Szilagyi, 1980a). Male candidates for managerial positions were rated as more promising than were equally qualified female candidates on such dimensions as acceptability and potential for service (Gutek & Stevens, 1979; Rosen, Jerdee, & Prestwich, 1975). When Ezell, Odewahn, and Sherman (1982) surveyed 360 male and female managers in state public welfare organizations, they found that on their entry into management and their promotion to higher levels, women's leadership potential was more likely to be judged on their past performance and men's according to future expectations about them, even though the men's and women's competencies and motivation were seen as identical. As a consequence, judgments about the men could be more subjective.

If a woman leader adopted more accommodative, participative leadership behavior, she faced criticism for being too passive. But if she adopted an autocratic or task-oriented leadership behavior or a more directive style, she was seen as too aggressive and masculine. Powell (1982), among others, showed that sex differences, as such, were related not to being a good manager but to differences in sex-role identities—how women and men are supposed to differ in the way they behave. For example, in mixed company, a woman was likely to be inhibited by the attitudes she held about the appropriateness of women attempting to take the initiative in such a situation (O'Leary, 1974). Her inhibitions were likely to be reinforced by the mixed reaction of others if she succeeded (Jacobson & Effertz, 1974). Nevertheless, Hyman (1980) suggested that people still perceived woman managers to be either tough, aggressive, unyielding, and autocratic or unassertive, good workers. As a consequence, women leaders were able to use their power as directly as men could (Johnson, 1976). Nevertheless, although women were expected to display less dominance and competitiveness in mixed-sex groups, Bunker and Bender (1980) suggested that female managers were as competitive as their male counterparts, but they competed in different ways. At the same time, Hollander and Yoder (1980) concluded, from a research review, that observed differences in the leadership behavior of women and men could be attributed mainly to the interrelationship of the role expectations, style, and task demands of particular circumstances.

According to Bayes and Newton (1978), subordinates responded to a woman leader partly as an individual and partly according to the cultural stereotype of women. The responses of many subordinates to a woman leader reflected their socialized expectations about women in general, which were likely to conflict with the more appropriate response to a woman who was a manager, and hence involved in a role that they considered to be primarily masculine.

There was disagreement between men and women as subordinates about the perceived characteristics of the prototypical manager, according to a study of the opinions of 702 undergraduates. For instance, male undergraduates were more likely to perceive the prototypical manager as aggressive and competitive, with feelings that were less easily hurt. (Deal & Stevenson, 1998). Women leaders themselves were in conflict when they faced a divergence in what was expected from them in their roles as managers and as females. But do the stereotypes reflect reality? Do women actually differ from men in traits that are of consequence to leadership even as they differ from the stereotype? A variety of answers emerge. For example, women are supposed to be less task-oriented than men. This was actually found to be true when the Orientation Inventory (Bass, 1967), a direct measure, was used for male and female counterparts from adolescence to middle age and for many student and occupational groups, except for one group of senior women at the University of California, Berkeley. But no sex differences appeared when the Least Preferred Co-worker (LPC) score,<sup>5</sup> a more disguised

measurement, was used by Chapman (1975) and by J. M. Ward (1977) to determine the task and relations orientation of male and female students, and by Schneier (1978) in a study of emerging leaders. Okanes and Murray (1980) found that the scores of 51 female managers on the Mehrabian achievement scale were significantly higher than those of 51 male managers. Furthermore, evidence has accumulated that the need to achieve is a complex of styles and orientations and that men score higher mainly in the competitive aspects of achievement. The differences in men's and women's scores for the desire for mastery (a component of achievement)—that is, the higher scores of men than of women—tend to diminish with experience. The same happens to the higher scores of women on orientation to work, another component of achievement (Deaux, 1985). Also, male executives are more comfortable than female executives about achievement when the criteria for excellence are clearly specified and when conformity to authority is desirable (Morrison, White, & Van Velsor, 1987).

*Hostile sexism* and *benevolent sexism* are brought into play to justify the stereotyped justification of the inappropriateness and inadequacy for leadership of the “weaker” sex. Hostile sexism sees women as usurping men's status and power in their traditional role as leader. Benevolent sexism offers chivalrous protection and affection to women who continue in their traditional role. Benevolent sexism also rewards women for conforming to the patriarchal status quo, but inhibits gender equality (Glick & Fiske, 2001).

### ***Caveat***

The voluminous research on sex stereotypes in the twentieth century suggests a continuing perception that management and leadership are masculine attributes. This does not seem to fit with the increasing parity occurring in the rise for women in management and leadership. It will take a replication of much of this research in the twenty-first century to see if the stereotypes remain and have a more subtle influence on the now-common presence of women as managers and leaders.

### ***Advantageousness of the Stereotypes***

Describing the good manager in masculine terms, as Miner (1974) did in his conception of the motivation to manage (which Powell and Butterfield [1979] also found among 694 business students), reveals stereotypes that may have worked to a woman manager's advantage. If women managers are not expected to perform well and are seen as operating under handicaps (Terborg & Ilgen, 1975), then if they do perform well, their performance may be attributed to extra effort and competence and considered more worthy of reward than that of comparable male managers. Kanter (1977b) and Alban and Seashore (1978) argued that the stereotypic female role requirement that women deal effectively with people offsets the disadvantages to a woman of the stereotypic submissive, nurturing role requirements. Similarly, Larwood and Wood (1977) pointed out, in agreement with what was detailed in preceding chapters, that the effective manager can make use of both the supposedly more masculine traits of competence, task orientation, and initiative and the supposedly more feminine concern for people, feelings, and relationships. Since then, as we have already noted, the stereotypical concerns of women for nurturing and consideration have increasingly appeared as requirements for the good manager in the postindustrial organization. For instance, Schmidt and Eagley (2001) found that estimates of the higher transformational leadership of female than male managers (involving concern for followers) were exaggerated in comparison to the norms for actual managers.

### ***Harassment***

Despite its illegality, sexual harassment is experienced by a sizable proportion of women in the workplace (Graham, 1986). For instance, in the U.S. federal government over a period of two years, 44% of women employees reported some form of unwanted sexual attention at work. Sexual harassment is consistently found to contribute to women personnel's loss of job satisfaction and psychological well-being (Offerman & Malamut, 2001). Based on a nationally representative Swedish sample of 594 male and 430 female medical doctors, Konrad and Cannings (2002) found that women reported more sexual harassment in medical units with large proportions of men.

The severity of sexual harassment ranges from teasing and unwanted touching and jokes to rape. Sexual favors may be demanded for women's advancement, and sexual threats may force women into resigning their positions. Sexual harassment may be a hostile response, unrelated to the quality of a woman's job performance, whose goal is to eliminate her as a competitor for advancement. It may be a form of displaced aggression, in which the woman colleague is seen as the weaker and safer target of hostility than the powerful male colleague who has caused the frustration. Both men and women in the workplace have to learn how to relate to each other comfortably without the usually more powerful men misinterpreting women's friendliness and sociability as readiness for sexual intimacy.

Harassers are typically older, married, and of the same race as the target (Seppa, 1997). In civilian organizations, sexual advances to women are usually made by superiors; sexual advances to men are usually made by subordinates (Zanville, 1997). Leadership makes a difference. Sexual harassment was less in army units where confidence in the leader and support from him or her was high, and where the commanding officer spoke out rather than seemed to encourage it. Sexual harassment may be declining in the military, perhaps because the leadership has been paying more attention to it and punishing the perpetrators instead of the victims (Shenon, 1997) and because women are increasingly being admitted to combat units, facing the same risks as their male counterparts. Offerman and Malamut (2001) analyzed military surveys completed in 1995 of 5,629 women from the Army, Air Force, Navy, Marine Corps, and Coast Guard. Women were freer to report harassment incidents when they felt that an adequate complaint process was available and that their hierarchically close superiors and organization were less tolerant of harassment. Both leadership and organizational policy were needed. Using data from 8,093 women in the same 1995 military surveys, Murray, Siva-subramanian, and Jacques (2001) demonstrated that the perceptions of immediate supervisors' trust, fairness, and support in preventing sexual harassment were enhanced when there were women in higher authority. In all five U.S. military services between 1988 and 1995, there were declines in the percentage of women personnel who experienced unwanted sexual attention, ranging from 49% in the air force to 61% in the army.

*Response to Sexual Harassment.* In two controlled experiments, when women were asked what they would do when sexually harassed during a job interview, they indicated that they would feel angry and confrontative. But when actually faced with such an interview for a research assistantship, they tended to remain nonconfrontational, polite, and respectful. They did express some concern, but would not jeopardize their opportunity for employment (Woodzicka & LaFrance, 2001).

## ***Sexual Relationships***

Real and imagined love affairs between men and women in the same corporation are seen as sexual opportunism and are likely to affect the performance of and the favoritism shown to the junior partner—usually the woman. Collins (1983) noted that love between managers is dangerous because it may challenge formal superior-subordinate and customary peer relationships. The dominant male–submissive female personal

relationship may take precedence over formal organizational requirements and affect political alliances. According to a survey of offices by Quinn (1977), two thirds of 130 employees believed office romances to cause much gossip; one third, to provoke complaints and hostilities; and one fifth, to result in distorted communication and threats to the unit's reputation. They lowered morale and output. While one third of the female supervisors of the men who were involved in these affairs openly discussed the situation, only 6% of the male supervisors of the women who were involved said they did so.

*Executives' Reaction.* According to Quinn's 130 respondents, once executives learned that coworkers were romantically entangled, they were twice as likely to fire the women involved. Female executives were less forgiving in this regard than male executives. Foley and Powell (1999) argued that management intervention was justified if the romance created a conflict of interest and if it interfered with work.

### ***Segregation of Work Roles by Sex***

Coser (1980) noted that half of all women at work could be found in just 21 occupations. Many studies showed that it was common to find jobs held either by women only or by men only within firms (Bielby & Baron, 1984; Gutek, 1985). This phenomenon occurred in Portugal, Britain, Russia, Ireland, and elsewhere, as well as in North America. The jobs held exclusively by women were likely to be both lower-paid and less likely to lead to advancement into administrative or executive positions. They were more likely to be transient opportunities and to call for less training and commitment. When women sought to enter or be promoted into a position, such as a managerial one, from which they had previously been excluded, they were likely to be judged to be less suitable for such a position if it had been male-dominated (Gutek, 1988). This likelihood was not necessarily due to a personal bias of the decision maker but rather a result of actual or assumed pressure from higher authority (Larwood, Gutek, & Gattiker, 1984).

The more one sex dominates an occupation, the more that performance in it is expected to conform to stereotypes about the sex of the occupants. As long as most nurses are women, expectations continue about their low pay and the warm, loving care expected from them. As long as management in industries and institutions remains male-dominated, high pay, task orientation, aggressiveness, and competitiveness are expected. Women are seen as better suited for traditional woman's work, such as nurse, and less well suited for traditional man's work, such as manager (Konrad & Gutek, 1987). The stereotypes of male competitiveness, adventuresomeness, and assertiveness fit with the stereotypical image of manager, in contrast to the stereotypical feminine qualities of consideration, supportiveness, and affection. What's reflected are the loving mother and the stern father. Successful managers were expected to be masculine when Powell and Butterfield (1979) asked college students to describe a good manager. The effect was the same a quarter of a century later (Powell, Butterfield, & Parent, 2002). Despite this effect, by 2006, due to affirmative action, fair employment policies, and greater numbers of management-educated women and career women, many more women had joined management, as both supervisors and CEOs, although they were still concentrated at lower levels.

*Women in Assistant and Service Roles.* The sex segregation of work has accustomed us to see women in auxiliary and service roles. Numerous surveys and observers' analyses substantiate that being a woman legitimates the performance of a service role as a nurse, secretary, or administrative assistant (O'Leary, 1974; Schein, 1973). R. S. Weiss (1956) noted this linkage of women to service roles in a study of the allocation and acceptance of responsibility in a governmental agency. Reinforcing this linkage is men's preference for receiving nurturance and emotional support from women rather than other men, according to a survey by Burda and Vaux (1987).

Women tended to be counseled accordingly. Weisman, Morlock, Sack, and Levine (1976) observed that the counseling of women who were denied entry into medical school was different from the counseling of men

who were denied entry. Men were encouraged to reapply to other medical schools or to try to obtain a doctorate in a related field. Women were reminded of the obstacles they would continue to face if they tried to continue in medicine. They were encouraged to change to more sex-role-accepted professions such as nursing. Such inadequate career counseling and the lack of successful female role models were seen as key factors in reducing women's choice of higher-status careers (Heinen, McGlauchin, Legeros, & Freeman, 1975; Lannon, 1977).

*Women in Solo Roles.* Women often find themselves the only member of their sex in a group or organization of men. This solo status further handicaps their integration into networks of consequence. A female senior vice president commented about serving solo with 13 men on a management committee: "It was very awkward at first. (After two years) what I have found is that they are never truly comfortable. ... And it is not because they don't like me. ... It's that certain guard, that what they might say in a roomful of men will be taken wrong when a woman is there" (Ragins, Townsend, & Mattis, 1998, p. 31).

*Tokenism.* The effects of being a token woman or man were observed by Berle, Biscone, Katz, et al. (1981) in 26 leaderless group discussions in which one member was of one sex and the rest of the members were of the other. Often, the woman in the solo role is a token of simulated enlightenment. She is at a considerable disadvantage in trying to succeed (Izrael, 1983; Spangler, Gordon, & Pipkin, 1978). Her performance is under closer scrutiny. She is under more pressure to conform to stereotypic expectations about women. Differences between men and women are exaggerated. The token woman is fitted into preexisting stereotypes of what is expected from her (Kanter, 1977b).

As a token, a woman may be thought to have been hired because of affirmative action guidelines rather than her qualifications (Northcraft & Martin, 1982). In blue-collar jobs, a token woman may experience considerable hostility (O'Farrell & Harlan, 1982). Furthermore, token women are more likely to be sexually harassed (Gutek & Morasch, 1982). Nevertheless, only 23% of 400 women executives agree that an obstacle to success for women in their firm was putting women in token positions without real power or operating authority (Segal & Zellner, 1992). In all, tokenism generates many questions about the solo woman leader in a male-dominated organization. How much does the visibility and pressure to perform result in more insecurity and resentment in the token woman? How often do the token woman's attempts to lead meet with resistance from the dominant males because of her token status (Adams & Yoder, 1985)?

*Stereotyped Expectations of the Solo Woman.* Men are likely to attribute a solo woman's success to her sexuality (Lockheed, 1975). When many men and few women are available, the women are expected to fall into their service and assisting roles (Guttentag & Secord, 1983). Frantzve's (1982) analysis of leaderless group discussions found that when men and women were systematically placed in solo roles among members of the opposite sex, the isolation from others of the same sex particularly inhibited a woman in an otherwise male group, but not vice versa. Solo females, but not solo males, were least likely to initiate proposals, were interrupted most, and were most often ignored. However, according to a survey by Frantzve (1985), women in solo status learn to cope with their isolation by using humor, "playing the game," working hard and competently, and relying on outside support systems. And being distinctive may have its advantages at times. If the group's task appears to be more relevant to the experience of the woman as a woman, she may become the resident expert on the subject for the men who make up the remainder of the group. The choice of task can result in a bias in favor of the woman in the situation (Maccoby & Jacklin, 1974).<sup>6</sup> As the only woman in her cabinet, Margaret Thatcher enjoyed role flexibility. When necessary, she could enact the role of traditional male manager, mother, nanny, dominatrix, or androgynous leader. Thatcher chose only men for her cabinet, men who were rarely strong and independent. While her colleagues might have known how to handle a male domineering prime minister, they were at a loss with how to deal with a domineering woman. They took the Iron Lady's orders and public humiliations (Genovese, 1995, p. 205).

## ***Status, Sex, and Leadership***

The lower status of women in American society is illustrated by what has usually happened when a large number of women entered an occupation: the occupation's prestige and desirability were lowered (Touhey, 1974). The high prestige of an occupation was linked to the presence of a large majority of men in it (Bartol & Bartol, 1975). Thus, the prestige of clerical work declined when women replaced men in it during the American Civil War. The prestige of physicians and lawyers may be affected by the large increase of women in those professions.

Lockheed (1975) noted that women's lack of influence, found in small-group research, has been attributed to sex-role socialization. Yet much of it is really a consequence of women's lower status. The conflict can be observed in stereotyped expectations of dominant male and subservient female that occur when women are assigned to lead men. [Chapter 10](#) noted the extent to which one's success as a leader is associated with the status one is accorded. Women in our society remain handicapped in their efforts to become leaders by their lower status. Illustrative of the impact of sex status was Megargee's (1969) finding that when participants were paired with their own sex, those who scored high in dominant personality tended to assume leadership, but males, when paired with the opposite sex, assumed leadership even when they were submissive personalities. Presumably, as women's status has increased relative to that of men's since 1969, much less difference in influence is now likely to be found between the sexes, all else being equal.

*Cultural Effects.* In most cultures, the male's position has higher status than the female's. But considerable variation exists, ranging from societies in which men and women are almost equal in status, as is the case among the Arapesh, to those in which women are higher in status, as, for example, among the Tchambuli. When women are higher in status than men, they were more likely to lead. Higher-status women are dominant; men are less responsible and more dependent. Women make the choice; men are chosen (Mead, 1935). Strodtbeck (1951) contrasted three cultural groups within the United States—Navajo, Mormon, and mainstream American—by arranging discussions between husbands and wives from the three groups. Mormon husbands were most likely to lead discussions, reflecting the higher status of men than women in the patriarchal Mormon culture. Navajo husbands were least likely to lead discussions because women traditionally have more status and are more active and demanding in the Navajo culture. Results for the mainstream American spouses were in between the Mormons and the Navahos. Even among two different geographic regions that presumably have the same general culture, differences in status and leadership appeared. For example, women undergraduates in New York reported “playing dumb” much more frequently when on a date than did women undergraduates from the West Coast (Wallin, 1950). Such regional differences are likely to have decreased, if not disappeared, since 1950. As will be discussed in [Chapter 33](#), the Anglo-American world and the traditional Muslim world differ greatly in status, education, and masculinity, which affects the extent to which Muslim women can participate in management or even work outside their homes.

## ***Stress***

Women have to cope, more than men, with career handicaps, conflicts, and disadvantageous stereotypes. A longitudinal study by Cooper and Davidson (1982) compared 135 top female executives in Britain with their 500 male counterparts. The women executives revealed more symptoms of stress such as migraine headaches, increased cigarette smoking, use of drugs, excessive drinking, and marital problems. Men benefit more than women from the social support of coworkers and supervisors, which can alleviate stress on the job (Geller & Hobfoll, 1994). Consistent with these findings, Ottaway and Bhatnagar (1988) reported that both U.S. and

Indian female managers described themselves as more conflicted and hard-driving than did their male counterparts. Similarly, Greenglass (1988) found, among 114 Canadian first-level supervisors in government social services, that the women were much more likely than the men to describe themselves as stress-prone Type A personalities. In coping with stress, especially if they were Type As, the women engaged in more wishful thinking as well as more effort to change the situation or their own behavior than did the men. Azar (2000) suggests that unlike men, who fight or flee from stressful interactions, women convert them into “tend-and-befriend” caring, which counters the potential fight or flight with nurturing, affiliative behavior. Women in management may experience more stress than their male counterparts, but they also may cope with it better. Reports of disasters have noted that although women are generally more open in revealing their emotions, they appear to survive the stress of prolonged isolation, cold (or heat), and hunger. On occasion, only the women walked out alive from disastrous crossings of the Mojave Desert in the covered wagon days. Again, women fared better when the Donner Pass wagon train was trapped by winter snows in the High Sierras and with the stress of prolonged siege during the bombings of London in World War II.

### ***Socialization, Sex, and Leadership***

In our society, we are socialized primarily within the nuclear family in a culture that defines sex roles as total roles that define our sense of self and our behavior. The sex role pertains to all aspects of life and takes precedence over situation-specific work roles if they are incompatible. Dominance and independence are associated with masculine roles. Submissiveness, passivity, and nurturance are associated with feminine roles. Desirable femininity, culturally defined, emphasizes giving and the avoidance of aggressiveness and domination (Broverman, Broverman, Clarkson, et al., 1970). On the basis of a meta-analytic review of 172 social psychology studies, Eagly and Crowley (1986) concluded that the male helping role is to be chivalrous and heroic, whereas the female helping role is to be caring and nurturing. Riger and Galligan (1980) pointed out that socialization may account for the development in females of traits and behaviors, such as an unwillingness to take risks, that are counter to the demands of the management role. Men learn to see risk taking as an opportunity for success as well as failure, whereas women focus more on the failure aspect of risk taking (Henning & Jardim, 1977).

*Importance of the Family.* Even the exceptions among women seem to be a consequence of the differences in the nuclear family in which the women were raised. Vogel, Broverman, Broverman, et al. (1970) and Alinquist (1974) found that women who chose nontraditional careers—those historically occupied by men—were raised in families in which the mother worked full-time. In the past, the nuclear family was often likely to discourage women from choosing nontraditional careers. In addition, even if high school students of both sexes had similar aspirations for college and the choice of careers, the male students received significantly more parental attention and pressure to pursue their aspirations (Goodale & Hall, 1976).

*Family Influences on Daughters.* The different socialization of men and women may explain why being firstborn was more helpful to women's than to men's subsequent attainment of positions of leadership. For women, but not for men, Sandler and Scalia (1975) found a significantly greater likelihood for firstborn women to serve as presidents or other officers of organizations. Particularly in large families (Bossard & Boll, 1955) and families with working mothers, the eldest daughters were delegated authority and expected to take on many family responsibilities, such as caring for younger siblings (Clausen & Clausen, 1973). Klonsky (1978) found that the eldest daughters in large lower-class families received significantly higher-than-average leadership ratings in high school sports from their coaches. In Puerto Rican families, the eldest daughter was expected to take on the leadership of her siblings. In the same way, Hennig and Jardim (1977) observed in a sample of 25 successful top-level women leaders that being firstborn was a common characteristic.

Other parental practices in rearing daughters were also seen as making a difference in the subsequent leadership of the girls as adolescents and adults. Parental warmth and discipline contributed to the development of a girl's subsequent performance as a leader, especially if leadership was fostered by the mother as the family's authority figure (Bronfenbrenner, 1961). However, Hennig and Jardin (1977) found that fathers' encouragement was important to women who achieved success in management.

*Psychosocial Development.* For Freud (1922), the sex difference in psychosocial development was the reason for the maleness centering of leadership in the family, culture, art, and civilization. Miller (1976) saw that in addition to biological differences in males, women were delegated—because of the cultural domination of men—not humanity's higher needs for achievement and success, but its lower needs for affiliation, cooperation, and attachment. Differential psychosocial development was also the cause of the more passive life goals of females. Grant (1988) suggested that women developed a higher value on connectedness than men did. According to Bernardez (1983), differences in socialization between males and females result in some males' unconscious fear of females' power. This fear bars such males from submission, passivity, and dependence on women. But other males create fantasies that woman leaders are perfect mothers who are selfless, totally accepting, abnegating, nurturing, and without aggression or criticism. When women do not fulfill these expectations, such men direct irrational anger and criticism toward them. To avoid this reaction, some female leaders unconsciously try to minimize their ability and visibility. Chodorow (1978) argued that girls are socialized with greater relational potential and empathy. They see themselves as less separated from others and more connected to the world. They value intimacy and closeness more (J. Miller, 1976). Males tend to emerge as leaders more than females, according to numerous studies of mixed-sex groups (Aries, 1976), and females tend to differ from men in their activity and influence in small-group experiments (Lockheed & Hall, 1976). Status and sex-role stereotyping handicap the elevation of women to leadership positions. Moreover, one's socialization as a female itself contributes to the reduced motivation to lead (Estler, 1975). But which observed differences in traits affect men's and women's respective tendencies to attempt to lead and to succeed as leaders? Are the differences observed in adolescent girls retained by adult women, particularly women who have chosen to enter management and have become experienced managers? Do systematic changes in male-female differences in such traits occur that are associated with societal change? These are some of the questions I will now try to answer.

## Differences in the Leadership Potential of Women and Men

---

Women and men may differ in general in their leadership potential as a consequence of genetics, socialization, and situational circumstances. The differences may be affected by differences in skills, values, motives, reactions to conflict, sex-role identification, self-confidence, and power and its uses.

### ***Verbal and Nonverbal Communication Skills***

There are systematic differences between men's and women's styles of conversation and communication, much as a consequence of their different socialization (Gray, 1992). There is a lot of room for misinterpretation when leaders and followers are of opposite sexes (Atwater & Yammarino, 1994). There are also sex differences in cultural stereotypes about communication skills. Women tend to be seen as better communicators (Hyman, 1980). A study of senior executives by Menkes (1999) found that women executives had better communication skills than their male counterparts. Grant (1988) explained this as a matter of women, at an early age, needing to use conciliation instead of confrontation. Their communication networks serve as the foundation for social interaction. In group discussions, men vie to speak, while women take turns. Case (1985)

intensively analyzed tapes of mixed-sex meetings of management students and identified speech that was assertive and authoritative as a male style. Such speech featured informal pronunciation, imperative construction, interjections, competitive/aggressive talk, slang, depersonalization, and use of the third person. The female style was personal and facilitative and characterized by intensifiers, conjunctions, passive agreement, tag questions, and proof from personal experience. Speech that combined elements of each style, which was supportive and assertive in language, was most influential. Bligh and Kohles (2003), using a dictionary-based language analysis, found that U.S. women senators differed from political norms. They were significantly less aggressive and more ambivalent. They used less praise and human interest in their public discourse.

In an assessment of 422 AT&T managers reported by Howard and Bray (1988), women were superior in one of their oral presentations and scored still significantly higher than the men on a test of verbal ability. The women assesseees also had better written communication skills, but no differences were observed for other oral presentations dealing with solutions to stimulated managerial problems.<sup>7</sup> Maccoby and Jacklin (1974) also reported that women were superior to men in communication skills, but subsequent analyses have suggested that this difference was weak (Hyde, 1981). According to a laboratory experiment by Steckler and Rosenthal (1985), the voices of females were perceived as sounding more competent when women were speaking to their peers.

*Communicative Cues.* Women have been found to be superior in encoding and decoding nonverbal cues (Hall & Halberstadt, 1981). Howard and Bray (1988) found that their woman assesseees were judged to be more sensitive and socially objective. Deaux (1976b) concluded, from a review of studies, that they are more sensitive to nonverbal cues. Women try to minimize social distance while men use nonverbal behavior to maintain social distance and assert their status (Denmark, 1977). Men more frequently initiate nonreciprocated touching of women, which declares their dominance or higher status. Women look more at the speaker than do men. But in a mutual gaze, women lower their eyes first. Men more frequently use the direct stare as a threat, while women use it as sexual provocation. Smiling, often a submissive gesture, is more frequent among women. The use of non-verbal power plays is unacceptable if used by women (Henley, 1973a, b).

### ***Cognitive and Noncognitive Skills***

Howard and Bray (1988) concluded, from their intensive assessment of AT&T managers, that in addition to the just-mentioned slight but significant superiority of women in verbal ability, men scored higher on a test of general information but both men and women contributed equally to the functioning of discussion groups and did equally well in the planning, organizing, and decision making aspects of an in-basket test. The women were somewhat more creative on the in-basket test. Similarly, strengths likely to contribute to effective leadership, such as goal setting and teamwork, tended to be higher for the women among 2,482 managers rated 360 degrees with the Manager-Leadership Practices Inventory (Pfaff, 1999).

Reviews by Shields (1975) and Wittig (1976) and a meta-analysis by Hyde (1981) found some support for sex differences favoring men in spatial visualization. Block and Kolakowski (1973) attributed this difference to a sex-linked chromosome. Maccoby and Jacklin (1974) concluded that particularly from adolescence onward, males are superior to females in mathematical ability, but a meta-analysis of studies suggested that the effects were small (Hyde, 1981), although males dominated in the achievement of extremely high scores in mathematics (Benbow & Stanley, 1983). However, 20 years later, Spelke (2005) completed a critical review on whether cognitive sex differences result in men having more talent in mathematics than women and more often attaining careers in mathematics and science. She found no difference between the sexes. Rosenthal and Rubin (1982) pointed out that in the preceding 20 years, females had shown significant gains relative to their male counterparts in verbal, numerical, and spatial skills. In the past several decades, the attraction of women

into higher education and careers in mathematics, science, and engineering has been marked.

*Socioemotional Skills.* Groves (2003) used the Riggio (1989) Social Skills Inventory, a somewhat disguised self-assessment, to analyze self-rated differences between 41 female senior managers and 67 male counterparts from universities, government, and business. The women saw themselves as stronger in socioemotional competencies than did the men. Results were similar when Groves (2005) expanded the study to 108 managers and their 325 direct subordinates in four public institutions, agencies, and programs. Women were higher than men in social skills ( $r = .24$ ), social sensitivity (.22), and social expressivity ( $r = .20$ ). They were higher in over-all emotional skills ( $r = .32$ ), in emotional sensitivity ( $r = .30$ ), and emotional expressivity ( $r = .33$ ). They were also higher in social control ( $r = .32$ ) but not emotional control ( $r = -.09$ ). Women managers were also described by their subordinates on the Conger and Kanungo (1994) scale as more charismatic ( $r = .22$ ). However, Gardiner and Tiggermann (1999) found no sex difference in the interpersonal orientation of Australian managers if their industry was male-dominated. Only in female-dominated industries were female managers more interpersonally oriented than male managers.

*Ways of Thinking.* Women may consider their thought processes as different from those of men. Myers and McCaulley (1985) reported systematic differences on the Myers-Briggs Type Inventory of the self-descriptions of 1,051 men and 181 women who attended management development programs at the Center for Creative Leadership between 1979 and 1983. Some of the differences may have been due to the greater proportion of men in upper management and the greater proportion of women in middle management and staff positions. More women than men frequently typed themselves as intuitive and feeling. Men more frequently typed themselves as sensing and thinking than women.

Women managers use different constructs to describe managers than do men. Alimo-Metcalfe (1994) subjected male and female managers in the British National Health Service to Kelly's (1955) repertorial grid, in which they generated constructs to describe the two designated managers with whom they could be compared in communication and interpersonal skills. The male managers' constructs dealt with the ability to influence, with confidence, and with the ability to communicate effectively with a wide audience. The female managers' constructs were about being approachable, fun to be with, sensitive and supportive, and helping someone who feels intimidated at meetings.

### ***Other Consistent Differences between the Sexes***

Tannen (1991) suggested that women and men talk and listen differently. Women need to learn not to be threatened by conflict and differences of opinion. Conflict may also arise about the intimacy of talk. Sharing details about their personal lives is more common between women than between men, who see such intimacy as a breach of trust. Often women talk to affirm their similarities and reinforce intimacy; men talk to define their independence and establish their status. Other small but real sex differences that affect leadership potential are in identification, self-confidence, moral values, interpersonal concerns, and use of power. Differences in attitudes toward authority, tendencies to conform, sex-role orientation, and attitudes toward oneself are involved. These may be continuing differences in traits between the sexes that are ordinarily of consequence to leadership. But they may still fail to result in differences between men's and women's attempts to lead and their success and effectiveness as leaders. For instance, although the women in a mixed-sex group may not be as assertive as the men, they may attempt as much leadership as the men because they are equal in experience or expertise in the task at hand. They may be as successful leaders as the men because followers happen to be more attentive to the members' knowledge. Although female executives may prefer to take fewer risks than do male executives, Muldrow and Bayton (1979) demonstrated that their effectiveness was as good as their male counterparts'. The quality of their decisions matched those of the male executives.

*Differences in Personality and Motivation.* A meta-analysis of 63 social psychology studies by Eagly and Steffen (1986) found that, on average, men were more aggressive than women. But the results for many other differences in traits between the sexes may appear more frequently for students and inexperienced adults and disappear among more mature adults and managers. Thus Morrison, White, and Van Velsor (1987) could find few sex differences in a large data bank of interviews and assessments of male and female executives. Only trivial differences were reported in four large samples of men and women, in the effects of race, age, and ethnicity, but women job applicants scored higher on overt integrity tests (Ones & Viswesvaran, 1998). Female MBA students, in four periods between 1960 and 1980, obtained mean scores that were lower than their male counterparts', in their motivation to manage: orientation toward authority, competitiveness, assertiveness, comfort with exercising power, efforts to obtain visibility, and ability to take care of detail (Miner & Smith, 1982). Among 232 MBA students, the mean score for the motivation to manage was 7.04 for males and 3.24 for females (Bartol & Martin, 1986). But for samples of male and female store managers and school administrators, Miner (1974a) could find no differences between the men's and women's motivation to manage. Further illustrating the impermanence of sex differences in personality, Miner (1965) found that the motivation of women changed with training and experience in a way similar to that of men. Comparable results were reported by Morrison and Sebold (1974). Female executives were similar to male executives in self-esteem, motivation, and mental ability. In a number of additional studies,<sup>8</sup> female executives differed from female employees in general in the same way that male executives differed from male employees in general. Again, after reviewing the evidence, Terborg (1977) concluded that, on the whole, women who become managers have motives that are similar to those of male managers. Concomitantly, women who are experienced managers show no differences from their experienced male counterparts in leadership abilities (Caudrea, 1975). At the same time, Pfeffer and Shapiro (1978) observed that managerial women differ from women in general. They are less likely to have traditional female characteristics and more likely, either by temperament or accommodation to the stereotyped male role (Hennig, 1971), to be analytical, rationally oriented, and personally competitive (Lannon, 1977). In a study of 27 women in middle management in a variety of organizations, Banfield (1976) found that all but two incorporated masculine characteristics; 17 were identified as masculine in self-concept and role behavior, only one was identified as feminine; and the other nine were identified as androgynous. Consistent with the masculine stereotype of the good manager (Powell & Butterfield, 1979), Schein (1975) found that, compared to men, women thought a good manager was more unlike themselves.

In developing a leadership orientation scale for the Women's Strong Vocational Interest Blank, Casey (1975) found that the interests of women leaders varied significantly from those of women nonleaders. The leaders indicated a preference for positions of eminence, freedom of thought, challenge, and interpersonal contact; the nonleaders favored artistic activities. Konrad, Corrigan, Lieb, et al. (2000) completed a meta-analysis of 31 studies of what managers and business students preferred in jobs. Men significantly regarded earnings and responsibilities as more important than women did. For women, prestige, challenge, task, significance, variety, growth, job security, good coworkers, and good supervisors were more important, as was the work environment. Jensen, White, and Singh (1990) found women to be significantly more concerned about the work environment. Larwood and Wood (1977) agreed that women in general have been found to differ from men in traits of consequence to leadership. These differences may include men's greater need for achievement, assertiveness, self-esteem, power, dominance, self-reliance, dependence and their preference for taking risks, and competitiveness and women's greater fear of success. These differences may result in women's failure, when they are first placed in leadership roles, to seek their maximum advantage. They may also fail because of their tendency to seek compromises too quickly when cooperation is required. But Larwood and Wood interpreted the results of experimental findings of such sex differences as transitory evidence of the women's relative lack of familiarity with the leadership tasks involved. With experience, the sex differences

disappear. At the same time the differences in traits of men and women, in general (even among adolescents), that are of consequence to leadership may be disappearing with societal change. By 1986, Santner (1986) found no differences in the cognitive skills, dominance, friendliness, task orientation, and motivation to achieve of male and female high school leaders, although female students were more likely to head formal groups and male students were more likely to lead informal groups. The generation from which data have been collected to analyze male-female differences is likely to be an important modifier of these kinds of results. An exception is male-female differences in interests. There has been surprisingly little change in the patterns of males' and females' interests. Hansen (1988) compiled analyses of the Women's Strong Vocational Interest patterns of 500 women in the 1930s; 1,000 in the 1960s; 300 in the 1970s; and 500 in the 1980s. Through all these decades, women tended to be more interested than men in art, music, drama, writing, social science, and nature, and less interested in realistic and mechanical activities. The only areas in which formerly sizable male-female differences disappeared in the 1980s were in teaching, mathematics, and scientific activities. This finding may have some implications for the movements of women into positions of leadership in finance, science, and high tech.

Women are thought to overemphasize the task at hand rather than its implications for future achievement. They concentrate on their current activities either because they personally have not learned to set goals or because they believe they are unlikely to be promoted. Also, they remain more concerned than men about their interpersonal relations, either because of socialization or because they must remain in the same "dead-end" position (Kanter, 1977b).

*Reactions to Conflict.* A study by Beatty (1996) of 193 Canadian professional women in their mid-30s to late 40s recognized the possibilities of family-work conflict but found that professional women did not reveal higher levels of anxiety, depression, hostility, or physical symptoms of stress. Results were similar for senior executives and those with children. But for a larger representative sample of women, their genetics and experiences handicap leadership performance, as they suffer from depression 1.7 times as much as men. Also, negative thinking and sad feelings are more common among women than men, according to the 1994 National Morbidity Survey. Women are more likely than men "to dwell on petty slights and to mentally replay testy encounters" (Gilbert, 2004). Consistent with Gilligan (1982), that women are more caring than men, Gibson, Mainiero, and Sullivan (2004) found in an online national survey three months after the September 11, 2001, terrorist destruction of the World Trade Center, involving 5,860 full-time workers (63.7% women, 36.2% men) that the women respondents expressed more caring and sensitivity than the men. But unlike earlier scholarly expectations, the women also expressed somewhat more desire than the men to seek justice.

Women may differ from men in how they react to obstacles and conflicts not faced by men that affect their potential as leaders. Heinen, McGlauchin, Legeros, and Freeman (1975) suggested that women managers have particular difficulty dealing with interpersonal conflict among subordinates because their socialization encourages them to avoid confrontation. Larwood and Wood (1977) saw that women were more likely to withdraw psychologically from organizations when they faced obstacles to their promotion to higher management levels. Role conflict with homemaking may be a second source of psychological withdrawal from the organization. When faced with opportunities to share a reward, men may be more likely than women to initiate competition for the whole reward. In comparison, women may first try to cooperate. They will enter competition only in retaliation when others reject their initial efforts to cooperate (Terhune, 1970; J. A. Wall, 1976).

In the 1960s, the implication was that women had to adapt to a managerial model that conformed to the male stereotype of our culture. Women's traits had to be altered so they could become more consistent with those of male managers. But subsequently it was noted that if and when there are personality differences between men and women, the two sexes could complement each other in management. Mixed-sex teams

could be more creative than same-sex teams (Loden, 1985). The leadership behavior of women, in contrast to that of their male counterparts in the same situation, could be positively enhanced by their greater recognition of and response to the needs of others, and greater sensitivity to interpersonal cues. To the degree that women, in general, are less assertive, they may make better leaders in situations in which such assertiveness would be threatening and likely to arouse competitiveness and defensiveness in followers (Larwood & Wood, 1977). Perhaps this may explain why women supervisors who expressed anger in video vignettes were rated higher by 370 undergraduates and 265 employees although supervisors as a whole who expressed anger were rated lower (Glomb & Hulin, 1997).

*Reactions to Feedback.* In laboratory studies, women were found more responsive to feedback than their male counterparts. Compared to men, they were more likely to alter their self-appraisals based on the feedback they received and to find feedback meaningful. Men remained more confident about their competencies despite the negative feedback they received (Roberts & Nolen-Hoeksema, 1989). The same male-female difference was also detected among male and female midshipmen at the U.S. Naval Academy, but the difference was not significant (Atwater & Roush, 1994).

*Differences in Sex-Role Identification.* An obvious difference between the sexes that remains at all levels of maturity and experience is sex-role identification. Each sex engages in different role activities. Men are more likely to pay attention to business affairs and sports. Women are more likely to pay more attention to friends and children. Male managers who choose to spend considerable time at household tasks are penalized in the workplace (Konrad & Cannings, 1997). Howard and Bray (1988) found sex-role identification to be the biggest difference in their personality assessments of male and female managers at AT&T. Such sex-role identification, if masculine, predicts stronger aspirations for management (Powell & Butterfield, 1981). It seems to have taken more than two decades of research to recognize that the various available masculinity and femininity scales appear to measure, respectively, the tendencies to be directive and assertive and to be nurturing and interpersonally concerned. Men score higher on the former scales, and women higher on the latter. But the best supervisors score higher on both scales (Motowidlo, 1981, 1982). However, even this positive association of androgyny with successful leadership in small groups seems to dissipate as groups continue to develop over time, according to a study of the development of ten groups by Spillman, Spillman, and Reinking (1981).

The identification of 68 Israeli women managers compared to 84 male equivalents was seen when they were presented with a brief incident of political influence. Generally, political behavior was less acceptable to the women but was tolerated more if the target was a man. Political behavior was generally more acceptable to the men, particularly if the target was a woman (Drory & Beaty, 1991). Seifert (1984) completed a contrived experiment in which male and female participants were led to believe they were working with male or female leaders. But all communications (by note) had been prewritten by the experimenter. The female participants rated themselves as less competent than did the male participants. When the outcome of the task was "successful," compared to the males, the females attributed more of the reason for success to the "leader" than to themselves. The male participants gave themselves relatively lower ratings and their "leaders" relatively higher ratings when their "leaders" supposedly were male.

*Differences in Self-Confidence.* An exception to the general reduction in the effects of differences between sexes, from adolescent students to experienced managers, is the continued lower self-confidence of females compared to males (White, 1981). This lower self-confidence is correlated with relatively lower self-esteem and less willingness to take risks because of a greater fear of failure. Females may also feel uncomfortable with too much success, although this issue has remained controversial.<sup>2</sup> These propensities may contribute to a lower career orientation and a lower desire to compete for advancement (Hennig & Jardim, 1977), as well as a greater tendency to conform (Eagly & Carli, 1981) and to avoid attempting to be influential (Eagly, 1983). According to a meta-analysis by Kling, Hyde, Showers, et al. (1999) with 216 effect

sizes for 97,121 respondents, the difference ( $d = .33$ ) favoring males in self-esteem is greatest in late adolescence. Results were replicated in a second analysis with three other large, nationally representative samples, although the differences found were not as large.

Maccoby and Jacklin (1974) obtained findings indicating that females had less confidence in their abilities across a wide variety of activities, such as achieving good grades in tasks requiring manual dexterity, solving puzzles, and the ability to deal with emergencies. In the past, possibly out of a desire to project stereotyped femininity (Ireson, 1976), females, more than males, tended to predict lower performance for themselves than was warranted by their intelligence (Crandall, Katkovsky, & Preston, 1962), and they presented themselves as dependent and incompetent (Vaught, 1965). Although the results were not uniform (Morrison, White, & Van Velsor, 1987; R. S. Schuler, 1975), typical reports like those of Schwartz and Waetjen (1976) and Hennig and Jardim (1977) concluded that women managers were observed by their own supervisors to be less confident, more conservative, and less likely to take risks than their male counterparts. The lack of confidence in themselves was seen in woman managers' tendencies to attribute their personal failures to their own lack of ability rather than to luck or to external forces. Despite these findings, Spence, Helmreich, and Stapp (1975) concluded that women's self-confidence was increasing with the incorporation into their own self-concepts of more stereotyped masculine traits. At the same time, in comparison with men, women appeared to be better able to express their vulnerability and acknowledge instances when they lacked self-confidence (Grant, 1988).

*Differences in Moral Values.* Another difference between the sexes that is of consequence to leadership is men's and women's values, how they develop, and the attitudes associated with them (Gilligan, 1982). For example, public opinion polls always show women, compared with men, as more supportive of peace and less supportive of militarism. Men's competitiveness shows up in the greater importance they attach to equity and fairness in the allocation of rewards. For women, valuing such equity is weaker than, say, valuing need (Brockner & Adsit, 1986). Consistent with this finding, Gilligan (1982) argued that the sexes differ in moral reasoning. Women focus on care and responsibility, while men are preoccupied with rights and justice. For a total sample of 187 people faced with real-life dilemmas, 92% of the women and 62% of the men were found to show care for others in their reasoning. None of the men ignored justice, while 23% of the women did (Gilligan, 1982). A meta-analysis of moral reasoning by Jafee and Hyde (2000) confirmed that women were slightly more oriented toward caring than men, while men were slightly more oriented toward justice (See [Chapter 9](#)).

Women are more concerned with seeing that no one is hurt and that everyone involved in a situation can be accommodated. Men attach more importance to hierarchical relationships; women, to networks and "webs of connection." Chodorow (1985) added that the separation of self from others is valued more by men, while the connection of self to others is valued more by women. Furthermore, when Powell, Posner, and Schmidt (1984) compared the reported values of 130 male and 130 female managers aged 34 to 45, they obtained results indicating that the women showed more concern for others with respect to ethical issues and religious values. Stamper and Van Dyne (1999) surveyed the organizational citizen behavior of 257 restaurant workers and their supervisors. They found the women to be more loyal, altruistic, and obedient than the men, but no difference appeared in their advocacy participation.

*Differences in Power and Using Power.* Historically, men have dominated business and government organizations. Even in nonprofit organizations two-thirds of which are based on a paid and unpaid female workforce, men have often dominated the leadership. Women came to the fore as leaders only on such specific national issues as women's rights and child welfare. At the local level, women concentrated as leaders of nonprofit social service, community, and volunteer organizations. More often, they served in supportive rather than leadership roles (O'Neill, 1994).

The sexes differ systematically in their respective relationships to power and therefore in their emergence as successful and effective leaders (Eagly, 1983; Henley, 1973). Women's status, relative to men, and their

legitimacy as leaders reduce their power to lead, as does their supposed lack of expertise. In the past, male leaders could more readily use power to induce members to conform to group norms without losing favor than could female leaders (Denmark & Diggory, 1966). However, when Ragins (1987, 1991) carefully matched male and female leaders by rank, department, and specialization, she found no difference in the evaluations of the leaders' effectiveness because of their sex. But she did find strong differences in the evaluations due to the perceived power of the leaders. In reviewing earlier studies on the subject, she noted that similar results had been reported by many other investigators,<sup>10</sup> who had controlled power-related variables. Sex differences appeared only when power-related variables could enter the picture.<sup>11</sup>

## Differences in Leadership Style between Women and Men

---

Differences in leadership styles between the sexes tend to be significant but small. Irwin (1988) found, in a large sample of U.S. firms, large and small, that female managers used a more participative, interactive style in working with others, while male managers more often tended to employ a more "directive" command and control style. This was to be expected from their known differences in traits and in male-female socialization.

Chapman (1975) reported no sex differences in leadership styles among noncoms to majors in the military or among civilian middle managers. However, differences in leadership style were found in laboratory and assessment studies but not in organizational studies. Bender (1979) inferred from laboratory studies that the leadership process was different with female and male leaders. However, Osborn and Vicars (1976) concluded that in leadership studies similarities rather than differences in style between the sexes appeared most frequently. Rosener (1990) argued that in the past, to advance in management, women had to adopt the masculine style of command and control. But "a second wave of women is making its way to the top, not by adopting the styles that have proved successful for men but by drawing on the skills and attitudes they developed from their shared experience as women" (p. 119). Statham (1987) reported that women managers depended for their leadership more on their social power, nurturing, and relations orientation. Men's leadership depended more on their personal power, individualism, and task orientation. Jago and Vroom (1982) found, among 483 students and managers, that when queried about what decisions they would make in various circumstances, the women chose to be more participative than the men did. Blanchard and Sargent (1984) obtained parallel results for situational leadership choices. Morrison, White, and Van Velsor (1987) found that female executives did more to personalize their experiences than did male executives. On the other hand, Boulgarides (1984) could find no differences in the personal values or preferred decision making styles of 108 male and 108 female business managers of the same age. Epstein (1991) argued that both men and women tend to describe their own style to match the stereotypes—what the culture says they should be like. Self-descriptions are suspect. Nevertheless, there is now considerable evidence of gender differences, often small, based on others' ratings. Eagly and Johnson (1990) completed a definitive meta-analysis of male-female comparisons in leadership styles in 329 comparisons, half of which had been published after 1981. No average significant difference was obtained for 269 organizational studies. The role of manager had more effect on style than did differences in sex (Eagly, 1991). However in the aforementioned meta-analysis by Eagly and Johnson, significant results fitting the stereotypical differences in interpersonal style, task orientation, and directive style were found for 43 personal assessment studies and 17 laboratory studies.

### ***Transformational and Transactional Leadership***

Women leaders seem to be more transformational; men, more transactional (Bass, Avolio, & Atwater, 1996).

In their transactional styles, women tend to be more humane and more appreciative of situational circumstances when correcting subordinates (Murphy, Eckstat, & Parker, 1995). Rosener (1990) obtained survey results suggesting that her “new wave” of female executives were likely to be more transformational than their male counterparts. Instructors were rated as more transformational as leaders by their female students, than by their male students (Walumbwa & Wu, undated). Another 262 teachers were rated by 101 vocational administrators. The women teachers were seen as more transformational (Daughtry, 1997). A small overall effect favoring women was found between male and female leaders in a meta-analysis by Van Engen and Willemssen (2004) of leadership studies between 1987 and 2000. Southwick (1998) reported that a large sample of female managers surveyed with the Multifactor Leadership Questionnaire (MLQ) were higher than men on all the transformational leadership scales and on contingent reward (which contains a transformational component). Men were higher than women on all the transactional leadership scales. The same was reported by Bass, Avolio, and Atwater (1996), regardless of whether the subordinate raters were men or women. In subsequent meta-analyses, Eagly and Johannesen-Schmidt (1995, 2001) extended the results to find mean differences indicating that 2,874 women leaders were somewhat more transformational and less transactional and less laissez-faire than their 6,126 male counterparts. Female leaders were more transformational than male leaders and also practiced more contingent reward. Male leaders were more likely to be transactional and laissez-faire in style (Eagly, 2002; Eagly & Johannesen-Schmidt, 2002). However, Yammarino, Dubinsky, Comer, et al. (1997) established with WABA analysis that the transformational or contingent style of each woman’s leadership varied from one individual follower to another and was not generalizable to her group of followers as a whole. Consistent with Southwick and with Bass, Avolio and Atwater (1996), Carless (1998) found for Australian managers, in an Australian experiment, that males acting as supervisors were more likely than females to use transactional messages of correction when faced with supposedly poorly performing subordinates.

### ***Subscale Differences***

In 1984, I observed in workshops for business and public agency managers in New Zealand and the United States that the MLQ subscale scores of charismatic leadership were higher among women than men. This was consistent with Grove’s (2003) finding that women leaders were higher in charisma on Conger and Kanungo’s (CK) scale. Telephone interviews of more than 100 state and national elected officials and legislators ascertained that the women were more transformational but they also rated themselves higher in active managing by exception, which the men practiced more passively (Bass & Harding, 1999). Tucker (1994) obtained similar results for 430 of the 1,517 women serving in U.S. state legislatures in 1993–1994.

A total of 120 junior and middle-level Australian female branch bank managers were rated on various instruments as more transformational than their 184 male peers by both their 32 superiors and their 588 subordinates. The differences appeared to center mainly around individualized consideration from the MLQ, enabling others to act and encouraging the heart from the LPI, and from interpersonal leadership responses to the Global Transformational Leadership Scale (GTL) (Carless, 1995). Thirty-one male hall directors were rated significantly higher in intellectual stimulation than their women peers, but the other expected scale differences for MLQ scores in transformational and transactional differences were too small to be significant (Komives, 1991). Instructors were rated as more transformational leaders by their female but not their male students (Walumbwa & Wu, undated). Again, 262 teachers were rated by 101 vocational administrators. The women teachers were seen as more transformational (Daughtry, 1997). At a New Zealand polytech, 153 students used the MLQ and the Bem Sex-Role Inventory (SRI) to describe a leader “of whom they had vivid recollections.” Business, social, sports and other leaders’ SRI ratings in *femininity* correlated significantly

higher with MLQ consideration (.56) and charisma (.57) than with SRI *masculinity* (.22 versus .43), and significantly lower (.29 versus .46) with MLQ intellectual stimulation (.29 versus .46).

*Relations versus Task Style.* Women leaders tend to be higher in concern for interpersonal relationships; male leaders, for task achievement. Such was the case for the just-mentioned hall directors (Komives, 1991). Likewise, an Eagley and Johnson (1990) meta-analysis indicated that male leaders were more task-oriented than women leaders. Also, women leaders were more concerned about relationships, but only in laboratory and assessment studies. No such differences appeared in organizational studies. In some samples but not others, Petty and Bruning (1980) reported, female supervisors displayed more consideration than male supervisors. Bowes-Sperry, Veiga, and Yanouzas (1997) found that women managers more than male peers tended to respond with understanding when employees sought help. Male managers did more evaluating, but both males and females relied more on evaluating for helping. With reference to emerging leadership, Deaux (1976b) suggested that women were more likely to seek interpersonal success, in contrast to men's greater concern for being successful in the task. Similarly, Eskilson and Wiley (1976) reported that women attempted to create a more positive group affect than did men. In allocating resources, Vinacke (1969) inferred that women focus more on maintaining harmony, whereas men concentrate on the quality of individual performance.

*Preferences in Ideal Leaders.* In a survey by Denmark and Diggory (1966), sorority leaders were likely to be described as displaying less authoritarian behavior than fraternity leaders. Consistent with this finding, school-teachers described female principals as exhibiting less coercive behavior than male principals (Kappelman, 1981). On the other hand, when a much broader set of studies was considered in Eagley and Johnson's (1990) meta-analysis, women leaders were found to be more participative and democratic, men more directive and autocratic. In a study by Rosenfeld and Fowler (1976), some differences emerged among the self-described scores for "ideal democratic leader" of 89 men and 89 women. But the results for preferred ideal autocratic leaders were the same for both groups. Women emphasized being helpful, affectionate, nurturing, and open-minded, and accepting blame; men emphasized being mature, forceful, competent, moral, utilitarian, and analytical, and valuing people.

*Administrative Styles.* Morsink (1966) found that when female principals were described by both male and female staff members, they were significantly higher on Leader Behavior Description Questionnaire (LBDQ-XII) factors than male principals were in representing their people, persuasiveness, emphasis on production, predictive accuracy, integration of the group, and influence with superiors. Kappelman (1981) obtained similar results in another survey of male and female principals. Millard (1981) obtained results indicating that 38 female managers, compared to a matched sample of male managers, in a large government agency, were described by subordinates as scoring higher on production and orientation toward superiors but lower on tolerance for freedom and uncertainty. Sleeth and Humphreys (undated) found differences between 122 men and 122 women students at a large urban university in self-descriptions of their leadership behavior, as scored on the LBDQ and Hersey and Blanchard's (1977) Leader Effectiveness and Adaptability Description (LEAD), as well as their self-descriptions of assertiveness and endorsement of the work ethic. The women reported themselves as slightly higher in consideration and the men reported themselves as higher in task than relations orientation. Similarly, more consideration than initiation of structure was seen in the self-descriptions of 51 first-and second-level women supervisors (DiMarco & Whitsitt, 1975).

*Involvement.* Eskilson (1975) reported that the women who emerged as leaders of three-person laboratory groups showed more intensive involvement with the task than did the men who emerged as leaders. Similar results appeared for coalition-forming in a competitive, high-risk game (Lirtzman & Wahba, 1972). The female executives were thought to be more concerned than their male counterparts about achieving organizational goals and following rules and policies (Hyman, 1980), but the male executives were more comfortable with intellectual authority (Morrison, White, & Van Velsor, 1987). Bass (1985a) reported that women managers display less management by exception than their male counterparts. This may point to

women's greater tendency to be involved in their subordinates' activities. Associated with this tendency may be the different ways in which female and male supervisors appear to view poor performance by their subordinates. In a laboratory simulation of a work-place, Dobbins (1985) found that women supervisors were more supportive in their leadership if the subordinates were women. Male supervisors were supportive only if they had inferred that the cause of the poor performance was stable and due to causes beyond the subordinate's personal control. They thought that close monitoring of a poorly performing subordinate was more appropriate if the subordinate was lazy and incompetent.

### ***Little or No Difference Due to Differences Between the Sexes***

The preceding studies found some tendencies for women leaders to be more relations-oriented and involved than their male counterparts. However, a large array of evidence has failed to establish any consistent differences. Many male managers are caring and considerate; many female managers are controlling and autocratic. Management training now "preaches the importance of nurturing, cooperation, and consensus" (McKee, 1992, p. 5).

Girls and women do differ from boys and men on many attributes. These attributes may be associated with one's emergence as a leader. But the differences between the sexes blur if one contrasts women and men who have already achieved status as leaders. Once they are legitimated as leaders, the preponderance of research suggests that women actually do not behave much differently from men in the same kind of positions. Most often, reviews and analyses of both field and laboratory studies have concluded that few or no effects of sex on leadership style were obtained, whether the leaders were describing themselves or being described by their subordinates.<sup>12</sup> Thus among 100 male and 100 female executives at the same middle-management level in federal agencies, Muldrow and Bayton (1979) found no differences in the handling of six personnel decisions, although the women described themselves as less likely to take risks. And Carpeno (1976) found no differences due to sex on the Leadership Opinion Questionnaire. Sonnenfeld (1995) found little significant difference in the behaviors of 220 male and 30 female CEOs described by an average of six members of their management teams. Southwick (1998) reported no gender differences in perceptions of transformational or transactional leadership when MLQ ratings were obtained from leaders' supervisors, although these differences had been found in subordinates' ratings of the same leaders.

Michener and Schwertfeger (1972) reported no differences between men's and women's preference for the use of coercive power or for withdrawing from a situation, although men, if they were liked, were more likely to be persuasive. In a study of a simulated work setting, Baker, DiMarco, and Scott (1975) obtained no significant differences between the way men and women allocated rewards or penalties. In a longitudinal field study, Szilagyi (1980a) failed to discern any differences in men's or women leaders' administration of rewards or punishments, according to their subordinates of both sexes. Likewise, Butterfield and Powell (1981) obtained no differences in the ratings of the styles of male and female managers. Osborn and Vicars (1976) also found no sex differences in initiation of structure or the amount of consideration of supervisors, according to their subordinates in men's residences. Similarly, Thomas (1982) reported no differences in the supervisory orientations of 252 male and 285 female business students or in the students' responses on in-basket tests. No sex differences in preferred solutions to the LEAD situational leadership questionnaire appeared among the male and female management students. Also, Birdsall (1980) reported that both men and women managers used the same masculine communication style.

*Androgyny.* According to Murphy, Eckstat, and Parker (1995), women leaders are no longer adopting a completely masculine orientation as in the past but are using a feminine or, better yet, androgynous orientation. They can be both nurturing and task-oriented; as was advised 44 years ago by Blake and Mouton

(1964): to be the best, managers must have strong concern for performance and concern for people. Both male and female leaders are adopting androgynous approaches, reducing the differences in style between them (Ballard-Reich & Elton, 1992). Androgynous leaders use masculine styles in some situations and feminine styles in other situations (Vonk & Ashmore, 1993). They integrate rather than polarize the masculine and feminine styles (Park, 1997). Androgynous women leaders rated themselves higher than did their peers, which male leaders were less prone to do (Gurman & Long, 1993). However, women leaders are more likely to adopt androgynous styles accompanied by more flexibility in response to different situations. Male managers still tend to concentrate more on performance and less on people (Stern, Dietz, & Kalof, 1993). And for 1979 and 1989 samples of undergraduate and graduate business students, the good manager was still being described as masculine rather than androgynous (Powell & Butterfield, 1989). Nevertheless, it is the androgynous leader—both task-and relations-oriented—who tends to be the most effective (see below).

## Success and Effectiveness of Women Leaders

---

When women rather than men are placed in supervisory and leadership roles, how well are they accepted and followed by their subordinates? How meritorious is their performance, as appraised by their superiors? How good is the performance of the groups they lead? How satisfied are their subordinates? Does the sex of the leader make a difference in whether the group attains its objectives and satisfies its needs? Are the productivity and satisfaction of the group affected by the sex of the leader? Rice, Bender, and Vitters (1980) commented that these questions are complicated when answers depend on subjective ratings that may reflect sex bias. However, at the beginning of the twenty-first century, the organizational requirements for more consensus and cooperation and less “command and control” styles of leadership, more common among women, are giving them greater success and effectiveness. This is despite the fact that women in the same leadership roles as men often tend to be less valued (Adams & Yoder, 1985). Powell (1993) concluded from a review that although there were differences in traits and styles of men and women leaders, the differences disappeared when one examines the effectiveness of their actual performance. In all, the evidence is mixed. Some studies show that groups and organizations do better with female leaders; some studies show that groups and organizations do better with male leaders; and still others find no differences due to the sex of the leader. In the aggregate, meta-analyses give a slight edge to the women. Ballard (1992) concurs that overall, women make better managers. Whether or not women managers are accepted as role models by their subordinates depends much more on their effectiveness than their sex, according to a survey of 1,579 Canadian public senior managers (Javidan, Bemmels, Devine, et al., 1995).

### *When Women Leaders Are More Effective*

Contrary to what they had hypothesized, Eskilson and Wiley (1976) found, in a study with 144 undergraduates, that groups led by females were more productive than those led by males. And from a review of the literature between 1979 and 1984, Smith (1986) concluded that on creative tasks, groups led by women outperformed groups led by men. Bass and Avolio (1994) confirmed the slightly greater effectiveness of women manager, saying it could be attributed to their being more transformational than their male counterparts. The results were the same for ratings from both male and female subordinates. According to Zimmerman-Treichel, Dunlap-Hinkler, and Washington (2003), firms were more effective when women served on boards of directors and in senior management.

Irwin (1998) inferred from the profiling of 360-degree ratings from a large sample of managers from Fortune 100 corporations and small businesses that women managers were somewhat more effective. Women

were stronger on such performance factors as communicating, planning, controlling, leading, problem solving, and managing relationships.

### ***Androgynous Leaders May Be Most Effective***

Park (1996) agreed (as was noted in earlier chapters) that the best leaders tend to be both task-and relations-oriented. The blending of the more masculine task orientation and the more feminine relations orientation by both men and women may make for the most effective leadership style. Thus the “one-minute manager” was seen as androgynous by Blanchard and Sargent (1984). Kaplan and Sedney (1980) suggested that an androgynous style allowed for broader, more flexible leadership. Women managers’ leadership styles reveal more willingness to consider circumstances when rewarding or correcting subordinates.

### ***When Women Leaders Are Less Effective***

Several studies pointed to the negative effects of women in leadership posts. Baril, Elbert, Mahar-Potter, et al. (1989) found, contrary to the above, that for 65 first-line supervisors administered the Bem Sex-Role Inventory, the androgynous supervisors were rated least effective by their superiors. Their successful women supervisors were rated higher in masculinity. In an employee attitude survey, Hansen (1974) found that women supervisors had less impact than men supervisors on the climate of their departments, as evidenced by the correlations between supervisors’ attitudes and ratings of the groups’ climate. Roussel (1974) examined the effects of the sex of 40 department heads on teachers’ ratings of the departmental climate in 10 high schools. Departments headed by men were rated higher in esprit and intimacy; departments headed by women were rated higher in hindrances. Atwater, Carey, and Waldman (2001) interviewed 163 subordinates about their supervisors’ workplace disciplinary behavior. Women supervisors were judged to be less effective in disciplinary actions and less effective overall. Hutchinson, Valentino, and Kirkner (1998) surveyed 91 employees and their leaders. Employees’ commitment to the organization was higher if their male, but not their female, supervisor was high in consideration and initiating structure.

Yerby (1975) assigned 192 male and female undergraduates to small problem-solving groups according to their positive or negative attitudes toward female leaders. All groups were led by women. The groups’ performance correlated with the attitudes of their members toward females as leaders. Such attitudes also resulted in the lower group morale of male subordinates under female leaders. Rice, Bender, and Vitters (1980) completed a laboratory study of 288 West Point cadets assigned to 724-person groups led by females and males with all subordinate roles filled by males. They found that groups with male leaders did better on two assigned tasks than groups led by females. When 312 Israeli soldiers rated 82 unit leaders, satisfaction was lowest in units led by women (Gavrieli, 2003).

### ***Null Evidence***

Bartol (1978) concluded, in a review of the results of laboratory studies, that in general the sex of the leader was not a consistent factor in determining a group’s productivity. Nor, according to Larwood, Wood, and Inderlied (1978), did the effectiveness of the performance of managers in field studies appear to be associated consistently with their sex. B. A. Hall (1975) reported no difference in the effectiveness of the assertiveness training of women as a function of the sex of the group leader.

## ***Emergence as a Leader***

Ross, Davidson, and Graham (1985) reported that 165 women who worked for a major domestic airline scored higher in their performance at centers to assess their management and leadership potential than 215 men did. These results were attributed to the relatively bias-free situation.

Men came to the fore more often as leaders than women of initially leaderless groups, according to a meta-analysis of 75 studies by Eagley and Karau (1991). They analyzed mainly college-age samples from four preceding decades of laboratory studies and from few natural studies, with a median size of four members. The mixed-sex groups were composed of an average of 53% males and 47% females. Male leadership was more pronounced if sessions were shorter than 20 minutes, if the tasks were masculine, if the groups were smaller, if the subjects were older, if the studies had been completed years farther back in the past, if general and task measures of leadership were used, and if respondents of both sexes thought men would be more likely than women to lead the groups performing the tasks. Consistent with social role expectations, women led if more social complexity was present and if social measures of leadership were used.

In all-male and all-female groups, members high in dominance, intelligence, general self-efficacy, and self-monitoring tended to emerge as leaders (Foti & Gershenoff, 1999). Masculine and androgynous-gendered individuals more frequently emerged as leaders of small mixed-sex groups, although biological sex was not significant (Kolb, 1997). Some earlier studies pointed to the biological sex difference in emergence between women and men in mixed-sex groups. Women were socialized to hold back from attempting leadership because of sex-role expectations (Eagley, 1983). When paired with men in work dyads, they were less likely to come to the fore as leaders even when they had the strengths to fit the requirements for leadership (Carbonell, 1984). No doubt this difference will disappear with the liberation of women and their efforts to increase assertiveness. For some tasks and for the continuing expectations of participants about the appropriateness of the leadership role for women (Hollander, 1983), men are seen as more likely to attempt leadership or emerge as leaders in mixed-sex circumstances (Eskilson & Wiley, 1976). As noted earlier, even when women are generally more dominant, they have tended to defer to men for leadership (Megargee, 1969). Attempts to lead, as seen in the initiation of structure and the amount of talking, were found by Strodbeck and Mann (1956), in jury deliberations, to be greater for men. At a Mormon institution, Brigham Young University, Oddou (1983) found that men came to the fore more frequently than women as leaders of mixed-sex work groups. However, at a nonsectarian school, while Kent and Moss (1993) found sex differences in leadership emergence among 122 undergraduates favoring men, they also noted that but men with an androgynous orientation were more likely to emerge as leaders.

Many studies failed to find any differences that could be attributed to gender differences. For instance, Schneler and Bartol (1980) examined sex differences in the appearance of leaders in 52 task groups participating in a personnel administration course over 15-weeks. They found no significant differences when leadership was assessed by sociometric choice or when it was based on observational data from Bales's interaction process analyses.

## ***Subordinates' Satisfaction and the Sex of the Leader***

The expected conflict between fulfilling the stereotyped role of a woman and fulfilling the role of a manager has already been noted. Yet the satisfaction of subordinates appears to be unrelated to whether supervisors fulfill appropriate sex-role stereotypes (Bartol & Wortman, 1975; Millard, 1981; Osborn & Vicars, 1976). It is difficult to divorce subordinates' attitudes and expectations about women leaders from the subordinates' job

satisfaction under female or male leaders. Nevertheless, many studies have reported little difference in the job satisfaction of subordinates as a function of the sex of their supervisor.<sup>13</sup> For instance, Terborg and Shingledecker (1983) could find no differences about staying in or quitting a job between 331 male and female employees under female supervisors and 132 employees working for male supervisors, except that of all the employees, the male subordinates under male supervisors were the most unclear about how their own performance was evaluated. Adams's (1976) survey of the 276 subordinates of 18 chain store managers failed to find differences in the subordinates' satisfaction with supervision that were due to the sex of the managers. But numerous other studies<sup>14</sup> have reported a preference for male supervisors, again with other relevant factors affecting the preference. For example, among blue-collar employees surveyed by Haccoun, Haccoun, and Sallay (1978), satisfaction of subordinates was higher with male supervisors.

*Confounding Factors.* In a study, Goetz and Herman (1976), looked at subordinates of department managers in a large retail store chain and found that employees working for women managers were more satisfied with their supervision than employees working for men. Yet, there the effects of sex could be accounted for mainly by other differences, such as commission versus noncommission payment plans and the composition of the work units. In the same way, Osborn and Vicars (1976) reported that the effects of the sex of the supervisor could be explained by other factors. One such factor may be the duration of the leader-subordinate relationship. In a short-term laboratory study, Rice, Bender, and Vitters (1980) showed that male West Point cadets holding traditional attitudes toward women as army officers were less satisfied in their interactions in a short exercise with appointed female leaders than were egalitarian male or female subordinates. But in summer training, an experience of longer duration, the correlation disappeared (Adams, Prince, Instone, & Rice, 1984). In cadet-training programs that lasted six weeks, no consistency in the correlation of these attitudes with satisfaction was obtained, regardless of the sex of the leader or the subordinate (Rice, Instone, & Adams, 1984).

The leader's influence "upstairs" is another confounding factor. Trempe, Rigny, and Haccoun (1985) demonstrated, from their findings with 197 semiskilled employees, 52% of whom were women, that although the sex of a supervisor was irrelevant to an employee's satisfaction, the supervisor's influence with a higher authority was important and male supervisors were seen to have greater influence (Terborg, 1977). Similarly, Taylor and Ilgen (1979) completed a survey of employees with female and male supervisors and could find no difference in the employees' satisfaction with their supervisors that was associated with sex. But in comparison to employees working under male supervisors, the employees working for female managers thought that their supervisors had less reward power.

Revealed wisdom and early research hinted that even women workers generally preferred male superiors. As White (1981) noted, a 1971 poll of working women showed that they strongly preferred a male rather than female boss. But by the 1980s, studies of college women were suggesting that women preferred women as bosses. The same changes were occurring for preferred opinion leaders. By 1975, men, on most topics, revealed no preferences in selecting opinion leaders on the basis of the leaders' sex, but women exhibited a distinct preference for women leaders, except on political issues (Richmond & McCroskey, 1975). As shall be seen later, better-educated subordinates had become more favorably inclined toward women as leaders than had less-educated subordinates. But male subordinates' attitudes toward women superiors have remained less sanguine.

### ***Performance Appraisals of Women Managers and Professionals***

Again, the evidence is mixed. On the one hand, as has already been noted, there is a bias toward men in positions of leadership. Nevertheless, such distortion tends to dissipate with performance appraisals based on intensive observation or extensive experience. Laboratory studies have tended to find no difference in the

performance appraisals assigned to men and women (e.g., Gianantonio, Olian, & Carroll, 1995), although such findings have not been uniform. Some have favored women (e.g., Bigoness, 1976); others, men (e.g., Woehr & Roch, 1996).

In field studies, Powell and Butterfield (1994) found that higher evaluations were received by women applicants for executive service in a federal agency. Schwartz and Waetjen (1976) reported that 95 percent of employers of female managers rated their job performance as excellent, very good, or good (probably no different from their leniency-prone ratings of male managers). But according to a review by J. E. Smith (1986), when managers were rated by their peers or superiors, no consistent sex differences appeared. Again, Tsui and Gutek (1984) could find no differences between the sexes in performance appraisals of middle-level managers in a corporation. This finding was confirmed in a meta-analysis by Dobbins and Platz (1986), who felt the search for such differences should be abandoned.

Deaux (1976a) obtained no difference in the rated performance of men and women retail store managers. M. M. Wood (1975, 1976) and Wood and Greenfeld (1976) also found little difference in the rated performance of men and women managers in several field analyses. Likewise, the AT&T assessment center's predictions of the managerial potential of 1,097 women were similar to those for men. The distribution of the assessors' ratings for men and women were similar (Ritchie & Moses, 1983). No difference was found in the leadership evaluations of male and female management students using the same style of leadership (Butterfield & Powell, 1981). On the other hand, making use of a professional accounting association, Griffith and Bedeian (1989) found that male supervisors in 464 dyads rated their male subordinates lower than their female subordinates.

*Some Differences on Specific Aspects of Performance.* In a few studies, women leaders received higher or lower ratings than male leaders on some particular kinds of performance. M. M. Wood (1976) surmised from a survey that male managers tended to rate their female peers more highly in decision making, competence, and ability to handle emotions. Women were seen as bringing a fresh outlook to business problems and as offering useful insights into marketing problems involving female customers. They were regarded as tending to reduce intense feelings of competition among male managers.

Rosen and Jerdee (1973) completed three experiments with in-basket evaluations to examine cross-sex role behavior by women supervisors. Although friendly, helpful leadership was rated as more effective whether the supervisor was male or female, a reward style was evaluated as more effective for male than female supervisors. At the same time, Petty and Lee (1975) obtained results suggesting that consideration by female supervisors is more highly related to the satisfaction of subordinates than the same consideration by male supervisors. Petty and Lee inferred that because more consideration is expected from women, when it fails to materialize, it is more likely to result in subordinates' dissatisfaction.

In an analysis using 192 male middle managers, R. A. Patterson (1975) found that females received lower ratings than males on evaluations of performance and promotability. As mentioned earlier, male cadets were satisfied to serve under female cadet leaders in summer training. But female cadet leaders at West Point earned lower staff appraisals than male cadet leaders for their performance in summer camp. The performance appraisals of 86 female cadets during summer training, compared to those for a random sample of male cadets, were found by Adams and Hicks (undated) to show that in assigned formal leadership roles, female leaders were rated more poorly in overall performance. Rice, Instone, and Adams (1984) reported these same results for larger samples. The female leaders were rated as having less capacity for increased responsibility, less ability to organize and coordinate the efforts of others, less initiative, forcefulness, and aggressiveness, and less ability to adjust to new or changing situations and stresses than the male leaders.

*Same Behavior but Evaluated Differently.* Although women leaders may behave in a way similar to their male counterparts and have similar effects on their groups, they are likely to be evaluated differently (Seifert, 1984). Van Nostrand (1993) argued that the culture plays favorites. Men are more privileged and

entitled. Women are less favored by higher authority. They are evaluated slightly less favorably, according to a meta-analysis by Eagley, Makhijani, & Klonsky (1992). This occurs especially when the women are autocratic, directive, and stereotypically masculine when they occupy masculine-dominated roles, and when the evaluators are men. But an earlier meta-analysis by Dobbins and Platz (1986) of studies comparing male and female leaders on the LBDQ measures of initiation and consideration did not reveal significant mean effects owing to sex differences. Findings by Ziegert and Hanges (2002) suggested that stereotyped attitudes affect what happens, whether they are measured implicitly or explicitly and regardless of efforts to statistically control the attitudes.

Differences in sex moderated the evaluation of the same expressive emotional leadership behavior in a laboratory study by Sherony (2003). Men's emotional expressiveness received higher ratings than women in positive, creative, and task situations, and lower ratings in negative situations; but Ashkanasy and Newcombe (2001) found otherwise. Women leaders on videotape received lower evaluations than men after being viewed giving the same negative feedback with negative affect.

Wheelan (1975) reported that for 72 female and 72 male undergraduates, women were ranked lower than men in leadership in mixed-sex, six-person groups, despite the women's greater participation, ordinarily predictive of leadership. In the same way, subordinates may be less satisfied with women supervisors who display the same styles as male supervisors (Petty & Lee, 1975; Rosen & Jerdee, 1973). Hansen (1974) could find no significant differences in support or goal facilitation by supervisors that were associated with the women's gender; nevertheless, subordinates of both sexes were more dissatisfied if their supervisor was a woman. This finding may have been due to the reports by women supervisors themselves that they had less autonomy or, as was found in other studies, that as women supervisors they had less influence with higher authority (South, Bonjean, Corder, & Markham, 1982). Subordinates may also favor male managers because male managers are generally more experienced (Liden, 1985). In all, one is forced to conclude, as did Denmark (1977), that in a majority of cases, differences between male and female leaders are more a matter of stereotyped expectations than actual fact.

One reason for the perceptions of the differences between the leadership of men versus women in the absence of actual differences in behavior between the sexes was demonstrated by Ceis, Boston, and Hoffman (1985). These researchers contrasted how viewing all-male and all-female authority role models in television commercials affected the subsequent leadership performance and leadership evaluations of 276 undergraduates in four-person mixed-sex discussions. The men and women performed equally as leaders in the discussion, but their equal performance was recognized only by those subjected to the all-female TV authority figures. Those who viewed the all-male authority figures recognized only the males as leaders in their own discussions.

As noted before, females who were perceived to be directive were negatively evaluated, while males perceived to be directive received positive evaluations (Jago & Vroom, 1982). Again, illustrating the difference in evaluations, Denmark (1980) contrasted the reaction of 384 students to a hypothetical male or female professor who had written an outspoken or a conciliatory letter in response to a suggestion made at a faculty meeting. Although the conciliatory style was favored by the students, the conciliatory female professor was rated as less of a leader, less interesting, less sophisticated, less strong, and less fair than her male counterpart. The outspoken woman professor was particularly downgraded by the female students. In the same way, Moore (1984) found that in evaluations of performance, masculine behaviors (ambition, self-reliance, independence, and assertiveness) were valued more highly than feminine behaviors (affection, gentleness, and understanding), especially in female high performers.

*Different Reasons Applied.* There are also differential attributions for why men and women succeed or fail. A man's success is more likely to be attributed to ability, but a woman's success is attributed to hard work, good luck, or an easy task (Deaux & Emswiller, 1974). Conversely, a woman's failure will be attributed to her lack of ability, but a man's failure will be attributed to bad luck, task difficulty, or lack of effort (Cash, Gillen,

& Burns, 1977; Feather & Simon, 1975). Forsyth and Forsyth (1984) used female confederates as leaders who behaved either in a task-oriented or interpersonally concerned way in mixed-sex groups. When the group was successful with a female leader, both the leader and the male subordinates attributed the success to luck. With a male leader, the group attributed the success to the leader's ability.

The attributions for the successful and unsuccessful leadership of women by men are related to men's attitude toward women as managers. For 143 male participants who evaluated a scenario of the performance of a woman manager, those with more favorable attitudes toward women as managers were more likely to attribute success to the woman's ability and effort rather than to luck or the value of the job. With such favorable attitudes, they were less likely to attribute failure to the woman's lack of ability or effort (Garland & Price, 1977; Stevens & DeNisi, 1980).

*Other Distorting Factors.* As noted earlier, men are more likely to explain a woman's success as a leader as due to her sex rather than to her job-relevant competencies if she is in a solo position (Lockheed, 1975). Devaluations of a woman's successful performance are also more likely if the job appears to be inappropriate for women or the outcome of the work effort is ambiguous.

When 96 experienced managers were asked by Wiley and Eskilson (1982) to evaluate the performance of a hypothetical male or female supervisor who used his or her expert or reward power to influence a subordinate successfully, the managers evaluated the male supervisor more favorably when he employed expert rather than reward power. But the female supervisor was evaluated more favorably when she used her reward-based power. The investigators thought these results were due possibly to the greater credibility of men as experts.

Evaluations come closer to reality when work objectives are clear and the job fits sex-appropriate stereotypes. For example, evaluations are closer to reality for female nursing administrators than for female engineering supervisors. Discrimination disappears if objective reasons for success are available (Riger & Galligan, 1980). In fact, with equally high levels of objective performance by men and women, participants explicitly evaluated women more favorably than they did men in overreaction to women's unexpected success (Bigoness, 1976). Distortions favoring the woman leader were seen by Jacobson and Effertz (1974) in subordinates' and peers' evaluations of leadership performance. They found that women leaders in experimental small groups were judged less harshly than male leaders when performance levels did not meet the groups' expectations. And unexpected success by a woman was seen as deserving more praise than the same unexpected success by a man (Taynor & Deaux, 1973).

## Moderating Effects

---

Despite their claims to the contrary, both male and female owners did not manage their small businesses using a masculine or feminine style. They actually practiced both styles. The results seen in a Canadian study by Cliff, Langton, and Aldrich (2003) of 229 small businesses depended on what the owners did rather than what they said.

### *Effects of the Sex of Subordinates*

After a review of the available evidence, Chapman and Luthans (1975) concluded that sex differences in leadership depended on the group and the situation involved. For instance, in a survey of 1,137 employees in three organizations, compared to men, the women preferred consideration from their supervisors. Nevertheless, both men and women with more education and tenure preferred less structuring from their leaders (Vecchio & Boatwright, 2002). Haccoun, Haccoun, and Sallay (1978) found that although nondirective styles were favored for women, the sex of both the supervisor and the subordinate determined the

group's performance. Differences between the sexes in the leadership of men and women occur that may be due partly to other moderating factors, such as differences in men's and women's age, education, seniority, experience, level in the organization, and professional training.

*Pygmalion Effect.* When supervisors, teachers, and leaders are led to believe that their subordinates, students, and followers are highly competent, improved performance results, according to experimental research on the "Pygmalion effect" (Eden, 1993). But the Pygmalion effect appears to work better for men than women, as seen in a meta-analysis of 19 studies (McNutt, 2000). Successful induction of the Pygmalion effect occurs when leaders' low expectations of subordinates are raised to high expectations.<sup>15</sup> Lees-Hotton and Syantek (2002) reported inducing the Pygmalion effect with women, although most other attempts with women have failed. Followers of control leaders who don't change their low expectations perform poorly compared to those for whom there are natural or induced expectations of better performance. The controls are an illustration of the "golem effect," in which leaders with low expectations generate or maintain poor follower performance (Eden & Davidson, 1997).

*Success of the Leader of the Same or Opposite Sex of Followers.* Whether the subordinate and the leader are of the same or opposite sex affects the leader's likelihood of success. Thus in trios, female leaders were least likely to succeed when the other two members were men; they were most likely to succeed when the other two members were women (Eskilson, 1975). Consistent with these results, Aries (1976) observed that males displayed more leadership than females in mixed groups of males and females than in same-sex situations. Likewise, Megargee, Bogart, and Anderson (1966) examined various combinations of dominant and submissive men and women in two experimental tasks. Dominant men paired with submissive men and women, and dominant women paired with submissive women tended to appoint themselves as leaders. But dominant women paired with submissive men tended to appoint the men as leaders. The dominant women avoided attempting to lead male partners. Among 144 undergraduates in 48 trios, Eskilson and Wiley (1976) observed that although typical sex-role expectations resulted in male leaders receiving more requests for direction, both sexes addressed more directive behavior toward groups of their own sex.

As was noted early in the chapter, the placement of women in leadership positions over men generates status-reversal conflict, particularly for men with traditional attitudes toward the role of women. The consequence is a negative impact on the men's performance (Yerby, 1975). Early on, Whyte (1949) described such a status reversal in restaurants in which waitresses gave orders to counter men. Although the counter men accepted such orders, they did so with resentment and hostility. Despite the continuing stereotypes, it is expected that greater acceptance of women as leaders has occurred since these studies were completed. Yet men who work for women may still feel a greater reluctance to disclose difficulties because they want to protect their own feelings of superior status and not be seen as lacking strength. Zammuto, London, and Rowland (1979) studied how resident advisory assistants in dormitories dealt with their supervisors as a consequence of whether the assistants and the supervisors were men or women. Both female and male assistants were less likely to withdraw when they were in conflict with female rather than male supervisors. Also, highly committed male assistants were more likely to try to smooth over differences, to compromise, or to confront their female supervisors.

But contrary to expectations, Frantz (1979) failed to find much effect on whether males or females emerged as leaders in initially leaderless groups when she systematically varied the number of females from one to six in six-person groups. Opposite results were found in the field studies of West Point cadets by Rice, Instone, and Adams (1984). Similarly, Lonetto and Williams (1974) found that regardless of the sex of the group, the same personal factors, such as a member's intelligence and self-orientation, were related to the men's and women's emergence as leaders for 31 males and 31 females in three-person undergraduate groups. In the same way, Kanter (1977b) noted that when all-male and all-female groups were given a specific assignment, the interactional patterns and leadership styles within each group were similar. Likewise, in a group of

experienced managers, Gaudreau (1975) could find no differences in leaders' competencies associated with their sex. But compared to male cadet subordinates under male or female cadet leaders, female cadet subordinates under female cadet leaders generally described their leaders less favorably. They attributed greater influence to hard work by subordinates and less to the leaders' skill.

*Effectiveness of the Leader of the Same or Opposite Sex.* Eisman (1975) found that in marathon encounter groups of one sex or the other, in which a goal is to promote self-disclosure for therapeutic purposes, more such disclosure occurred when groups were led by a person of the opposite rather than the same sex. But most studies that dealt with short-term, less emotionally involved performances found the contrary to be true: same-sex supervision was better. Females supervised by a woman rather than a man performed better on mechanical tasks (Larwood, O'Carroll, & Logan, 1977), standard mathematics tests (Pheterson, Goldberg, & Keisler, 1971), and mathematical word problems (Hoffman & Maier, 1967). Groups with same-sex leaders were reported by Bullard and Cook (1975) to develop a better group atmosphere than groups led by opposite-sex leaders. However, no differences in productivity were found.

*Attitudes toward the Leader by the Same or Opposite Sex.* Subordinates' sex and other personal characteristics moderate the difference in the attitudes of subordinates toward female or male supervisors. Subordinates' attitudes are a complex interaction of the sex composition of the subordinate groups and the leader's sex (Yerby, 1975). Male subordinates looked less favorably on their women superiors than did women subordinates (Jacobson, Antonelli, Winning, et al., 1977). Subordinates received better performance ratings and were better liked in same-sex leader-subordinate dyads than in opposite-sex dyads (Tsui and O'Reilly, 1989). Compared with men, women were more favorably disposed toward women managers (Stevens & DeNisi, 1980). Male midshipmen subordinates led by women rated their leaders slightly lower than male leaders. The women subordinates evaluated their leaders equally whether their leaders were male or female (Atwater & Roush, 1994). But in another military school study, female cadets reacted more favorably to female cadet leaders (Larwood, Glasser, & McDonald, 1980). In all, according to Helland, Barksdale, and Peat (2005), women have an advantage in subordinates' and peer ratings, but not in self-, supervisor or assessment center ratings of leadership.

In their laboratory study of 72 teams of male cadets led by males or females, Rice, Bender, and Vitters (1980) found that the male subordinates with traditional attitudes toward women were lower in overall team morale when led by women. When led by women, traditionalists attributed their groups' success more to luck and less to the leaders' shared work. For subordinates with liberal attitudes, the leaders' sex did not matter as much. Nevertheless, male subordinates, as a whole, thought that women leaders contributed more to the group's performance but that the expert ability of male leaders was more important to their own individual performance. In agreement, Garland and Price (1977) found that men with favorable views toward women managers attributed the managers' success to factors such as ability and effort and avoided attributions of success to luck and the difficulty of the task. These attributions differed from those of more traditional men that women succeed because of good luck, easy tasks, or extra effort (Deaux & Ernswiller, 1974). They subscribed to the stereotype that men with masculine characteristics make better managers. But women looked on successful managers as having both masculine and feminine characteristics (Brenner, Tomkiewicz & Schein, 1989).

Vecchio and Bullis (2002) examined the appraisal by U.S. Army officers of their satisfaction with their 2,883 supervising U.S. Army officers. Satisfaction with one's supervisor generally decreased over time. The largest decrease occurred for women supervised by women. The most consistently satisfied were men supervised by men. Petty and Lee (1975) found that male subordinates of female supervisors rated their supervisors as lower in consideration and higher in initiating structure than did female subordinates of female supervisors or subordinates of either sex of male supervisors. But it is not known whether the ratings reflected the actual differences in the behavior of the female supervisors toward female and male subordinates or

differences in the way subordinates perceived the same behavior by female and male supervisors. The male subordinates with female supervisors felt less satisfied with their work and with their supervisors. Since women are expected to exhibit more consideration, and generally do, Petty and Lee suggested that when female supervisors display a lack of consideration, their inconsiderate behavior has more of an effect on their subordinates' dissatisfaction than similar inconsiderate behavior by a male supervisor.

*Differential Effects of Leaders' Behavior.* Petty and Lee (1975) reported the tendency for male subordinates to be more dissatisfied with female supervisors who were high in initiation of structure and to be more satisfied when both male and particularly female supervisors were more considerate. Petty and Miles (1976) noted that considerate leadership behavior by female supervisors of social service agencies (as well as initiation of structure by male supervisors) was most conducive to the subordinates' satisfaction with supervision. But when larger samples were employed, Bowman, Worthy, and Greyser (1965) found that among 2,000 active executives, 86% of the men and 77% of the women reported that men were uncomfortable working for women executives. Consistent with what was reported earlier about stereotypes of women's lack of leadership potential (Bass, Krusell, & Alexander, 1971), 41% of the men were unfavorable toward women as managers; women respondents were less unfavorable.

*Effects of Marriage.* Career women executives are more likely to be divorced or never married. A national sample of male managers and executives in 1975 revealed negative expectations about married women executives. They felt that married women could not handle the responsibilities of both home and career (Rosen, Jerdee, & Prestwich, 1975). On the basis of field research using participant observations, S. S. Mayes (1979) concluded that women in authority elicited hostility and dependence in men. Men resist the changes in sex-role behavior involved in promoting women to positions of authority over them. The men fear such change will destroy the traditional norms of family and relations between the spouses. Few men talk openly about such hostility, but they continue to harbor much resentment. "Behind every woman manager is a man who thinks she got the job only because she's a woman" (Wessel, 1986, p. 20D). When competing for a job, it is difficult for a man to accept defeat on the basis of qualifications; it is easier for him to blame the woman's success on affirmative action. (Attitudes and expectations may have changed in the last 20-plus years.)

*Effects of Subordinates' Age and Education.* Often women have been found to prefer working for a man (Ferber, Huber, & Spitze, 1979; Robic, 1973). However, women with higher levels of education were more favorable toward women managers. And younger college women indicated they were looking forward to working for a woman (Koff, 1973; Terborg, Peters, Ilgen, & Smith, 1977). Undergraduate women appeared to be more favorable toward working for women leaders than male students, who were slower to change their outlook (Welsh, 1979). Wheelless and Berryman-Fink (1985) suggested that, compared to male respondents, female respondents perceive female managers as more competent communicators, regardless of their previous experience in working for a woman manager. Yet Hollander and Neider (1978) found that women, but not men, generated more negative critical incidents about female leaders. When Petty, Odewahn, Bruning, and Thomason (1976) employed larger samples, they found that, regardless of the sex of the supervisor or the subordinates, the subordinates' satisfaction with supervision was positively correlated with all leadership behaviors except emphasis on production. Similarly, Bartol (1974), in a study of 100 undergraduates in 24 same-sex and mixed-sex teams of four members playing a business game, failed to find that dominant (counter-stereotype) women had a detrimental effect on the subordinates' satisfaction. Again, Fallon and Hollander (1976) reported no difference in the satisfaction of undergraduate males and females with their elected male and female leaders of mixed-sex groups. But the male leaders were seen by both male and female members as more influential and better able to deal with tasks.

### ***Effects of the Task***

According to social role theory, people are expected to pursue activities that are congruent with their culturally defined gender roles (Eagley, 1987). Hollander and Yoder (1980) pointed out that some tasks, such as mechanical construction, are seen as masculine, while others, such as child care, are seen as feminine. Men are more likely to take the lead in dealing with stereotypically masculine tasks, and women are likely to do so with feminine ones. In the latter case, women who ordinarily might not accept leadership roles will think it is legitimate to do so when dealing with a task that is relevant to them.

*Congeniality of Tasks and Sex Roles.* Since leadership in a mixed-sex group is less customary for women, women may be more sensitive to the need to be competent in dealing with the task (Eskilson & Wiley, 1976). Beckman (1984) found that with married couples, in general, it was the wife who tended to dominate the decision processes about fertility and contraception. However, interviews with 376 Egyptian villagers indicated that it was the husband who dominated the basically economic decision for the family to migrate to better employment opportunities (McDevitt & Gadalla, 1985–1986).

Similarly, Bass (1965a) reported in an experiment that *directive* and persuasive wives were more acceptable as leaders in working with their husbands on a task that dealt with household issues. At the same time, they were unacceptable as *directive* and persuasive leaders if the task involved issues within the organization in which the husband worked. Carbonell (1984) demonstrated that females with leadership ability were less likely to display leadership in interactions with males when they were dealing with masculine tasks. Musham (1980) found that women, in general, and men whose role preferences were androgynous were more likely to emerge as leaders if the tasks were socioemotional. Men, in general, and androgynous women emerged as leaders when task-oriented leadership was required. The intention of female and male Japanese university students to lead in a laboratory situation depended on whether the task was customary for their sex—feminine (doing embroidery) or masculine (making frequent decisions in an adventure computer game) (Sakata & Kurokawa, 1992). For a meta-analysis to show the effects of task-sex congeniality to effective leadership, Eagley, Makhijani, and Karau (1992) asked 306 undergraduates to rate 119 leadership roles for congeniality to men or women. A leadership task congenial to men was coaching a football team; a leadership task congenial to women was editing a women's fashion magazine. Gender match with sex role affected leaders' effectiveness. The meta-analysis of 56 organizational and 20 laboratory comparisons found that men were more effective in "masculine" leadership tasks; women were more effective in "feminine" leadership tasks.

## Career Advancement of Women Leaders and Managers

---

"Doctor Asserts Women Are Unfit for Top Jobs" was a headline on July 26, 1970, in *The New York Times*. Dr. Edgar Berman declared that "raging hormonal influences" of the menstrual cycle as well as menopause disqualified women for key executive jobs because they had the potential to disrupt crucial decisions. Some selection committees might still be influenced by such considerations. But according to a review by Vecchio (2002) of leadership research on sex differences, the claims of women being less successful leaders and the weaker sex have been seriously overstated. Their role as mothers is more influential than the father's role, according to a Gallup poll. While 53% of Americans said their mother had more influence on their life growing up, only 28% chose their father. The relationship with the mother was very positive for 75%, less so with the father. Klein (2000) notes that the advent of the information technology of the Internet and computer communications has leveled the playing field, increasing the opportunities for women's advancement in management. "Old-boy" networks are less important for information, and virtuality has increased in decision making when awareness of the sex of other members may be obscured.

### *The Glass Ceiling*

Lyness and Schrader (2002) compared announcements in 1998 in *The Wall Street Journal* of the appointments of men and women to senior management positions; women received 6% of the appointments. They were severely underrepresented in appointments to top management in business and industry but not in federal government administration. (Powell and Butterfield [1994] studied promotion decisions for senior executive service positions in the U.S. federal government and found that being a woman was advantageous.)

In business and industry, staff women, compared to men, were more likely to be appointed to new staff rather than line positions and to remain at the same management level with no increase in job scope. Stroh, Brett, and Reilly (1992) looked at the career advancement of 795 male and 223 female managers in 20 Fortune 500 firms. The women lagged behind the men in the progression of their salaries and job promotions. The women were comparable with the men in education, industry, contributions to the family, steady employment, and apparent readiness to transfer, but they were actually less geographically mobile. In the same way, Kirchmeyer (1998) found that experience, tenure, career continuity, and professional degree had stronger effects on men's than women's management career success. Women had to be better than their male counterparts to be promoted (Baumgardner, Lord, & Maher, 1991). Women's entry into management was handicapped by male administrators' tendencies to discriminate against women in personnel decisions involving promotion (Gutek & Stevens, 1979).

Gradually, women are reaching parity with men in middle-management but not higher-level management positions. Except for selected industries such as publishing, cosmetics, and retailing, a "glass ceiling" still keeps women from advancing to top management (Ragins, Townsend, & Mattis, 1998). They have the necessary abilities but may lack the network required (Adler & Izraeli, 1994). To be promoted to senior levels, senior women executives in Fortune 100 firms have to have fewer weaknesses and more strengths than their male peers (Morrison, White, & Van Velsor, 1987).

*Ann Hopkins.* Her failure to fit the male stereotype of a woman was enough to block her promotion. Ann Hopkins, a successful manager at PriceWaterhouse, was the only woman nominee for promotion into partnership. She had brought into the accounting firm more new business—over \$40 million—than any of the other 87 nominees, but she was denied promotion, while 47 of the 87 men were promoted. Her supporters described her as courageous, self-confident, assertive, independent, and outspoken—traits ordinarily seen as important for leadership. But her detractors interpreted the same behavior as being overbearing, arrogant, self-centered, abrasive, and lacking in interpersonal skills. She used profanity. She did not fit the stereotype for a woman. Her behavior was interpreted differently "because she (was) a woman and leadership is a (cognitive) categorization less likely to be applied to women" (Lord & Maher, 1991, p. 5).

Such discriminatory practices have been justified on the basis of women's higher absenteeism and turnover and their lack of geographic mobility, particularly if they are married or have children (Robie, 1973). Absenteeism and turnover rates of women used to be far higher than those of men at all age levels (U.S. Department of Labor, 1977), often as a consequence of child care problems and their husbands' relocation. In the movement to upgrade women at work, it has been especially important to provide adequate day care for their children, more challenging jobs, and the opportunity for individual women to decide about relocation instead of being treated as a class who follow in the wake of their husbands' career moves.

A Glass Ceiling Commission was created by the U.S. Congress as an amendment to the 1991 Civil Rights Act. In a 1992 *BusinessWeek* interview poll of 400 women executives in corporations with \$100 million in annual sales, 56% agreed that a glass ceiling, a point beyond which women never seem to advance, was an obstacle to success in their company (Segal & Zellner, 1992). This was abetted by the unfavorable view that the stock market takes upon the announcement of the appointment of a women CEO, although the negative effect is lessened if the promotion is from within the firm (Lee & James, 2003). The glass ceiling has been pervasive in U.S. corporations, according to a 1990 mail survey of executive women and CEOs. In 1995,

women accounted for 10% of corporate officers and 2.4% of corporate leadership in Fortune 1000 firms.

*The Myth about Quitting.* The glass ceiling is costly. Eighty percent of women middle managers reported quitting their organization for another. Many leave to start their own competitive business (Ragins, Townsend, & Mattis, 1998). The revealed wisdom is that women managers voluntarily quit their jobs more readily than men. However, women's turnover among 26,359 managers in a financial services organization proved to be somewhat lower than the rates for their male counterparts. Also, women promoted in the previous 11 months were less likely to quit than their counterpart promoted men (Lyness & Judiesch, 2001). The early-21st-century economy requires a two-income family. Both spouses in middle-class families must usually remain gainfully employed.

*Shattering the Glass Ceiling.* To be able to shatter the glass ceiling, it is necessary to understand the barriers to promotion of women to top positions and the strategies of women who succeed in overcoming the barriers. In addition, corporate leaders, male and female, need to understand the barriers and corporate climate, unfavorable to women's advancement to the top, faced by their female employees. In a survey of male CEOs in 1990, the lack of women in top management was blamed on too few having line experience (82%) and too few women being in the pipeline long enough (64%). Among women executives, only 29% and 47%, respectively, agreed. They saw, as the reasons for the glass ceiling, male stereotyping and preconceptions (52%), exclusion from informal networks (49%), and inhospitable cultures (35%) (Ragins, Townsend, & Mattis, 1998). In a Korn Ferry International survey (1990), half the CEOs saw opportunities for women to advance to senior management as having improved greatly in the preceding five years; but only 23% of the women executives agreed. In a survey of 708 employees, 33% of them women, in a large insurance firm, the scaled perception of six items that a glass ceiling was present correlated .81 with the scaled perception of nine items that men and women employees were treated differently (example: "At our company, men are assumed to be competent, but women must prove their competence"). Perceptions of a glass ceiling correlated .59 with the perceived existence of an old-boys' network and the importance of having decision makers as friends. However, perceived upward mobility was viewed as aided by the firm's standard promotion procedures, by mentoring one's immediate manager, and by special career development programs for women (Elacqua, Beehr, & Curtiss, undated).

*"Queen Bees."* Fewer high-level women are available to serve as mentors. Their number is reduced further by "queen bees," who are uninterested in or unsuited to such mentoring (Riger & Galligan, 1980). Queen bees tend to be antifeminine. They are interested primarily in preserving their unusual high-level status in a world of men (Staines, Tavis, & Jayaratne, 1974).

*Mentoring.* Fortunately, queen bees do not represent the majority of high-level woman executives, more of whom are supportive of their younger junior women managers (Terborg, Peters, Ilgen, & Smith, 1977). Bowen (1985) compared 18 male with 14 female mentors of female protégés. Although the cross-sex pairing created problems, such as jealousy among spouses, the most salient problem, regardless of the sex of the mentor, was the resentment of coworkers.<sup>16</sup> Women indicated that they needed more help than men to rise in the organization (Van Velsor, 1987). Men, who occupy most of the higher-level positions, are thought to be less willing to serve as mentors for young women managers. Nevertheless, women reported having received more help from mentors than their male manager counterparts did, according to Shapiro's (1985) survey of 75 middle and senior male managers and 67 comparable female managers.

Hoffmann and Reed (1981) concluded, from interviews of both clerks and supervisors in a Fortune 500 firm, that the lower rate of promotion of women was self-imposed rather than due to discrimination. They found that promotion was directly dependent on both men's and women's motivation for advancement. However, although marriage increased the motivated men's efforts to be promoted into management, it decreased such efforts to be promoted, among similarly motivated women. Women who sought and accepted promotion were disproportionately those who had rejected marriage and parenthood. The societal change in

delaying marriage and parenthood and the increased career orientation and higher education of women in the past few decades have changed the calculus and considerably increased women's motivation for careers in management. Hymowitz (1997) argued that many women in exit interviews may give as their reason for leaving the need to return home full-time but in fact may be quitting to accept another job elsewhere. Maintaining both family and job provides more income, opportunities to experience success, and an expanded frame of reference, but it may also bring occasions of failure, frustration, and increased distress.

*Personal and Family Factors.* Women leaders are less likely to explicitly orient themselves toward careers as leaders. In interviews by Apfelbaum and Hadley (1986) and a 1999 Gallup poll, women were less likely than men to consider themselves leaders. Nonetheless, Fagenson's (1986) survey of 260 women entrepreneurs and managers found that women advanced in their careers because of personal orientation as well as organizational opportunities. Those who were higher in their organizations gave more weight to their careers than to their personal lives and were more committed to their organizations. Also, they were more satisfied with their jobs than those at a lower level. At the same time, those in higher-level positions thought their organization was more concerned about the growth of their careers. In addition, they felt that they were included in the informal power structure in after-hours activities.

*Family Considerations among Political Leaders.* Carroll (1987) examined the personal and family factors that were of consequence to a sample of 609 women and a comparable representative sample of 365 men who were in state legislatures or the federal administration. Although 24% and 31%, respectively, of the female political appointees in the Carter and Reagan administrations had never been married, the corresponding figures for the male appointees were 4% and 12%, respectively. Over 80% of the men but only half the women appointed were currently married. The pattern was the same for state senators and state representatives, although the differences due to sex were not as extreme. On the other hand, while 80% to 100% of the married women officials reported having very supportive husbands, only 58% to 72% of their male counterparts indicated that they had very supportive wives. The men were more likely than the women to have at least one child under age 12. The women who were elected to the state legislatures, compared to the men, more often felt it was important "to my running for office that my children were old enough for me to feel comfortable about not being home as much." However, family and job roles were the single largest source of conflict for women in politics. Nevertheless, Barnett and Hyde (2001) argued that the multiple roles that have to be enacted do not mean less commitment to one role or the other.

*Affiliations.* Personal affiliations were also important for the career women professionals. From 64% to 81% were members of at least one major women's organization, such as the American Association of University Women. Many federal appointees, especially in Democratic administrations, were also members of at least one feminist organization, such as the National Organization for Women. Regardless of political party, they tended to belong to organizations of women public officials and women's business and professional organizations.

*Attractiveness.* Riger and Galligan (1980) noted that personal attractiveness may be disadvantageous for female applicants seeking managerial positions that are believed to require predominantly male attributes such as ambition, decisiveness, and rationality (Heilman & Saruwatari, 1979). But countering this "dumb blonde" syndrome is the fact that physically attractive women are likely to find more office doors readily open to them and to be granted longer interviews. Then (1988) found that, in the judgments of 35 male and 37 female students in a simulation experiment, very attractive women were rated higher than average-looking or unattractive women in their potential for promotion to top management. The unattractive women received the lowest ratings, despite being seen as more "masculine" in their potential for promotion, as well as more suitable as a coworker or friend. Among 285 female and 452 male MBA graduates surveyed over a period of 10 years, the attractiveness of women's faces contributed to their salaries in later years, but not when they started their careers, while attractiveness helped men both at the start and in later years (Frieze, Olson, &

Russell, 1991).

*Competence, Personality, and Advancement.* Larwood and Kaplan (1980) surveyed 80 women bank officers concerning the reasons for their success. These women thought that their ability to make decisions and their demonstration of competence were most important. Successful officers were distinguished from unsuccessful ones by their greater interest in learning from male models and their decision-making ability. They reported themselves to be successful, despite their lower evaluation of their self-confidence. At the same time, the women middle managers studied by Banfield (1976) emphasized their human relations skills, participative decision making, sacrifice of femininity, and reluctance to assert themselves. As a group, they revealed well-integrated personalities with high levels of self-esteem. According to Litterer (1976), the successful woman executive was characterized by the ability to move socially between informal male and female groups. She could be part of the important informal communication. Similarly, Bartol (1978) distinguished between women managers and women in general, finding that, compared to non-career-oriented women managers, the career-oriented women managers saw themselves as more broad-minded, dominating, efficient, and independent.

*Motivation, Support, and Advancement.* A survey of 1,087 Australian managers and their 1,000 subordinates indicated that career advancement was predicted by managerial aspirations and masculine traits (Tharenou, 2001). According to Koff and Handlon (1975), women who were more likely to advance were motivated to do so. Their motivation is evidenced by their desire to achieve, their previous successes, and their personal commitment to develop their careers. Those who are career-oriented are pioneers, climate sensitives, or support seekers. *Pioneers* are innovators, initiators, risk takers, and high achievers. They enjoy challenges and are not easily discouraged. They have a positive sense of self-worth and expect to be successful. They also expect to operate independently and autonomously and to be rewarded for their achievements. They feel a sense of accomplishment from handling increased responsibilities. *Climate sensitives* are more responsive to the psychological climate around them and to approval and recognition from top management. *Support seekers* need stroking and hand-holding. Their upward path needs to be cleared of external obstacles and resistance. These women are easily discouraged, readily lose confidence, and do not like to take risks. But support from a higher authority is important for most women for successful careers in management.

*Organizational Factors.* Organizations may foster or deny opportunities for women to advance. They may have developmental systems such as career counseling for women, networking groups, mentoring programs, and diversified job assignments. They may provide training programs. On the other hand, they may deny women opportunities by excluding them from the inner circles of management, from opportunities to earn rewards and recognition, and from entry into development programs (Ruderman, 2002). Wood (1975) argued that women have to be more competent and work harder to rise in a corporation than do their male counterparts. Although women have been concentrated at the lower levels of management, their failure to advance may be due partly to the fact that in the past, many have had less seniority and experience than their male counterparts. Contrary to expectations, when Tsui and Gutek (1984) examined a representative sample of 217 male and 78 female middle managers in a large corporation with business in computers, education, and finance, they found that the women had a faster rate of promotion, higher performance appraisals, and more merit pay increases.

A further illustration of the organizational aspect of women's careers is that, historically, women in smaller firms have been more likely to advance (Bowman, Worthy, & Geyser, 1965). However, it is the larger firms that have the best-developed affirmative action programs and more standardized promotion plans that constrain sex biases (Donnelly, 1976). Probably, as a consequence of affirmative action programs in larger organizations, Dreher, Dougherty, and Whitely (1988) found that for 486 business school alumni, the typical lower management salaries for women were less common in larger organizations.

Despite affirmative action programs, Gutek (1988) noted that women appear to have only one real route to

high-level positions. They must enter the organization with a professional job of reasonably high status—one that traditionally has gone to men. Such an opportunity in the twenty-first century is a realistic expectation. Graves and Powell (1988) found no sex discrimination in 483 campus interviews by outside organizational recruiters. The results were the same for both male and female recruiters. But affirmative action is unlikely to help women move up the corporate ladder from female-dominated, low-status jobs. Furthermore, according to a survey by Chacko (1982), affirmative action programs are a mixed blessing. Women managers who thought they had been hired because of affirmative action by the organization instead of their abilities were less committed to the organization. Also, they were less satisfied with their work, supervision, and coworkers. They experienced more role conflict and role ambiguity than the women managers who believed that their status as women had not been important to their selection.

In larger firms, most women enter managerial ranks in staff rather than line positions. In these positions, they can become specialists and earn credit and acceptance from male colleagues for their skills, expertise, and competence in performing tasks (Hennig & Jardim, 1977; Jacobson & Kock, 1977). But to advance, they usually need to move into more general management. In an Australian study, a mailed survey was completed at three time periods by 1,399 female and 1,431 male employees. Some could be tracked as they were promoted into various levels of management. Compared to the men, advancement of the women from nonmanager to lower-middle and senior management, occurred in organizations less dominated by a male hierarchy (Tharenou, 2001).

*Foreign Assignments.* Women are less likely than men to be offered, to seek, and to accept foreign assignments (Adler, 1986–1987; Adler, 1994). They are often pioneers when they accept such assignments. They report feeling more isolated and excluded, according to Linehan (2001), who interviewed 50 senior Western European and North American female managers experienced in at least one international career move. They mentioned the difficulties involved with trailing male spouses; work family conflicts; lack of mentors, career planning, networks and female role models; and tokenism. Almost all reported that, upon return, they had more difficulty in reentering their home organization. They felt a loss of status and autonomy. Needed support was unavailable.

*Support and Encouragement.* Kimmel (2002) found that women elected to political office in Mississippi particularly owed their career to family encouragement, family financial responsibility, and the power of their connections. But generally, men benefited even more from social support.

*Support from Higher Authority.* In Tharenou's (2002) Australian survey, women were more likely to be promoted into management early if they had worked closely with a female manager. Especially for advancement into middle and senior management, women, compared to men, were helped more by a sponsoring mentor's encouragement, coaching, and challenging assignments. Hennig and Jardim (1977) found that 25 women who had reached the higher executive level in major corporations were similar to one another in many respects. All were firstborn children.<sup>17</sup> Their fathers, with whom they tended to be close, had encouraged them to be independent, self-reliant, and risk-taking. As children, they had been active in team games. The encouragement, support, and help of a male superior with whom they had developed a close relationship tended to be crucial to their success. Morrison, White, and Van Velsor (1987) confirmed the importance, to the success of the careers of 22 women executives, of help from above. Ruderman (2002) reported that for women in a firm, lack of promotion opportunities correlated  $-.51$  with being supervised by an unsupportive boss. The support of a higher authority is, no doubt, of considerable consequence to the advancement of men, but the powerful person of consequence to a woman's promotion usually has to be an enlightened male manager. Protégés of male mentors obtained greater financial reward than protégés of female mentors (Dreher & Cox, 1996). Male protégés of female mentors had the lowest rate of promotion.

### ***Reasons for the Failure of Careers***

Driscoll and Goldberg (1993–1994) advised that having a woman senior executive meet with clients at breakfast outside the “comfort zone” of some senior male executives. Failure of women to be promoted has been attributed to biased selection committees. But Powell and Butterfield (1994) could find no such tendency in the U.S. Senior Executive Service. And Knott and Natale (1997) found that sex differences did not account for benchmark skills, in a sample of 400 managers at medium and upper levels rated by their superiors. It may be that some of the women with the necessary seniority and experience who fail to rise prefer to avoid increased responsibility, challenges, and risks. Or possibly they are passive and lack ambition and energy. They may lack self-esteem and be motivated mainly by the need for security. They may view their peers as family. Or promotion may conflict with their loyalty to their peers, since it may mean the need to sever relations with friends.

Failure to perform effectively as a manager results in reduced self-confidence and motivation. And that failure reinforces the negative stereotypes about women’s potential for management (Schwartz & Waetjen, 1976). The two main reasons for women’s failure as managers, according to a survey of 100 male managers, were the women’s unwillingness to help other women and their tendency to be overdemanding at times, particularly of other women (M. M. Wood, 1976). Women are expected to behave in a feminine manner by showing their subordinates more consideration and less direction than would be expected from male leaders (Bartol & Butterfield, 1976). But, as mentioned earlier, some women who achieve high status exhibit a “queen bee syndrome” and downgrade their women associates (Staines, Tavis, & Jayaratne, 1973). As noted earlier, women managers who attributed their hiring to their status as women rather than to their potential contribution to the firm suffered more role conflict and role ambiguity, which interfered with their effectiveness as leaders (Chacko, 1982). But this cannot account for the small proportion of women in upward movement from middle to top management blocked by the glass ceiling.

### ***Tactics and Strategies for Women***

Some women, such as Cynthia Trudell at Saturn, do manage to reach the top even in traditional male-dominated industries such as the automobile industry. Argentina’s Maria Lacroze de Fortabat took over a cement company on the death of her husband and built a large conglomerate enterprise. When South African’s Wendy Lomathemba Luhabe hit a glass ceiling at BMW, she formed her own training organization (Crowe & Wucker, 1999).

*Credentialing.* According to a mailed survey of 486 business school alumni by Dreher, Dougherty, and Whitely (1988), no differences appeared in the upward-influence tactics and strategies of women and men. But Larwood and Wood (1977) suggested strategies women managers should use to promote their success in an organization. Even more than male managers, women managers should assure their superiors of their competence by earning the right credentials and by receiving competitive job offers and outside acclaim (M. M. Wood, 1975). Mainiero (1994) agreed and, based on 55 successful women executives, added that women especially need to be assigned high-visibility projects, attract high-level support, accurately identify what their organization values, and display entrepreneurial initiative and critical skills for effective job performance. Parents should encourage sports-mindedness and self-reliance in their daughters (Fierman, 1990). And although early socialization correlates with women’s entry into management, it does not predict their further advancement (Tharenou & Conroy, 1994). Nonetheless, as with men, career encouragement of women predicts more engagement and training, leading to advancement in management (Tharenou, Latimer, & Conroy, 1994).

Interviews with and surveys of managers in a Fortune 100 firm by Lauterbach and Weiner (1996) indicated that the women were more likely to involve others in planning. They were more likely to act out of

organizational interests, consideration of others' points of view, and concerns for both task and relationships. Men were more concerned about their self-interests and the task, showed less concern for others' feelings, and planned alone in their upward-influence efforts.

More than their male counterparts, women managers need to have the opportunity to demonstrate their abilities in successive organizational experiences (Konrad & Cannings, 1997). Learning how to befriend and give and receive help from men without letting that experience turn into a sexual encounter is important. Pearson (1980) concluded, from a study of the choices of 60 employers in the human services field who had viewed videotapes of six employment interviews, that female applicants who combined a warm, cooperative style with goal-oriented leadership skills were most preferred.

*Suggested Strategies to Advance Careers.* Four strategies stood out in a national survey of 461 female executives and 325 CEOs reported by Raggins, Townsend, and Mattis (1998). To achieve status as executives, 77% said it was crucial to consistently exceed performance expectations, 61% said it was crucial to develop a style that men were comfortable with; and 50% said it was crucial to seek high-visibility "stretch" assignments. Other less crucial, but still fairly important strategies included having an influential mentor, networking with influential colleagues, gaining line management experience, changing functional areas, initiating discussions about career aspirations, having the ability to relocate, upgrading educational credentials, changing organizations, developing leadership on the outside, and gaining international experience. A poll by Segal and Zellner (1992) found 83% of the 400 women interviewed agreeing that women should build networks with other women to help each other; 76% of those polled agreed that women should take legal action against discrimination, and 70% agreed that women should take a strong public stand on hiring and promotion of women executives.

*Networking.* It is important not just for women to be in a network but to have the right network of contacts relevant to their profession, business, and interests. Pragmatic business contacts are likely to be more useful than general meetings with other women managers (Cox, 1986). Interviews with 15 women TV industry executives suggested that a woman manager needs to network 360 degrees—with her superiors, peers, and subordinates (Ensher, Murphy, & Sullivan, 2002). The woman manager needs to act and dress more like a manager and less like a secretary. She can take a visible seating position at meetings (Donnelly, 1976). She can make sure to inform superiors about her activities. Like the male manager, the woman manager can profit from an apprentice role with several superiors. Sometimes she may find it useful to exploit her stereotypic differences by requesting assignments to ensure that "the woman's point of view is represented." Depending on the situation, the woman manager needs to be able to play the female role or the managerial role, whichever is appropriate (Trahey, 1977). As was already mentioned, she needs to know how to deal with sexual advances and sexual harassment. Almost all the women executives surveyed by Litterer (1976) had experienced sexual advances from male executives, but practically none reported having had an affair with someone in their own organization. The traditional "casting couch" demand on an entertainer for a successful career is obviously present but not required for success as a woman manager. Women need to learn how to use and react to power effectively (Instone, Major, & Bunker, 1983). They must convert aggressiveness into assertiveness and initiation. They need to appreciate their own competencies better (Wood, 1975).

*Constraints on Acceptable Behavior.* After a review of interview and assessment data on more successful and less successful women executives, Morrison, White, and Van Velsor (1987) concluded that executive women may actually differ little from their male counterparts on most matters that count, but, unlike the men, they must confront two sets of demands. To be successful, "[they have] to show their toughness and independence and at the same time count on others. They [must] contradict the stereotypes that their male executives and coworkers have about women—they [must] be seen as different, 'better than women' as a group [yet they must not] ... forfeit all traces of femininity, because that would make them too alien to their superiors and colleagues. ... [They must] do what wasn't expected of them, while doing enough of what

was expected of them as women to gain acceptance. The capacity to combine the two consistently, to stay within a narrow band of acceptable behavior, is the real key to success” (p. 4).

Women in leadership positions need to make special adjustments that are not required of their male counterparts. Satisfaction with one’s job and one’s life in general tend to be correlated. However, Kavanagh and Halpern (1977) found them uncorrelated for women at higher levels of university leadership. This lack of correlation may be due partly to the fact that, as was mentioned earlier, women executives are less likely to have husbands to assist with the social and home care demands on their time (Harlan, 1976). But for a majority of women managers, work/family conflict is regarded as inevitable. They need to ask for programs like flexible work arrangements (Nelson & Burke, 2000).

*Dealing with Conflicting Roles.* As Hall (1972) noted, women managers who are married and mothers face role conflicts that are best handled by *structural role redefinition*—changing the demands within the conflicting roles of homemaker and manager—rather than trying to meet the conflicting demands of both. Unlike the glass ceiling they encounter in large firms, women have fewer such obstacles starting small businesses. Often these are in the service sector in new industries. Women’s decision to start such businesses may reflect family considerations, the desire to make better use of their knowledge and abilities, the desire to restart interrupted careers, less discrimination, more control of their own fate, and greater financial opportunities (Bowen & Hirsch, 1986). In all, a resilient woman will treat perceived obstacles with a sense of realistic optimism. Potential threats will be converted into challenges to be overcome (Nelson & Burke, 2000). Tharenou and Conroy (1994) found that while career advancement for Australian women managers continued to be impeded by the smaller degree of mobility they had compared to men, they were able to adequately handle their home responsibilities. Their educational level was not as important to their advancement as it was for their male counterparts. They appeared to have an advantage in advancement in the public sector due to equal opportunity legislation. Their advancement was disadvantaged, compared to men, by their greater unavailability for training. But they reported more career encouragement from organizational peers and seniors than men did.

## Summary and Conclusions

---

Surprisingly, the research results about the stereotyping of women in conflict with the “male” factor in management have continued into the twenty-first century. Nevertheless, because changes are rapidly occurring for women in leadership roles, earlier research may need to be discounted. Progress toward seeing women as compatible with management continues, despite the handicaps of socialization, status conflicts, and stereotyping. Some consistent differences in traits between boys and girls remain as they do, to a lesser extent, among adult men and women managers and leaders. Characteristics that are usually linked to masculinity are still demanded for effective management, though most differences between male and female leaders tend to be accounted for by controllable or modifiable factors. Still, women continue to face conflicts in their decisions about their roles as wives and mothers, and managers and leaders.

When it comes to the traits underlying the potential to lead, women benefit by having slightly better verbal skills, but differences in cognitive skills are generally small. With reference to personality traits and the use of power, women may suffer from a lack of self-confidence; but this trait, along with other personality differences in the needs, values, and interests that are of consequence to leadership, appears to evaporate for women who move up the corporate ladder and gain positions of power. For instance, Menkes (1999) found that senior executive women were as comfortable wielding power as their male peers and were no more democratic in doing so.

The rise of feminism and affirmative action has been accompanied by a flood of analyses of sex differences

in leadership, to the point where, by 1985, Dobbins called for a moratorium on such studies. Publications since then may reflect societal and institutional changes. Society is changing from a time when smart women played dumb, to a time when assertiveness training for women is commonplace. Yet it seems necessary to continue to give careful consideration to the underlying dynamics and dimensions of the success and effectiveness of women leaders. The same careful consideration is necessary to the development of a new appreciation of racial and ethnic differences in leadership.

<sup>1</sup> Languages, particularly English, evolve because of usage, not because of logic or consistency. Hence, words that are used incorrectly often come into vogue. Such has been the case with the use of “gender” to mean one of the two sexes.

<sup>2</sup> See, e.g., Bartol (1974, 1975), Bartol and Wortman (1976), Herrick (1973), and Jacobson and Effertz (1974).

<sup>3</sup> A *stereotype* is “a generalized perception ascribing particular traits, characteristics, values, or behavior ... without regard to accuracy or applicability.” It is a judgment with “an inability or unwillingness to alter a personal point of view” (Corsini, 1999). In reading this chapter, the reader will consider the years in which various research studies were published. Nonetheless, stereotypes about women in management may still apply after a half-century or more.

<sup>4</sup> See [Chapter 6](#).

<sup>5</sup> See [Chapter 17](#).

<sup>6</sup> Witness the rapid movement of women into management in consumer-oriented and service-oriented industries, such as banking, publishing, cosmetics, and retailing, in contrast to their much lower participation in management in manufacturing, chemicals, and mining.

<sup>7</sup> See [Chapter 34](#).

<sup>8</sup> Bartol (1976a); Brief and Aldag (1975); Brief and Oliver (1976); and Matteson, McMahon, and McMahon (1974).

<sup>2</sup> See, e.g., Horner (1970), O'Leary (1974), Tresemer (1976), Wood and Greenfeld (1976), and Zuckerman and Wheeler (1975).

<sup>10</sup> The studies included Adams (1978); Day and Stogdill (1972); Dobbins and Platz (1986); Osborn and Vicars (1976); Rice, Instone, and Adams (1984); and Terborg and Shingledecker (1983).

<sup>11</sup> The studies included Bartol and Butterfield (1976); Haccoun, Haccoun, and Sallay (1978); Jacobson and Effertz (1974); Petty and Lee (1975); and Rosen and Jerdee (1973).

<sup>12</sup> See, e.g., Bartol (1973, 1974); Bartol and Butterfield (1976); Bartol and Wortman (1975, 1976); Chapman (1975); Day and Stogdill (1972); Martin (1972); Remland, Jacobson, and Jones (1983); Roussel (1974); and Wexley and Hunt (1974).

<sup>13</sup> See, e.g., Bartel (1974, 1975), Bartol and Wortman (1975), N. R. E Maier (1970a), Millard (1981), and Osborn and Vicars (1976).

<sup>14</sup> Brief and Oliver (1976), Osborn and Vicars (1976), and Renwick and Tosi (1978).

<sup>15</sup> See [Chapter 17](#).

<sup>16</sup> See [Chapter 34](#) for a detailed discussion about mentoring.

<sup>17</sup> This finding is consistent with earlier discussions about the greater responsibilities parents place on their eldest daughters and the effects on the daughters' subsequent performance as leaders.

# Minorities as Leaders and Followers

Four criteria distinguish a minority from the dominant mainstream group of white Americans: (1) visible differences from the mainstream; (2) differential power; (3) differential and pejorative treatment (discrimination); and (4) group awareness (Dworkin & Dworkin, 1999). In addition to the various nonwhite and ethnic groups, older persons, the disabled, and the obese also meet some of the criteria of disadvantaged groups. Attention to diversity tends to pay off. Between 1986 and 1992, organizations recognized by awards from the U.S. Department of Labor for having excellent affirmative action programs showed greater increases in stock prices after the award than they had experienced before. Those settling lawsuits for discrimination showed losses in stock prices following the news. According to a survey of 242 employees in an office of a federal agency, in general, the diverse groups do not share a common culture. Each group, including both men and women, organizes its experience differently (Fine, Johnson, & Ryan, 1990). Socially, as they have assimilated, they have been able to increasingly identify as both Americans and members of a minority. Differences among the races in attitudes and values tend to be social rather than genetic. There is more genetic variation within racial groups than between them (Tomes, 2004).

The racial and ethnic composition of the American workforce is continuing to change. The Hispanic population gained 9.8% in a little over two years between 2000 and 2002 and became the largest minority of 38.8 million, passing the 36.6 million African American population, which grew only 3.1%. The 12.7 million U.S. Asian minority also grew fast at 9.0%, compared to the 200 million whites, who increased by only 0.7% (Armas, 2003). An important factor in this population growth has been immigration, which has increased the diversity of race and ethnicity. In California and Florida, there are now fewer whites than nonwhites. Pursuing diversity has become an important organizational goal for three reasons: (1) diverse insights and skills are potentially valuable resources; (2) diversity enables organizations to gain legitimacy and access to diverse markets, and (3) fairness and avoidance of discrimination are moral imperatives (Slay, 2003). But diversity has its costs. It is both an emotional issue and an intellectual one. It can be divisive and a cause of conflict among leaders and followers (Cox & Beale, 1997). Until the mid-twentieth century, assimilation into the mainstream was generally sought by diverse minorities. But increasingly, there is an effort of those not in the mainstream to honor their racial or ethnic roots and to maintain some of their traditions.

There is much diversity within the various groups. Black Americans vary from purely Negro African ancestry to almost purely white European forebears. They may be partly American Indian. Their ancestors may have arrived as slaves from 1619 on, or they may be recent immigrants from Africa, Haiti, the Dominican Republic, or Jamaica or from elsewhere in the West Indies. Hispanics or Latinos include Mexican Americans (Chicanos), Puerto Ricans, Cuban Americans, and Central and South Americans. Asian Americans range from Koreans to Vietnamese. American Indians come from more than 500 tribes. The disabled include both the physically disabled and the mentally impaired.

*The Current Situation in America.* Affirmative action regulations inhibit gross discrimination in hiring, promotion, and benefits for disadvantaged minorities and women. Yet there remain subtle and sometimes not so subtle biases when leaders and followers are of different races and ethnicities. Biases may be automatic, unintentional, and unconscious when we compare people like “them” with people like “us.” Intergroup biases create a hostile environment for out-groups with “awkward social interactions, embarrassing

slips of the tongue, unchecked assumptions, stereotypic judgments, and spontaneous neglect.” Stereotypes are primed. Open hostility is not expressed, but in-group comfort and out-group discomfort are felt. Liking and respect are missing (Fiske, 2002). Research by Heilman, Block, and Stathatos (1997) suggested that affirmative action hires are stigmatized as less competent. Some minority department chairs in educational institutions complain that because of lack of respect for them (1) they are not taken seriously, (2) they face continuous end runs to higher administration, (3) their initiatives are blocked, and (4) all discussions with them are reduced to routine business (E. Smith, 1996). Often the biases against another race or ethnicity are mixed, both favorable and unfavorable, associated with the perceived competition and status of the out-group (Fiske, 2002, p. 124). Because of earlier experiences of unfair treatment, minority subordinates have greater expectations than subordinates in the mainstream majority of being treated unfairly by their superiors and are more likely to reject rational explanations for perceived discrimination (Davidson & Friedman, 1998). Organizations differ in how much their human resources policies and practices comply with affirmative action and equal opportunity legislation. Lawsuits and compliance reviews are highest for organizations lacking identity-conscious policies and practices. Such organizations also have the lowest percentages of disadvantaged minorities and women (Konrad & Linnehan, 1995).

*The Rising Status of Minorities.* Thousands of African Americans have sought and been elected or appointed to public office. They have been mayors of Los Angeles; Detroit; Washington, D.C.; Chicago; Philadelphia; Atlanta; New Orleans; and New York City. Hispanics have achieved similar success in San Antonio, Miami, Los Angeles, and elsewhere. Black general officers are no longer unusual. Blacks are taking leading roles in sports, entertainment, and the Democratic Party, and served in high-ranking positions in Republican administrations. Ethnic blacks, Asian Americans, and Indian Americans serve in the U.S. Senate and state governorships. Blacks, Hispanics, Asian Americans, Indian Americans, and members of ethnic minorities have achieved prominence as political, governmental, business, and professional leaders. But in comparison with mainstream Americans, members of these minority groups face systematic differences in the likelihood of their emerging as leaders and the probabilities of their success. Minorities are underrepresented in top management in business. In 2003, although they comprised 27% of all personnel, only 3% of blacks or women occupied senior executive positions (Bell, Gilley, & Coombs, 2003). But diversity may have unexpected effects on decision making. For instance, 26 new Internet-based ventures developed with “ethnic presence” in their teams were more likely to pursue strategies as prospectors than did 26 matched mainstream teams (Chaganti, Watts, Chaganti, et al., 2003). Firms such as Allstate Insurance may turn diversity to comparative advantage by maintaining a highly diverse organization to link their business to their diverse customer base. Such firms can better understand, attract, and handle the needs of customers outside the mainstream (Wan, 1999).

*Affirmative Action.* It is clear that the pressure of legislation promoting equal employment opportunities has brought marked increases in employment and advancement of women and minorities. But organizations differ in the extent to which their human resources management practices are fully supportive of affirmative action. As noted before, according to Konrad and Linnehan (1995), the practices of less supportive firms are revealed in both fewer women and minority members and a history of more lawsuits and legal bouts with government equal opportunity regulators.

*Research on Leading Diverse Groups.* Diversity of organizations’ personnel has increased substantially, but leadership research in the past has been concentrated on white leaders and white followers (Offerman & Gowing, 1990). Most of the research on leadership on minorities has dealt with blacks as leaders or subordinates. Considerably less has been done with Hispanic, Asian American, and other racial and ethnic minorities. There is also a dearth of information on the movement of Jewish Americans, Italian Americans, Polish Americans, Greek Americans, American Indians, and other minorities into top-level positions of leadership, although highly visible members of these groups continue to appear in industry, government,

education, and nonprofit organizations. Much of the available diversity research hinges on objective demographic diversity, which has weaker effects than the subjective sense of being a member of a particular race and ethnicity and the value and emotional significance of that membership (Phinney, 1990). Initially, ethnically diverse teams, compared with nondiverse teams, may have different perspectives about the same issue. They may perform less adequately due to greater difficulties in coordination (Cox, 2003). This tends to dissipate over longer periods of time (Wagner, 1995). Watson, Johnson, and Merritt (1998) found more self-orientation than team orientation in ethnically diverse student problem-solving groups. Such teams remained more self-oriented over time. Nevertheless, the ethnically diverse teams, “regardless of the extent of cultural diversity, ... learn to perform better with periodic feedback about performance and how to improve interpersonal processes for better performance” (p. 185). Sensitivity to race or ethnicity may disappear with time in a supervisor-subordinate relationship as both become accustomed to each other, especially if the relationship becomes a high-quality exchange.

## The Challenge of Diversity

---

In 2002, the 815 hotel workers in the Washington Hilton spoke 36 languages. About 65% were foreign-born (Offerman & Phan, 2002). Diversity is a challenge to their supervisors. Mayo, Pastor, and Meindl (1996) found that diversity in race, age, sex, and tenure in 68 work groups, combined with poorer performance, resulted in the leaders’ loss of feelings of self-efficacy. Although diversity may enhance the social processes of a group, more often, according to Williams and O’Reilly (1998) who reviewed the results of 80 studies, it had adverse effects on social processes. Reskin, McBrier, and Kmec (1999) reached a similar conclusion in their review. More specifically, Foley, Linnehan, Greenhaus, et al. (2003) reported that racial dissimilarity of subordinates and supervisor was likely to reduce family-supportive supervision. Vecchio and Bullis (2001) collected surveys from 2,883 U.S. Army officers and noncoms about the leadership of their officer supervisors, who ranged in rank from second lieutenant to general. An analysis focused on the demographic similarity of each subordinate rater and rated supervisor. The respondents included 23% blacks, 13% women, 12% Hispanics, 3% Asian/Pacific Islanders, and 2% American Indians and Eskimos. The officer supervisors were 13% black, 10% female, 9% Hispanic, 2% Asian/Pacific Islander, and 1% American Indians and Eskimos. Female and Hispanic supervisors received slightly less favorable ratings than did their male and non-Hispanic counterparts. A stronger effect emerged when it was found that white subordinates were least satisfied under nonwhite supervisors. Managing diversity needs to be part of an organization’s reward structure.

Based on interviews with managers and executives, a review of the literature, and their own experience in various organizations, Joplin and Daus (1997) detailed six “preeminent” challenges confronting leaders of a diverse workforce:

1. *Changes in power.* Mainstreamers may try to bolster and retain power at the expense of promoted minority newcomers. Leaders must avoid showing favoritism. Mainstreamers may feel an erosion in their power. They may feel less attached and committed to the organization and more uncertain about how they fit in. They may become more negative in attitudes if forced to attend diversity training. Tensions increase as minorities gain voice and express opinions.
2. *Diversity of opinions.* Leaders must be prepared for the exponential increase in the number and range of perspectives of a workforce with an increased range of values and norms. Leaders need to be able to recognize the different frames of reference of minority members. They need to synthesize diverse opinions and get to the crux of issues, while maintaining the respect and dignity of their diverse constituents. Visible disdain must be avoided.
3. *Perceived lack of empathy in the leader.* Leaders must sense the feelings of others and anticipate

reactions to proposals. They must understand “where others are coming from, what they have been through, and where they are going” (p. 41).

4. *Real and perceived tokenism.* An organization with tolerant policies will find it less necessary to fill quotas rather than hiring and promoting based on candidates’ merits. It will achieve fair representation through active recruitment in diverse categories. Perceived tokenism is likely to be greater in intolerant organizations that hire to fill quotas, causing more resentment and attributions of failure to race or ethnicity.
5. *Participation.* Minority participation needs to be encouraged to capitalize on new, different, and creative ways of thinking. Leaders need to ensure that everyone has a voice in reaching solutions to problems. This will require a lot of a leader’s time.
6. *Overcoming inertia.* The leader needs a strong and clearly communicated vision and goals. If the organization is in a state of intolerance of diversity, the leader needs to communicate the advantages of diversity. If diversity is already appreciated, the leader needs to integrate ideas into implementation plans and action to avoid relapses into inertia and malingering.

### ***Effects of Demographic Similarity and Dissimilarity***

Supervisory support for equal opportunity affects majority and minority groups differently. The majority look on their supervisors more favorably if they feel their supervisor does *not* support equal opportunity. The minority are more favorable if they feel their supervisor supports equal opportunity. Over time, satisfaction of subordinates with their supervisor drops if they are different in race. Tsui and Reilly (1989) reported that demographic dissimilarity between supervisor and subordinate resulted in less supervisor attraction to the subordinate, lower supervisor rating of the subordinate, and more role ambiguity for the subordinate. In New Zealand, Chong and Thomas (1997) noted that dissimilarity between whites and Maoris produced less satisfied followers. On the other hand, Wright, Ferris, and Hiller (1995) compared organizations that had won awards for affirmative action programs with organizations that had had to settle discrimination lawsuits. The stock prices of those that had promoted diversity increased in the days surrounding the awards, while the stock prices of those having to settle discrimination lawsuits declined. Simmons and Nelson (1997) found that the performance of 30 firms identified as “better for minorities and women” was slightly better than their industry average for the years 1985 to 1994. Clark and Clark (1994) proposed that for an organization to benefit from diversity, common ground and true integration needed to be established and overtly supported by its leadership. Organizational support for diversity for 90 solo minority managers correlated .37 with job satisfaction and  $-.31$  with intention to quit. Solos were the lone representatives of their race or ethnicity in their work group (Wagner, Rosek, DePuy, et al., 2001).

*Military Integration.* In 1948, President Truman ordered the integration of the U.S. military. In 1973, a worldwide leadership survey was completed by the U.S. Army in each of its major commands (Penner, Malone, Coughlin, et al., 1973). Data were obtained by asking about one third of the 30,735 respondents to complete a written questionnaire describing the leadership of their immediate superior; another third, to complete a questionnaire describing the leadership of one of their immediate subordinates; and the final third, to complete a questionnaire describing their own leadership. In addition to various demographic items and a single measure of satisfaction with the overall performance of the individual described, the questionnaire used in the study included a list of 43 specific items of behavior that are commonly observed in U.S. Army leaders. About half these 43 behaviors were derived fairly directly from the SBDQ and LBDQ. For each behavior, three questions were asked: “How often does he ... ?”, “How often should he ... ?”, and “How important was this to you?” The first question was a measure of perceived actual performance; the second, a statement of

expectations; and the third, an indicator of the criticality of the behavior according to the respondent. Surveyed were the differences among supervisors', self, and subordinates' overall satisfaction with U.S. white and nonwhite field-grade officers and company-grade commissioned and senior and junior noncommissioned officers.

All but the junior noncoms gave higher evaluations to white than to nonwhite leaders, while the subordinates did the reverse, favoring nonwhites. Self-ratings of satisfaction were generally the same for whites and nonwhites. White and nonwhite field-grade officers differed in the list of behaviors that correlated most highly with how satisfied they were with their own overall performance. The list for nonwhite field-grade officers contained seven negative items to be avoided. The list for white field-grade officers contained only one such negative item of behavior. Thus, in evaluating themselves, the nonwhite field-grade officers were satisfied with their own overall performance if they avoided doing negative things such as "hesitating to take action," "failing to show appreciation for priorities of work," or "making it difficult for subordinates to use initiative." On the other hand, the white field-grade officers were satisfied with their own overall performance if they did positive things such as "being technically competent to perform their duties," "seeking additional and more important responsibilities," and "being aware of the state of their unit's morale and doing all they can to make it high." The investigators attributed this difference to the discrimination experienced by the nonwhite officers in the 1950s and early 1960s when they first entered service, when it was more important for non-white officers to avoid making mistakes than it was for them to stand out in a positive manner. Consistent to some degree with these results, Sackett and DuBois (1989) combined civilian data from U.S. firms with military data and found that both nonwhites and whites gave lower ratings to nonwhites.

*Networking of Minority Managers.* Revealed wisdom suggests that corporate advancement depends on whom you know as much as what you know. Minority managers are seen to have more difficulty gaining support (Thomas & Alderfer, 1989). Minorities' advancement is handicapped by their exclusion from social networks (Morrison & Van Glinow, 1990). To study this issue, Ibarra (1995) examined the contacts outside their business unit of 17 minority middle managers (12 black, 3 Hispanic, and 2 Asian American) with a survey and interviews, and compared them with the contacts of 46 white middle managers. Altogether, 20 were women, but sex was statistically controlled when the results were extracted. Compared to white managers, minority managers felt that networking was less important to their advancement. The managers reported more racially mixed networks but fewer intimate ones. Minority managers with high potential balanced same and cross-race contacts rather than being dominated by whites. They had more contacts outside their groups.

*Effects of Marginality.* Marginality can be an asset. A marginal person who lives at the boundary of two world-views has two ways of looking at problems and of finding answers to them. The acculturation of black or Hispanic subordinates to the mainstream varies. High "biculturals" have their feet planted firmly in both the mainstream and the minority. According to an experiment by Carza, Romero, Cox, and Ramirez (1982), high biculturals, whether they are Chicano (Mexican American) or black, attempt more leadership in simulated, nonsupportive groups with a mix of Chicanos, blacks, and whites if they are externally oriented. They ask for more opinions and evaluations and make more clarifying remarks. But minority status may be a liability. Lovelace and Rosen (1996) compared perceptions of a group of 157 white, 35 black, and 24 Hispanic of the managers' organizational fit. The blacks perceived themselves as significantly lower in fitting into the organization than did the whites and Hispanics. Poor fit was correlated with job dissatisfaction, intention to leave, and more stress.

Marginality as a source of stress was seen by Ford (1985), who analyzed job stress in five empirical studies of black, American Indian, and Mexican American professionals and found that they experienced more job stress than their white counterparts. They experienced less stress when supervised by nonwhites and when given emotional and structural support.

## *Leading and Managing Diversity*

Diversity can be effective if it is well managed (Adler, 1990). Well-managed top-management teams with diversity in members can achieve greater performance and cohesion (Elron, 1997). Creativity can be increased by using people from different perspectives. Turnover can be reduced among minorities with good leadership (Cox & Blake, 1991). To lead and manage a diverse workforce, constituency, or organizational membership, and to avoid hindering follower performance, leaders need to identify and understand what disturbs individuals from minority backgrounds. They need to appreciate the stress and conflict that may be created in multicultural settings of implicit and explicit organizational policies. These negative influences need to be removed (Mai-Dalton, 1993). Findings from 200 interviews and surveys of 450 employees by Gordon and Loden (1989) suggested that in addition to awareness of multicultural issues, management needs to be open to change and actively create opportunities for minority employees. They need to be ethically committed to fairness and to mentoring and empowering minority employees, and need to be models and catalysts for organizational change. Offerman and Phan (2002) added that leaders need to facilitate implementation of diversification policies and the flow of information, set high expectations, provide for continuing education and training, and watch out for backlash from mainstreamers. Pastors of urban churches support diversity by (1) raising awareness of diverse racial and ethnic groups in the organization; (2) using cognitive dissonance between biases and brotherhood; (3) providing expertise and credibility in introducing change; (4) providing a voice for different stories; and (5) connecting experience with transcendental vision.

*Cultural Competence.* Management of diversity calls for cultural competence: attitudes, practices, and policies that respect different cultures and people. Culturally competent leaders seek advice and consultation from diverse racial and ethnic groups and communities and actively incorporate the information into their behavior and commitment (Cross, Bazron, Dennis, et al., 1989). Such leaders are able to leave behind intelligent behaviors learned in one cultural context for what is intelligent in a new context (Offerman & Phan, 2002). Del Castillo (undated) associated transformational leadership with cultural competence. The transformational leader appreciates and adapts to the diversity of followers, and understands her or his own culture and the dynamics of cultural differences.

*Programmatic Efforts.* Ellis and Sonnenfeld (1994) noted that brief “one-shot” contacts to propagandize for diversity may hinder rather than help manage diversity by reinforcing stereotypes, hostility, and misunderstanding of other races and ethnicities. They listed eight programmatic approaches that firms have used to encourage and support diversity: (1) multicultural workshops; (2) meetings on a monthly basis to confront stereotypes and personal biases; (3) minority support groups, networks, and advisory councils that report directly to senior management; (4) reward systems for training and promotion of minorities; (5) fast-track programs for minorities who demonstrate exceptional talent and potential; (6) mentoring of minorities by senior managers; (7) corporate announcements of appreciation; and (8) commitment to diversity. Few evaluations of the effects of these approaches have appeared.

Allstate Insurance is an example of a program that enhanced diversity relations and its effects. When employees join Allstate Insurance they receive the message, accompanied by an informational booklet, that they can expect to enjoy a bias-free environment. In the 1960s and 1970s, the emphasis was on assimilating differences. In 1993, it became a strategic initiative to accept differences and to incorporate them into all business processes. This initiative increased Allstate’s customer base and satisfaction. Twenty-five percent of the merit pay or compensation of leaders at all levels is tied to their upholding diversity in their workplace or business unit. A diversity index asks respondents to what extent (1) quality service is delivered to customers regardless of their background; (2) respondents are treated with respect and dignity at work; (3) their managers and team leaders seek out and utilize the diverse backgrounds and perspectives in their group; (4) they observe

insensitive behavior at work such as inappropriate comments or jokes; and (5) they work in an environment of trust (Anonymous, 1999).

Chen and Van Velsor (1996) suggested that diversity leadership needs to consider the impact of sociopsychological processes and minority group identities embedded in organization group identities. DiTomaso and Hooijberg (1996) point to the need for leaders involved in managing diversity and multiculturalism to remain conscious of their effects on various racial and ethnic groups and to provide role models. The leaders need

To create bridges, channels, pathways, connections, perhaps “safe passages” for those who have been hindered, excluded or constrained from participating to maximum effect, and they ... [ought to] ... require the same of other organizational leaders. They [should] be inclusive, while expecting and then supporting superior achievement. (p. 170)

Strategic planning and initiatives should take diversity into account. Structures should be adapted to enable equal access to the organizational networks. Ethical considerations need to be kept in mind.

*Caveat.* Fairholm (1994a) declared that leadership is impossible outside of a community of individuals with shared values and vision. Leaders need not accept unreservedly the values of every racial and ethnic group. Instead, they need to use the mainstream American culture as a foundation on which to build the basis for their leadership. E pluribus unum—one from many. Much is held in common by Americans, regardless of their diverse group identities. For instance, according to overt integrity tests of 724,806 job applicants, although women scored higher than men, age and racial or ethnic identity made little difference in scores (Ones & Viswesvaran, 1998). Leaders need to create unity out of diversity. Similarities, not differences, need to be highlighted. A leader needs to create a group that is more than just an amalgam of diverse views. The leader needs to bring the followers together in a common work culture to fit “the work done and the character and capacities of the stake-holders to the benefit of all concerned. ... Leaders create a set of group values that supersede organizationally inappropriate ones and replace them with values all can accept and work under” (p. 88). Leaders build unified groups from diverse individuals in alignment with organizational goals (Fairholm, 1994b). Since 2006, in order to win the presidential election in 2008, the Democratic Party has been asked to appeal more to the common economic and social interests of both the mainstream and minorities.

## African Americans and Leadership

---

A system of prejudice has built up over the centuries. Although socially and politically we have agreed to get rid of this system, its effects still linger, often in subtle ways. A supervisor may fail to see what he is doing to a black employee or black fellow manager. ... In turn, the African American may feel prejudice from the supervisor when it is not present. (Bass, Cascio, & McPherson, 1977)

### *African Americans as a Subculture*

Of minorities in America, black Americans have been among the most negatively stereotyped (T. W. Smith, 1990). Blacks in the United States are not members of another culture. Rather, they form an American subculture that is tied to the majority white cultural institutions without clear boundaries to mark off their society from the larger white society (Liebow, 1967). Increasingly, their norms and values are influencing the majority culture, and vice versa. Blacks have adopted the cultural patterns of the dominant white society (Baldwin, Glazer, Hook, et al., 1966). The social groups they identify with are American and black. Being black and being American has significance both emotionally and in values. They span two worlds (Slay, 2003). Unlike other minorities, African Americans’ perceptions of family, friends, society, love, work, and money are

fairly similar to those of white Americans. Blacks and whites are psychoculturally close (Cunningham, 1984). In fact, Pinkney (1969) found that middle-class blacks tended to overconform to white middle-class standards of behavior. As Bass, Cascio, McPherson, and Tragash (1976) noted, in a study of 315 managers' responses to a racial awareness questionnaire, many agreed that the "system" is biased against blacks and that blacks are still often excluded from the mainstream. Even potential black leaders may restrict themselves. Thus Gump (1975) found that black female college students were more likely to see their future roles as wives and mothers, whereas white female college students were oriented more toward their own career development than toward fulfilling the traditional woman's role. But this has changed with the large increase in black women attending college and seeking careers.

Among 359 black executives surveyed by E. E. Jennings (1980), 45% still believed that racial prejudice was the most important impediment to further progress in their careers. Nevertheless, the legacy of the master-slave relationship is giving way—by fits and starts prompted by war, civil strife, civil rights legislation, and education—to the rise of a large number of black Americans into positions of leadership. By 2007, two blacks were successively U.S. secretaries of state. The CEO of TIAA, the country's largest nonprofit organization, is black. The 359 black executives in Jennings's (1980) survey were located primarily in large organizations, mainly in manufacturing, real estate, insurance, or finance. They performed the same organizational functions that provide for the faster advancement of whites: marketing, manufacturing, and finance. Their higher education and personal contacts were important to their being recruited.

### ***Race Relations in Transition***

Experimental, observational, and survey research lags behind the changes in attitudes and behavior since the 1940s resulting from desegregation, the civil rights movement, affirmative action, and the increased visibility of blacks in politics, athletics, and entertainment. Moreover, the scant research that was available prior to the mid-1960s is of less relevance to an understanding of the attitudes and behavior of minorities and whites in the twenty-first century. For example, consider Goode and Fowler's (1949) finding that the tough, autocratic, punitive supervisor was most effective for maximizing productivity among marginal<sup>1</sup> predominantly black workers in a Detroit bumper-grinding and polishing shop. Today, large numbers of African Americans are present in the work-force, including in manufacturing, service, sports, education, government, law enforcement, and the armed forces. Black line workers, army privates, teaching assistants, and government personnel would not expect nor accept white leadership that was overtly coercive. Black women have almost reached parity with white women in employment and earned income, and proportionately surpassed white male students in entering higher education. Nevertheless, 30% of black men are unemployed or not in the labor force. One of seven has spent time in prison.

The Gallup Poll Social Audit (1997) interviewed by telephone a nationally representative sample of 1,269 blacks and 1,767 whites. In 1965, 54% of blacks and 93% of whites were satisfied with their jobs. In 1997, 73% of blacks and 86% of whites were satisfied with their jobs. The gaps between blacks and whites tend to disappear for those with high levels of education and income. In 1965, 53% of whites said they would vote for a black person for president; in 1997, 93% said they would do so.

### ***Emergence of African Americans as Leaders***

There is a rich store of biographical literature on the emergence of black political, community, educational, and religious leaders, ranging from the leaders of slave insurrections such as Nat Turner to reform leaders Frederick Douglass and Martin Luther King, Jr. To work within "the system" like Booker T. Washington, to

modify it like W. E. B. DuBois, to attempt to destroy it like Malcolm X, or to lead it like Jesse Jackson have been the different goals of emergent, charismatic political leaders. There is continuity in leadership among blacks. According to a longitudinal study by Tripp (1986), the black student activists of the 1960s continued to be involved in community activities in 1969 and 1978. But entry into leadership positions in business and industry, except for a few black service-oriented industries, such as insurance and undertaking, is mainly a consequence of the equal opportunities legislation of the 1960s. The entry of blacks into military leadership was stimulated by President Harry S. Truman's order to integrate the armed forces in the late 1940s, which was followed by continuing increases in the proportion of blacks, particularly in the all-volunteer army. By the end of the twentieth century, according to Oscar Williams, the Southeastern Training of Trainers Program had been responsible for the training of roughly 10,000 black leaders (approximately 65% female) in five southern states, in empowering others, and in long-range planning and implementation.

When legislation, higher authority, or political climate demands it, such as occurred earlier in the military and more recently in industrial and educational organizations, blacks have advanced into higher-level positions. There are numerous black generals, CEOs, presidential candidates, police chiefs, government executives, judges, and university chancellors. School desegregation and affirmative action have opened opportunities for education and advancement of blacks and made visible the movement of blacks into higher-status positions. Formalized recruitment procedures and personnel policies with responsible documentation have resulted in large increases in the advancement of minorities, particularly in larger organizations (Braddock, 1984). The legal impediments to political leadership have changed drastically since the restrictions on black voting rights were lifted in 1964. Especially where blacks form a majority of large minority voting blocs, such as in the Deep South and the inner cities, blacks have succeeded in being elected to office in large numbers. Some black politicians have gained large white constituencies. They have become prominent in federal, state, and local government.

In a laboratory experiment using pairs of high-and low-dominant white and black coeds performing a clerical task in which one participant had to assume the role of leader and the other of follower, Fenelon (1966) found, contrary to expectations, that black women assumed the role of leader twice as often as did white women, no matter what their relative assessment scores in dominance. The white women with high scores in dominance thought it more important to show their egalitarian attitudes than to become leaders.

*Group Membership.* Although white Americans tend to be addicted to joining groups and associations, black Americans are even more extreme in this regard. Membership in associations is a springboard to leadership experiences and political influence. Concrete, visible issues, such as the right to vote, integration of schools, and lack of access to public accommodations mobilized black followers. But when these concrete issues were resolved and when only more amorphous or less visible issues remained, such as whites-only school board membership, leadership and organization become blunted and the willingness of individuals to be followers declined (Davis, 1982). Without salient black issues, blacks are less likely to assume leadership roles even when they form a sizable proportion of the membership of an organization.

*Underrepresentation.* Despite their high proportions in some types of organizations such as labor unions, blacks were often underrepresented in positions of leadership. For example, Lamm (1975) found that among 30 union locals with black members in the San Francisco Bay area, only 10 had blacks in leadership positions in proportion to their number in the membership. In 10 locals, blacks were proportionally underrepresented among the leaders, and in the remaining 10 locals, there were no black leaders. Similarly, despite their overrepresentation in excellence in athletics, blacks remain underrepresented in sports leadership positions such as football quarterbacks or team coaches.

Blacks remain underrepresented in management in both the public and private sectors, except in special circumstances. In a study of black MBAs, Brown and Ford (1977) found that relative to their white counterparts, black MBAs had lower opportunities for promotion and advancement. Again, Fernandez (1981)

found the biggest gap between aspirations and expectations of upward mobility among black male managers. And according to Jones (1986), 84% of the black MBAs from the top five graduate business schools reported that considerations of race had a negative impact on their performance appraisals, pay, assignments, recognition, and promotions. Nonetheless, black managers could advance when conditions were favorable. For 194 black managers with MBAs who were working in larger organizations, advancement occurred more often when they had more seniority, were in line rather than staff positions, and had help from mentors. They were also helped by their social activities (Nkomo & Cox, 1987).

The entry of blacks and whites into positions of leadership is likely to follow different paths. The importance of a religious ministerial practice as a route to leadership for black men is well known. What is less well known is how the route to leadership often differs for black and white women. Mottl's (1977) interview study of the different career paths of white and black women reform leaders found that the school bureaucracy was immediately more accessible to white women, who became involved as teachers and middle-class mothers. Their ease of entry from home into school politics was related to the closeness of the schools, particularly the elementary schools, to family life.

African Americans remain underrepresented as small-business owners in America's inner cities. Earlier in the twentieth century, Jews were inner-city small-business owners; currently it is the immigrant Asian Americans, such as Koreans, who do so. Unlike Koreans, blacks often lack stable families working together and the rotating credit associations that are often required to start and maintain these small businesses (Fukuyama, 1997). African Americans also face additional constraints.

### ***Constraints on African Americans as Leaders in America***

Lower rates of achievement and leadership can be attributed to personal deficits or to educational or cultural deprivation due to blocked opportunities because of cultural conflict and discrimination (Bowman, 1964). Much of black's experience and how they feel about it is invisible to whites, according to a survey of 270 black professionals and 39 in-depth interviews with black executives. Whites need to understand how their black colleagues experience the organizational environment. What is invisible to whites needs to be made visible. Nearly 90% of the black professionals feel that if they are successful, other blacks will be seen in a better light by whites, but half of those surveyed said that if they are failures, other blacks will be seen unfavorably. They remain ambivalent about networking and confiding in white managers because they are not unsure if they can trust white managers (Livers & Caver, 2002). Overtly racist expressions, such as racial slurs, have become less socially acceptable and more politically incorrect, but more subtle discrimination still exists. Discrimination has been outlawed in the work-place and public facilities by government legislation and regulation. Nevertheless, blacks' encounters with understated slights and devaluations are still common (Essed, 1991; Stone, Stone, & Dipboye, 1992). The continuation of such incidents can have a debilitating effect (Swim, Cohen, & Hyers, 1998), be a source of physiological stress (Miller & Kaiser, 2001), and result in feelings of hopelessness (Branscombe, Schmitt, & Harvey, 1999).

The differing perspectives were seen in public opinion polling in 1997. Blacks were treated unfairly on the job, according to 45% of blacks but only 14% of whites in a national representative sample. From 42% to 46% of the blacks also felt that they were treated unfairly in shops and malls and in restaurants, while only 12% to 19% of whites agreed that blacks were treated unfairly in those situations. Sixty percent of blacks and 30% of whites agreed that blacks were treated unfairly by the police (Gallup, 1997). Arguing that perceived mistreatment was a more valid measure of discrimination and prejudice on the part of their superiors, Deitch, Barsky, Butz, et al. (2003) analyzed the responses of 314 line workers, 5,483 navy personnel, and 8,311 U.S. Army personnel who were questioned on the extent to which they had been victims of mistreatment.

Questions included “Has anyone has set you up for failure?” “given others privileges you didn’t get?,” “failed to provide you with the information to do your job?” In the military samples, blacks reported more mistreatment than did whites, resulting in lower job satisfaction and felt physical well-being.

*Black Women Managers.* Black women are less disadvantaged than black men. The 2000 Census indicated that black women outnumbered black men in professional and managerial work by approximately 800,000. But only 3% held managerial positions. They said that racism is more of a barrier to their opportunities in a mainstream organization than is sexism (Delany & Delany, 1993). But compared to white men and women, “black women executives are more likely to suffer from the interactive effects of racial and gender discrimination” (Parker & Ogilvie, 1996, p. 201).

Black women managers display some of the same feminine leadership style as white women noted in the previous chapter, such as emphasis on interpersonal relations, empathy, and collaboration. But more often than white women managers, they also tend to observe the traditional masculine style of command, control, and competitiveness. They are likely to be androgynous in their leadership, both task and relations oriented (Parker & Ogilvie, 1996). Their socialization contributes to this tendency as adults. Much is due to dominant and protective disciplinarian mothers (Parker & Ogilvie, 1996). In comparison to white girls, black girls are expected to become self-assertive and independent. Their parents expect them to mature earlier. Even as preschoolers, black girls may already be required to carry considerable responsibility for younger siblings. Early on, they are exposed to strong, dominant mothers as role models (Baumrind, 1972).

“Black mothers ... raise daughters who are self-reliant and assertive” (Collins, 1990), and “not socialized to be ‘passive’ or ‘irrational’ ... but rather independent, strong ... and self-actualizing in a society that devalues black women” (Parker & Ogilvie, 1996, p. 195). The daughters are socialized to resist the standards of mainstream culture and its ideology about race. They are enabled to hold on to a positive sense of self. They have equal or higher educational and career aspirations than white adolescents (E. Smith, 1982). Proportionately more black women now enter college than do white men.

Black women managers need to offset the stereotype by whites that they are too direct, assertive, and flashy; black men need to offset the stereotype as angry and intimidating. About half believe that their own mistakes will reflect badly on other black managers in the organization and that they will be affected adversely by the mistakes of other black managers (Livers & Caver, 2002b).

*Succession Problems.* Black leaders, whether of social movements or in politics, have often been highly charismatic. One has only to think of Martin Luther King Jr., Jesse Jackson, and Malcolm X. But as often occurs with many charismatic leaders,<sup>2</sup> they seldom leave strong organizations behind them. Because of this, their successor can ordinarily command little of their predecessor’s influence (Davis, 1982).

*Financial Support.* In contrast to comparable white leaders, black leaders usually run underfunded organizations that limit their growth. They must concentrate their efforts on raising money, face bankruptcy, and curtail their programs. By the 1980s, a number of traditional black organizations experienced reductions of up to 90% in their operating capital. Many newer black organizations (and subsidized black businesses as well) have collapsed in proportionately greater numbers than was expected from the experience of mainstream organizations. Funds to support black organizations have shifted since 1970 from predominantly black to primarily mainstream corporate sources. The influence of the mainstream on black organizational development is also seen in the extent to which mainstream organizations select and identify black leaders of assimilation rather than leaders of protest or black nationalism (Davis, 1982).

## ***Cognitive and Interpersonal Abilities***

In Chapters 4 and 5, it was concluded that leaders need to be more intelligent (but not too much more) than

those they lead. Whatever the reason, blacks score lower on tests of general cognitive ability. Although more than 30% of whites score in the 108 to 134 IQ range, only 3.3% of blacks do the same. Blacks with the same amount of education as whites (but not necessarily the same quality of education) who apply for the same jobs or admission to the same colleges score considerably lower in general cognitive abilities, and these black-white differences are resistant to change (Gottfredson, 1986). Meta-analyses of studies of black-white differences in tests for college admission and applying for jobs indicate that black applicants are about a standard deviation lower in mean than white applicants (Roth, Bevier, & Bobko, 2001). More intellectually demanding jobs tend to employ proportionately fewer blacks. Reviewing the research evidence, Schmidt and Hunter (1974) concluded that the lower average job performance of blacks from cognitive ability tests is accurately predicted from their lower average test scores. The lower scores of blacks than whites are not due to test biases. In fact, if anything, the job performance of blacks has been overestimated based on their test results.

Howard and Bray (1988) reported a similar amount of black-white differences in their large-scale manager assessment project. Minorities, mainly black employees of AT&T, were in the 22nd percentile in tested cognitive abilities, while whites were at the 57th percentile. Whites also scored better in general information and on in-basket decision making. But the minorities did just as well as the whites on interpersonal skills, oral presentations, and group participation exercises. In all, compared to 50% of the whites, 29% of the minorities were seen as having middle-management potential. For 13 management competency assessments of 545 whites and 88 blacks, the *cognitive* differences, such as in assessment of judgment, showed up as expected, but most of the *non-cognitive* black-white differences, such as assessment of human relations, were not significant (Goldstein, Yusko, & Nicolopoulos, 2001).

Despite these continuing black-white differences, it is clear that a sizable percentage (29% in this instance) of blacks have the potential to be leaders. More generally, 25% of blacks are still higher in tested intelligence than 50% of whites. Although they may be proportionately fewer than the number of whites who are available, a substantial number of blacks with the necessary cognitive skills are on hand for positions of leadership (Elliot & Penner, 1974). And such leadership, for instance in the black community, is related to ability, as reflected in the educational level that is attained.

*Education.* J. J. Cobb (1974) showed that blacks who were nominated as the most influential members in their black communities were well educated in diverse fields. The educational levels of black executives who were surveyed by E. E. Jennings (1980) were similar to those of their white counterparts. Social class was an important determinant of educational level attained (Bell & Nkomo, 2001) and no doubt affected social class attainment.

In 1970, one in 10 whites had completed at least four years of college, but fewer than one in 20 blacks had done so. Only 15% of blacks aged 55 to 64 had completed high school, compared to 45% of whites. Among those aged 20 and 21, 82% of whites and 50% of blacks had completed high school. But the educational gap between blacks and whites has narrowed considerably since 1970. By the 1980s, blacks were actually entering college in greater numbers and obtaining more years of education than were whites of the same intelligence level of (Manning & Jackson, 1984). Nevertheless, it is the lack of educational attainment, reflected in large dropout rates, coupled with the often inferior quality of the education that is available, that continue to be factors in keeping lesser proportions of blacks than whites in positions of political, educational, military, and industrial leadership.

### ***Socioeconomic Status***

Socioeconomic status, one key to leadership, remains lower for blacks than for whites. Blacks' incomes are lower and their unemployment rates higher than those of whites. Nevertheless, it is a mistake to equate

impoverishment with race. Half of all blacks do not live in slums. And there is a small black upper class. This “high society” of black professionals and businessmen is characterized by conspicuous consumption and the excessive formation of clubs because of their exclusion from the counterpart white society (Frazier, 1966). Increasingly, however, social exclusion is diminishing. There is a larger black middle class, although the plurality of blacks falls into the lower class. The black class structure is unlike the white structure. Whites see themselves mainly as middle class, with small proportions in the upper and lower classes (Drake & Cayton, 1966).

*The Slum Subculture.* Any study of blacks as leaders would be incomplete if it ignored the large subset of blacks who are the disadvantaged poor. The slum subculture contains its own ethos, which is a more important determinant of behavior than is being black. The characteristics of this subculture include the absence of a sheltered childhood, early initiation into sex, female-centered families, authoritarianism, marginality, helplessness, resignation, fatalism, dependence, feelings of inferiority, lack of impulse control, inability to defer gratification, belief in the superiority of males, and tolerance of psychological pathology (H. Lewis, 1965).

There are strategies for survival in the slums, according to Rainwater (1966), and presumably black leaders in the ghetto become masters of such strategies. First, to obtain immediate gratification, one needs to make oneself interesting and attractive to others to manipulate and seduce them, even though one really has little to exchange. The second strategy is to resort to force and violence. Getting into trouble with the law is a rite of passage for some. Blacks constitute half the inmate population of American prisons. Toughness and masculinity are sought, along with cleverness in manipulating others, excitement and thrills, and luck and autonomy (W. B. Miller, 1965). At the same time, lower-class black youths, particularly the boys, miss the socialization experiences to prepare them for the world of work that are obtained by white working-class youths (Himes, 1965). Lower-class blacks have a generalized distrust of mainstream organizations. The contingencies between effective work and its positive outcomes are weak. They see considerate and supportive supervisors as hostile and untrustworthy—evaluations that are unlikely to foster success in an organization (Triandis, 1984).

*Family Life.* For the population as a whole, black family life is less stable than white family life. Black children are much less likely to live with both parents, and black women are more likely to encounter marital discord than are white women. Moynihan’s (1965) well-publicized analysis concluded, from these types of differences, that black fathers, often transient, failed to provide their children with support, discipline, or direction. Hill (1971) countered by pointing with pride to five strengths of intact black families: the adaptability of family roles, strong kinship bonds, a strong work orientation, a strong religious orientation, and a strong achievement orientation.

An interesting question is whether the absence of fathers as role models for children who are raised only by their mothers reduces their leadership potential in either childhood or later life. Actually, strong, dominant mothers have been most significant for many world leaders. Fatherless children may have to take on responsibilities earlier, although evidence suggests that fatherless boys who lack a masculine role model with which to identify develop personalities that are marked by impulsivity, academic failure, indifference, immature dependence, and effeminacy (I. Katz, 1974). Role models for black boys are often provided by older street gang leaders and older brothers. In urban inner-city ghettos, being arrested and going to prison are viewed by many black adolescent boys as a rite of passage into adulthood.

The educational impact of fatherlessness seems minimal. Whiteman and Deutsch (1968) found no relationship between black children’s reading skills and the intactness of their families. Similarly, the national survey by Coleman, et al. (1966) found that the presence or absence of a father was not a factor in the scholastic attitudes or achievement of lower-class black or white students. Also, Feld and Lewis (1967) found practically no relationship between family intactness and school anxiety.

Relevant to their adolescent and adult tendencies to influence rather than to be influenced, young black girls, especially those in lower-middle-class black families, are likely to become highly self-assertive and independent, despite authoritarian treatment by their parents. In particular, their mothers provide strong, dominant role models. Parental warmth is moderate, but the parents discourage infantile behavior. As noted before, early maturity of behavior is expected of the daughters, who are required to assume considerable responsibility for the care of younger siblings at an early age (Baumrind, 1971; Billingsley, 1968; Ladner, 1971).

*Black Stress Due to Marginality.* As noted earlier, minorities often live marginal lives, in between the mainstream and their own minority world. To capture the constraining effects on individual blacks who attempt to succeed as leaders, particularly in a white world, one must attend to the stress created by marginality. At the extreme, black managers, particularly female black managers, may be alone in a white-dominated organization, solo pioneers seen by many as tokens of integration (Bell & Nkomo, 2001). They face anxieties from internal conflicts (such as between their higher visibility and their lower social status) and confusion from external inconsistencies (such as policies of racial equality but incidents of apparent prejudice). They lack exposure to the informal networks of consequence (Jones, 1973). They may lack accessibility to superiors and respect, appreciation, and encouragement from them (Human & Hofmeyr, 1984). Many black managers feel isolated and alienated. They may suffer a loss of identity. They report difficulties in adjusting to the cues and norms of the corporate environment. They experience value conflicts and may feel uncomfortable among whites. Even though mentoring or counseling might be helpful, they avoid getting involved for fear that the information they reveal may be used against them. As with other disadvantaged groups, their families are unlikely to understand what they do. They often feel rage against some whites' subtle devaluation of them. Therefore, it is not surprising that blacks suffer from high blood pressure at twice the rate of whites (B. M. Campbell, 1982).

### ***Personal Attributes Associated with Black Leadership***

As with whites, leadership potential shows up early in the lives of black individuals. According to personal interviews and surveys of 221 black men and women who were serving in elected positions in North Carolina in 1977, evidence of leadership within the black community began as early as elementary school. Each experience as a leader or a follower in the family, school, church, or community was seen as an opportunity for learning and developing leadership potential (Buie, 1983). But there are also systemic aspects that are particular to black leaders.

*Black Values and Black Leadership.* As was indicated in [Chapter 10](#), individuals who “typify the group norm” are more esteemed than are those who reject or depart from it. Grossack (1954a) found that blacks who were attracted to black activities and who valued the Negro race, as such, were more esteemed by fellow blacks than were those who were indifferent to black activities, who rejected blacks, or who disliked black heroes. Thus it follows, as Kirkhart (1963) showed that college students who were accepted for group leadership and external leadership positions were those who identified themselves with their own racial group. Dellums (1977) thought that black political leaders must fully identify with “black politics,” a commitment to the eradication of the oppression of minorities.

Lamm (1975) noted that black union leaders, despite their own higher incomes, identified themselves with the black working class and had more favorable attitudes toward blacks. They were also antiwhite and anti-Semitic in attitude. Fifty percent were identified as “Race Men.” Compared with 27% of the members of the black middle class who were identified as “Uncle Toms” (subscribing to the white value structure), only 6% of black union leaders could be so identified. On this question of values, blacks who aspire to positions of leadership may be faced with a conflict between the black movement's concerns for social, political, and

economic equality and the achievement and individualism that are likely to be of more importance in mainstream organizational life.

Differences in the leadership potential of blacks and whites are likely to accrue from the differences in personal values expressed by black and white college students. According to Fichter (1966) and Bayer and Boruch (1969), in comparison to white college students, black students placed a greater emphasis on being helpful to others and to society. They were less concerned than whites about experiencing leadership, making money, and being autonomous. Traditionally, blacks sought high-status open occupations with little interaction and competition with whites, such as teaching in all-black schools (Porat & Ryterband, 1974). But the occupations they sought broadened by the late 1960s (Bayer & Boruch, 1969) as affirmative action opened new opportunities in the professions and industry. Nevertheless, educated blacks continue to concentrate much more than their white counterparts in education and social service occupations. They favor law over medicine. They remain underrepresented in engineering, science, and medicine. The differences in aspirations and access are reinforced by the different networks of contacts and information that are available to blacks and whites and by continued segregated living (Spilerman, 1977). Black managers remain convinced of the importance of "the system" to their own job satisfaction. Wright, King, Berg, and Creecy (1987) found that organizational rather than personal factors most accounted for the job satisfaction of black managers.

*Job Satisfaction of Black Leaders.* Overall, satisfaction that their needs were being met was lower among black leaders and professionals than among their white counterparts. Slocum and Strawser (1972) found that black certified public accountants (CPAs) reported more deficiencies in the fulfillment of their needs than did other CPAs. Black CPAs felt significantly more deprived in compensation, opportunities to help people and to make friends, independent thought and action, and feelings of self-fulfillment and self-esteem. E. E. Jennings (1980) reported that black executives felt their progress as a group had been slower than that of women and was likely to be slower over the next 15 years. Nonetheless, a correlation of .37 was found between support of black managers for diversity and job satisfaction and -.37 between support for diversity and intention to quit.

O'Reilly and Roberts (1973) reported that overall job satisfaction was significantly higher for white than for nonwhite female registered nurse supervisors. On the other hand, contrary to King and Bass's (1974) prediction, Scott and Moore (1981) discovered in a survey of the assessed value of management by objectives (MBO) to 77 black managers and 61 white managers, supervisors, and professionals, that although both blacks and whites were favorable toward the use of MBO, blacks found more value in MBO than did whites for doing their jobs and for the organization. Again, Alper (1975) observed that, compared with white newly hired college graduates, black graduates gave the contextual rather than the intrinsic elements of work significantly higher ratings in importance.

*Motivational Differences.* Watson and Barone (1976) noted that black managers were lower in power motivation. Yet in a study of 23 black and 75 white supervisors, Miner (1977c) found the black supervisors to be higher than their white counterparts in the motivation to manage (good relations with superiors, competitiveness, masculinity, assertiveness, visibility, and willingness to deal with routines). Consistent with Miner, Thomas (1982) obtained results indicating that black male and female business students were more task oriented in their supervisory orientation than were comparable white students. Black leaders of U.S. Navy squads scored lower than did white squad leaders on Rotter's Internal-External Control Scale (W. R. Allen, 1975b). Vinson and Mitchell (1975) showed that black managers assigned higher ratings than did white managers to the importance of obtaining autonomy, self-fulfillment, friendship, and promotion.

These results may reflect the extent to which middle-class blacks conform to mainstream norms more than do their white counterparts. Black-white values and orientation probably depend more on the segments of the respective professional groups from which they are drawn. Black managers may be more task-oriented than their mainstream counterparts, whereas black ministers may be more concerned about social issues than their

mainstream counterparts.

*Differences in Self-Esteem.* Studies in the 1960s found that, on the average, blacks had lower self-esteem than did whites (Ruhe, 1972) even when they were given evidence that their abilities were equal to those of whites (Lefcourt & Ladwig, 1965). Such lack of self-esteem affected their assertiveness, desire to be integrated, and expectations of success in their careers (Crain & Weisman, 1972). However, in a large-scale study of more than 5,000 blacks and whites in 25 northern metropolitan areas, Crain and Weisman (1972) found that the lower self-esteem of blacks was more common among blacks who were born in the South. The self-esteem of blacks who were born in the North tended to be as high as or higher than that of whites. Furthermore, the lack of self-esteem among blacks and its implication for black leadership (Proshansky & Newton, 1968) had to be discounted, to some extent, as a factor. Since the 1960s, there has been a rapid increase of successful black models in sports, television, movies, the military, government, and politics. Opportunities for qualified black professionals and managers in the white world of work have opened, stimulated by programs to foster diversity. With the rise of the black movement, the “new” black person has come to value assertiveness and a feeling of having greater control over fate (Ruhe, 1972). The findings of L. Campbell’s (1983) survey of 20 black women leaders in rural southern communities illustrate the changes that have occurred in the South. On various self-report instruments, these leaders described themselves as high in self-esteem and feelings of expertise, competence, and internal control. They were high in the need for achievement and felt they had the concrete personal resources to influence others and to fulfill their groups’ expectations. Another sign of higher self-esteem was seen in a study of U.S. Navy squad leaders. Black leaders chose themselves as the best squad leader in their company more often than did white leaders (W. R. Allen, 1975a). Gray-Little and Hofdahl (2000) confirmed a full turnabout with a meta-analysis of 261 comparisons of the self-esteem of blacks and whites involving more than 500,000 individuals. Higher self-esteem was found in black than white children, adolescents, and young adults. The black-white difference increased with age and more for females rather than for males.

*Disappearing Differences.* A number of older studies also reported little or no personal differences owing to race. For instance, Dexter and Stein (1955) found little difference among women leaders on campuses as a function of race in masculinity, personality, and speed of association. And Barati (1981) could find no significant differences in the preferred leadership styles or attitudes toward subordinates of 160 black and white undergraduates of both sexes. In better-controlled subsequent studies, especially studies of individuals who have already achieved positions of leadership, black-white differences in values, motivation, and other personal attributes have tended to disappear. For example, among blacks who have attained leadership and management positions, less difference has been found between their values and the values of their white counterparts. Watson and Barone (1976) failed to detect such differences in self-concept on England’s (1967a) Personal Values Questionnaire or in the need for achievement and affiliation. And W. R. Allen (1975b) could find no significant differences between black and white naval squad leaders’ levels of aspiration and expectancy of success.

## Performance of Blacks and Whites as Leaders

---

Shull and Anthony (1978) found that among 21 black and 56 white participants in a supervisory training program, the blacks were less willing to support harsh punishment for violation of organizational rules than were the whites, especially when the subordinates had a history of good performance. Otherwise, there was little difference in the way blacks and whites thought they would handle disciplinary problems and role conflicts. Somewhat different findings emerged when Stogdill and Coady (1970) used the Ideal Form of the Leadership Behavior Description Questionnaire (LBDQ) in a study of two vocational high schools. The white

students thought that consideration was the most highly regarded factor for ideal leaders, whereas the black students thought that initiating structure was most important.

The importance of the race of the supervisor was shown by Richards and Jaffee (1972), who completed a laboratory study in which groups consisting of two white undergraduate males and a black or white supervisor played a business game. Trained observers rated the white supervisors significantly higher than the black supervisors on human relations skills and administrative-technical skills. Their ratings were based on checklists of effective and ineffective behaviors, as well as overall graphic ratings. The observers also used Bales's Interaction Process Analysis to assess the leaders' and subordinates' behavior. The white supervisors of the all-white groups of subordinates engaged in significantly more signs of solidarity, giving suggestions, and giving orientation, which lent support to King and Bass's (1974) hypothesis that white supervisors are more directive and less passive about relationships than are black supervisors when dealing with predominantly white subordinates. However, Bartol, Evans, and Stith (1978) argued that the evaluative data may have been biased, since all the observers were white.

Experiments before the early 1960s with biracial teams working on intellectual-type problem-solving tasks showed that blacks spoke less and, therefore, exerted less effort to be influential than did whites (Katz & Benjamin, 1960; Katz, Goldston, & Benjamin, 1958). But, possibly reflecting societal shifts in the 1960s, Fenelon and Megargee (1971) obtained contrary results with female college students who had described themselves as either high or low in dominance. Despite the white women's personal dominant tendencies, the white women yielded to the black women with whom they interacted, apparently to avoid the implication of prejudice.

### ***Charismatic-Transformational Black Leaders***

Bass, Avolio, and Goodheim (1987) asked sets of students to describe the transformational and transactional leadership behavior of world leaders. Among the 69 leaders, three were black and almost all the rest were white. Martin Luther King, Jr., was at the top of the scale in charisma, and Malcolm X was not far behind. The two were also near the top of the sample in intellectual stimulation. For Davis (1982), this finding was to be expected, for he felt that "the needs and experiences of the black population may dictate a greater emphasis on transformational leadership" (p. 194). Jesse Jackson illustrated these charismatic and transformational tendencies in the 1984 and 1988 presidential election campaigns. Consistent with this was an MLQ survey and interviews of 17 black women college presidents whom Jones (1992) found tended to be transformational, empowering, envisioning, and directly involved in whatever work needed to be done.

Martin Luther King, Jr., a national icon, was a profound, provocative, emotionally powerful orator. Although charismatic in most respects, he was filled with self-doubts, and was never able to gain mass support for nonviolent struggle to achieve radical social change. He used black Christian idiom to advocate unconventional political ideas. He galvanized black protest activists with his oratory, but the actual protest movement was more often led by self-reliant local and student black leaders. He served as a conciliator among them in strategy sessions. His influence with public officials was based on his moral and intellectual clarity. He articulated blacks' concerns to white audiences and mobilized black community institutions, financial resources, regional networks of black churches, grassroots leaders through his emphasis on nonviolence and received much positive press coverage (Carson, 1987).

Malcolm X attacked three myths that denigrated blacks and justified racism by whites, and resulted in blacks demeaning themselves: (1) blacks were animals, (2) blacks were a minority, and (3) blacks supported and would be benefited by integration. He instilled a sense of history and racial pride in blacks. He noted that colored races were in the majority in the world. Their cultures predated the European. Integration would

weaken black identity and reinforce the belief in white superiority (Flick, 1981). Like other leaders of black movements, Malcolm X focused on group identity and the need for a sense of community. Though leaders in the white mainstream more often direct their attention to conserving resources and the status quo, leaders of minorities, such as blacks, must more often be transformational in their concern for social change (Burns, 1978), as well as for unmet social needs and for inequities in the distribution of opportunities (Thompson, 1963).

### ***Importance of the Leader's and Subordinates' Race***

A study of black and white supervisors is likely to require knowledge of whether the subordinates are black or white. Wesolowski and Mossholder (1997) surveyed 170 subordinates and their immediate superiors according to whether each dyad was the same or demographically different in age, sex, race, and education. With an 87% return rate, the subordinates reported that differences in race correlated with their perceptions of job satisfaction and procedural justice, but not with job burnout. Again, a study by Rosen and Jerdee (1977) illustrated the expectation that a leader's effective supervisory style depends on the racial composition of the group he or she is supervising. Rosen and Jerdee administered a decision-making exercise to 148 business students. The students evaluated the extent to which participative decision-making styles were appropriate when supervising work groups of various organizational statuses and minority compositions. Significantly less participation was seen as likely to be efficacious with minority subordinates. Such subordinates were judged to be less competent and less concerned with the organization's goals.

A line of evidence that indirectly indicates that race affects interactions between leaders and subordinates comes from studies reviewed by Sattler (1970) on the influence of race on behavior in interviews. Respondents tended to give socially desirable responses to interviewers of races other than their own, responses that were socially "correct" or acceptable, whether or not they reflected the respondents' true feelings. Lower-class respondents were even more likely to be sensitive to the interviewer's race than were middle-and upper-class respondents.

*Black Supervisor with Black Subordinates.* Traditionally, blacks were limited to leading other blacks. Black supervisors with mainly black subordinates were expected by King and Bass (1974) to be highly concerned about how their subordinates felt about them. Therefore, although in general black leaders were more directive, they were expected to be less directive than were white supervisors of blacks. Adams (1978) reported that both black and white subordinates perceived their black supervisors to be more considerate. The 11% of the subordinates in a retail organization who were black gave their black superiors particularly higher ratings for consideration over their white counterparts. However, as noted in [Chapter 28](#), for 19 black social service agency heads supervising 54 counselors of black inner-city clients, Schriesheim and Murphy (1976) found that more consideration was helpful mainly in low-stress job settings. When blacks supervised blacks and stress was high, more initiation of structure was helpful.

Black leaders often face the problem of having to earn the trust of their black subordinates, since the latter see them as having been co-opted into the white power structure (M. L. King Jr., 1968). Delbecq and Kaplan (1968) studied the managerial effectiveness of local leaders in neighborhood opportunity centers in an urban ghetto. Clients served by the centers thought that the directors were conservative, unwilling to permit the community to be involved in decision making, and ineffective in negotiations with leaders in the larger community. Subordinates in the centers sought immediate change and action through social protest, marches, and rallies. The directors tended to see such activism by subordinates as a threat to their own self-esteem and to their leadership position. They knew that higher authority was opposed to demonstrations and therefore felt in the middle between conflicting demands from subordinates and from the higher authority. At the same time,

King and Bass (1974) suggested that in comparison to white supervisors, black supervisors of black subordinates may have more difficulty identifying with a white higher authority than with their black work group. A black supervisor may need additional symbols of authority as well as higher-level support to make his or her position credible.

Black supervisors of black subordinates in particular may have to be able to converse fluently in the street language ("Ebonics" or black English) of their subordinates and the general American English of their superiors and to be flexible about using both (Kochman, 1969).

*Black Supervisor with White Subordinates.* King and Bass (1974) suggested that, in comparison with whites supervising whites, black supervisors with mainly white subordinates would be expected to engage more often in general rather than close supervision and to allow or encourage subordinates to initiate boss-subordinate interactions. Doing so would reduce the possible feelings of status incongruity<sup>3</sup> among the white subordinates. The minority-majority status inversion that occurs when blacks supervise whites may generate, for status-conscious whites, a conflict between wanting to avoid the black supervisor and the need to interact with him or her (Blalock, 1959). Such whites may also suffer from a sense of lost status as a consequence of the required interaction with a black superior (Blalock, 1967). Even if the black leader has status as an expert, hostility and loss of status may be experienced, particularly by lower-status white subordinates (Winder, 1952). In a retail organization in which 88% of 406 subordinate managers were white, the black male bosses, as predicted by King and Bass, were perceived by the white subordinate managers to exhibit more consideration than did their white male counterparts. But as was noted earlier, their black subordinates were more extreme in perceiving the black superiors as more considerate (Adams, 1978).

The job of black supervisors of white subordinates may be made more difficult, according to Richards and Jaffee (1972), by white subordinates who go out of their way to hinder their effectiveness. For this and other reasons, King and Bass (1974) suggested that it is particularly important for black supervisors of whites to have the full support of higher authority.

King and Bass (1974) also noted that the small number of black leaders in organizations, particularly blacks who supervise whites, makes them more visible than their white counterparts. This visibility, King and Bass advised, should cause the black supervisors to have more anxiety about succeeding, a greater sensitivity to negative data regarding the activities they supervise, a possible overreaction to such data, and a greater need for external confirmation of the value of the group's and the leader's performance.

*White Supervisor with Black Subordinates.* King and Bass (1974) suggested that white supervisors were likely to be more *directive*<sup>4</sup> and less consultative when supervising groups with predominantly black subordinates than when supervising groups of white subordinates. They would be more likely to undervalue the capabilities of black subordinate. Their rejection of black workers, in turn, would cause the workers to perform poorly (I. Katz, 1968, 1970). White supervisors would want black subordinates to respect them rather than to like them and to be concerned primarily with pleasing (probably white) higher authority. Furthermore, King and Bass (1974, p. 256) noted

Whites supervising blacks often reflect ... in private conversations, a feeling of walking on eggs. This feeling may well be reflected in (1) greater censoring of responses and reactions by white supervisors when most of their subordinates are black, (2) less spontaneity in supervisory-subordinate relations, and (3) less certainty on the part of white supervisors as to how rigidly to enforce company rules or procedures. ... Reciprocally, black subordinates may be less willing to discuss personal problems with a white as opposed to a black supervisor.

Consistent with this comment was Sattler's (1970) research review, which indicated that black clients preferred black counselors. Also consistent was the finding among 1,944 workers in various hotels that, compared to other nonwhite workers, the African Americans were more sensitive to their white supervisors and management and felt the supervisors showed less behavioral integrity. The black workers were also lower in

commitment, trust, and satisfaction with supervision. They revealed more intention to quit (Friedman, Simons, & Liu, 2003). And in agreement with King and Bass's (1974) suggestion that white supervisors would be more *directive* with their black subordinates, Kipnis, Silverman, and Copeland (1973) found that although they mentioned similar kinds of problems with their black and white subordinates, white supervisors reported using more coercion, such as suspensions, more frequently when dealing with black than with white subordinates. Kraut (1975a) also noted that white managers are often apprehensive about supervising new black subordinates, but they frequently react by giving special help to new black employees. White supervisors may be concerned about how white clients will react to black subordinates. Also, they may worry about how to handle mixed-race social events.

Indirect confirmation of the possible subtle effects of a white leader–black subordinate interaction came in an experiment. White interviewers deliberately treated the white job applicants to the same subtle features of the negative interaction by not leaning forward, sitting farther away, and making the interviews shorter. The white job applicants reported that they were more nervous and performed less effectively in the interview than did the white applicants who were treated to a positive interaction with the interviewers. This study corroborated commentary that new black professional employees experience many stresses above and beyond what would be expected for white employees and their new, usually white, superiors.<sup>5</sup>

When blacks were involved in intellectual-type experiments, their performance was affected adversely especially if anxiety levels were high and if they were led to believe that they were being compared with equivalent whites (Katz, Epps, & Axelson, 1964; Katz & Greenbaum, 1963)

*The Hard-Core Unemployed as Subordinates.* Although many whites are numbered among the hard-core unemployed, blacks are heavily overrepresented. Therefore, the literature about their supervision has relevance, particularly the possible extra need for supervisors to be generally both supportive and controlling. This need was demonstrated by Friedlander and Greenberg (1971) and by the National Industrial Conference Board (1970). Both studies found that the hard-core unemployed wanted supervisory support in terms of friendliness, courtesy, and encouragement. The need for supervisors to intervene with the interpersonal difficulties of the hard-core unemployed (Goodman, 1969; Hodgson & Brenner, 1968; Morgan, Blonsky, & Rosen, 1970) and possibly to provide close supervision (Triandis & Malpass, 1971) was suggested, even though such close supervision might prove dissatisfying (Goodale, 1973).

Beatty (1974) found generally positive correlations between the extent to which 21 hard-core unemployed black women described their supervisor's consideration on the Supervisory Behavior Description Questionnaire (SBDQ) and their earnings and performance over a two-year period. But supervisory initiation of structure on the SBDQ<sup>6</sup> was negatively associated with the black women's work performance. W. S. MacDonald (1967b) found somewhat different results in Job Corps centers with large percentages of black trainees. Positive incentives had little value in shaping behavior. Nor was verbal reproof of much use in contrast to setting and policing goals and applying sanctions for infractions by the group. Infractions dropped 60% in two weeks.

Similar in many respects are unskilled and precariously employed black day laborers. Still lingering are some of the master-slave effects of black slavery in America of white bosses and black day laborers hired and paid for the day. Soaries (2003) found the similar themes in 10 interviews recorded in the 1930s with former slaves and 10 interviews of blacks hired and paid for the day from a day-labor pool. The similarities included themes of superior master (boss) and inferior slave (laborer), a sense of paternalism, and coercive leadership.

*Black or White Leaders with Mixed Racial Groups.* No simple generalizations are possible here. Some studies reported that whether the supervisor was black or white did not matter. For instance, in groups of mixed racial composition, Adams (1978) could find no differences in satisfaction or job problems among 406 subordinates in a retail organization (88% of whom were white) that were associated with whether their supervisor was a black male, a white male, or a white female. Nor did the subordinates' satisfaction depend on

whether the subordinates were black or white. The specific behavior of leaders, rather than their race or the race of their subordinates, may be a much more important influence on subordinates' performance and satisfaction. Schott (1970) found that among nonwhite school principals with integrated staffs, job satisfaction of faculty members was highly related to the principals' reconciliation of demands, tolerance of uncertainty, persuasiveness, tolerance of freedom, assumption of roles, consideration, predictive accuracy, and integration of the group, as measured by the LBDQ-XII.

When subordinates comprise a mixed group of black and white employees, King and Bass (1974) suggested, the group will lack cohesion, which should result in the need for more directive behavior by supervisors, black or white.<sup>7</sup> Conversely, when groups of subordinates are racially homogeneous, cohesion will probably be higher and will result in the possibility of more participative supervisory styles by both black and white supervisors. But experiments failed to support these conjectures. Hill and Hughes (1974) and Hill and Ruhe (1974) conducted a laboratory experiment in which undergraduate student participants had to compare black and white leaders under conditions in which the subordinate dyads were black, white, or both. Black and white observers were employed. The one significant difference in Bales Interaction Process Analyses observations showed that both the black and the white leaders of the black dyads were less *directive* than were the leaders of the white or mixed dyads on a fairly structured knot-tying task. (Of the three tasks, the knot-tying task was expected to require the most *directive* behavior from the leaders who possessed the knot-tying knowledge.) Hill and Ruhe (1974) reported no difference in the total time each supervisor talked during the three tasks, regardless of the racial composition of the subordinate pairs, and Allen and Ruhe (1976) found no difference in the supervision of mixed dyads involved in ship-routing and knot-tying tasks.

But some investigations did show that it made a difference whether a black or white was in charge of a mixed-race group and that subordinates acted differently depending on the supervisor's race. According to May-hand and Grusky (1972), when black supervisors adopt a close and punitive style of leadership with a mixed group of black and white subordinates, the black subordinates are likely to be more vocal than are the white subordinates in opposing the leaders. But the white subordinates may show their dissatisfaction by reducing their output. Whites in this situation may be more accommodating in attitude but not in behavior to coercive black supervisors. Hill and Fox (1973) noted, on the basis of a study of 17 racially mixed rifle squads in a training battalion of the U.S. Marines, that white squad leaders reported giving proportionately more reprimands, but also more praise, to white subordinates than to black subordinates. And the praise white leaders reported giving to white subordinates was more than that given by black leaders to white subordinates.

In a previously mentioned study of 288 male naval recruits, W. R. Allen (1975a) formed 64 experimental groups of four members each, 25% black, 50% black, and 75% black. The supervisors were black or white. The leaders, regardless of whether they were black or white, experienced increasing supervisory difficulties as the relative proportion of blacks increased in the groups they were supervising. But the subordinates' SBDQ descriptions of the consideration or initiation of their leaders failed to account for any of the results. Furthermore, black leaders were less expressive in their behavior and were generally more inhibited. White-supervised groups performed tasks faster than did black-supervised groups. Allen explained that these results were because of status incongruence and social stress.

In another previously cited study, W. S. Parker (1976) administered the Survey of Organizations<sup>8</sup> to a sample of 17 white supervisors and all of the 16 black supervisors in three plants with a total of 427 supervisors and 7,286 hourly employees. A total of 72 black and 36 white subordinates described the 33 supervisors. Smaller percentages of Chicano supervisors and subordinates were also involved in the racially mixed work groups. When the four leadership effectiveness measures derived from the Survey of Organizations were examined, significant differences were found between black and white supervisors. Compared to the white supervisors, the black supervisors were rated significantly more favorably by their subordinates on

managerial support, emphasis on goals, and facilitation of work. The difference for facilitation of interaction was in the same direction but was not statistically significant. Furthermore, according to Parker, blacks achieved higher ratings from their black and white subordinates because black supervisors were seen as giving more support, stimulating a contagious enthusiasm for doing a good job, emphasizing the task to be completed, and removing roadblocks to doing a good job. Also, when white subordinates were the minority in their work group, they tended to rate their white supervisor more favorably on managerial support than did white subordinates who were in the majority in their own work group. This finding was an exception to the general finding, to be discussed next, that subordinates did not give more favorable ratings to supervisors of their own race.

### ***Are Performance Evaluations of Black Leaders Biased?***

A variety of different kinds of bias have been demonstrated, but the effects have been decidedly mixed. Hammer, Kim, Baird, and Bigoness (1974) asked participants to rate workers who were shown performing on videotape according to an objective criterion of effectiveness. The raters and workers included whites and blacks of both sexes. Although high performers were generally rated as more effective than low performers, blacks rated blacks higher than whites, whites rated whites higher than blacks, and greater differences were seen between high-and low-performing whites than between high-and low-performing blacks. A total of 22,431 managers were rated, 73% of them white, in a meta-analysis by Mount, Fisher, Holt, et al. (1995). It was concluded that black superiors, peers, and subordinates rated black managers more favorably than they rated white managers. White superiors rated white managers more favorably than they did black managers, but white peers and white subordinates were not inclined to do the same. Black raters were more lenient in their ratings of managers of both races.

Explanations for the good or poor performance of blacks and whites are systematically different. Similar to what was found for the performance of women compared to that of men in the previous chapter, the attributions given blacks for high performance were that they were lucky or highly motivated. Equally high-performing whites were seen as able and well educated. Poorly performing blacks were perceived as showing their lack of ability and education; poorly performing whites, their anxiety and lack of luck or motivation (Pettigrew, Jernmott, & Johnson, 1984).

Bigoness (1976) found that raters tended to give higher ratings to poorly performing blacks than to poorly performing whites yet rated high-performing whites and blacks similarly. Bartol, Evans, and Stith (1978) concluded after a review of studies<sup>9</sup> that there was a tendency to evaluate black leaders more positively on relations-oriented than task-oriented factors.

For example, Beatty (1973) found that sponsoring employers' perceptions of social behaviors, such as friendliness and acceptance by others, had a greater influence on the employers' performance ratings of new black supervisors than did employers' perceptions of the new black supervisors' task-related behaviors. At the same time, Richards and Jaffee (1972) obtained results suggesting that subordinates with more liberal attitudes were more likely to give their black supervisors higher ratings, especially on human relations skills, than were subordinates with less liberal attitudes. This finding may account for the different results obtained in field and laboratory studies by Kraiger and Ford (1985), who completed a meta-analysis of 59 studies involving almost 15,000 black and white ratees. Whites tended to give higher ratings to white supervisors; blacks tended to give higher ratings to black supervisors. The effects of race were substantial in the field studies but close to zero in the laboratory studies. (Most laboratory studies are done in college settings, where norms for racial equality and against racial bias are likely to be greater than in the field.) Nonetheless, reports of bias have not been uniform in either setting. There has been a considerable variation in findings.

Burroughs (1970) studied black and white girls in discussion groups. White followers rated black leaders higher when they exhibited a high quality of performance. But Hall and Hall (1976) found no differences due to race or sex in undergraduates' ratings of a case of an effective personnel administrator. And Durojaiye (1969) studied the effects of sex and race on sociometric choice among schoolchildren aged 8 to 11. Although these children preferred friends of their own sex and race, neither sex nor race influenced their choice of leaders. However, Richards and Jaffee (1972) found that, as a whole, white trained observers judged black leaders more severely than they did white leaders. But Vinson and Mitchell (1975) reported the opposite. They noted that from mostly white superiors, black managers received higher performance ratings than did white managers. Schmidt and Johnson (1973) found no differences in peer evaluations among supervisory trainees, whereas among naval squad leaders, W. R. Allen (1975b) found that white leaders received significantly higher ratings from white subordinates than from black subordinates. Similarly, black subordinates chose their black leader as best squad leader in the company more often than they chose their white leader. Finally, Cox and Krumboltz (1958) and Dejung and Kaplan (1962) found, in early nonsupervisory situations, that ratees received significantly higher evaluations from persons of their own race. In the same way, Flaughner, Campbell, and Pike (1969) found that black medical technicians were rated significantly higher by black than by white supervisors.

*Some Implications.* No simple answers emerge to the question of whether racial considerations bias evaluations of performance. As long as one must depend on subjective evaluations of black and white leaders, one must be sensitive to the potential for bias in their evaluations, although such biases may fail to show up in particular instances. One can imagine some circumstances in which superiors will bend over backward to give unearned higher evaluations to black supervisors, but other situations in which prejudice may cause lower-than-deserved ratings. Black subordinates and superiors may feel the need to overvalue members of their own race or may set extra-high standards for them. Student participants' ratings in transitory experimental settings may be freer or more biased by the students' generalized feelings about race in comparison to the ratings by long-time organizational colleagues of the performance of familiar associates. But such colleagues also may be more biased or less biased, depending on their general racial attitudes.

Individual differences may override any possible generalizations. Thus Bass, Cascio, McPherson, and Tragash (1976) collected the responses of 315 managers and professional employees in a large light-manufacturing establishment on 109 racial awareness items. A factor analysis revealed that the respondents differed reliably among themselves to the extent to which they agreed that the effectiveness of blacks in leadership and management is generally influenced by five factors: (1) bias in the system, (2) limited implementation of affirmative action policies, (3) incompetence of black employees, (4) failure to include black employees in the system in a real way, and (5) need for black employees to build self-esteem.

### ***Personal Strategies for Black Managers and Professionals***

Among the personal strategies that African Americans can adopt is to make themselves more valued. They can enhance their competence through higher education, particularly in fields such as engineering or business. They can avoid resegregating themselves within white schools, to develop as much experience and comfort working in a white as in a black world. As Ken Chenault, the black CEO of American Express, noted, "I learned very early to move between both (black and white worlds) and develop a level of confidence no matter what world I am operating in" (Slay, 2003, p. 56). African Americans can seek entry into firms with good track records for developing and promoting blacks. They can seek sponsors and mentors in those firms. They can prepare themselves to be at the margin of two influences, accepting and maintaining both the desirability of their black identity and the organization's values.

Henderson (1986) suggested that individual African Americans need such specific strategies to anchor

themselves in corporate America. They must strengthen their leadership skills and develop a healthy and secure home life. Bowman (1964) used the path-goal hypothesis to sum up what African Americans need to consider in their efforts to succeed. In addition to pursuing education, they must believe that their efforts will pay off for them and they must learn to cope with the various social and organizational barriers that stand in their way. Black social identity may need to be emphasized in a black organization but deemphasized in a mainstream organization. Colin Powell, when faced with racism early in his army career, chose to be successful rather than to become enraged by racism (Slay, 2003).

African-American leaders as a group can assist in the process of upgrading those who follow them. Black leaders in the emerging black middle class need to channel their political energy, talent, and imagination to constructive ends, particularly to help cope with the problems of lower-class blacks (Loury, 1985).

Walters (1985) called for a shift in political strategy from the protest movements of the 1960s and 1970s. Much of this has occurred in the past 30 years. Consultation has replaced confrontation. The black community has been reconstructed internally by strengthening its common resource base and its common frame of reference. The newer strategy is harder to pursue as the issues have become so complex that black leaders may have difficulty with their constituencies because of the additional information and comprehension required (Davis, 1987). African American leaders continue to face a strong challenge in unifying the diverse sectors of their community (Jacob, 1985), but signs of their success are prevalent in higher education, suburban living, and leading roles in politics, government, business, religion, sports, entertainment, and the military. Nevertheless, the success is not shared by the one-third or more who remain mired in poverty, unemployment, and slum housing.

## Hispanics

---

Hispanics are the most rapidly increasing minority in the United States. As noted at the beginning of this chapter, they have passed African Americans as the largest minority in the United States and are expected to continue to grow at a faster rate than the mainstream, increasing from over 40 million in 2005 to 88 million by 2050, when one of every four to five Americans is expected to be Hispanic. Sixty percent of the Hispanic population are descendants of the Mexican settlers and American Indians of formerly Mexican territory from Texas to California, but the remaining 40% are divided among recent immigrants from Mexico (66%), Puerto Rico, (9%), Cuba (4%) and from 21 other countries of the Caribbean and Central and South America (21%). Hispanics are far from homogeneous. Many Cubans came from middle-class backgrounds and have moved much more rapidly into positions of political and business leadership than those who came from the Mexican peasant and labor class. The long-established Hispanics of New Mexico contain a small elite of Spanish descent from whom some of the governors of the state have come; they are far different from working-class Puerto Ricans or Dominicans of New York City. An immigrant Chilean engineer of European descent has little in common with the former Indian peasant from Nicaragua or El Salvador (Estrada, undated). Hispanics are concentrated in New Mexico (41% of the population), California (32%), Texas (30%), Arizona (23%), Nevada (17%) and 15% in Florida, New York, and Colorado. They are highly urbanized. Forty-five percent live in Los Angeles, New York, Miami, San Francisco, San Jose, and Chicago. "To build a political base and influence, (many) Latino leaders concentrate their work in populated areas dealing with critical issues that proliferate in urban settings" (Bordas, 2001, p. 125). But they have also led the unionizing of agricultural workers. The rate of employment for Hispanics without college is about the same as for mainstreamers (Boo, 2004).

### ***Socioeconomic Status***

Half of Hispanics are less than 25 years old. Education is a critical issue. Their average educational attainment is low, and their high school dropout rate is high. Latino students have the highest high school dropout rate of all racial and ethnic groups. Disparities in educational attainment begin in kindergarden. Hispanics are handicapped by family responsibilities, poverty, poor schools, placement in lower-track classes, poor self-image, limited neighborhood resources, lack of role models, and negative gender role attitudes (Zambrana & Zoppi, 2002). According to the 2000 U.S. Census, 57% of Hispanics had graduated from high school and 10% from college, compared to 88% of whites graduating from high school and 28% of whites graduating from college. The figures for blacks were 79% and 17%, respectively. Females headed 24% of Hispanic families, compared to 13% of white families. Poverty rates are disproportionately high. In 1999, median family income for Hispanic married couples was \$37,132, for non-Hispanic whites was \$59,697, and for blacks was \$50,656. Most generally, Hispanics are employed in manual labor, service, and support, although in 2000, 15% of Hispanics were employed as executives, administrators, or managers and another 13% as professionals (National Council of La Raza, NCLR, 2004). An estimated 11 million Hispanics have entered the United States illegally in 2006, mainly by crossing the porous border with Mexico. These work as unskilled labor in agriculture and industry, often for less than the legally required minimum wages.

Despite their diversity of race, origin, and socioeconomic status, Hispanics share cultural commonalities that are likely to affect their emergence and success as leaders, as well as their attitudes and performance as subordinates. They are more likely to be found in service and manual labor jobs and to face poverty and language barriers. In large proportions, they are newcomers, and average nine years younger than the general population. We can infer how Hispanics differ from Anglo mainstreamers in their attitudes and behavior as leaders and subordinates from how they differ from mainstreamers in selected attitudes and values that are likely to affect leader-subordinate interactions (Bordas, 2001)

### ***Attitudes and Values***

“Three dynamics ... position Latinos for leadership. *Personalismo* is ... needed to earn the trust and respect of followers. *Tejando lazos* (weaving connections) describes leaders as storytellers, keepers of cultural memory, dream weavers, and dream makers ... The third dynamic ... is knowing how to foster consensus and encouraging collective action” (Bordas, 2001, p. 112). Hispanics are diverse in history and color. Their classification requires answers to two questions, since they can vary in identification in both race and ethnicity (Kirnan, Bragge, DeNicolis, et al., 2001) But they are bound together by the Spanish language, colonization, the Catholic Church, and diverse indigenous roots. They value *confianza*, *respeto*, and being *simpático*. A leader with *confianza* is trustworthy, someone in whom you can confide. A survey of 3,000 Latinos by the National Community for Latino Leadership (NCLL) found that keeping one’s word, doing what you say you will do, and fulfilling promises were the most valued qualities in Latino leaders. Traditionally, *respeto*, deference and respect, was shown to those of higher status and authority by body language, tone of voice, and manners and by offering profuse thanks, praise, and apologies. According to the NCLL survey, leaders need to be unselfish, empathetic, courteous, and respectful. Latino leaders are expected to be *simpático*. Their social relations should be congenial and pleasant. They relate first on a personal level, focusing on “the individual, the family, where people are from, and personal preferences. ... Being polite and gracious ... are just as important as having many achievements” (Bordas, 2001, pp. 116–117). More collectivistic than individualistic,<sup>10</sup> compared to mainstream Americans, an individual Hispanic who is faced with a decision such as whether to join the U.S. Navy will worry about how other Hispanics view the action. Other Hispanics are not likely to favor such a decision, and the individual will worry about how this disfavor will affect his family. Ridicule and

the loss of cultural identity may be seen as the price of entry into mainstream organizations (Triandis, 1981).

*Importance of la Familia.* Leaders of Hispanics must shape organizations to retain relations and personal connections. Of particular importance is the family. In contrast to mainstream Americans, Hispanics are more intensely attached to their nuclear and extended families and more concerned about meeting family obligations and sacrificing their own interests for the sake of their families. Compared to the strong pull of the family, they are ambivalent about work environments (Triandis, Marin, Hui, et al., 1982). They do not separate their professional and personal lives. Trusted leaders are regarded as part of their extended family of intimate friends and godparents. Leaders of Hispanics “are challenged to fashion” organizations that remain “user friendly” and keep the family as the “bridge ... to the impersonal institutions of society” (Bordas, 2001, p. 125).

*Collectivism.* In her dissertation survey of 377 Latina U.S. Army officers, Zoppi (2004) found that collectivistic attitudes headed one of two canonical roots (correlations with other variables). Hispanics have difficulty separating the person from the role taken by the person (Rojas, 1982). Likely to affect their performance as leaders, they tend to emphasize cooperation and assistance as opposed to competition and rivalry (Triandis, Ottati, & Marin, 1982). They are more optimistic about interpersonal interactions but less likely to feel that criticism by another person will be constructive (Triandis, Marin, Lisansky, et al., 1984). Latino leaders have a sense of destiny. They feel that chance, unforeseen events, and outside forces govern their lives. A greater power guides their efforts, unlike mainstream leaders who are more likely to value self-determination and their own individual efforts (Bordas, 2001).

The collectivist values to which Hispanics subscribe, more than do those in the mainstream, that are likely to affect their performance as leaders include being sensitive, loyal, respected, dutiful, gracious, and conforming. Mainstreamers are more likely to emphasize being honest and being moderate (Triandis, Kashima, Lisansky, et al., 1982). Hispanics have the highest participation of any minority in the U.S. labor force. They do not shy away from manual labor as beneath their dignity. Leaders are expected to help with onerous work when necessary. Other important values for Latino leaders include making time for socializing, and sharing. The NCLL survey indicated that Latino leaders needed to express compassion, kindness, and affection. Other ethnics and mainstreamers might be made uncomfortable by the extent to which Latinos are encouraged to express their feelings and emotions, which can result in misunderstandings (Bordas, 1994). To enjoy life is an important value. They commemorate many occasions and spend more on entertainment, movies, food, and eating out than do mainstreamers. They arrange community celebrations and fiestas, and entertain family and friends. They try to balance work with time for having fun (Bordas, 2001). At the same time, there is considerable spirituality among them. “Spirituality for traditional Latinos is a mixture of indigenous beliefs and the influence of the Catholic Church. ... When Latinos marched in support of the farm workers’ rights ... they went in procession with a statue of Our Lady of Guadalupe leading the way” (p. 127).

The attitudes and values of loyalty of Mexican Americans to their ethnic group are factorially independent of their cultural awareness. Arbona, Flores, and Novy (1995) surveyed 364 technical college and university students in south Texas. Two factors emerged in their responses to the questionnaire: (1) ethnic loyalty concerned the students’ preference for one culture over another, (2) cultural awareness involved knowledge and practice of cultural traits.

These analyses, mainly of male Hispanics, do not account for the greater acceptance of responsibilities and leadership in school sports by lower-class Puerto Rican girls in comparison to their matched black or white lower-class counterparts. Klonsky (1987) attributed such results to the closer attention that Puerto Rican girls receive from their overprotective mothers (as observed by Cahill, 1967) and less neglect of them by their fathers than is true for other lower-class children. In general, socialization is greater among Puerto Rican girls than among their black or white classmates.

*Leadership.* Hispanics are more likely than mainstreams to favor supervisors who provide social support

and consideration even if the supervisors are not well organized (Triandis, Hui, Lisansky, et al., 1982). Supervisors are likely to find it useful to keep in mind that some Hispanic subordinates may be hostile to and distrustful of non-Hispanics and the establishment. According to a survey of 139 Hispanic workers by Sanchez and Brock (1996), they may feel discriminated against, resulting in tensions at work, job dissatisfaction, and lack of organizational commitment. For Hispanic workers, links between behavior and reward are less clear. They are likely to be ambivalent about their self-esteem and see themselves as a bundle of roles, rather than as a bundle of traits. They tend to accept and favor social, sex, and power differentiation and will tolerate inefficiency. Furthermore, they are likely to view competence in a task to be less important than agreeableness, conscientiousness, and getting along with others, and will favor equality over equity. In addition, they will tend to favor group over individual assignments but may not necessarily value participative decision making (Triandis, 1984). Consistent with finding that like leadership in many collectivistic cultures, Zoppi (2004) showed that Latina army officers described themselves as more transformational than U.S. norms. They also said they were less passive leaders.

Some evidence has accrued about the impact of black or white supervisors on mixed Hispanic-mainstream groups. For example, Hill and Fox's (1974) examination of the extent to which black and white squad leaders reprimanded or praised their black, white, and Puerto Rican subordinates found that the squad leaders treated all their subordinates similarly. As was noted earlier, although it was expected that one minority group would favor another, Parker (1976) found that Mexican-American subordinates of black and of white industrial supervisors gave the white supervisors significantly higher ratings on support, emphasis on goals, and facilitation of work and interaction than they did their black supervisors.

Among the best-known Hispanic leaders was César Chávez. He embodied leadership that was attuned to the needs of the Hispanic farmworker. As a child, he followed his parents into the fields as a migratory farmworker and witnessed the inhumane treatment of farm labor. He believed strongly in participative leadership. To be successfully unionized, he believed, farmworkers must build and control their organization. There had to be collaboration between the leader and the led. He adapted Saul Alinsky's approach that workers themselves could identify problems and come together to solve them. They could be the source of new ideas and directions. He encouraged workers to take on leadership roles, telling them that good organizers were not afraid to make mistakes. He uplifted the Latinos as no one had before. He made use of Latino rituals, ceremonies, language, dress, religious ceremonies, and prayer meetings (Martinez-Cosio, 1996).

## Other Ethnic Minorities

---

### ***East Asian Americans: Chinese, Japanese, and Koreans***

Considered our model minority, Asian Americans have burst into the U.S. scientific and professional community in record numbers, although they made up only 1.5% of the population in 1980. Asian Americans are likely to be as collectivistic as Hispanics (Hsu, 1981), with a strong sense of family obligations and concerns about their own acculturation. Again, they are diverse in national origin and ethnicity. But Asian Americans suffered from institutionalized legal impediments of state and national restrictions and still suffer from the stereotype that all Asian Americans are foreigners (Locke, 2000). J. Tang (1997) argues that despite their success in science and professional careers, they remain less able to move into management compared to African Americans and whites. In surveys, like Hispanics and blacks they reported more discrimination against them than whites and were more favorable to affirmative action programs than were mainstream whites (Bell, Harrison, & McLaughlin, 1997).

Chinese immigrants first arrived in California in the early 1800s. In the 1848 gold rush, they prospected, mined, and formed a significant source of labor and services. They set up the first school for Chinese children in San Francisco in 1857. The Naturalization Law of 1790 had reserved naturalized citizenship for whites only, and beginning in 1882, further immigration of Chinese and their naturalization were prohibited by the Chinese Exclusion Act. Citizenship was restricted to those of Chinese descent born in the United States until that act was repealed in 1943. (The Cable Act of 1922 had declared that any American woman who married an alien ineligible for citizenship would lose her own.)

The Japanese first immigrated as contract laborers to the then-independent Hawaii after the Chinese, and later followed them to the U.S. West. However, all Asians were excluded from immigration in 1924. During World War II, 120,000 Japanese Americans, two thirds of them citizens born in the United States, were interned in detention camps.

The first Korean workers arrived in Hawaii in 1900; the preponderance of Koreans came to the U.S. mainland during and after the Korean War, which ended in 1953. The same was true for the Vietnamese during and after the end of the war in Vietnam, which ended in 1975 (Chan, 1991). Between 1944 and 1952, all the exclusion orders were repealed. Small quotas were established for Asian Indians and Filipinos, 5,000 highly educated Chinese residing in the United States, and war brides of Asian-American veterans. Not until 1965 was immigration based on national origin abolished. Other immigrants from Asia, such as the Vietnamese, share many values with the Chinese and have similar cultural attitudes.

*Management and Leadership.* In 1985, Asian Americans constituted 8% of the professionals and technicians in the United States but made up only 1.3% of the managers and executives. Some of this difference may be due to racial prejudice, but some may also be due to the ambivalence of Asian Americans toward integration and socialization into the American mainstream's values, attitudes, and behaviors. Conflict is due to a cultural background that stresses modesty and the stereotype of Asian Americans as being passive and retiring rather than having the assertiveness needed for leadership (Yu, 1985). Kelsey (1998) found that when she studied small mixed groups of Chinese and white males, in all the groups, the Chinese had less influence than the whites. Whites were more talkative than the Chinese Americans and whites became the leaders. Nonetheless, in 1946, Wing F. Ong became the first Asian American to be elected to a state office (the Arizona House of Representatives). Starting in the 1960s, Daniel Inouye began a long career as a U.S. senator and Spark Matsunaga and Patsy Mink as representatives from Hawaii in the U.S. Congress (Chan, 1991). Asian Americans serve in state legislatures and as governors from Alaska to California.

With their family and peer support for education, their large overrepresentation at leading American universities, and their acceptance as professionals and technicians, they are likely to experience an upward trend in such employment unless a backlash occurs. But their movement into management in proportions representative of their numbers in technical and professional work is likely to lag, despite Agor's (1986a) finding that, along with women, Asian Americans in general have more intuitive ability than mainstreamers, which is critical for decision making at higher levels of management. As managers, compared to whites, they reported using less self-disclosure, less self-focused impression management, and less supervisor-focused management. Instead, they tended to employ job-focused impression tactics, but their supervisors said they were not impressed. Furthermore, Asian Americans don't do as much impression management to improve supervisor-subordinate relations as do whites (Xin, 1997). According to Yammarino and Jung (1998), Asian American collectivism is likely to show up in the better or worse treatment of the entire group of followers by their leader, rather than as in each different dyad formed by a white leader with different individual white followers. Jung (1997) compared the performance of 153 Asian American and 194 white American undergraduate students by subjecting them to transformational and transactional leadership simulated by trained actors. Along with the expected positive direct effects on both cultural groups, transformational leadership had indirect effects mediated by the collective efficacy among the Asian Americans, while

transactional leadership had stronger effects on the performance of the white students.

Jung and Yammarino (2001) compared 105 Asian American business students in 30 groups and 31 white American business students in a group task to prepare an essay recommending how to improve the quality of the education provided by the business school so it could be reaccredited. A project manager was provided to each group, whose style and effects were rated by the students afterward. As hypothesized, the correlation between the rated transformational leadership of the manager and the perceived potency of the group and effectiveness of the manager were much stronger for the Asian American students than for the white students, whereas the correlation between the transformational leadership of the manager and the followers' self-efficacy was much stronger for the whites than for the Asian Americans. Jung and Avolio (1998) subjected 153 Asian Americans and 194 whites (mainly students) to a brainstorming task. Compared to whites, Asian Americans generated more ideas when working with a transformational leader than did whites. Collective efficacy mediated the impact of transformational leadership on the Asian Americans but not the whites.

More Asian American leaders are needed in both the public and private sectors, according to the state of Washington's first Chinese American governor, Gary Locke (2000). They are needed: (1) to fight for education, (2) to combat the collective punishment of an entire racial or ethnic group for individuals' actions, (3) to combat hate crimes, (4) to speak out against prejudice, and (5) to protect the rights of immigrants. More leadership is needed to provide "a more vibrant and healthy Asian American community" (p. 1).

### ***South Asian Americans: Indians and Pakistanis***

Along with many other important immigrant groups to the United States, we will have to depend mainly on [Chapter 33](#) to consider how the nationality of their origins affects their attitudes and behaviors as leaders and followers. South Asian Americans have become prominent as small-business entrepreneurs and in the health care industries. Additionally, Indian immigrants have become important to U.S. high tech and higher education.

### ***Native Americans: American Indians, Inuits, and Aleuts***

The Iroquois constitutional arrangement for a council of representatives from the six tribes was well known to Benjamin Franklin and provided him with a model at the U.S. Constitutional Convention in 1787. Prominent American Indian leaders were Chief Sitting Bull, medicine man of the Lakota Sioux; Chief Joseph of the Nez Percé; Chief Seattle of the Suquamish and Duwamish; Chief Tecumseh of the Shawnee; Chief Pontiac of the Ottawa, Potawatomi, and Ojibwa confederacy. They were known for their eloquence, political acumen, strategic thinking, and ability to mobilize movements.

Billy Frank Jr., a Nisqually tribal elder, is a wide-ranging contemporary Indian leader and visionary. Starting as a youth, he was active in the "fishing wars" with state game wardens and police until the historic 1974 Boldt decision in U.S. District Court upheld Indian treaty fishing rights. As of 2003, he was serving as the chairman of the Northwest Indian Fisheries Commission, which he cofounded. He presided over the restoration of the salmon industry, essential to tribal tradition (Adams, 1984, p. 1). The commission represents 20 tribes in Washington state. His peacemaking program has been a model for several other states. He has also played an important role in the WaHeLut school with students from 22 Indian nations. He was involved as a leader in cooperative management environmental agreements dealing with wildlife and water resource planning. In 1976 he worked with the timber industry and the Washington state government to change logging and spraying practices, which helped the comeback of the bald eagle. In 1984, he helped found the Northwest Renewable Resources Center, which mediates natural resources conflicts in six states. In 1989, as chairman of the Native

American Committee of the Washington State Centennial Commission, he argued for celebrating future rather than past Indian interests. In 2003, he declared that Indian tribes have emerged as a political force to be reckoned with.

*Identity.* Native Americans are extremely varied in cultures and values, although they have some values in common. They now constitute more than 300 self-determined nations with sovereignty, and many smaller tribes. They vary in race from white to black because of their traditional tendency toward inclusiveness and inter-breeding. Cheyennes intermarried with Arapahoes, Ojib-ways with Crees, Choctaws with Chickasaws, and so on. One of the spouses would join the other tribe's family, depending on whether it was patrilinear or matrilinear. It was the same for offspring. Adoption of outsiders, individual or groups, was widely practiced. One third of Seminoles are partly descendents of runaway black slaves. Many Indians have English or French surnames going back to early colonial times. Those of mixed race sometimes identify with Indians, sometimes with whites or blacks. John Ross, the seventh-eighths white son of a Cherokee and a fully white mother, led the Cherokees for 20 years in their losing effort to avoid forced resettlement in Oklahoma by the federal government in 1838. John Ridge, one-eighth white and seventh-eighths Cherokee, opposed Ross and led the accommodationist faction supporting the move. This was a cause of divisiveness lasting for several generations. Jim Beckworth, a full-blooded black adopted by the Crows, eventually became a chief.

Nevertheless, strongly influenced by Bureau of Indian Affairs (BIA) personnel, the 1934 Indian Reorganization Act called for constitutions for each tribe that defined as Indian racially those at least one fourth Indian in ancestry. In the 1960s, the U.S. government turned many Indians into non-Indians by unilaterally dissolving 103 Indian groups, such as the Mission Bands of California. Enacted in 1990 but not enforced was congressional legislation to limit Indian identity for arts and crafts to only those created by members of federally recognized tribes. The 1975 constitution of the Cherokee Nation of Oklahoma was the only one to abandon race as a criterion for tribal membership and to return to the traditional Indian openness to enrollment as a tribal member. Formal Cherokee membership grew from 10,000 in 1950 to over 300,000 in 1998. In 1990, self-identification as an Indian could range from 2 million, based on the 1990 U.S. Census, to an unofficial 30 million (Churchill, 1998).

*Deculturation and Assimilation.* Until the 1930s, federal policy was directed toward deculturation and assimilation. While most Indians lived on reservations in 1900, less than 45% do so now. Some now live on farms and ranches. A larger portion live in cities. Many whose homes are on reservations work in the cities. The movement from reservations was encouraged by the 1887 General Allotment Act, which replaced collective ownership of land with individual allotments. Of the 150 million acres of Indian lands, 50 million were allocated to Indians and 100 million were opened to others (Churchill, 1998). No provision was made for any increase in population. Many Indians were completely impoverished. According to Adams (1984), many living on reservations became depressed and apathetic. Many others assimilated and faded into the general population. But the change in America in attitudes toward minorities beginning with the Roosevelt administration (1933–1945) and developments such as fair employment practices, racial integration of the U.S. Army in 1948, and the civil rights legislation of 1965 improved their chances for better incomes, social, and educational condition. Recent years have seen marked improvements, but Native Americans' health, educational levels, and incomes still fall below the mainstream. Many state, federal agencies and NGOs are still directed at the uplift of Native Americans.

Native American names and cultural and spiritual symbols have been adopted by professional sports teams, schools, universities, Hollywood, and corporations. The Washington Redskins and the Atlanta Braves were seen as racist and belittling to Indians by the National Coalition on Racism in Sports and the Media. Students on college campuses helped eliminate attaching the name "Indian" to the Dartmouth and Stanford University teams. Unfair stereotypes and disrespect for Indian nation sovereignty are fostered by the Cleveland Indians baseball fans' supportive gesturing of "scalping" and Braves fans "tomahawk chop." Treating Indians as

mascots, and offensive usage of Indian names and symbols are being fought in courts and boardrooms (Teters, 1999). Until the 1950s, Indians were portrayed in the movies and on television as treacherous villains.

*Education.* Pavel (1999) commented that starting in the 1860s, federal boarding schools were inaugurated to convert Indians from their tribal cultures to the mainstream culture. The model was Carlisle, founded in Pennsylvania in 1875. The students, all male, were expected to learn Christian morality and the benefits of private property. They had to cut their long hair and dress in mainstream clothes. They were forbidden to speak their native tongue and were taught English, mathematics, and a trade to instill the work ethic. The forced transfer of children from tribal homes to boarding schools was strongly resisted. By 1997, this model had long since been abandoned. A comprehensive survey completed by the National Center for Education Statistics (1997) found that 47% of the almost half-million Indian and Alaskan Native American youth were concentrated in 1,244 public schools and 170 BIA schools, out of approximately 82,900 schools nationwide. "This relatively small number of schools enrolling a relatively large number of Native American students has provided fertile ground to improve Indian education. Exemplary programs have advanced Indian education throughout the nation. ... A growing number of schools have dramatically improved academic achievement among Native students" (p. 2). BIA students are required to pass more coursework in English, mathematics, social studies, and the sciences than are public school students. Stricter graduation requirements are observed. In 1989, graduation rates were 82% in BIA schools and 91% in public schools with concentrations of native students. Thirty-three percent of BIA graduates applied for admission to college. The marked advances in native education in the 1980s and 1990s are seen by Pavel, Swisher, and Ward (1996) as a consequence of tribal self-governance and national school movements.

In BIA tribal schools, traditional culture and values are incorporated into the curriculum. One-third of BIA students speak their native language at home; 16% in public schools with high concentrations of natives do so, as well. Almost half of teachers and principals are cultural role models as they identify as American Indians or Alaska natives, and virtually all of them are enrolled in a state or federally recognized tribe. In public schools with high concentrations of native students, 13% identify themselves as tribal members. Thirty-eight percent of BIA teachers are native, most of them members of a tribe. In schools with concentrations of native students, 15% of the teachers are natives, a majority enrolled as tribal members (Pavel, 1999).

A number of major universities such as Penn State, Ohio State, and Arizona State now offer graduate education to prepare American Indians and Alaska natives for leadership in their nations. Harvard University's John F. Kennedy School of Government offers a graduate program dealing with research and executive education to take account of Indian nation sovereignty, institutions, culture, and social and economic development.

*Leadership and Management.* More than 300 self-governing sovereign Indian nations within the 50 states are federally recognized as democratic entities with their own constitutions. Only the federally recognized tribes can participate in federal housing, health, and education programs and maintain their government-to-government relation with the federal government (Echohawk, 1990). Such recognition of sovereignty has permitted the establishment of gambling casinos on tribal land when it is illegal elsewhere in a state. Gambling casinos have turned poor Indian nations into wealthy ones (*Wall Street Journal*, 2004) and enhanced resources for health, education, and welfare. The often large casino revenues have also increased the potential for corrupt leadership. There have been abuses of power by the governing bodies of reservations. They have muffled criticism of mishandling millions of dollars of tribal money. A report by *The Detroit News* (2001) detailed abuses of democracy, judicial process, and financial benefits by the leaders. They used their power to expel political opponents and to change the election rules to favor themselves.

The observed leadership tends to differ from one Native American tribal culture to another. Although in most tribes men are the leaders, women play a more important role among the matrilinear tribes such as the Navajo. Warner (1989) completed a study of American Indian female supervisors and their stereotypes.

Anthropological reports sift out the patterns of consequence. Illustrative was a study by Dekin (1985) of the Inupiat of northern Alaska, who live in the Point Barrow area.<sup>11</sup> Dekin observed that in community meetings, Inupiat leaders need to conform to Inupiat social norms, which would confuse unsophisticated mainstream Americans. Indulgence, indifference, acquiescence, noncompetitiveness, and tolerance are highly valued among the Inupiat and socialized in childhood. These deeply held values are reflected in the unwillingness to impose one's will on others to divert or correct them, particularly if others have already expressed their points of view. Community development and planning among the Inupiat are particularly difficult because of traditional leadership patterns; whoever speaks first determines what will be accepted. Avoidance of conflict and an unwillingness to impose on others or to correct them are the rule. Those with recognized leadership roles, such as the city mayor, must speak first. In public meetings, others are reluctant to disagree with the leaders, so all acquiesce even though they do not privately agree. The followers are tolerant but uncommitted. Elections and secret balloting can produce results that diverge markedly from what was expressed openly at public meetings. Some politicians and administrators take advantage of these norms by obtaining a false consensus in public hearings, despite the fact that if private voting had been allowed, quite different opinions would have been revealed.

The Inupiat's tolerance and indulgence of deviation by followers may be misinterpreted by outsiders as apathy. Rather, these traits represent their reluctance to impose decisions on others, if decisions are made at all. Decisions, which must be made by a single leader, are consciously avoided, if possible, even if doing so means delays or inaction. The Inupiat norms also mean that public safety officers, clerks, and accountants, who must abide by impersonal rules of enforcement in the face of differences of opinion, cannot be selected from among the Inupiat.

### ***Italian Americans***

To the original European immigrants to North America from the British Isles and northern Europe have been added diverse ethnic groups from southern and eastern Europe. Prominent among these immigrants and their descendants are Italian Americans. More than five million Italians emigrated to the United States, mainly from the south of Italy and Sicily, fewer from Rome and the North. In the 1990 Census, the approximately 16 million Italian Americans formed 6% of the U.S. population. Although a majority of the first generation were manual laborers, by 1990 two thirds held white-collar jobs and had moved rapidly into positions of leadership in government and industry. This section points to some elements that may continue to contribute to the leadership and follower performance of Italian Americans. There is a paucity of controlled research on what may distinguish their leadership from the mainstream. Just as American Indians were stereotyped until the 1950s as villains in the movies and television, so Italian Americans were stereotyped in entertainment and by widely publicized accounts of the Mafia as members of organized crime families. Although there has been some immigration of educated middle-class Italian professionals from northern Italy, the large preponderance of Italian immigrants were uneducated peasants from southern Italy and Sicily whose children in the United States moved rapidly into the middle class and a broad range of occupations and professions.

*Social Beliefs.* Prud'homme and Baron (1988) found that Italian Canadians have a pattern of irrational beliefs that are likely to influence their interactions with others and that are different from the beliefs of English Canadians. Social approval ("It is essential that one be loved or approved of by virtually everyone in his community") was more fully endorsed by the Italian Canadians than the English Canadians in their study. This need for social approval is consistent with Rotonno and McGoldrick's (1982) finding that Italian Americans tend to build a network with relatives of the same age, however distant. In contrast to the beliefs of English Canadians, those of Italian Canadians contained more irrational fatalism ("Unhappiness is caused by

outside circumstances, and the individual has no control over it"). This finding by Prud'homme and Baron fit with the sense of resignation to events that Spiegel (1982) observed among Italian ethnics. Prud'homme and Baron also found irrationally high self-expectations in their Italian Canadian sample ("One must be perfectly competent, adequate, and achieving to consider oneself worthwhile") and a necessity for perfect solutions ("There is always a right or perfect solution to every problem, and it must be found or the results will be catastrophic"). There are other elements that may be of consequence to leadership among those who identify with their Italian American heritage. For example, the Italian American community tends to be as cohesive as is the Italian American family, with its emphasis on strong family ties (Ziegler & Richmond, 1972).

*Leadership Status.* Italian Americans have moved into top leadership positions in every walk of American life, as witnessed by Lee Iacocca in industry; Amadeo Giannini in banking; football coach Vince Lombardi; Antonin Scalia on the Supreme Court; Mario Cuomo in politics; Francis Ford Coppola, Martin Scorsese, and Frank Capra as movie directors; Arturo Toscanini as a symphony orchestra conductor; and A. Bartlett Giamatti, as both president of Yale University and commissioner of Major League Baseball. On the local level there are many Italian Americans politicians, such as Fiorello La Guardia, who became mayor of New York with the help of a strong Italian American voting bloc but was reelected on his own merits alone. Former Mayor Rudolph Giuliani of New York City attained his political success by his performance as U.S. Attorney and his national prominence by his pseudotransformational leadership following the destruction of the World Trade Center on September 11, 2001. Italian Americans played an important role in Franklin D. Roosevelt's Democratic Party coalition of ethnic groups, but by the years following World War II, as their social and economic status rose, they became equally likely to support Republican politicians.

Italian Americans have showed up in leadership roles in increasing numbers. In 1950, 6% of the members of the New York State legislature were Italian Americans; in 1994, they made up 34% of the members, far exceeding their proportion of the state's population (Primo, 2003). Italian Americans elected as U.S. Republican and Democratic senators in recent years include Peter Domenici, Alfonse D'Amato, and Rick Santorum. State governors include Ella Grasso of Connecticut and Richard Celeste of Ohio. In addition to New York City, other cities that have elected Italian Americans as mayors include San Francisco (George Mosconi), Philadelphia (Frank Rizzo), and Boston (Thomas Menino). Geraldine Ferraro, a U.S. congress member, was the first woman to be nominated as a vice presidential candidate in 1984.

There are curious anomalies. For example, Italian Americans constitute 26% of Roman Catholic Church membership but only 8% of its leadership. In the private sector, 12% of the CEOs in the Fortune 500 firms have Italian surnames, twice their proportion in the general population, but they total only 3% of senior managers and are overrepresented in middle management. Corporations founded by Italian Americans, such as Bank of America and Planters Peanuts, have none on their executive boards. Chains featuring Italian American food products, such as the Olive Garden and Domino's Pizza, were not founded by Italian Americans, nor do they have any Italian-surnamed senior executives (Italic Institute of America, 2004). In the 1960s, Italian Americans were considered a potent source of elected political leaders. However, assimilation, unrelenting media defamation, and stereotyping in the movies (*The Godfather*) and television (*The Sopranos*) have drained away their potential. Mario Cuomo, an exceptional speaker and popular reelected New York governor, was reported to have turned down the nomination for presidential candidate in 1988 because he didn't think anyone with an Italian name could be elected (Italic Institute of America, 2002).

## ***Jewish Americans***

A national Jewish population survey (2000–2001) estimated that 2.2% to 2.5% of Americans were Jewish. This was much lower than the median estimate of 18% believed to be the case by both Jews and non-Jews,

according to a 1990 national Gallup sampling of the general population. Three percent estimated that 50% or more were Jewish. Even 18% of Jews projected themselves as making up more than 15% of the U.S. population. Except for the recent immigration of Russian Jews, their numbers are not likely to grow much. As of 1996, 53% to 54% had intermarried with gentiles. Three quarters of the children of mixed marriages are not raised as Jewish, and 86% of these children marry gentiles. From colonial times, Jews have been disappearing into the American mainstream culture. Much of the overestimation is probably due to their eminence in science, medicine, law, education, literature, art, music, entertainment, and communications, and their prominence in American life as candidates for national office, such as Joseph Lieberman, as secretaries of state, such as Henry Kissinger, as senators, such as Dianne Feinstein, as governors, such as Herbert Lehman, as financiers, such as George Soros, and as program directors, such as Robert Oppenheimer and Hyman Rickover of applications of nuclear energy.

*Identity.* Identity is a problem. Jews are an ethnic group supposedly identified by religion, yet the 2001 national survey found that 27% of those who identified themselves as Jews said they had no religious preference, compared to 14% of non-Jews who said the same. Only 51% believed in Judaism. Younger Jews want to identify as an ethnic rather than a religious group. The percentage of Zionists had fallen from 90% in 1948 to 22% in 1995. Only 9.7% were Orthodox in religious practice.

Korman (1988) reviewed the research evidence on the Jewish experience in America and concluded that despite the liberalization that has occurred in the mainstream in the past half century, despite the fact that Jews have built and managed many successful organizations, despite their prominence and visibility, and despite strong family support in their development, Jewish Americans remained absent from managerial and executive roles in many of the largest and most important American industries, ranging from oil and chemicals to foods and commercial banking. Paradoxically, they serve in these same industries as professionals, staff personnel, and consultants. There is a parallel here to the experience of women in general, Asian Americans, and other minorities in the past several decades. Although American Jews have reached positions of leadership in government and in selected industries, such as retailing and the communications media, that far exceed their small percentage of the population, they still remain outsiders in their access to careers in line management in many other industries. Although Jews make up less than 2.5% of the U.S. population, 10% of college graduates identify themselves as Jewish, so it would be expected that they would be over-represented rather than underrepresented in management positions. Four decades ago, Powell (1969) found in a survey of 239 executives from a variety of industries that more than 23% said that being Jewish hindered an executive's career, but less than 2% said that being gentile had the same impact. More than 63% thought being Jewish kept one from being promoted, compared to the 24% and 20%, respectively, who said the same about being Mormon or Roman Catholic. But the comparable figures for lack of promotability were less than 4% for Episcopalians, Methodists, Congregationalists, Lutherans, and Presbyterians.

These executives did not base their opinions on lack of competence, morality, or motivation, or on outright discrimination. However, they believed that Jews, Mormons, and Catholics could not develop the network of necessary friendships inside and outside the firm as easily as could a Protestant mainstreamer and could not meet the criteria of social acceptability, compatibility, and "fitting in" in the company. These beliefs, in turn, may have been supported by stereotypes, such as that Jews are overly aggressive. The continued exclusion of qualified Jews as well as Asian Americans and other ethnic minorities from line management appeared to be based primarily on the belief that they were not socially acceptable, which, in turn, reinforced the self-perceptions of the ethnics that they were outside the mainstream. Jews remained outsiders in a "Catch-22" bind: they were excluded from higher levels of management because they were not members of the right social clubs, and they were excluded as members of the clubs because they were Jews and partly because they had not attained the higher levels of management (Zweigenhaft, 1980). Quinn, Kahn, Tabor, and Gordon (1968) found that although 139 executives in the Cleveland-Akron area were generally un-prejudiced in the abstract in

that they agreed that Jewish persons should be hired or promoted to important management positions on the same basis as everyone else, when it came to a concrete decision, a fifth indicated that they would choose a gentile over a Jew with equal qualifications. There also was systematic exclusion from entering the corporation at the bottom. When it was still legal to do so, 50% of the requests for management applicants to the California Public Employment Service explicitly discriminated against Jews, as did 27% in Chicago (Waldman, 1956). Most public and private employment agencies in many other cities continued to accept such open discriminatory requests well into the 1960s.

Jewish executives are likely to be found in representative numbers more often in sales functions and in states such as New York, New Jersey, Pennsylvania, and Illinois that have large Jewish populations. But they were less likely to be promoted to higher positions in corporate headquarters in the 1960s and 1970s. And they were still highly underrepresented on corporate boards of directors (Korman, 1988). However, by the mid-1980s, much depended on differences in industries and specific firms. For example, 27% of senior managers in the apparel industry are Jewish, as are 21% in retail and supermarket chains and 10% in textiles and publishing, but 8% in the aerospace industry and the soap and cosmetics industries, and less than 1% in the petroleum industry. Within industries, they were more prevalent in the smaller firms. And when they did attain top management positions, it was because of their status as founding entrepreneurs or investors, or their staff or outside status and professional accomplishments as lawyers, accountants, scientists, or engineers, not their promotion through line management (Korman, 1988).

Despite all the progress of the past half-century in moving minorities into positions of business and industrial leadership, company policies can still account for much of the continuing discrimination. The exclusion of Jews from entry into line management in industries with few Jewish executives can also occur as a consequence of a corporate policy not to recruit graduates from even highly prestigious schools with more than 30% Jewish enrollment (Slavin & Pradt, 1982) in contrast to recruiting graduates from comparable schools with low percentages of Jewish students. Corporate policy also modifies the potential of prejudicial managers to make biased decisions. Although only 29% of the managers who would prefer to discriminate against Jews in recruiting, hiring, and promotion to management positions said they would act on their biases even if they believed their company was concerned about equal opportunity, 68% would do so if they thought their company did not care (Quinn, Kahn, Tabor, & Gordon, 1968).

There is only indirect evidence about differences in the leadership and leadership preferences of Jews and gentiles. For instance, Jewish Americans are more likely to support liberal political leaders and are much less affected by their income levels in this regard than are gentiles. Higher incomes of mainstreamers ordinarily reduce liberal preferences. Ward (1965) found that when the top management of a firm was composed of Jews rather than of gentiles, the firm's personnel policies and practices were likely to be more liberal. However, firms that had both Jewish and gentile senior managers were even more liberal.

### ***Arab Americans***

From 1960 to 1980, an elite class of Arab Muslims immigrated to the United States from Syria, Jordan, Lebanon, Saudi Arabia, Egypt, Yemen, and other parts of the Middle East. After 1980, they came more from the middle class, and were more alienated from Western values. They and their descendents were more interested in maintaining an Islamic way of life. By 2000, Islamic student associations were common on many college campuses. Some remained more connected to Islamic countries and under the influence of foreign imams in spirituality, culture, and politics. Alienation and discrimination increased with the "war on terror." Younger Muslim Americans became more observant Muslims than their parents. They began to pursue Islamic traditions and practices with a social and political agenda (Abdo, 2004). More will be said about the cultural

elements of Arab leadership in the next chapter.

## Other Minorities

---

### *The Physically Impaired*

Legally, a person has a real or perceived disability if it limits major life activities. Likely to affect the performance of physically impaired people, both as leaders and as followers, is the tendency for impaired people to cut short and distort interactions with them. Presumably, such behavior may reduce the success of handicapped people in leadership positions.<sup>12</sup> Nonetheless, a physical impairment need not be an impediment. Franklin D. Roosevelt still provides an inspiring model of a person who lost the use of his legs at 39 years of age, midway in his political career, but was able to overcome the adversity. The deafblind Helen Keller is another such inspiration.

According to Bell, McLaughlin, and Sequeira (2002), the U.S. workforce includes more than 4.5 million adults with disabilities. In 1986, of these, 46% with disabilities were able to work. By 1995, 15% were telecommuting (Kugelmass, 1995). According to Bell et al., 56% were employed in 2000. Federal legislation was enacted in 1973 to protect against discrimination of disabled government employees. The Americans with Disabilities Act (1990) did the same for all employees in the private sector. Nonetheless, people with disabilities work in less challenging jobs than unimpaired persons. Thirty-six percent of the disabled report having been denied an interview, promotion, or job for which they were qualified and being paid less for work similar to that of those without disabilities. But among 61 managers in the Chicago area, those who had experience hiring people with disabilities said they were more likely to hire physically impaired applicants. The disabled seen as personally responsible for their disability (e.g., deafness after playing in a rock band) are seen more negatively than people with congenital disabilities or those caused by accidents. A model of what coworkers judge as fair for accommodating workers with disabilities based on equity and need has been proposed. Managers with previous experience with the physically impaired say they are more likely to hire disabled job applicants (Messina, Roberts, & Becker, 2004), although there is consistent evidence of pervasive discrimination against highly overweight job applicants and employees (Roehling, 2002). Obese people are subjects of discrimination and are looked on less favorably by employers because of their appearance and their greater health risks. They are not shielded by federal anti-discrimination laws unless they can prove that their obesity comes from physiological causes (Roehling, 2002). Except for a few states including Michigan and California, the obese are not legally protected against discrimination by state laws. Most tend to be excluded from higher-paying occupations. Being obese is perceived by employers and supervisors as self-caused due to lack of self-control, lack of discipline, incompetence, and laziness—traits unfavorable to being recruited, hired, or promoted (Bell, McLaughlin, & Sequeira, 2002).

*Some Evidence.* Few controlled studies have been unearthed that compared impaired and unimpaired supervisors in their leadership of impaired and unimpaired subordinates. When 133 deaf subordinates of 21 deaf and 21 hearing supervisors described the supervisors on the LBDQ-XII in a survey analyzed by Sutcliffe (1980), no differences were revealed except that the deaf subordinates rated their deaf supervisors higher in orientation to higher authority. But Sutcliffe found in interviews that the deaf supervisors achieved the same quality of leadership as the hearing supervisors by keeping their communications short and to the point. They avoided communicating over the heads of their subordinates. Furthermore, the deaf supervisors tended to be more charismatic than the hearing supervisors.

Baker, DiMarco, and Scott (1975) noted a compensatory reaction in supervisory reinforcement of blind

workers. In an experiment with subjects who acted as supervisors, the subjects were more likely to administer rewards to blind workers than to sighted workers for identical performance. In a simulation and in a field study of 41 supervisors and 220 subordinates, Colella and Varma (2001) found that with disabled subordinates, ingratiation was more strongly correlated with supervisors' quality of leader-member exchange (LMX) ratings. The increasing availability of physical and sensory computer aids should lead to more job opportunities for the physically impaired.

### ***The Older Worker***

The aging of the U.S. and European populations makes understanding older leaders and supervising older workers of increasing importance. Legislative sanctions against mandatory retirement have increased the average age of managers, supervisors, and employees. The working life of employees and professionals in the past century has increased from 25 to 50 years. Again, discrimination and stereotyping need to be overcome. Leaders need to be mindful of the age of their followers.

The effects of age on leadership and management are found extensively in previous chapters. With the aging of the population, the interest in, need to, and opportunity to continue working part-time or full-time for those who would have retired in their sixties have increased in the past several decades. Many large employers such as Wal-Mart have found it economically advantageous to employ part-time older workers in large numbers, although little has been published about supervising this group.

*The Older Leader.* Aging has some benefits for leadership. As Simon (1987) concluded, intuition depends directly on the richness of experiences.<sup>13</sup> In a survey of 200 business school alumni, Pinder and Pinto (1974) found that older managers (aged 40 to 55), were less autocratic and more skilled in human relations, compared to younger ones (aged 20 to 29). They were also regarded as more efficient and gathered more information before making a decision. Liden, Stilwell, and Ferris (1996) noted that 122 sales representatives achieved higher levels of performance both objectively and subjectively working under older than younger supervisors. However, Campbell (1981), using a mailed survey administration of the LBDQ returned by 127 program supervisors of community mental health centers as well as by their superiors and their subordinates, obtained only slight differences in LBDQ descriptions. According to a survey of 189 nonfaculty staff members at a university, who were aged 18 to 70, LBDQ ratings of their supervisors' initiation of structure were more predictive of the younger employees' satisfaction. For the older workers, their supervisors' consideration was more important (Gallagher, 1983).

*The Older Subordinate.* Older subordinates are likely to react differently from younger ones to different styles displayed by their leaders. Selvin (1960) examined older and younger military trainees under three types of leadership: persuasive, weak, and arbitrary. For the trainees as a whole, arbitrary leadership generated the most tension and escape activities, and persuasive leadership generated the least. Under persuasive leadership, the younger trainees tended to exhibit aggressive behavior, such as fighting with each other. Under arbitrary leadership, the younger trainees exhibited relatively personal forms of withdrawal behavior, such as attending mass entertainments and sports events and concentrating on their hobbies. Older trainees under the arbitrary leader tended to respond with anger. Liden, Stilwell, and Ferris (1996) reported that older employees performed better on both objective and subjective performance measures, but a meta-analysis by Waldman and Avolio (1986) found little difference in objective performance in studies comparing the job performance of younger and older employees. However, despite the small objective difference between the employees, the subjective performance appraisals by their supervisors were biased in favor of the younger workers. A decrease in sensory and memory functions does accompany aging, but greater experience appears to compensate for these declines.

*The Generation Gap.* Since the publication of the book by Strauss and Howe (1991) on the historical cycling of successive generations born 20 years apart, there has been considerable popular interest focused on the possibility of systematic changes in the managers, leaders, and followers of the *traditional* generation, born approximately between 1925 and 1945; the *baby boomer* generation, born between 1946 and 1965; *Generation X*, born between 1966 and 1985; and the *millennial*, or *Generation Y*, born between 1986 and 2005, who will be entering the workforce in 2010. Strauss and Howe proposed that the values of a generation were shaped by their first 10 years of life, as a consequence of the generation into which they were born. Most currently available empirical research compares the baby boomers and Generation X. Anecdotal evidence suggests that Gen Xers are expected to show more job mobility than baby boomers, to work to live rather than live to work, as the baby boomers do, and to prefer a relations-oriented rather than a task-oriented work environment. It may be of practical use to determine the generational attitudes and behavior, but the differences are likely to be accounted for by the fact that *at any point in time* baby boomers are 20 years older on average than Gen Xers. Prensky (1998) argued that the generation gap requires that personnel under 30 years of age (late Generation X) have to be treated differently from their parents by supervisors and colleagues. They have grown up with advances in technology and have different cognitive styles than older people.

*Studies with No Correction for Age of the Different Generation Members.* Dittman (2005) mentioned a study by Ruth Fassinger of 100 prominent women. The younger women were more likely to question workplace expectations that called for taking work home and working long hours. They expressed concern for their parenting obligations and commitments. A hundred fifty baby boomer managers and leaders were compared with 150 Generation Xers on what it took to keep them committed to their organization. The two generations mentioned the same top seven themes in the same order of importance: compensation (45% versus 34%), challenge (40% versus 33%), support (33% versus 25%), advancement (31% versus 29%), recognition (20% versus 27%), values (18% versus 21%), and organizational success (16% versus 11%) (Bryson & McKenna, 2002). A higher percentage of Gen Xers than baby boomers mentioned five of the same themes.

Rodriguez, Green, and Ree (2003) compared Gen Xers and baby boomers on five themes in a mailed survey of a representative sample of 1,000 personnel managers and executives from five levels of leadership in a telecommunications company. The response rate was 81% (805 responded). Fifty-two percent of the respondents were male, 48% female. Whites constituted 46% of the sample; African Americans, 19%; Hispanics, 29%; and Asian Americans, 5%. The survey was made up of 25 forced-choice pairs of statements, each expected to discriminate between the two generations. The statements were suggested by Bass and Avolio's (1994) definition of transformational leadership. One of each pair was expected to be preferred by baby boomers (older in age); the other, by Gen Xers (younger in age) When forced to choose, boomers differed significantly from Gen Xers. Boomers chose tasks accomplished in several days; Gen Xers chose tasks completed in one day. Boomers (especially women and Hispanics) chose the telephone to compare prices; GenXers chose the Internet. Boomers chose regularly scheduled hours; GenXers chose flexible hours. Boomers chose retirement plans with benefits; GenXers chose a portable 401(k) plan with a lump sum distribution. Boomers chose jobs with security; Gen Xers chose jobs with challenge and fun, again not when age was controlled (p. 10). Smola and Sutton surveyed 350 baby boomers and Gen Xers again years later. They found that values changed as each generation matured. The priority given work and sense of pride in it was reduced. Self-orientation and wanting promotion more quickly increased. Loyalty to the firm decreased in the Gen Xers.

*Studies Corrected for Age.* Hart, Schembri, Bell, et al. (2003) collected survey data from 635 baby boomers (ages 39 to 59) and 382 Gen Xers (ages 21 to 38) from five organizations. Boomers were significantly higher than Gen Xers in organizational commitment, but the results were not at all significant when age was

controlled. The same was true for rewards for loyalty, although the Gen Xers were significantly higher in belief in mobility.

## ***Sexual Orientation***

Gays and lesbians are a minority protected by antidiscrimination legislation. Organizations are increasingly including sexual orientation in their diversity programs (Raeburn, 2000). Gays and lesbians may represent a larger proportion in the workforce than some other minorities included in diversity efforts (Woods, 1993). They usually discover their identity as homosexual in late adolescence or as young adults. They face societal intolerance, fear, and prejudice. In most states, they cannot marry their domestic partners nor obtain the health and social benefits provided to spouses. Homosexuals often have a negative self-image. They often lack confidence in themselves and self-efficacy and are unwilling to compete for advancement (Boatwright, Gilbert, Forrest et al., 1996). Presumably, they are less likely to attempt leadership in a heterosexual group. They choose to work in organizations that have nondiscriminatory cultures and policies. They are now more likely to be open about their sexual orientation, resulting in their greater commitment to such organizations (Day & Schoenrade, 1997).

Trau and Hartel (2002) were able to survey anonymously online 582 gay working men with the cooperation of an Australian organization of gay men. Their education ranged from high school to PhD. They came from nine states ranging from New South Wales to Western Australia. Thirty-six percent were in management and administration; 18% were in health practice; human services, or education; 9% worked in research and policy; 9% were in sales or marketing; 5% in the police or military; 3% in the arts and writing; and the rest in blue-collar and unskilled jobs. Some had disclosed their sexual orientation in their workplace; others were still closeted. In-depth interviews were also completed with career counselors involved in organizational diversity. Results indicated that gay men reporting more difficulties with their identities had lower career satisfaction and less career encouragement. Those who felt a high degree of support and help from their organization and in their career were more satisfied and committed to both. Those who reported that there was fair treatment of gays were also more committed to their organization and felt more satisfaction with their career. Comfort with their sexual identity and disclosure appeared to have little moderating effect on the results. One expected finding from the interviews was the importance of top management's understanding of diversity issues and leadership in providing fair policies and environment in the organization from top to bottom. Ragins and Cornwall (2001) queried 534 homosexual employees and found that homosexuals were more likely to report discrimination when they had no support from organizational policies, worked in groups that were mainly heterosexual, had negative work attitudes, and received fewer promotions.

## **Summary and Conclusions**

---

The many changes that have occurred in this area in recent years suggest the need to discount the findings of many of the earlier studies. The mainstream in the millennial generation is likely to be less prejudiced toward minorities than its predecessors. But discriminatory constraints are still apparent among African American leaders and leaders from other minorities. Leadership styles are affected by whether leaders and subordinates each are black or white. Situational constraints and personal factors may be associated with the emergence of blacks as leaders. The performance and satisfaction of black leaders depends on the extent to which their performance is contingent on the racial composition of their subordinates. The supervision of black subordinates by whites calls for whites' understanding of the black subculture. However, more needs to be known about black leaders' supervision of whites or mixed groups. We are just beginning to learn about

Hispanics, Asian Americans, and those from other racial and ethnic groups as leaders and as subordinates. In each group, different factors may be important. Hispanics and Asian Americans share an emphasis on collectivism over the mainstream emphasis on individualism. While educational achievement is lower for blacks and Hispanics, it is higher than the mainstream for Asian Americans and for Jewish Americans, and although both groups are prominent in corporate America as staff members and consultants, they remain outsiders and are underrepresented in the seats of power in much of American industry. Equally little known but likely to increase in importance for study is the impact of age and physical impairment on supervisory-subordinate relationships when prejudice may outweigh differences in performance.

From examining leadership in subcultures of the United States, we now move on to consider how leadership and its study are affected by the cultures and nationalities of leaders and their followers.

<sup>1</sup> Marginal workers, in this context, were the last hired by and first fired from the automobile assembly plants, the source of better-paying jobs.

<sup>2</sup> See [Chapter 21](#).

<sup>3</sup> See [Chapter 13](#).

<sup>4</sup> As defined in [Chapter 18](#), *direction* or *directive* (italic) refers only to giving orders with or without explanation.

<sup>5</sup> See, for instance, E. W. Jones (1973), T. R. Mitchell (1969), Nason (1972), and C. H. Williams (1975).

<sup>6</sup> SBDQ initiation includes autocratic items (see [Chapter 20](#)).

<sup>7</sup> See [Chapter 18](#).

<sup>8</sup> See [Chapter 17](#).

<sup>2</sup> The studies were by Beatty (1973), Drucker and Schwartz (1973), Huck and Bray (1976), and Richards and Jaffee (1972).

<sup>10</sup> Collectivism versus individualism will be discussed in more detail in the [Chapter 33](#).

<sup>11</sup> The Inupiat are an Inuit (Eskimo) people.

<sup>12</sup> See [Chapter 6](#).

<sup>13</sup> Although I presented examples in [Chapter 8](#) of the potential decline in effectiveness of leadership that may accompany advanced age, I can also cite Armand Hammer, Claude Pepper, Konrad Adenauer, and Colonel Sanders as a few examples of effective older leaders.

---

# Globalization and Cross-National Effects

Some questions about cross-cultural leadership are: how much is it possible to generalize the results of leadership research from one country to another? How transferable are managers with experience and education from one country to another? How do managerial decision-making practices and leadership styles vary in different cultures? What dimensions of leadership are universally relevant while others are culturally specific?

The effectiveness of organizations at home and abroad depends much on their leadership (Hodgetts & Luthans, 1994). Multicultural groups can be highly effective or highly ineffective, depending on whether the diversity of cultures within them is effectively managed (Adler, 1990). To meet this challenge, Gordon and Loden (1989) argued that *pluralistic* leaders are required who: (1) recognize and support diversity at all levels of the organization; (2) are ethically committed to fairness and the elimination of prejudice; (3) are broadly aware of multi-cultural issues, (4) accept feedback and make changes accordingly, (5) are empathic to cultural differences, and (6) create developmental opportunities for their diverse employees.

The internationalization of managing took several new twists in the past 25 years. Multinational businesses and nongovernmental organizations (NGOs) proliferated. European, Japanese, and third-world multinational corporations increased in number and importance relative to the previously dominant U.S.-based multinational corporations. Multinationals increased their presence greatly in the United States itself. This resulted in a much more frequent intercultural mix of foreign ownership and management and North American employees.<sup>1</sup> Thus, Japanese cars began to be assembled in the United States by North American employees under North American and Japanese supervisors and managers for domestic sales and export to Japan and elsewhere. By 2005, China, India, Taiwan, South Korea, and Singapore had become major global players. India had become a telecommunications call center for the English-speaking world. As noted in [Chapter 29](#), a research manager in the United States could be in immediate two-way contact by e-mail and video conference with a sizable number of immediate subordinates in France and China who were engaged in a common project. Such information technology made it possible for one organization to operate continuously on a project 24 hours a day with units located in four locations each successively six time zones apart.

The economies of the former Soviet bloc were built with investment and technology from the first world. Russian gas pipelines became important to industry and heating in western Europe and Japan. The “offshore” relocation of whole plants and industries and the decline of manufacturing from higher-cost-production to lower-cost countries became an important political issue in the first world. Rapidly developing China overtook Japan in production, second only to the United States.

By 2005, the U.S. military had contingents in 130 countries and was trying to establish and maintain peace in Afghanistan, Iraq, the Balkans, and Haiti in collaboration with NATO and other members of the United Nations. Terrorism had taken on a greater international scope from Indonesia and the Philippines to the United States and Great Britain driven by Islamic militants against the Christian “infidels” and Israel. Militant groups such as *Hezbollah* could take over south Lebanon and start a war and, like *Hamas* in Gaza, obtain a significant number of elected seats in the Palestinian parliament.

International organizations such as the United Nations, the International Red Cross, and the World Trade Organization dealt with long-festering disputes within and between countries. Along with its economic integration, a one-world popular culture has emerged from the world market for television, by rock concerts,

and fashions. Multinational military teams and peacekeeping forces have become commonplace. Cross-cultural and multinational research publications on leadership have annually grown more than fourfold in the last half century (Hofstede, 2001, p. 525). First-world universities remain responsible for the advanced education of numerous current and future leaders of third-world nations.

## Issues of Consequence

---

The issues of consequence since 1960 have become more sophisticated. Understanding of universal and culturally specific values and leadership practices has become more complex and realistic. Dimensions of culture have been identified, validated empirically, and replicated in large studies across many countries. The effects of culture on social information processing has been added (Hanges, Dickson, & Lord, 2002). Triandis (1993) observed that parameters can now be established for leadership theories by examining cross-cultural variations.<sup>2</sup>

The internationalization of institutions and their leadership continues to grow. The industrialized societies of Europe, Japan, and the Anglo-American world are converging. The traditional Japanese value of lifetime commitment is becoming less important. In diverse countries such as Argentina, India, Israel, Nigeria, and Pakistan, employment in business and industry has resulted in many converging values (Miner, 1984). A large, affluent middle class with an international outlook is arising in China. Converging values were seen by Podsakoff, Dorfman, Howell, et al. (1986) when they compared Mexican and U.S. employees who were working for the same *maquiladora* firms in Mexico that assemble U.S.-made components for distribution of the final products in the United States and elsewhere. They found little difference in the way the Mexican and U.S. employees in the same firms conceptualized leaders' rewarding and disciplinary behaviors and their effects. Similarly, Smith, Tayeb, Peterson, et al. (1986) found that questionnaire items dealing with relationships, such as those on the consideration scale of the Leader Behavior Description Questionnaire (LBDQ) or on Misumi's PM (1985) (M)aintenance orientation scale kept the same factor structure whether in the United States, Britain, Japan, or Hong Kong. Yet there were variations across national boundaries for items on the scales of initiation of structure and (P)erformance orientation. And, as shall be seen from the considerable research on leadership that has been completed in countries ranging from Australia to Zambia, there are differences in the concept and meaning of leadership.

Chemers (1994) proposed an integrated contingency theory of cross-cultural leadership involving three components: (1) projection of a "leaderly" image that instills in followers an acceptance of the leader's influence; (2) motivating relationships based on understanding followers' needs and providing opportunities to meet those needs; and (3) coordinating efforts and followers' capacities to meet those needs. To this should be added that the leadership will be successful to the extent it fits with universal or culture-specific values. Thus, the successful leader values individual merit in North America but in East Asia, must value group merit. To be successful, the leader's style needs to match the culture's dominant themes. Some cultural differences remain strong. Pakistanis born and raised in Britain may still show Pakistani rather than British reactions to power distance and uncertainty avoidance (Shackleton & Ali, 1990).

*National Wealth.* The global marketplace has increased the spread of income and wealth between the rich and poor nations, both those that can compete successfully and those that fail. Peters (1998) suggested seven determinants that signal nations that fail: (1) restriction on the free flow of information, (2) subjugation of women, (3) inability to accept responsibility for failure, (4) the extended family or clan as the basic unit of social organization, (5) domination by a restrictive religion, (6) a low valuation of education, and (7) low prestige attached to work. Leadership development is handicapped by these same seven national signs. In the

poorer of 36 countries, assertive masculine values correlated with well-being. In the wealthier countries, the opposite was true; feminine caring values correlated with well-being ( $r = .69$ ) (Arrindell, 1998).

*Subjective Well-Being.* In the aggregate, wealthier countries report more subjective well-being. But Latin American countries such as Brazil and Chile report a greater sense of well-being than would be predicted by their wealth. Former Soviet bloc countries and Japan report a lesser sense of well-being than accounted for by income. The sense of well-being has risen in China, India, and Nigeria with increased national development and wealth (Luthans, 2002).

*Caveat.* People and countries with similar cultures are coming together in the process of globalization. Yet Huntington (1993) foresaw a clash between civilizations of people from the Judeo-Christian world and Islam based on fundamental cultural differences in ideologies. Civilizations in conflict are more intransigent and less compromising than nations divided by different national interests or how to balance power. To paraphrase Haire (1966), exporting democracy from the West to the Arab world may be preaching to people who believe in the divine right of kings.

## **Methods**

Most cross-cultural sampling is a matter of convenience and opportunity. Within countries, samples may be small and unequal in size. Representative sampling may be limited to large polling organizations with proprietary interests. Between-country results may thus reflect differences between organizations rather than between cultures or individuals (Adler, 1984). Data from members of multinational organizations in one country may not be comparable with data from members of local firms in another. Complex designs suitable for research in one country may be unsuitable in others. Research is also ethnocentrically biased; the sources of concepts, theories, models, and methods have been primarily American and secondarily European (Den Hartog & Dickson, 2004). As Hofstede (2001) noted, American concepts and theories fit American value patterns. For instance, Maslow's (1954) hierarchy of needs, from security to self-realization, was found valid for American managers but not necessarily elsewhere. What might be true of value patterns in American and other individualistic cultures might not be true in the collectivistic cultures such as China and Japan (Triandis, 2004). Similarly, factor structures of beliefs and personality traits may differ in collectivistic Eastern countries from the individualistic United States. Clusters in 22 European countries that share the same cultural values also share the same concepts of ideal leadership, according to a survey of 6,052 middle managers using the GLOBE project questionnaire of 112 questions about the traits and behaviors of an outstanding leader (Brodbeck, Frese, Akerblom, et al., 2000).

*Language.* The same words in a questionnaire for one country, literally translated, may be different in meaning in another. The internal consistency of correlations among items of the authoritarian *F* Scale in the United States break down in Turkey (Kagitçibasi, 1970). As one crosses national and cultural boundaries, the differences in socialization in the various nations of the world give rise to different conceptions of leadership. To avoid the ethnocentrism endemic in the heavy use of American-originated concepts, cross-cultural research must create its concepts cross-culturally, as was done in the GLOBE project (House et al., 1994). What Western Aristotelian thought conceives of as "either/or" opposites such as pro-activity or reactivity, action or inaction, work life or family life, and self or other, in China the culture sees as the need for harmonious balance between them (Chin, Gu, & Tubbs, 2001). In Iran, being direct is not a prized principle. Praise is

given and promises are made but not meant. Hope is offered when there is no reason. Symbolism and vagueness are inherent. Iran is a poetic culture where “yes” may mean “yes,” “no,” or “maybe.” The practice of insincerity (*taarof*) can be good manners (Slackman, 2006).

Language clearly distinguishes cultures. Needed across cultures are translations that provide equivalent meanings rather than literal translations. The concept of what is good leadership will vary. Even the English word *leader* may not be directly translatable. For instance, it does not easily translate into French, Spanish, or German, so *le leader*, *el lider*, and *der Leiter* may be used instead of the available French, Spanish, or German words, *le meneur*, *el jefe*, or *der Führer*, which connote leadership that is only directive (Graumann, 1986). Replications demonstrating the same phenomenon generalized under differing conditions are helpful. Functional equivalence of subsamples from different countries are an ideal requirement. Quantitative analysis needs to be buttressed by qualitative methods (Peng, Peterson, & Shyi, 1991). The mean variance between countries is likely to be greater than the variance within countries among the same respondents, indicating that WABA analysis is likely to be useful. Larger samples for each country studied are needed from the same representative organizations, as well as control of extraneous differences in the data between countries such as age, sex, education, status, and function. The IBM Work Values Survey and the GLOBE project, described below, are two examples of such efforts. Dorfman (2004) suggests that in the future, studies comparing just a few countries will need to be justified by compelling reasons explaining why they were selected for comparison. Assumptions about rapidly changing countries like China will have to be based on recent findings.

*Cognitive mapping* is an innovative method that Sims and Siew-Kim (1993) applied to studying the tensions involved simultaneously in being a woman, an Asian, and a manager in Singapore. Singaporean women managers used the concepts, beliefs, categories, and ideas in relating anecdotes that were most enlightening in their own language and thought systems. The themes that emerged were integrity, coping with male insecurity, Western versus Taoist-Confucian values, supporting friends and superiors, female leadership, fighting, individual versus group rights, not wishing to undermine others, and high standards for self. On the combined map, for instance, Taoist-Confucian values linked to acting with reticence with seniors, which was seen by Asians as respect. The values also linked with openness and fights, which were enjoyed if they were good fights. Integrity depended on being honest and not on accurate but unsympathetic reporting. Integrity also connected with protecting men from difficult unethical decisions, which indirectly led to coping with male insecurity. As a consequence, men were seen to feel threatened and to become macho and controlling.

*Within-Country Differences.* There is often a failure to appreciate the regional differences in cultures within countries. For instance, in southern Brazil, Lenaetowicz and Roth (2001) examined the differences in values of kiosk owners in four distinct regional groups: *Mineiros* from the mountains of mineral-rich south-central Brazil, *Cariocas* from around Rio de Janeiro; *Paulistas* from around the high plateau surrounding São Paulo; and *Gauchos* from the plains of southernmost Brazil. The 189 kiosk owners varied regionally in their values. Individualistic *Gauchos* emphasized achievement more than did *Mineiros*. The more introverted and reserved *Mineiros* worried about taking risks more than the business-oriented *Paulistas*. The investigators also correlated their findings with business performance. *Paulistas* demonstrated the best business performance (sales to inventory) over a five-week period. Next best were *Gauchos*. In third place were *Cariocas*. In a separate data analysis, *Paulistas* were also better in business than *Mineiros*. Independence and enjoyment correlated with business performance. Concern for security was negatively related to performance.

### ***Similarities and Differences***

Both similarities and differences in leadership are found in cross-cultural research (Dorfman & Ronen, 1991). But there is a tendency to focus more on differences and less on similarities (Fu & Yukl, 2000). For instance, managers in China and the United States view rational persuasion as an effective influence tactic, and pressure as an ineffective tactic. Some behaviors, attributes, causes, and effects are found everywhere. But other elements tend to be concentrated in some cultures and countries rather than others. Executives are faced with the challenge of the global marketplace and what strategy to use in entering a particular local market. They must consider how much they can remain consistent in practices from one country to another and how much they need to consider local uniqueness (Peterson & Hunt, 1997). North American leaders need to consider how adaptable are American leadership theories and styles as they move abroad (Dorfman, Howell, Hibino, et al., 1997).

### ***Cross-Cultural Variables of Consequence***

The values, beliefs, norms, and ideals embedded in a culture affect the leadership behavior, goals, and strategies of organizations (Dill, 1958; Negandhi & Relmann, 1972). Thus Smith and Whitehead (1984) found that North Americans emphasized individual ability and effort as the bases for promotions. In India, advancement was attributed to externalities such as marriage, friends, family, and corruption. Linked with these values and ideals are attributes of cultures such as traditionalism versus modernity, particularism versus universalism, idealism versus pragmatism, cooperativeness versus competitiveness, the sense of duty and obligation, interpersonal competencies, communication skills, effective intelligence, liberalism versus conservatism (political, religious, and social) and needs for achievement, affiliation, and power. Interests, goals, and objectives also differ and likewise contribute to differences in leadership style (Dawson, Haw, Leung, & Whitney, 1971; Negandhi & Estafen, 1967).

### ***Hofstede Indexes***

For his IBM Values Survey, Hofstede (1980) began with 126 survey questions to be asked of individual middle managers, technical professionals, and sales personnel about their personal goals and beliefs. Forty-four questions were extracted from the larger set and subjected to oblique factor analyses. Hofstede conceived five conceptually based indexes of value: (1) power distance (PDI), (2) uncertainty avoidance (UAI), (3) individualism versus collectivism (IDV), (4) masculinity versus femininity (MAS). A fifth index, long-term versus short-term orientation (LTO), was added later. (Hofstede, 2001). The indexes were based on brainstorming of IBM staff with multinational experience, the author's familiarity with the subject, and post hoc factor analyses of data collected from IBM personnel in 50 countries and three regions. The indexes were hypothesized to represent, for each given country, the normative beliefs and personal goals of the average member of the country's middle class. The indexes tended to be independent of one another except that national income had to be controlled to achieve independence between PDI and IDV. This independence disappeared for the other four indexes unless a wide range of rich and poor countries was included in the analysis (Hofstede, 2001). For the index scores and ranks of the 50 countries and three regions (Arab World, East Africa, and West Africa) on the five indexes PDI, UAI, IDV, MAS, and LTO, see Hofstede (2001, p. 500).

1. *Power distance (PDI)* is an index of inequality and dependency in a country or culture. It is based on

- perceptions of the superior's decision making, the type of decision making preferred by subordinates, and whether they fear disagreeing with their superior. Malaysia, Guatemala, Panama, the Philippines, and Mexico were highest in PDI; Austria, Israel, Denmark, New Zealand, and Ireland were lowest. In countries with high power distance, discipline was high but with less acceptance of responsibility.
2. *Uncertainty avoidance (UAI)* is an index of the average respondents' belief about uncertainty in the future. It was assessed by rule orientation, employment instability, and stress. It correlated with the national anxiety level. Greece, Portugal, Belgium, Japan, and Peru were highest in uncertainty avoidance; Singapore, Denmark, Sweden, Hong Kong, and Ireland were lowest.
  3. *Individualism versus collectivism (IDV)* is an index of the prevailing relationship between the individual and the collective. It was assessed by the perceived importance of personal time versus the importance of company time. Favoring collectivism correlated with acquiescence. Collectivism related to the easy integration of the individual into primary groups. Individualism was highest in the United States, Australia, Britain, Canada, and the Netherlands; collectivism was highest in Venezuela, Columbia, Pakistan, Peru, and Taiwan.
  4. *Masculinity versus femininity (MAS)* is an index of the extent to which respondents in a country endorsed work goals usually more popular among men than women. It correlated with greater preference for risk, need for achievement, and differences in values between men and women working at the same jobs. It related to the differences in emotional roles between men and women in a country. Japan, Austria, Venezuela, Italy, and Switzerland were highest in masculinity; Denmark, the Netherlands, Norway, and Sweden were highest in femininity.
  5. Long-term versus short-term orientation (LTO) This dimension, well known to managers and to scholars of organization and strategy, was a fifth index added later. Long-termers are persistent; short-termers expect quick results. LTO is related to focus on the future or focus on the present. LTO was evidenced in a Chinese Value Survey completed by students in 23 countries (Bond & Smith, 1996). The highest factor loading on Long-term orientation was on perseverance (.76). The highest factor loading on short-term orientation was on personal steadiness and stability (-.76). Adaptation was likely to be faster.

The gaps in the indexes between Hong Kong and Britain shifted considerably between 1970 and 1993. PDI increased more in Hong Kong than in Britain; UAI decreased more in Britain than in Hong Kong. The gap in IDV decreased between the more individualistic Britain and the more collectivistic Hong Kong. The gap in MAS between Britain and Hong Kong disappeared (Lowe, 1996). Hoppe (1990) replicated the findings among predominantly European leaders. A review by S ndergaard (1994) of 61 binational and multinational comparative reports found IDV nearly universally applicable, and PDI, UAI, and MAS relevant in many nations in the reports.

Long-term orientation (LTO) predicted transformational leadership in Russia (Ardichvili, 2001). LTO correlated .70 with a World Bank index of national economic growth between 1985 and 1995. National wealth moderated the indexes and their effects. In the wealthier nations, although the indexes were conceptual, only UAI could be extracted as a factor. In 23 countries, the direction of correlation of IDV with MAS reversed in poorer compared to wealthier countries (Hofstede, 2001).

*Caveat.* Hofstede's indexes are widely cited and used in cross-cultural research. Nevertheless, they have been criticized. The 1980 version was dependent on a single source—IBM middle managers working in 50 countries—and on questions not necessarily relevant to non-IBM personnel. They were not a representative sample of a country's middle managers nor of the general population. The 2001 version was enlarged to include non-IBM managers. It ignored within-country heterogeneity. The content of some of the survey items

lacked face validity and was a mixture of different matters. For instance, the masculinity-femininity score of cultures on the MAS was high if cultures were seen as assertive and tough, interested in money, materialistic, uncaring about people or the quality of life, and oriented toward performance and achievement. MAS was low if the culture valued modesty and tenderness, warm social relations, and caring for the weak (Den Hartog, 2004) and in countries where opportunities for women had increased, as, for instance, in Israel, where

women, flextime, and child care and its publicized positive attitudes toward women rapidly increased the opportunities for women and their supply in administration and management from hardly any to 18 percent. By 1982, in Israel, proportionately more female than male supervisors were being elected to offices of blue-collar unions. (Israeli, 1982).

The indexes are correlated. Country IDV is negatively correlated with PDI. Individualism predicts lack of power distance. France and Belgium are exceptions that are strong in individualism but high in power distance. Costa Rica is also an exception: collectivistic, yet low in power distance.

Gerstner and Day (1994) failed to corroborate the existence of an MAS factor. House, Wright, and Aditya (1997) noted that the five scales are not independent of one another and lack face validity. As with the MAS scale, the uncertainty avoidance items include perceived stress, length of time the respondent expects to remain with the company, and whether rules can be broken. All individualism-collectivism items are about the respondent's job goals. Nevertheless, the ranking of the 50 countries on the dimensions has not changed much in 25 years, and several studies have verified the rankings for independent smaller sets of countries (e.g., Ralston, Gustafson, Elsass et al., 1992; Morris, Davis, & Allen, 1993; Smith & Peterson, 1994), as has Hofstede (2001) for the 50 countries from before 1980 to 1990 and beyond.

A Chinese Value Survey (CVS) was administered by Hofstede and Bond (1988) in 20 countries. Its items came from 22 scholars' opinions about Chinese values, and were factored into four dimensions (Chinese Culture Connection, 1987). (1) Integration correlated .65 with Hofstede's country rankings of collectivism (IDV) and  $-.58$  with power distance (PDI). (2) Human-heartedness correlated .67 with femininity (MAS). But (3) Confucian work dynamism was low in correlation with any of the Hofstede dimensions. Hofstede and Bond (1988) used results from countries such as Brazil and India without Confucian or Chinese connections; they felt that the factor was about valuing entrepreneurship. Ng, Akhtar, Ball, et al. (1982) calculated discriminant functions of 100 student-rated values. Two functions emerged matching PDI and IDV; a third function correlated with both UAI and MAS; and a fourth function failed to match any of the Hofstede dimensions. Different questions have been substituted within an index, so that one has to be careful about referring to the same index in different studies. For instance, a question about the importance of earnings and advancement was introduced in 1982 to contribute to the Masculinity-Femininity Index, but the importance of earnings was dropped in 1994 when earnings were negatively correlated with advancement among Eastern European students (Hofstede, 2001). Helmreich and Merritt (1998) obtained Work Values Survey question responses from 15,000 commercial airline pilots from 23 countries. PDI and IDV fit expectations, UAI less so, and MAS not at all. Commenting on these results, Hofstede (2001, p. 67) noted that the "underlying syndrome (of four indexes) can still be universal ... and permanent, but the measuring instruments have to be adapted to the population ... and the times. ... When correlating the country (index) scores, I always include GNP/capita as a (control) variable." For 18 eastern and western nations (nine rich and nine poor), Franke, Hofstede, and Bond (1991) showed that 77% of the growth in GNP between 1965 and 1980 could be accounted for by collectivism (IDV) combined with Confucian dynamics; 81% of the growth in GNP could be accounted for by collectivism combined with competitiveness, Confucian dynamics, and lack of power distance (PDI).

*Stability of Answers to Survey Questions.* Hofstede (2001) found the mean country correlations

between responses to 44 questions completed four years apart by IBM employees in 19 to 29 countries to range from .12 (unclear on duties) to .95 (importance of freedom). Responses to individualism (IDV) question items were less stable, ranging from .09 to .76. Country rankings based on mean responses to questions of satisfaction had a median rate-rerate correlation of only .39. Country rankings based on mean personal goals and beliefs had a median rate-rerate ranking of .76.

### ***The GLOBE Project***

The GLOBE project studied middle managers in the same industries from 62 nations in more than 800 organizations. A coordinating team headed by Robert House collaborated with more than 180 internationally representative investigators! More than 15,000 middle managers participated. A meeting of 84 scholars reached consensus on a universal definition of organizational leadership as “the ability of an individual to influence, motivate, and enable others to contribute toward the effectiveness and success of the organizations of which they are members” (House, Wright & Aditya, 1997). For GLOBE, data were extracted from three industries in all the countries studied: food processing, financial services, and telecommunications. All regions of the world were represented: eastern Europe, Latin America, Germanic Europe, Nordic Europe, Far East, northern Arab, central and southern Arab, Anglo, and Latin European. At least three countries represented each region. India, Pakistan, Japan, and the United States were treated separately. At least 150 middle managers were surveyed in each sector and each country. The unit of analysis for a country was the aggregated responses of middle managers and, wherever possible, from two echelons in the organizational hierarchy above and below them.

Quantitative surveys were combined with narrative case materials. Unobtrusive measures and participant observation were also employed. Data were collected over a three-year period between 1993 and 1995 on leadership preferences, attributes and behavior of outstanding leaders, and organizational and societal culture (House, 1998). The dimensions that emerged from analyses of the data on which countries differed in culture expanded from those of Hofstede's. They depended on the purposes of the analyses. Some were focused on the effects of societal practices; others on the effects of societal values. Some concerned leaders behavior; others implicit theories of leadership. Attributes of leadership compared included autocratic and domineering, decisive, diplomatic, face-saving, self-concerned, inspirational, methodical, performance-oriented, self-concerned, status-conscious, and visionary. Additionally, it was expected that some attributes of leaders, such as integrity, administrative competence, and charisma, would be universally endorsed. However, leader attributes were also expected to reflect societal and organizational culture (House, Agar, Hanges, et al., 1994). Each country's investigators participated in scale development and validation. They also arranged for the translation and back translation of the survey questions, scale development, validation, and collection of data. International meetings of the investigators provided additional sharing of ideas. The GLOBE constructs and model aimed to incorporate thinking about leadership on a global basis (House, Javidan, & Dorfman, 2001).

The 112 leadership items factored into 21 correlated scales. The scales yielded six second-order factors: (1) charismatic (integrity, decisive, performance-oriented); (2) self-protective (self-centered, status-conscious, face saving); (3) humane (modest, humane-oriented); (4) team-oriented (diplomatic, not malevolent, administratively competent); (5) participative (not autocratic, not nonparticipative, delegative); and (6) individualistic (in-dependent, unique) (Den Hartog, House, Hanges et al., 1999). The first of several volumes began to appear summarizing the empirical findings of the GLOBE project (House, Hanges, Javidan, et al., 2004).

# Culture, Country, and Attributes of Leadership

---

Some aspects of leadership are universal (*etic*); they are found in all countries and regions studied. Other aspects are specific (*emic*) to countries and cultures and vary from one country to another. For instance, as nations become industrialized, their leaders come to share many values in common. At the same time, they may continue to maintain some of the values specific to their culture. For instance, 567 managers from 12 nations all agreed that being broad-minded, capable, and courageous was more important to a manager than being forgiving, helpful, and loving. Although the 12 socialist republics of the former Soviet Union entered the market economy, by 1998 only 20% of the GNP of Belarus was due to private enterprises, while 60% of Armenia's GNP was from the private sector. In Eastern Europe, the respective percentages in 14 former Communist countries varied from 35% in Bosnia and Herzegovina to 80% in Hungary.

## Universality

---

Universal leadership tendencies are common to a wide variety of cultures and countries although, at the same time, unique or unusual leadership practices may appear in a particular culture and its institutions (Smith, Misumi, Tayeb, et al., 1989). According to Triandis (1993), one must look hard to find a culture where the high-performance and high-maintenance leader (Misumi's PM leader) is not effective. Again, using standard survey procedures in 12 countries and clusters of countries ranging from the United States and Britain to India and Japan, Bass, Burger, Doktor, et al. (1979) found that managers everywhere wanted to be more proactive and to get work done by using less authority. In the same way, managers with higher rates of career advancement everywhere saw themselves as having higher effective intelligence. The GLOBE project identified 22 universal positive attributes of leadership such as trustworthy, just, dynamic, dependable, and informed. Yet Latin Americans place more emphasis on relationships than do North Americans, who are more task-oriented. In a 24-nation comparative study, Spector, Cooper, Sanchez, et al. (in press), reported that in all 24 nations from Ukraine to Japan and from the United States to China, widely varying in culture, 5,185 managers' sense of well-being at work was directly related to their perceived control.

*Types.* Dorfman and Ronen (1991) suggested four kinds of possible regularities across all cultures: (1) *Simple universals* are illustrated by parenting; humans require parenting for survival. (2) *Variform universals* are regularities such as single parenting, which is frequent in countries with high divorce rates. (3) *Functional universals* such as laissez-faire leadership are seen almost everywhere as dissatisfying and ineffective. (4) *Systematic behavioral universals* are whole theories of leadership that explain a web of relationships across cultures. The effects of transformational leadership on followers' evaluations of their leaders tend to be positive everywhere (Bass, 1997).

Helping to wash out cross-cultural effects may be the more powerful transcending organizational effects of the multinational corporation. For example, to see if the original Early Identification of Management Potential assessment program in the United States could be validated cross-nationally, the analyses were replicated with 800 Exxon managers from Norway, Denmark, and the Netherlands (Laurent, 1970). Success as a manager was measured by salary, adjusted for age and the organization's salary structure. [Table 33.1](#) shows the extent to which the results generalized across the four countries.

The same traits and measurements of ability in Norway, Denmark, and the Netherlands were predictive of the success of North American managers, as well as of managers in other countries who were working in the

same multinational corporation. Cassens (1966a, b) obtained similar results using the same biographical information blank for selecting Exxon executives with samples of nearly 400 Latin Americans working in their native country (Venezuela and elsewhere) and 200 North American managers. There may be several reasons for this similarity. First, universal traits may be involved for relatively uniform tasks. Second, Exxon may tend to recruit “Americanized” Europeans and Latin Americans. Third, socialization processes that occur after one enters an organization may result in uniform requirements that transcend cultures. Another reason that indigenous values are washed out is the convergence in values that occurs among Asians, Africans, and Arabs who have had a westernized MBA education (Mellahi, 2000).

The GLOBE project identified, for 53 countries, 22 of 112 attributes that were universally endorsed as contributing to outstanding leadership (House, Hanges, & Javidan, 2004, p. 677). The criteria for choosing the attributions were that they achieved a country mean of 6 on a 7-point scale (7 = highest endorsement) and that 95% of a country’s respondents gave them at least a score of 5. These were items such as being positive, just, trustworthy, intelligent, encouraging, confidence building, honest, informed, dynamic, and dependable. They were attributions associated with charisma, inspiration, and vision. Eight attributions were universally condemned in a leader: ruthless, asocial, irritable, egocentric, nonexplicit, noncooperative, dictatorial, and a loner. Such leaders were self-centered, malevolent, face-saving, and autocratic (Den Hartog, House, & Hanges, 1999). Dorfman, Hanges, and Brodbeck (2004) considered 21 dimensions and six higher-level factors attributed to outstanding leaders drawn from the GLOBE data. Team-oriented leadership was universally endorsed, as were vision and inspirational leadership.

For eight countries with widely differing cultures, Carl (1999) used GLOBE data from more than 2,300 middle managers to find a highly effective, universal, culture-free profile of charisma: vision, motivation, and proactivity. GLOBE data confirmed, in a multigroup analysis of eight countries, that charismatic leadership revealed a universal profile of visionary, inspirational, and performance-oriented attributes (Carl & Javidan, 2002). In the same way, the GLOBE project established that entrepreneurship had universal appeal in its 62 countries (Gupta, MacMillan, & Surie, 2002).

Robie, Johnson, Nilsen, et al. (2001) found that among various competencies *drive for results* and *analyzing issues* were highly regarded as critical management skill dimensions in the United States and all seven European countries using a managerial performance feedback system. When leaders were assessed by their subordinates in Japan, South Korea, Taiwan, Mexico, and the United States, charismatic leadership, supportiveness, and contingent reward were endorsed in all six countries. On the other hand, directive leadership was country-specific. It yielded positive effects in Taiwan and Mexico, while participative

leadership yielded positive effects in South Korea and the United States.

## Country and Culture Specificity

Although leadership, management, and management education have universal characteristics, they also reflect a country's culture (Thornhill, 1993). GLOBE attributions in the 53-country analysis reported by Den Hartog, House, and Hanges were deemed country-specific if they were seen to contribute to outstanding leadership in some countries and impede such leadership in other countries. They were identified by the intraclass correlations and within-group variance compared to between-group variance for the 53 countries. For example, the attribute *individualistic* had a mean range among countries from 1.67 (moderately impedes outstanding leadership) to 5.10 (moderately contributes to outstanding leadership). Thirty-five of the 112 attributes were identified. They included *evasive* ranging from 1.52 to 5.57; *independent*, ranging from 1.67 to 5.32; and *cautious*, ranging from 1.26 to 5.78.

According to Dorfman, Hanges, and Brodbeck's (2004) examination of GLOBE attributions, being self-protective (self-centered, status-conscious, face-saving, and conflict-inducing) was counterproductive for outstanding leadership in the Scandinavian and German cultures but much less so in Asian cultures. The pattern of attributes specific to German culture and German leadership included a strong orientation toward performance, uncertainty avoidance, and assertiveness, along with low levels of humane orientation. In the workplace, interpersonal relations were stern and straightforward. Compassion was low. German leaders were low in self-protection and team orientation, but at the same time they favored participation and autonomy. "German leaders are tough on the issue, and tough on the person" (Brodbeck, Frese, & Javidan, 2002). Other examples specific to countries and cultures are listed next.

*Family Ownership.* Specific to Indians, overseas Chinese, and many other national groups is the extent that to which their large corporations are owned by a single family. Middle managers can aspire to senior management only if they are members of the family through birth, marriage, or adoption. In China and for overseas Chinese, Hofstede (2001) labels the personal intervention of the owner and his relatives in family-owned businesses "direct supervision." There are many, mostly smaller corporations elsewhere whose shares are owned by a single family. Where trust is low, for example in countries or regions such as Taiwan and southern Italy, small family-owned companies are the rule and large investor-owned corporations are the exception. The leader is the family head, usually the oldest male of the extended family. Criminal gangs like the tongs and the Mafia mirror family enterprises (Fukuyama, 1997).

*Leader Behavior Matches Cultures.* Jackovsky, Slocum, and McQuade (1988) reported that in general the leadership styles of samples of French, West German, Swedish, and Taiwanese CEOs matched the values of their own culture. Bass, Burger, Dokter, et al. (1979) concluded that, more often than not, national boundaries did make a difference in managers' goals, preferences for taking risks, pragmatism, interpersonal competence, effective intelligence, emotional stability, and leadership style. National boundaries also affected the degree to which these attributes were associated with the speed of promotion. Consistent with these findings, on the basis of a survey of 1,768 managers in a single multinational firm, Griffeth, Hom, DeNisi, et al. (1980) found that 52% of the variance in managers' attitudes could be accounted for by their nationality.

*Implementing Plans by Self and Others.* Bass (1977) demonstrated by using exercise organization (Bass, 1975d) that in general, for North American managers, productivity and satisfaction are greater when they complete plans developed in their own group than when they carry out plans assigned by another group. North Americans are extreme in this regard, compared to nationals from selected countries of Europe, Latin

America, and Japan. Objective efficiency was 14% higher for North Americans carrying out their own rather than others' plans. Similar results were obtained for Irish (13%) and French (12%) managers but not for Danish or German managers, for whom it did not make any difference whose plans were followed. In between in these effects were British, Colombian, Italian, Swiss, Belgian, Dutch, and Japanese managers. Although the managers from all the countries studied rated their own plans as better than those assigned to their group by others, the French managers were most exaggerated in this competitive effect.

*Leadership Requirements.* The same method may place a greater burden on leaders in one country than in another. For example, Miskin and Gmelch (1985) contrasted the requirements for leadership of quality control teams in Japan and the United States and argued that Japan's organizational culture (mainly in its larger and better firms and agencies) of entire careers spent in the same organization, security of employment, gradual upward mobility, strong familial relationships, and collective decision making provides more ready-made support for quality control efforts than does the U.S. organizational culture with its short-term company loyalty, tough-minded management, rugged individualism, and ambitious upward mobility. In the United States, the leader of a quality control team needs to place more emphasis on the socioemotional components of the group's cooperation, involvement, commitment, and Long-term loyalty, which are already present in Japanese teams. When data derived from Misumi's PM theory were obtained from shop floor work teams in individualistic work teams and their supervisors in individualist Britain and the United States and in collectivist Hong Kong and Japan, Smith, Misumi, Tayeb, et al. (1989) noted that although the PM dimensions were reliably identified in all four locations, there were systematic differences in the behaviors that fit the dimensions and the way they were applied by the supervisors. Furthermore, although Misumi's Japanese PM theory is applicable universally, there are specific behaviors that differentiate collectivist Japanese and individualist American respondents. For instance, only for Americans is "checking on the quality of a person's work" a behavior contributing to the P(roduction) scale score. Only for Japanese is "waiting longer for tardy employees before showing disapproval" a behavior contributing to the M(aintenance) scale score. Other items are ambiguous in translation and for equivalence need modification before use in the West (Peterson, Brannen, & Smith, 1994). The interaction of P and M is less consistent and clear in the United States than in Japan (Peterson, Maiya, & Herreid, 1993).

*Ubuntu.* Specific to sub-Saharan Africa is *ubuntu*, a way of living. Relationships are reciprocal rather than instrumental. One should treat others as brothers and sisters. "I am because I belong." The extended family is important. To name is to create. Poetry and wordplay are signs of wisdom, as are gray hair and age, which are respected. Time heals. Allow enough for reaching a decision and restoring harmony. Rewards are shared; so is suffering. Solidarity and spirituality are important, as is support for complex consensus (Hampden-Turner & Trompenaars, 1993). Ubuntu is ordinarily collectivistic, but in postapartheid South Africa, blacks are surprisingly individualistic. They are likely, at the managerial level, to be acculturated to the common national culture, which resembles that of the Netherlands and the Anglo-American cluster of nations (Thomas & Bendixen, 2000).

*Islamic Concepts.* Specific to leadership in Islamic countries still influenced by the fourteenth-century Ibn Khaldun's concept is *asabiya*, the cohesiveness that was found in tribal society but not in cities, where coexistence was enforced by a ruling dynasty. After several generations, each dynasty was overthrown by a new dynasty, which began with a new set of rules based on interpretations of the Koran. Muhammed, a religious leader of an autonomous group of followers in Mecca, was inspired by revelation of God's purpose and determined to lead his followers to assert that purpose among the surrounding Jews, Christians, and pagans. The commands imposed on believers on how to live in a community dealt with the many problems, public

and private, from commercial to family “in a disordered but consistent set of absolutes ... everything is owed to God, nothing is owed to Caesar.” The vision in the Koran is one of seventh-century Arabia—loyalty is to the family and the tribe, but accountability for one’s actions is only to God. The threat of punishment or the promise of reward by God is ever-present (Scruton, 2002).

Those matters which in Western societies are resolved by negotiation, compromise, and the laborious work of offices and committees, are the object of eternal decrees, either laid out explicitly in the holy book, or discerned there by some religious leader whose authority, however, can always be questioned by a rival *imam* or jurist, since the *sharia* recognizes no office or institution as endowed with any independent lawmaking power. (Scruton, 2002, p. 5)

Among the Sunnis, the imam leads the community in prayer and is selected for his personal qualities and religious knowledge. Among the Shia, the imam is a descendant of Ali, a first cousin of Muhammed. Arab and Muslim countries are high in power distance and moderately high in collectivism, masculinity, and uncertainty avoidance. Voters in Pakistan and political party holders, using a list of 30 traits, preferred their leaders to be helpful to people, politically aware and reliable, nationalist, and patriotic. Postgraduates highly rated “places country before life,” as did military officers and other ranks. However, unlike civilians, the Pakistani military placed democratic, politically aware, helpful to people, and business awareness at the bottom of the list of 30 preferred traits (Akhtar, 1997).

*Sources of Specificity.* The cultures and nation states that tend to be compared are somewhat arbitrary. In the aggregate, countries and cultures differ from one another in the environments that systematically affect leader-follower relations. They may differ from each other in language, religion, values, attitudes, beliefs, education, social organization, technology, wealth, politics, and law (Terpstra, 1978). National boundaries make a convenient difference. But they may or may not be coterminous with cultural boundaries. The Dutch-speaking Flemish are culturally closer in many respects to their Dutch neighbors in the Netherlands than to their French-speaking Wallonian Belgian countrymen. Nevertheless, it is the national boundaries between the Netherlands and Belgium, not the cultural boundaries between the Dutch and French speakers, that determine the educational institutions, legal forces, political effects, and economic considerations that are of consequence to understanding leadership and management. On the other hand, cultural boundaries are likely to have a greater impact on values, sentiments, ideals, language, and role models.

The combined culture-country effect can be seen when persons from one culture move into a country dominated by another culture. Kelley and Worthley (1981) found that Japanese Americans in financial institutions in Hawaii have managerial attitudes that lie between those of Japanese and American managers. The same kind of result was reported by Zurcher, Meadow, and Zurcher (1965) for Mexican bank officers and employees who were working in Mexico and comparable Chicanos and Anglos who were working in the United States.

### ***Countries Clustered by Cultures***

The universal and specific cultural tendencies are seen in the extent to which countries can be clustered by culture. Thus, North American managers (excluding those in French Canada) tend to cluster with their British cousins on numerous dimensions of leadership behavior and attitudes. Together, they form part of an even larger Anglo-American cluster that includes Australia, Canada, New Zealand, and South Africa. With more than 190 countries in the world, containing several hundred cultures, it is important to try to merge comparisons into a framework of fewer but larger clusters of nations and cultures. Clusters of countries

provide a way to display cross-cultural results in summary form. The labels provide a preliminary identification of the leadership patterns that are likely to be found and the basis for predictions and explanations of what will be found. They may have practical value. For example, they make it possible to determine relevant policies for a country cluster. Preliminary comparisons can concentrate on a dozen clusters, rather than on 192 individual countries.

Ronen and Shenkar (1985) synthesized eight previous efforts<sup>3</sup> to cluster countries according to their similarities and differences in the importance of work, satisfaction with work, autocratic versus democratic attitudes toward work, personal values (such as pragmatism, achievement, decisiveness, and orderliness), and interpersonal values (such as conformity, recognition, and benevolence). Geography, history, language, religions, and technological development strongly influenced the clustering.

*The Anglo-American Cluster.* There are more commonalities than differences among the Anglo countries, for example, in the importance they attach to the individual. In addition to language, these countries also have in common high per capita wealth, democratic forms of government, and a British heritage. Anglo countries differ in particular from the Far Eastern, Middle Eastern, and Arab clusters of countries, which, for instance, place much more of a premium on authority than do Anglos. The Anglo-American cluster places more of a premium on individualism, merit, willingness to take calculated risks, profitability, and productivity. Anglos are more assertive, pragmatic, and trusting of their subordinates to display initiatives. They are more self-determined and imaginative and less judgmental. They are more open and prefer general to close supervision. They engage in more short-term objectives. Compared to other clusters, they place relatively less emphasis on family and employee welfare. They are more ready to compromise than to prolong conflict. Self-control and equality are valued more than in some other clusters.

The Anglo cluster was studied by Kipnis, Schmidt, Swaffin, Smith, and Wilkinson (1984), who found no differences in the various strategies used by 360 American, Australian, and English managers to achieve their personal objectives. Posner and Low (1988) reported more similarities than differences in the value placed on organizational stakeholders and personal traits by 426 Australian and 1,498 U.S. managers. However, Kabanoff and Daly (2000) found that while their leadership and collegiality value structures were similar, elite value structures were more common in the annual reports of 77 Australian firms; meritocratic value structures were more prevalent in the annual reports of 55 U.S. organizations.

*The Scandinavian and Germanic Clusters.* In addition to geographic, historical, religious, and (except for Finland) linguistic affinities, the Scandinavian countries, even more than the Anglo-American countries, strongly support parliamentary democracy in government and industrial democracy in the workplace. Language, industrial development, and attitudes toward work, among other things, tie together the Germanic nations of central Europe. Weissenberg (1979) reported that German-speaking managers varied significantly in their judgments of the importance of 6 of 11 life goals, depending on whether they came from Austria, West Germany, or German Switzerland. The Austrians placed relatively more emphasis on service; the West Germans on leadership, independence, and prestige; and the Swiss Germans, on wealth and duty. Weibler, Brodbeck, Szabo, et al. (2000) found communalities and differences in a survey of 900 Germans, Austrians, and Swiss Germans on leadership attributes, behavior, and leadership schemas. Szabo, Reber, Weibler, et al. (2001) and Brodbeck, Frese, Reber, et al. (2000) found the differences among German, Austrian, and Swiss managers in leadership values and behavior to be much smaller than the differences found among managers elsewhere.

*Latin Europe.* The cluster of Latin Europe—France, Italy, Portugal, and Spain—is separated from its Germanic neighbors by history, language, generally later technical development, and more uniformity in

Catholicism. The distinctiveness of the difference is evidenced in the much slower introduction of organizational development and related participative leadership practices.

The Latin European and Latin American clusters separate the colonizers from the colonized. The Latin European countries are more advanced in their development and more stable politically, for the most part. France, Italy, and Spain have accelerated in technical development. They also tend to be more homogeneous ethnically and racially in their populations than are the Latin American countries, although the numbers of their African immigrants have increased substantially. Common to the Latin European and the Latin American cultures are Roman law and the lack of a consensual basis, which are seen to strengthen the centralization of the state's authority (Faucheux & Rojot, 1979). The Latin cultures also share a lower capacity for openness, trust, and the rational expression of feelings, in contrast to the Anglo cluster. Competence is more likely to be overruled by considerations of formal status in the Latin than in the Anglo cluster. The tolerance for uncertainty and ambiguity is likely to be lower. The transfer of programs and practices, such as management by objectives or organizational development, from the Anglo to the Latin world is fraught with impediments, including the greater Latin than Anglo institutionalized centralization of decision making, bureaucratic protection, state intervention. Lesser importance is attached to internal organizational processes in comparison to the class struggle and to social movements that are external to the individual organization (Faucheux, Amado, & Laurent, 1982). There is also more hidden game playing in the Latin than in the Anglo organization.

*Latin America.* In addition to sharing a common Spanish language and colonial heritage, Spanish America has common patterns of leadership and decision making. For instance, Heller (1969b) stated that South American boards of directors do not seem to abide by standards of Anglo-American efficiency. He also saw common values and habits in Argentina and Chile, each with its own different Latin American subculture, that were deleterious to the effectiveness of organizations. In 59 of 68 business organizations, he observed, board meetings were held without precirculated minutes and agendas. Consequently, the boards spent some 38% of their time reexamining the same subject matter that they had previously discussed. Furthermore, the organizations did not carry out decisions that had been reached by the boards. Heller also noted that managers in these countries tended to equate authority with rapid decision making and to stress its importance. Anglo-American managers commonly try to gather more information before they make a decision. But Heller sensed that in Argentina, Chile, and Uruguay, senior managers were expected to make quick decisions. Adding to the inefficiency of decision making is the Latin American propensity to rely on intuition, emotional arguments, and justifications (McCann, 1964). Thought proceeds in a series of direct perceptions of truths. The truths concern the object being contemplated, independent of any demonstrated reasoning process. The truths are neither verifiable nor repeatable. The tendency is toward action that is improvised—undertaken without conscious planning. When planning is done, projects may be considered completed after they have been planned (*projectismo*).

*East Asia.* Japan, China, and Korea have common roots in the Confucian ideology of harmony through proper obedient behavior according to one's prescribed role in one's family, village, and society. East Asians tend to focus more on social roles and obligations (Fukada, 1983; Markus, Kitayama, & Heiman, 1996). The countries in the East Asian cluster build on their shared Confucian heritage and "shame" culture. Unlike the West's "guilt" culture, in which individuals are accountable mainly to themselves, in the "shame" culture, interpersonal behavior is more restrained. The verdicts of others are more acceptable, as is parental authority (Ronen, 1986). In the Confucian tradition, the stability of society is based on unequal relationships between those unequal in status. Seniors owe juniors consideration and protection; juniors owe seniors respect and obedience. The family is the model for all social organizations. The Confucian Golden Rule, while like

Hillel's, is worded negatively: Do not unto others as you would not have them do to you. The virtuous person works hard, is patient and devoted to becoming educated, and practices moderation (King & Bond, 1985). The boundaries between self and others are unclear. Challenge is less of a personal and more of a collective goal (Metzger, 1977). Little importance is attached to having sufficient time for personal and family life. One's obligation to the family is strong, but being the family breadwinner is what is important, not spending time with the family (Eberhard, 1971). Work and duty are more important than are leisure and enjoyment (Dawson, Haw, Leung, et al., 1971). It is more important to comply with legitimate authority. Personal aggrandizement and advancement are valued less than is recognition by one's peers. Achievement is tied to team efforts (Shenkar & Ronen, 1987). More than for Americans or Europeans, it is important to do things right and to comply with legitimate authority (Latham, 1988). The shared Confucian-principled culture goes a long way toward explaining the rapid economic growth of the "Five Tigers"—China, Taiwan, Hong Kong, South Korea, and Singapore—between 1965 and 1995 (Hofstede & Bond, 1988), despite the setbacks of the Cultural Revolution in China and of the continued recession in the 1990s in Japan. In the early twenty-first century, China has passed Japan and is now second only to the United States in gross national production.

*The Arab Cluster.* The Arab countries form a distinct cluster of countries with authoritarian regimes that resist political liberalization, remain unaccountable to their people, and pocket public assets. Civil liberties are repressed, and the state is controlled by force and conspiracy. Support comes from their common enmity toward Israel. A rich, urban, educated elite and the majority of the both urban and rural agricultural poor prefer strong leaders and remain beholden to their tribal chiefs. But in the past several decades, literacy rates have improved, public administrations have been modernized, women's rights have improved in some Arab countries such as Egypt and declined in others such as Iran, and the structures of tribal societies have changed. The mass media have provided competition with state propaganda. Morocco, Egypt, and Lebanon have become freer (Kubler, 2000). Saddam Hussein's repressive dictatorship was forcefully replaced in Iraq by a coalition force led by the United States with a constitutional government, which had been absent for 35 years. But terrorism, instability, insurrection, and civil war between Sunnis and Shias threaten stability. Islamists remain a threat in many of these countries, as occurred in Iran of a return to the medieval laws and government of religious fundamentalism ruled by the imams, Koran, and *sharia*.

*Eastern Europe.* The countries of Eastern Europe are mainly Slavic and were socialist under Soviet hegemony. Citizens of the former Communist countries were more likely to regard compromise as a personal loss and perhaps unethical as well. They were more supportive of the use of punishment as a deterrent (Cunningham, 1984). As will be noted later, the former Soviet economic system and the Russian historical heritage resulted in different supervisor-subordinate relationships from those in western Europe and North America.

*The Sub-Saharan Cluster.* The sub-Saharan African countries like Angola, Uganda, and Rwanda form a cluster of former European colonies. They remain poor and underdeveloped, scourged by civil wars, corruption, and the AIDS epidemic. Nonetheless, the rural peasants in particular share cultural traits of hospitality and *ubuntu*, a form of collectivism and sociability.

*Other Countries.* Brazil, India, and Israel do not fall into any of the clusters. India's different technological development, colonial history, and heterogeneity of ethnic and language groups and Israel's unique history and development keep them separate from the Anglo cluster. Unlike in Spanish America, in Brazil, Portuguese, Indian, and African influences have had the strongest impact. In contrast to the overly rapid decision making observed by Heller in Spanish-American Argentina, Chile, and Uruguay, Harbron (1965) noted the opposite tendency in Portuguese-American Brazil. Traditional Brazilian managers running inherited

family factories practice *jeitinhos*, finding solutions to small problems and avoiding dealing with big problems with which they have had no experience. They are characterized by languid, compromising, “wait and see” attitudes. Despite this type of leadership, Brazil has undergone a remarkable economic expansion since 1965 that has involved robust (and sometimes ruthless) entrepreneurial activity not often seen in Spanish America.

### ***Cluster and Country Differences***

*Within-Cluster Differences.* Despite these cultural clusters, considerable differences exist among the countries that are clustered on the basis of similar cultures. For example, Hines and Wellington (1974) found that both entrepreneurs and middle managers in New Zealand who were native to Britain had a much higher need for achievement than did those who were native to Australia and New Zealand. Shouksmith (1987) further pointed to the sharp cultural differences in work values and social orientation of the Europeans (*pakehas*) and Maori in New Zealand. The same can be said for the growing number of black leaders and managers in South Africa, in contrast to their white counterparts (Hofmeyer, 1987).

Although the United States and Britain are both in the Anglo cluster, considerable differences are often noted between managers in the two countries. In the United States, it is polite to be friendly whether you mean it or not; in Britain, it is impolite to be friendly if you do not mean it (Terry, 1979). With respect to the firm and the job, in the United States, the shop supervisor, who represents management, is more important to workers’ performance than is the shop steward, who represents the union; the reverse is true in Britain (Earley, 1986).

In an in-basket simulation, U.S. management trainees responded more favorably than did their English counterparts to both praise and criticism, and attached more value to social interaction (Earley, 1985). The results suggest that a contingent reinforcement style of leadership is likely to be more effective with U.S. than with English subordinates.

In particular, Britons are more class conscious. Speech, dress, and style limit mobility and acceptance. It is still much more unusual in Britain than in the United States to move out of the working class into the higher ranks of political and business leadership (Newman, 1985). Nor are leaders likely to be as oriented to the postindustrial world as are their counterparts in the United States, Europe, or Japan. Public school education (actually private, elitist boarding schools) stresses the need for middle-and upper-class Britons to develop a commanding social presence with grace, wit, eloquence, self-possession, and subtlety. Technical and business education are considered to be of less value (Hampden-Turner, 1983).

Although the U.S. and British cultures are similar in many respects, British managers are regarded as less aggressive and less ambitious than their North American cousins. British employees are more likely to regard their jobs as a right and privilege, not something to be earned. Work is less of a focal point in their lives than it is for Americans. British employees see themselves as members of their community; Americans see themselves as members of their company. British managers are more likely than their American counterparts to dislike and distrust foreigners, to be more averse to risk taking, to be fonder of tradition and formality and less accepting of change, to be more class conscious, to want to see more structure, and to follow precedents rather than written codes (Terry, 1979).

The countries in the Latin American cluster vary widely in many ways that are of consequence to leadership. Mexico is characterized by its mestizo majority; Argentina, by its diverse European ethnic groups. Venezuela is thoroughly Latin; Chile is more northern and Latin European. Starting with Cuba in 1959, Latin American and Brazilian governments have moved from rightist dictatorships to populist leftist democracies. In 18 countries of Latin America, most of which had democratized in the past 25 years, a poll of 18,643 citizens and

intense interviews with 231 political, economic, and social leaders, including 41 current or former presidents and vice presidents, found much disillusionment with democracy. Fifty-five percent said they would support a return to an authoritarian regime (Hoge, 2004).

The East Asian cultures also differ in many respects. Confucianism took a different path in Japan than in Korea or China. The result is that in China and Korea, people feel a more personalized loyalty to individuals, family, and kinship, whereas in Japan, people have a greater loyalty to an organization. (The role of the samurai, *joeishikimoku*, formulated in the twelfth century, placed more emphasis on ability and common causes than on blood relations.) There is a greater acceptance of top-down leadership in China and Korea and a greater acceptance of bottom-up leadership in Japan. In Japan, by being competent in playing one's proper role in the organization and being committed to it, one can aspire to rise to the top. Among South Koreans and Chinese in Singapore, Taiwan, and Hong Kong, only members of the family clan who own a firm can aspire to top positions. In Japan, harmony is achieved with leadership that fosters consensus through much participation; harmony is achieved among Koreans and Chinese by leadership that seeks consensus through much more planning and control by the leader (Castaldi & Soerjanto, 1988).

Japan's history and technological development have diverged widely from those of other Far Eastern countries. Professional management appeared earlier in Japan, even earlier than in the West. The history of entrepreneurial activity in Japan was likewise quite different from that found elsewhere in Asia.

Japanese, Korean, and Chinese leadership and management practices are different in numerous ways, despite their common emphasis on collective responsibility and the in-group. Likewise, the preferred management styles of Japanese business students were found to differ significantly from those of Thai business students (Neranartkomol, 1983). In Japan, the East Asian collectivistic loyalty to the family is converted into loyalty to the organization.

Aside from the obvious effects on them of the differences in their economic, political, and social systems, the Chinese in the People's Republic of China diverge from the Chinese in Hong Kong, Taiwan, and Singapore. Unlike those in offshore locations, Selden (1971) found that subordinate officials in mainland China were expected to interpret, modify, and adapt policies that were initiated higher up in the system. Another difference is the greater stress in the People's Republic of China on cooperation among workers and less emphasis on the promotion of managers. These differences were revealed in surveys of Chinese managers' judgments of the importance of various work goals in the People's Republic of China, Hong Kong, Taiwan, and Singapore (Shenkar & Ronen, 1987). They were also seen between 49 managers in the People's Republic of China and 49 managers in Hong Kong by Birnbaum and Wong (undated). Managers in the People's Republic of China valued power differences, risk taking, individualism, and assertive masculinity considerably less than did their Hong Kong counterparts. Consistent with this finding, according to Lindsay and Dempsey (1985), collectivism is shown in the attention that managers of firms in China pay to the lower-level needs of workers and by the managers' holistic concern for workers and for their lifetime employment. Korea is the most Confucian of the countries; by the thirteenth century, Confucianism had replaced Buddhism. Nam (1991) found that Korean managers, following Confucian tradition, accepted responsibility for group failure instead of blaming the group members. Nonetheless, by the 1950s, 20% of Koreans were Protestant Christians. Syngman Rhee, who became the first president of South Korea following the departure of the Japanese colonizers in 1945, was a Christian.

As it did in China, a mandarin bureaucracy emerged with Confucianism. Rules and regulations became de rigueur. Illustrative are the rules for court officials displayed in office hangings in the Duksu royal palace in Seoul, Korea: REGARDLESS OF YOUR RANK, DON'T ENTER THIS OFFICE WITHOUT PERMISSION. ONLY OFFICIALS ASSIGNED TO THIS OFFICE ARE ALLOWED TO ENTER. DO NOT LEAVE THE OFFICE UNLESS ON OFFICIAL BUSINESS.

While Taiwan and Hong Kong have a very large number of small private firms, Korea has extremely large

corporations and a highly concentrated industrial structure. Unlike Japan and more like Taiwan, in Korea families dominate private enterprise, but Korea differs from Taiwan and Hong Kong in its gigantic networked conglomerates, *chaebol*s, such as Samsung and Hyundai. The *chaebol* bears some similarity to Japan's *zaibatsu*. In 1988, three *chaebols* were networks for 672 companies in many different industries that produced 36% of Korea's GNP. *Chaebol* member firms own shares in one another and collaborate on a nonprice basis. They were instituted as government policy by President Park Chung Hee to promote Korean economic development.

The patriarchal family tradition translates into hierarchical and authoritarian leadership in business. Kinship and class are important. Korean entrepreneurs are likely to come from the *yangban* gentleman-scholar class. Although collectivistic like the other Tigers, they also can be more individualistic, and their labor-management relations are more adversarial as in North America and Europe. Investigators are sometime surprised when they fail to find expected differences between Korean and American leadership scale scores (Chah & Locke, 1996). Education and literacy are prized, and managers are recruited mainly from prestigious universities (Fujiyama, 1997).

*Within-Country Differences.* Within-country differences in the cultural orientation of leaders were seen as significant in Italy by Gallino (1975). Three types of Italian managers were observed: the liberal, the lay humanist, and the Christian socialist. These types varied in how they conceived the manager's role and functions, how subordinates should be trained, their use of formal organizational techniques, their models of economic development, their investment preferences, and their attitudes toward the workforce and the representation of workers. Liberal managers were more often found in older, established private companies operating in relatively traditional productive and technological sectors; lay humanists in newer, recently established private companies operating in the advanced production and technological sectors; and Christian socialists in companies run fully or partly by the state. The liberal managers were task-oriented and profit-maximizing, the lay humanists were more concerned about relations and people, and the Christian socialists were oriented toward the public good and the collectivity.

Chowdhry and Pal (1960) also warned against focusing on an overall pattern of values among people within one country, such as India, which could obscure the differences between subgroups in that country. Furthermore, emphasizing the overall patterns of values among countries could miss the commonalities among similar subgroups within these countries. Thus, Singh, Arya, and Reddy (1965) reported that patterns of leadership behavior in Indian villages differed systematically with the leaders' socioeconomic status, caste, and occupation. Similarly, Gopala and Hafeez (1964) reported, for a sample of Indian supervisors, that high educational attainment was associated with favorable attitudes toward employees, while lack of education was associated with a production orientation. But what is of as much or more consequence to leadership in countries such as India are the divisions among communities caused by religion, language, and region.

## Origins of Leaders

---

Differences among countries are the rule rather than the exception when one investigates the origins of their leaders in the public and private sectors.<sup>4</sup> Thus countries may vary in the extent to which their managements are drawn from all social classes or from the upper or lower portions of society. Japan is an almost classless society, in that one can climb to positions of leadership through demonstrated capabilities certified by admission and passage through elite universities. At the other extreme, McClelland (1961) noted that 54% of Turkey's business leaders came from the upper-middle and upper classes. In Turkey, managers in the public

sector come from much different class backgrounds than do managers in the private sector; in contrast, managers in both sectors in Italy have much more similar backgrounds. In Poland, a former socialist country, 96% of the managers reported that they came from the working or lower middle classes. In a country like the United States, managers are drawn somewhat more uniformly from all classes. Neither the working classes nor the aristocracy and upper classes are the prime sources of managers in the private sector in Mexico or Italy.

Curiously, despite their public service leadership, it was not the established landed gentry in Britain who sparked industrialization and the moves toward modernity. Generally, the founders of new industry came from dissenting minorities. In England, the leaders of the industrial revolution were drawn disproportionately from the Methodist and other dissenting religious groups. In Roman Catholic France, until the revocation of the Edict of Nantes in 1685, the source was Protestant Huguenots. In Colombia, much business development was due more to the minority of Antioquian miners than to the landowning latifundists. In India, it was due to the Parsee minority, and in Southeast Asia, to the Chinese minority. In the Western world, the Jewish minority played an important entrepreneurial role (Hagen, 1962).

### ***Differences in History, Climate, and Institutions***

Cross-country comparisons of the differences in the leaders' origins need to consider what are often almost unique circumstances within a given country. For instance, religion and history (the Roman Catholic ethos and the return of French entrepreneurs to France after the British takeover of Canada in 1763) were seen to have retarded the emergence of French Canadians as leaders in Canadian industry and business (Pelletier, 1966). Studies of leadership in the United States, with its cultural emphasis on individualism, action rather than contemplation, pragmatism, and egalitarianism, cannot capture the diversity of relationships found in other countries, which are influenced by their own histories, climates, and institutional peculiarities. In many ways, the U.S. experience has been unique for the development of leadership. Alexis de Tocqueville drew attention to this uniqueness in *Democracy in America* (1832/1966), based on his travels in the United States:

These Americans are the most peculiar people in the world. You'll not believe it when I tell you how they behave. In a local community in their country a citizen may conceive of some need which is not being met. What does he do? He goes across the street and discusses it with his neighbor. Then what happens? A committee comes into existence and then the committee begins functioning on behalf of that need. ... All of this is done without reference to any bureaucrat. All of this is done by the private citizens on their own initiative (quoted in Miller & Hofstede, 1987, p. 91).

The military historian S. L. A. Marshall (1964) noted the surprise in 1917 of the European trainers of the American Expeditionary Force to be sent to France that the U.S. draftees responded naturally to discipline and that a high percentage of them were potential leaders. Getting this army ready was not the formidable task they had originally envisaged on the basis of their European experience.

An institutional peculiarity of the United States is its litigiousness. The country has about 18 lawyers for every 10,000 inhabitants. Legal education is an important source of American leaders in government and business, but it is much less important in most other first-world countries. Japan, in contrast, has one lawyer per 10,000 people. In Japan, one's behavior following an ambiguous agreement is much more important than is the written contract, whose words are critical for the American. Close attention must be paid to the Japanese intimations of their needs without explicit statements of them. To the Japanese, qualifiers are more important than are definite positives and negatives (Morita, 1981). Nor do France (two lawyers per 10,000) or West Germany (four lawyers per 10,000), whose languages are more explicit, depend as much on lawyers as a source

of their leaders as does the United States (Lee & Schwendiman, 1982).

In decided contrast to the United States, in Britain managing in business or industry (other than finance) was not historically the occupation of a gentleman. The eldest son inherited the estate; the younger sons went into the armed services or the church. Middle-class sons went into the professions, the civil service, or the family business. Until recently, a businessman who wanted a title had to work hard for public causes, devoting less time to business and more to public service. But business has finally become respectable; finance always was (R. Stewart, 1966).

In Britain, public school education followed by matriculation at Oxford or Cambridge University was the basis for careers in finance, the civil service, foreign service, the military, and the Church of England (Copeman, 1955). According to an analysis of the educational backgrounds of 3,682 of the British elite by D. P. Boyd (1974), the importance of the public schools and Oxford and Cambridge Universities to careers changed little between 1939 and 1971. Social class traditions and entrance into management as a consequence of social class and academic (nonmanagement) education continue to remain strong.

In Britain, the importance of class and the “right” schools has been coupled with a lack of mobility within the firm. In the traditional British firm, each department was a self-contained unit in which members frequently spent much of their whole careers. In consequence, the members of a department were exposed to a limited range of management attitudes and ideas. They became so immersed in their department’s way of thinking that they were unlikely to be able to think outside this pattern of beliefs (R. Stewart, 1966).

In France, the major route to political leadership and ministerial office is not, as in Britain or in present-day Germany, through election to Parliament; rather, it is often through experience in the civil service and the French president’s or premier’s confidence in the official with such experience. This same source of government leaders was seen in Bismarck’s Germany (Dogan, 1979). But as was noted in [Chapter 30](#), only later in their administration do U.S. presidents draw their cabinet officers from within the government. Early on, presidents seek politically acceptable leaders, for the most part, from business, education, agriculture, and other nonpolitical institutions.<sup>5</sup>

In the Netherlands, participative leadership is an important correlate of transformational leadership. Heroes are less likely to be acknowledged as they are in the United States or Britain. Supposedly, fewer statues of heroes are erected in the Netherlands than in the United States and Britain. In Australia a particularly high value is placed on egalitarianism—a successful leader must remain “one of the boys.” In Mexico, a particularly high value is placed on social status; competent applicants for leadership positions are rejected because of their lower-class status (Den Hartog, House, & Hanges, 1999). This hurts the country’s economic competitiveness. Mexican firms need to become more competitive since they joined the North American Free Trade Agreement, and need to avoid blocking the upward flow of information that is likely when subordinates are afraid to disagree with their superiors (Sibeck & Stage, 2001).

### ***Leadership in the Public and Private Sectors***

Some common patterns have been observed across what at first would appear to be extremely different cultural settings. Wilkinson (1964) noted that Confucian China and Victorian England emphasized the same developmental requirements for leaders in the public sector. Good manners, good form, and classical cultural training better fitted amateurs for government service in comparison to experts with technical or professional education. Civil servants were drawn from the landed gentry and those of middle-class origin who went to the same schools and adopted the accent, dress, and mannerisms of the upper class. Of course, particularly in the People’s Republic of China, leadership in the public sector now originates quite differently. A detailed study by

M. Sheridan (1976) of five prominent women party leaders in the People's Republic of China indicated that they came from families of manual and service workers. They earned merit in their political, familial, and work roles and became models for others. But by the 1990s, as in the former Soviet Union, the new leaders were increasingly likely to come from the favored classes of party officials, military officers, managers, business owners, and intellectuals.

*Meritocracies.* In France and Belgium, educational achievement, a source of income from property, and bourgeois origins underlie the leadership of industry and government. Elite cadres dominate the management of business and government on the basis of an educational level that is not ordinarily attained by children from the working classes. Particularly important is a degree from one of the highly selective *grandes écoles* of technology, administration, and the military. Leadership in nonremunerative high-prestige fields is pursued by those with income from property. In Japan as well, educational achievement, based on graduation from the highly selective and prestigious Tokyo University, is a key to success in business or government.

Strong class divisions characterized the former Soviet Union. Party officials, the military, intellectuals, and industrial and scientific technocrats were the upper classes. The workers and peasants were the lower classes. In a production-oriented economy, engineering or technical training was almost mandatory for advancement in industry. Still a different and changing pattern is seen in Germany. Since World War II, there have been increasing opportunities for people of working-class origins to advance into positions of top leadership in business and governmental service. Before 1945, such leadership was dominated by the landed, business, and military aristocracy (Granick, 1962b).

*Family Control.* A high degree of authority is exercised and obedience demanded in the Indian family system. Children are taught obedience to their elders. This obedience continues into adulthood, as is seen in the lack of delegation in management. Yet subtle constraints prevent the head from giving directions without consulting with senior family members (Chowdhry & Tarneja, 1969). At the same time, it is difficult for nonfamily members to advance into upper-management positions. There is a sharp gap between middle and upper management, unlike, say, the situation in firms in the United States. In India, the managing agency system was the basis for the development of largescale indigenous private and public enterprise, as well as of foreign subsidiaries. The agency promoted, financed, and managed the reorganization of India with capital from London. It was rigidly structured, highly characterized, personal, and likely to be a family unit dominated by one person, the *karta* or head of the extended Indian family, responsible for its other members and with authority over them.

The leadership of a country by the few large landowning families, *latifundismo*, is still strong in many Latin American countries and is a prime cause of revolutionary action. The leaders of business and government in Chile sprang from such a landed aristocracy (Harbron, 1965). In other Latin American countries, the technocrats of public and private enterprise, who are of middle-class backgrounds, are leading social change efforts. Thus, Mexico is a "guided democracy" run by self-made millionaires, an industrial elite, top government bureaucrats, and political figures with middle-class origins. In countries such as Argentina and Peru, the rise of industrial managers from the middle classes occurred with the post-1945 industrial expansion. Lauterbach (1963) observed, in interviews in 13 Latin American countries, that family relationships are important to the emergence as a leader, particularly outside the major industrial centers. There is a lack of specialization. The same person, family, or executive office can administer a wide variety of enterprises. Immediate objectives predominate. Competition is accepted in the abstract, but in practice is considered a bothersome condition to be restrained by public or private action.

## Cultural and Institutional Changes

---

A common set of antiauthoritarian values emerged in the developed nations following World War II. These values emphasized democratic participation in the decisions of organizations and government. According to repeated national surveys, the postwar generation remained more oriented toward freedom of opportunity. It represented a systematic change from the preceding generation, particularly in Germany and Italy. Elsewhere, privileged classes were the rule (Inglehart, 1981). However, although sharp social, economic, and political changes may occur in a country, strong underlying historical continuities remain. For instance, Shouksmith (1987) pointed to the changes in the meaning of work in New Zealand in the 1980s. After a history of full employment, New Zealand faced a situation in which disadvantaged, older, and unskilled workers were finding it increasingly difficult to obtain and keep jobs. And jobs themselves were being deskilled by automation. The social values of the Maori were becoming increasingly important in the work force, as were women.

*France.* Centralization is still characteristic in France. Its most recent appearance occurred with the accession of the socialist president François Mitterrand and the nationalization of 90% of France's banking, its entire steel industry, half of its major electrical, data-processing, and pharmaceutical industries, and its public works construction. Since the Middle Ages and the Counter-Reformation, there has been a centralized government and industry, submission to hierarchy, lack of autonomy, antieconomic attitudes, and a strong civil service in France. Today, centralization continues, with its top management originating in three *grandes écoles* and the meritocracy of the *grand corps*. The favored few remain the symbolic expression of society, whether they work in the public or private sector (Aubert, Ramanantsoa, & Reitter, 1984).

*Japan.* In Japan, economic stagnation set in 1990. The structure of its economy is changing. The close ties in Japan among government, business, and workers are being replaced by increased entrepreneurship, concern for shareholder value, and divestment of unprofitable activities. Lifetime employment has been replaced by layoffs of workers. The low unemployment rate has doubled. Foreign multinational firms such as Ford and Renault are gaining control of failing Japanese corporations. The financial markets are being overhauled. Venture capital firms have appeared (Chandler & Tolbert, 2000). The decline in the industrial base has reduced employment particularly for men aged 24 and under (Struck & Tolbert, 2000).

The downturn of the Japanese economy in the 1990s and beyond radically changed Japanese business practices (Onishi, 2003). The *keiretsu*, large groups of companies that agreed to buy from one another and exclude competition, created inefficiencies in a global economy where firms buy supplies based on price and quality. More innovation and flexibility were needed. Banks continued to carry bankrupt companies on their books. The country now had to face strong competition from China, South Korea, Taiwan, and the other surging Asian Tigers, not to mention the reawakened North American and western European economies. It is particularly in its domestic market that it needed to overcome protectionism, deals made on the basis of personal connections and favoritism, copycat strategies, and corruption (Behr, 1998). The Japanese population needs to shift its emphasis from personal savings to investment, which may in turn mean more old-age insurance and social security. Japan has the highest longevity rate of any nation.

*Other East Asian Countries.* Hong Kong, Chinese values were strongly affected by Western values. Although ethnically Chinese, Hong Kong managers' values were in between those of Chinese and American managers (Ralston, Gustafson, Elsass, et al., 1992). In 1997, the British lease ended and capitalist Hong Kong became part of the Communist mainland. However, Hong Kong was able to continue its successful economy. Meanwhile, the opening of the People's Republic of China to capitalistic enterprise in 1980 resulted in an explosion of private companies side by side with continuing state enterprises. China rapidly overtook Japan as

the world's second largest economy. Its middle management and professionals became mobile. Instead of being assigned to a state enterprise and remaining with it, as in the socialist system, the annual turnover among middle managers is now up to 20% in multinational firms. In 1995, firms were offering 50% or more increases in salaries to retain managers who were threatening to leave (Kaye, 1995).

South Korea and the other East Asian Tigers suffered an economic downturn in the late 1990s and had to make major reforms. In South Korea, to reduce expenses, more flexible union-management agreements were introduced, including wage reductions of 10% to 30%, unpaid leave, and a return of bonuses (Joon-Hun, 1998). The many *chaebol*, large family-founded and family-controlled conglomerates holding companies with diverse interests ranging from electronics to shipbuilding, followed the Confucian principle of deference to the family elder and promotion based on age and seniority. Their productivity was considerably lower than that of their competitors. By the late 1990s, merit increasingly replaced age, seniority, personal relations, and politics, providing opportunities for younger, well-educated managers and professionals and more democratic leadership (M. Baker, 1998).

*Russia.* Tuller (2001) found that early in Russia's transformation from a planned to a market economy, norms for American managers were significantly higher than those of 120 Russian managers who wanted to start a business. But four years later, the national differences between 58 Russians and 59 Americans had almost disappeared. Puffer (1994) noted that market-oriented Russia replaced centralized leadership with shared power; micromanaging with delegation; service to the party and to the collective with individual success; following rules with chasing opportunities; struggling to accomplish the routine with struggling to accomplish the new; two sets of books with wild capitalism; and greasing the wheels of the state with greasing palms with gratuities (*blat*). They learned to do business straight, with less cynicism, overpromising, and emphasis on bigness and quantity. The new Russia and its Confederation of Independent States (CIS) continues to be different in leadership and management ideology from Western countries. Nonetheless, many of the practices of the former Soviet Union are still seen to affect management and leadership in Russia and the CIS.

Successful Russian managers see themselves as working in a collective with community spirit. Authoritarianism is still acceptable if it includes some of the human side of enterprise, paternalism, and egalitarianism. Impersonal group meetings are less valued than one-to-one relations. Productivity per employee is much less than in the West, since there are still many more employees to do the same tasks than in firms in the First World. The law is regarded as having been created to protect those in charge rather than to safeguard personal and intellectual property (Holden, Cooper, & Carr, 1999). There was a decline in personal and political freedom between 1991 and 2004. The authoritarian president Vladimir Putin's administration became increasingly repressive; nonetheless, his approval rating remained at 70% (J. Taylor, 2005).

*Spain.* In Spain in 1975, there was a rapid shift from a highly controlled authoritarian government, which had ruled for almost 40 years, to a liberal parliamentary democracy. The protection and regulation of business of the Franco regime were replaced by the need for leaders of business to survive in the new, highly competitive environment of aggressive unions, changing political ideologies, and autonomous regional governments. Spain's joining the European Common Market added a new challenge of foreign competition and the opportunity of an enlarged market. In Spain, leaders who were adaptable were seen to be of particular importance (Anzizu & Nuenos, 1984).

### ***Changes in Origins and Opportunities for Women Leaders***

The origins of women leaders and their opportunities for leadership can be quite different in different countries. For example, in Egypt, women leaders seem to come from wealthy families, in which females had the requisite educational opportunities and could obtain social prominence and visibility by being active in social work (Khuri, 1981). In Italy, the small percent of business executives who are women is likely to come from families who own their own businesses; nevertheless, a woman headed Italtel, the top telecommunications company in the country. In Britain, the universities are becoming a source of women managers. Between 1965 and 1983, Singapore's national policy of support for training programs for women, flextime, and child care, and its publicized attitudes, greatly increased the percentage of woman leaders from almost zero to 18% in administration and management. The percentage continues to increase. By 1982 in Israel, many more women were being elected to offices of blue-collar unions (Israeli, 1982). Women serve as prime ministers and occupy other important political offices around the world, as already noted in [Chapter 31](#). In parliamentary democracies, they sometimes constitute more than 40% of the members of a national legislature. In the GLOBE data, Bajdo and Dickson (2001) found that the estimated percentage of women in management in a country was correlated with country means of gender egalitarianism and humane management.

### ***Socioeconomic Development, Climate, and Delegative Leadership***

Historians have noted the success or failure of societies at the societal level. Thus, for Toynbee (1987), civilization developed and thrived where the climate was neither too severe nor too mild. This was corroborated by Van de Vliert, Huang, and Parker (2001). However, leadership style appears to be affected in the opposite way when it results in leaders' relying for guidance on their subordinates' judgments and decisions. Reliance on subordinates' judgments by 4,022 senior executives in 59 countries correlated nonlinearly .43 and .76 with national development. National development was correlated with Hofstede's (2001) cultural indexes of power distance (PDI) and individualism (IDV). Willingness to delegate authority was greatest in underdeveloped and highly developed countries where the climate was uncomfortably cold or hot, as in Estonia, Iceland, Thailand, and Hong Kong. Moderate willingness to delegate was intermediate in countries with moderate levels of development regardless of their climate, such as Brazil, Lithuania, South Korea, and South Africa. Willingness to delegate was lowest in the least and most developed countries with comfortable climates, such as Guatemala, Zimbabwe, Greece, and Uruguay. An explanation of these results was offered by Van de Vliert and Smith (2002) as follows: (1) Basic human needs make life in uncomfortable climates more demanding. (2) The development of societies in uncomfortable climates make their members more interdependent. (3) Leaders in such societies experience more interdependence between their own goals and their subordinates' goals. (4) Greater development provides more resources to meet the demands of the uncomfortable climate. (5) Underdevelopment in uncomfortable climates results in negative interdependence and more willingness to delegate. (6) Greater development produces positive independence and more willingness to delegate in uncomfortable climates.

### ***Cross-Cultural Differences in Planning, Control, and Accounting***

Horovitz (1980) noted the systematic cultural differences in planning and control among Great Britain, France, and Germany, with British managers doing a better job than the Germans. Hofstede (2001) suggested

that personal rather than impersonal planning and control are higher with more power distance (PDI). Cultures and organizations higher in uncertainty avoidance (UAI) want more short-term feedback. Although it was expected that more information and detail in planning and control was desired where UAI was high, Hofstede cited the research of Zaheer and Zaheer (1997) that found the opposite to be true. They examined the number of conversations in an electronic network originated by currency traders from more than 3,000 banks in 23 countries. Information was less likely to be sought by the traders in high-UAI countries. They preferred to rely on set procedures.

Hofstede (2001) regarded accounting systems as culture-based rituals with underlying values. For instance, in Germany and France, accounting is theoretically based on general economic principles; in the United States, accounting is more a matter of traditions seen as established facts. In Germany, annual reports to shareholders offering valuations are the same as those provided to tax authorities. In Holland, Britain, and America, where highly profitable corporations can avoid or defer taxes, they are quite different. In high-PDI countries, accounting is used more often to justify the decisions of those at the top in status and power. In high-UAI countries, accounting systems contain more detailed rules; in low-PDI countries, more decisions are left to the discretion of the organization. The focus on achievement of purely financial targets is higher in masculine (MAS) countries such as the United States and Germany than in feminine countries such as the Netherlands and Sweden. In the West, the managerial or administrative decision itself is much more discrete and separable from the implementation that is to follow. In Japan, the making of the decision is seen as the beginning of a search for the best way to implement it. In the West, a decision is ordinarily identified with an individual; in Japan, it is more often a collective action (P. B. Smith, 1984a). More will be said about this difference later in the chapter.

### ***Traditionalism versus Modernity***

The strength of traditionalism in Pakistan, the strength of modernism in Sweden, and the mix of the two in Japan are well known. Traditionalism emphasizes the family, class, revealed truths, reverence for the past, and an ascribed status hierarchy in which everyone has a rightful place. Modernism stresses merit, rationality, and progress (Inkeles, 1966). Traditionalism takes different forms in Moslem, Hindu, and Buddhist societies. Traditional Muslim Arabs turn the clock back to conform to its medieval culture and the seventh-century Koran, to be learned by heart in the *madrasa*—often the only available education. Modernity is a threat. Traditional Hindu Indians integrate spiritualism and a sense of detachment into their everyday life, but this does not preclude modern education and modern development. In the World Value Survey of 43 countries, Inglehart (1997) found a cultural factor of secular rationality versus traditional authority. The traditional leader is likely to be the oldest—usually male—head of the family. The status of women is relatively low. Corruption may be a way of life and an accepted means of supplementing a bureaucrat's income (Davis, Ming, & Brosnan, 1986). As the members of a society receive more modern education, the society shifts toward modern attitudes. At a certain point, the most educated may revert to a semitraditional point of view and lead a revival of traditionalism, such as has been seen in Iran and elsewhere in the Islamic world.

In traditional societies, such as in rural Indonesia, time is preindustrial and agricultural in orientation. There is no sense of urgency or time pressure. Life is paced naturally; punctuality and long-range planning are unimportant (Davis, Ming, & Brosnan, 1986). There is a multiple instead of a single time frame (E. T. Hall, 1976). In a multiple time frame, the explicit and implicit times to meet may be different, making coordination and decentralization more difficult (Ronen, 1986). Traditional societies are more responsive to authoritative leadership. A modernist leader like Kemal Atatürk in a traditional society like the former

Osmanli Turkey often had to resort to autocratic and coercive methods to promote change. Such a response to authority could be the cause of delay in modernization. Moreux (1971) observed that progress in a traditional semirural French Canadian community was held back by its one wealthy, charismatic leader. Valuing modernity rather than tradition is likely to be accompanied by a reduction in the sense of obligations to family and friends. More traditional French Canadian managers are likely to choose family over business obligations when they are in conflict, whereas the less traditional English Canadians do the reverse (Audclair, 1968). Differential effects on successful leadership are likely to follow. Strong traditionalists are unlikely to be willing or able to lead their followers toward modernity but will be more influential when attempting to turn back the clock.

Within societies that were changing from traditionalism to modernity, systematic differences among students and managers could be observed. Along with the traditionalism of 138 Botswanan students, Ulin (1976) measured their elitism, prejudice, anomie, and authoritarianism. Ulin found that the students were ambivalent about traditionalism and authoritarianism but showed weakened social norms, anomie, and elitist convictions; they held strong anti-Asiatic prejudices and weaker antiwhite attitudes, but they were not biased against other tribes of Africans. In Iraq, a survey of 232 managers by Ali (1982) found that traditional tribalisms were more common in smaller organizations, among older managers, and among those with a lower income.

### ***Particularistic versus Universalistic Orientation***

A particularistic value orientation implies institutionalized obligations to friends, whereas a universalistic value orientation stresses institutionalized obligations to society and places lesser emphasis on interpersonal considerations (Parsons & Shils, 1959). In the particularistic value orientation, family relations and friendships take precedence over considerations of merit and equity. Particularism with reference to work is likely to be more common in a Latin American country; universalism, in the Anglo-American world. As mentioned before, Zurcher (1968) contrasted Mexican, Mexican American, and American bank officers and employees. As expected, the Mexicans were more particularistic than were the Mexican Americans, and the Mexican Americans were more particularistic than were the Anglo Americans. Beyond this, the bank officers, as a whole, were more universalistic than line employees of the same ethnicity. Such universalism correlated with job satisfaction and plans to continue working in the bank (Zurcher, Meadow, & Zurcher, 1965).

### ***Decisions about Compensation***

Schuler and Rogovsky (1998) reported that lack of power distance (PDI) correlated with signs of modernity such as child care at the work site, stock options, and ownership for managers and employees. Evidence of cross-cultural differences in particularism versus universalism among managers was seen in an analysis by Bass, Burger, et al. (1979) of the responses to Exercise Compensation (Bass, 1975b) of 4,255 managers from the same 12 national groups. The respondents had to decide the percentage salary increase to recommend for each of 10 engineers who differed in merit, job context, and personal problems. A universalistic response was seen in managers who awarded salary increases only for merit. Particularism was noted by the respondents' focus on various personal problems rather than on merit as the basis for awarding an increase. Although the 4,255 managers as a whole recommended only 82% as much of an increase for the engineer in the tenth percentile in

merit as for the engineer at the fiftieth percentile, the Indian managers gave him 103% of the average-performing engineer's increase. Only in India was the poor performer given more of an increase than the average performer. Ryterband and Thiagarajan (1968) suggested that in India, a salary increase is seen as a stimulator, rather than as a reward for meritorious performance as is the case in developed countries. They reported a similar tendency for Colombians in contrast to U.S. and Scandinavian managers. For each individual manager in the sample of 4,255, the standard deviation in his recommendations for eight engineers in the fiftieth percentile in merit was calculated by Bass, Burger, et al. (1979). The results confirmed the earlier findings by Ryterband and Thiagarajan that in the less developed countries, family, job insecurity, alternative offers, lack of job prestige, and so on justified such differentials. However, managers from more developed countries (except from Japan) tended to justify salary differentials for people doing the same job only by merit differences among the job occupants. In Bass, Burger, et al.'s (1979) analysis of the results for Exercise Compensation, discussed earlier, Japanese managers stood apart from the managers in the other developed countries in that they awarded a hypothetical engineer in the ninetieth percentile in merit only 138% of the average salary increase, in contrast to the 162% favored by managers from elsewhere, and paid more attention to the engineer's personal problems. However, when Howard, Shudo, and Umeshima (1983) compared the surveyed attitudes and values of Japanese and American managers, they inferred that although the Japanese attached greater importance to socially beneficial values in contrast to the Americans' emphasis on individuality and being straightforward, the Japanese had a higher motivation for money and advancement, but these were to be achieved through collective action. Japanese managers may score puzzlingly low in their preference for good relations with their colleagues (Hofstede, 1980) because such collective feeling is a matter of obligation to them, not a personal preference (Atsumi, 1979).

Japan differed from the West in that salary increases did not accompany merit promotions. Westerners have difficulty appreciating such "empty promotions" (Yokochi, 1989a). Consistent with these conclusions, Beatty, McCune, and Beatty (1988) delineated the policies that differentiated 41 Japanese from 63 U.S. managers. Again, U.S. managers emphasized job performance while the Japanese focused on other elements in deciding on pay increases. Similar to Bass, Burger, et al.'s (1979) findings, the Japanese managers were much less likely to vary the increases for the different employees than were the American managers. Respect for money differed in Taiwan, Britain, and the United States. Chinese employees in Taiwan endorsed the money ethic the most and Americans viewed money as relatively least in importance. At the same time, Americans were most in agreement that money was good (Tang, Furnham, & Davis, 2003).

Attitudes toward merit and competence were also reflected in the differential decisions of more particularistic Greek and more universalistic U.S. personnel directors and students when rating hypothetical applicants for positions in accounting and finance. Triandis (1963) asked 100 American students, 100 Greek students, 32 American personnel directors, and 20 Greek personnel directors to rate 32 candidates who differed systematically in competence, age, sex, race, religion, sociability, and wealth. For the American personnel directors, 54% of the variance in the ratings of the candidates was accounted for by whether the candidates were described as highly competent or barely competent. But such competence accounted for only 24.8% of the ratings of the Greek personnel directors. Competence was even more important to the American students, whereas sociability was particularly important to the Greek students.

### ***Idealism versus Pragmatism***

Pragmatists look for what will work; idealists search for the truth. Pragmatists are opportunistic (England, 1967a). Idealism is greatest and the pragmatic orientation is rare among theology students, regardless of their

cultural background (England, 1970). *Webster's Third International Dictionary* of 1933 included "active and skilled in business" in the definition of "pragmatic." Managers from different countries are more like one another in pragmatism than like compatriots who are not managers (England, 1970). Nonetheless, national differences in judging what is right, good, and important to managers showed up strongly in England, Dhingra, and Agarwal's (1974) survey of more than 2,600 managers in five countries. The primary orientation of 66% of the Japanese, 61% of the Koreans, and 58% of Americans was pragmatic. But it was pragmatic for only 40% of the Australians and 34% of the Indians. Moralism (idealism) was the primary value orientation only for 11% of the Koreans and 12% of the Japanese. However, it was much higher among the Australians (40%) and the Indians (44%).

Variations across countries in pragmatism as opposed to idealism were seen in a multinational survey of IBM personnel completed by Hofstede (1978). Factor scores varied greatly in national norms for personal acquisitiveness in contrast to social concerns. Japanese personnel were most acquisitive, and Scandinavians were most socially concerned. The factor scores were as follows: Japan, 95; Germany, 73; Italy, 70; Britain, 66; United States, 62; Latin America, 61; Belgium 54; India, 50; France, 43; Spain and Portugal, 37; the Netherlands, 14; Scandinavia, 10. (The factor scores for 50 nations can be found in Hofstede, 2001.)

The relatively greater extent of pragmatism among Japanese managers underlies their task and relations orientation toward employees, based on pursuing leadership that works (Yokochi, 1989b). Similarly, for the 5,122 managers in 12 countries who were administered Exercise Objectives (Bass, 1975a) by Bass, Burger, et al. (1979), there were wide variations among the managers of different nationalities on budgeting decisions in their willingness to spend money to deal with problems of social responsibility. Whereas 71% of Latin American managers chose to clean up a stream the company was polluting, only 46% of Japanese managers did so. In a replication by Palmer, Veiga, and Vora (1981), 82% of the Indian managers chose to clean up the stream, but only 61% of U.S. managers did. And the decision of Indian and U.S. managers to reject such expenditures in Exercise Objectives was higher among those with stronger pragmatic values (economic, political, and theoretical) and lower among those with altruistic or idealistic values (social, aesthetic, and religious).

*Relation to Advancement.* England and Lee (1974) found pragmatism, as measured by their Personal Values Questionnaire, to be related to the success of managers in the United States, Australia, India, and Japan. The success of the careers of these approximately 2,000 managers was indexed by their income adjusted for their age. In all four countries, successful managers were more likely to hold pragmatic values emphasizing productivity, profitability, and achievement. Among the managers studied by Bass, Burger, et al. (1979), significant relations were found between nationality and the managers' rate of advancement and the tendency to be idealistic or pragmatic about two of the budgeting decisions. For instance, in general, the slower-climbing managers favored the idealistic decision to accept a costly wage agreement to settle a strike immediately, whereas in India, the faster-climbing managers did so more frequently than did the slower-rising managers. It may be that in India, idealism is more favored for leadership than is pragmatism. In a study of student leaders and nonleaders in India, Kumar (1965) found that unlike the usual results for American or European students, Indian student leaders scored high on theoretical and religious interests, while nonleaders scored high on economic and social values. But Govindarajan (1964) observed that Indian high school leaders were more interested in professional and technical jobs than were nonleaders. They more frequently mentioned salary, prestige, and status as reasons for choosing a job.

### ***Individualism versus Collectivism***

Based on a review of the literature, Triandis (1995) pointed to four ways in which individualism differs from collectivism: (1) Conceptions of the self are different. For the individualist, the self is independent of groups; for collectivists the self is connected to others in various in-groups. (2) Goals differ. Personal goals have priority for the individualist and self-interest overrides collective interests; for the collectivist, personal goals are subordinated to collective goals. (3) Acceptance of prevailing attitudes and norms differ. For individualists, their own beliefs, values and attitudes are more important to their behavior than the prevailing social norms, beliefs, values, and attitudes that drive the collectivists. (4) Orientation toward tasks and relationships differ. Individualists are oriented toward task accomplishment, sometimes at the expense of relationships; collectivists emphasize harmonious relationships, sometimes at the expense of task accomplishment. Additionally, individualists draw a boundary between themselves and others; collectivists distinguish between those who are personally related to them and those who are not. Individualists are more comfortable moving into and out of groups depending on needs and objectives; collectivists are more attached to fewer, more stable, and more closely knit groups. According to Schaubroeck and Lam (2002), in individualist cultures advancement in a unit is related to similarity of personality with that of one's peers. On the other hand, in collectivist cultures, advancement is related to the similarity of the personality of the subordinate to that of the unit supervisor. Earlier, Triandis (1993) had suggested that compared to the individualist, the collectivist (1) bases success on help received rather than own ability; (2) attributes failure to lack of effort rather than difficulties or bad luck; (3) interprets the self in terms of the in-group rather than traits; (4) attaches more importance to group than individual goals; (5) favors interdependence rather than independence; (6) values security, obedience, duty, and intimate relations rather than pleasure, achievement, competition, autonomy, and freedom; and (7) has a few important in-groups in which harmony is valued and social behavior is different from that in many less important out-groups.

*Other Consequences.* When the Schwartz Value Survey (SVS) was administered to participants in 20 countries, Schwarz (1992) found that individualism-collectivism was a higher-order factor. Individualism was composed of the primary factors of (1) power, (2) achievement, (3) hedonism, (4) stimulation, and (5) self-direction. Collectivism, as opposed to individualism, was composed of the factors of (1) benevolence, (2) tradition, and (3) conformity. Individualists were more open to change and would follow their own emotional and intellectual interests. Collectivists are motivated to maintain the status quo and the stability of personal relationships. People in individualistic societies find meaning in life through their uniqueness; people in collectivistic societies find meaning in belonging to their society and identifying with its goals (Schwartz, 1999). Ralston, Holt, Terpstra, et al. (1995) found that mean individualism scores were highest on the SVS for 166 U.S. managers, next highest for 156 Russian managers, next to lowest for 130 Japanese, and lowest or most collective for 152 Mainland Chinese managers. The Americans were highest and the Chinese lowest on openness to change, with the Russians and Japanese in between. Schwartz and Sagie (2000) found in 47 countries that democracy and socioeconomic development enhanced independent thinking and general concern for others, not just close friends and family members. Conformity, tradition, and security became less important. On the other hand, in collectivist societies, more favoritism was observed in evaluations of in-group members and more acceptance of team reward (Kirkman & Shapiro, 2000). In the GLOBE data for individualist countries, outstanding leaders were autonomous, independent, and unique, but these same traits were contraindicated for outstanding leaders in collectivist countries (Den Hartog, House, Hanges, et al., 1999). In 10 countries, Jackson (2001) found systematic differences in ethical judgments, attitudes, and subsequent decisions between individualist and collective countries. In the same way, the local firms of collectivist Asia were more likely to share the burden than to downsize in dealing with a downturn in the economy in 1997 to 1998. The more individualistic foreign multinational firms with subsidiaries in the same area of Asia were more likely to downsize (Wyatt, 1999).

In her seminal study of 13 primitive societies, Mead (1939) contrasted those societies that were cooperative or collective with those that were individualistic or competitive. In cooperative societies, one is more concerned with one's relations with others, and the achievement of the team and one's group is more important than one's personal achievement. In individualistic societies, self-interest dominates. Earley (1993) conducted an experiment using 60 Chinese, 45 Israeli, and 60 American managers. The more individualistic managers performed better if they thought they were working alone. The more collectivistic managers did better if they thought they were working in their own in-group of nationals than by themselves or in a foreign out-group.

Individualism was correlated with compensation for individual performance in the 24 countries studied by Schuler and Rogovsky (1998). In China, collectivism made it possible to maintain the system of regular meetings of workers to critique state-owned company performance. In a quantitative survey of 46 U.S., 203 Mexican, and 503 Taiwan Chinese employees working in the same electronics manufacturing plants in Taiwan and on the U.S.-Mexican border, Dorfman and Howell (1988) found, as expected, that the Mexican and Taiwanese employees were more collectivistic in their beliefs than were the U.S. employees. Pas, a, Kabasakal, and Bodur (2001) ascertained in surveys of Turkish managers that collectivism was dominant in organizational norms and practices. The same was true for ideal and observed leadership. Team leadership in Turkey satisfied the need for belonging in collectivistic Turkey (Pas, a, Kabasakal, & Bodur, 2001).

An analysis of GLOBE data from 24 countries involving 5,185 middle managers found that the mean level of individualism in a nation or region predicted internal locus of control, which in turn correlated with sense of well-being, job satisfaction, and absence of strain. But individualism failed to predict well-being (Spector, Cooper, Sanchez, et al., 2001). When Smith, Peterson, and Wang (1996) asked 78 managers from the United States, 88 from Britain, and 132 from China how they would deal with nine risky events such as changing work procedures, choosing new subordinates, and improving communications with senior executives, the U.S. and British managers were more likely than the Chinese managers to rely on their own experience. The Chinese preferred to rely on rules, procedures, and their superiors.

Turkish and Dutch high school students living in the Netherlands considered the same scenario of an altercation between a Turkish boy and a Dutch boy. The Turks, from a collectivist culture, attributed the fight to a provocation by the Dutch boy. The Dutch, from an individualist culture, were more willing to blame the Dutch boy. The Turks, but not the Dutch, were willing to engage in in-group favoritism (Schruijer & Lemmers, 1996).

*Horizontal versus Vertical Relations.* Triandis (1995) suggested that the social relations in individualist and collectivist cultures may be horizontal or vertical. In *individualist-horizontal* cultures, self-reliance is prized but status remains unimportant. In *individualist-vertical* societies, individuals compete for high status. In *collectivist-horizontal* societies, emphasis is on common goals, connectiveness, interdependence, and similarity to others in the in-group. Authority is not readily accepted. In *collectivist-vertical* societies, there is a willingness to sacrifice for the good of the in-group. The in-group is supported in competition with out-groups. Tradition and authority are respected. Social relations in the United States are more vertically oriented; in Denmark, they are more horizontally oriented. Although both countries are individualistic, this may explain the greater valuation in America than in Denmark of achievement and the display of success (Nelson & Shavitt, 2002).

*Individualism in the United States.* Among 50 countries, the United States ranked the highest in individualism, according to Hofstede's (1980, 2002) surveys. Hofstede (1993) further noted that North American theories emphasized market processes and managers more than workers. The "take charge, individual initiative" of U.S. managers contrasts with the more collegial approaches preferred elsewhere (Bennett, 1986). The participation of individual students is prized in the North American classroom but not as much in

classrooms elsewhere. Among the IBM employees and supervisors in 50 nations surveyed by Hofstede (1980), those in the United States were most extreme in their individualism, which was seen as a contributor to greatness. Elsewhere, for example among the Chinese, it was not. Individualism was high in the Anglo cluster of countries and lowest in some of the Latin American and Far Eastern countries and Pakistan.

Foreign managers who work in the United States see this difference from their own cultural backgrounds. Repeated apologies for a late report by a Japanese may produce anger in a North American. An Iranian's polite social circumlocutions may produce frustration in a North American. A Latin American's small talk and socializing to enhance relations before getting down to work is seen as time-wasting by a North American. North American managers are likely to want more autonomy than Swiss superiors want to give them.

*Collectivism in Japan.* The collectivistic, cooperative Japanese downplay their own individual intelligence. To make much of it would be a threat to the group's harmony, equality, and achievement and would meet with criticism. In Japan, one's concern is for members of one's in-group, not for those in temporary groups or out-groups. But the importance of group and collective action in collective societies fails to materialize in the ordinary laboratory studies in which unacquainted U.S. students are temporarily brought together. In such studies, loyalty to the team and acceptance of its influence will not necessarily be seen because the team may not be a real in-group for the participants. Nevertheless, Klauss and Bass (1974) found the greatest conformity in such temporary groups of Japanese managers compared to 12 other nationalities. Frager (1970) did likewise in studying conformity and anticonformity in Japan with students as subjects.

Collectivism in Japan is reflected in the structure of corporations. Individual stock ownership is small and of little consequence, and the corporation's board of directors is often identical with its management. What is stressed are cooperation, consensus, and working for the goals of the majority of company members and optimizing benefits for all. Promotion is from inside. The organization is expected to defend its employees' interests. Loyalty to the firm and a sense of duty are paramount. Collectivism is expressed in Japanese, Chinese, and Korean family-owned companies as loyalty to one's family. In addition to being born or marrying into the family, future company leaders may be legally adopted as sons and heirs (Abegglen, 1984).

*Quality Control Circles.* Collectivism in Japan goes a long way toward explaining the greater success in Japan of an American idea, the quality control circle. According to a 1983 survey by the Union of Japanese Scientists and Engineers, such small-group activities were in effect in more than 80% of Japanese companies with more than 1,000 employees and in 50% of companies with 100 to 1,000 employees. Attendance was 90% (Ishikawa, 1985). In turn, the Japanese attention to quality was dramatized by Gavin (1983), who compared nine U.S. and seven Japanese manufacturers of room air conditioners. The technology, equipment, and product were identical. During the period studied, the U.S. firms averaged 6.3 defects per 100 units on the assembly line and the Japanese firms averaged .95 defects. The U.S. firms averaged 10.5 service calls the first year per 100 units, whereas Japanese firms averaged 0.6. The cost of failures for the U.S. firms was 4.0% of sales, but 1.3% for the Japanese firms. At the same time, the Japanese firms' output was higher. Productivity in the U.S. firms averaged 1.3 units per labor hour, compared to the Japanese average of 1.8 units per labor hour. Comparisons of the printed circuit board industry in the two countries unearthed similar results. The error rate in American firms averaged 5%, but in the Japanese firms, it averaged .05%. The error rates were lower in the Japanese firms, even though the Japanese produced more complex boards that are ordinarily more prone to errors. The Japanese also dealt with much more variety in the product. The yield was 70% in the United States but 92% in Japan. The U.S. firms produced approximately 1,200 styles, whereas the Japanese firms produced approximately 17,000 styles. At that time, the refinement of the printed circuits in the United States was 15-millimeter spacing compared to Japan, where it was 4-millimeter spacing. However, in many ways, by 2000, the United States had caught up with and passed Japan in quality and quantity of productivity.

*Antipathy to Individualism.* Collectivism explains the antipathy of Japanese managers toward individualistic behavior. "Scapegoating" is avoided by collective responsibility, even though ultimate responsibility rests with the highest-ranking overseer of a project or enterprise. Criticism of performance is for the betterment of the organization and is seen to be directed toward the task or project for which the group has accepted responsibility, although the leader remains ultimately responsible (Yokochi, 1989b). Even the introduction of a new idea that does not emanate from one's group may be seen as selfish or inconsiderate. Innovators may resign because their successful, accepted ideas were embarrassing and disruptive (Hornstein, 1986). In contrast to the results for Britain and the Netherlands, cooperativeness is more likely to be rewarded with advancement in Japan, according to Rosenstein's (1985) analysis of the results of the performance of several thousand managers on selected exercises that were correlated with their rates of advancement.

*Role Concepts.* Organizational role concepts are different in Japan than in the West. The Japanese operate their large organizations with a lack of specificity about the nature of each member's job and area of authority and responsibility. According to a 1960 survey, one-quarter of the larger Japanese firms had no organizational chart, and only one-third had rules delineating the authority for the chief of the general affairs division or for the chief of the accounting division (Keizai Doyukai, 1960). When Japanese were asked what their job was, they were likely to reply that they were members of a particular company instead of saying what they did (Tsutomu, 1964). Associated with this lack of specificity was a lack of career specialization (Mannari & Abegglen, 1963). The ambiguous organization worked effectively because of the group orientation of its members, the members' willingness to work organically with one another, and their taking into account not only a particular role requirement but who was filling it. The group orientation was accompanied by strong peer pressure (Abegglen, 1958). Hesseling and Kormen (1969) reported that during a decision-making simulation, the Japanese managers were extremely critical of their peers compared to the Dutch managers. In this situation, the Japanese managers appeared to combine behaviors that Westerners would consider to be incompatible.

*Commitment, Involvement, Loyalty, and Collectivism.* Collectivistic values strengthen commitment, involvement, and loyalty. Collectivism is high in Mexico, as in many other Latin American countries, and lowest in the United States on Hofstede's index. Although, after hearing bad news about an investment, 168 Mexicans and 153 Americans both escalated their commitment to the investment, the Mexicans were much more inclined to do so (Greer & Stevens, 2001).

The lifetime employment assignments in Japan were well known. However, what may be less well known is that, as Abegglen (1958) noted, the employer was generally more obligated than was the employee. Complicating the issue of lifetime employment were the two levels of discourse in Japan. *Tatemae* is the polite, open communication; *honne* is when the communication expresses true feelings about the matter. Lifetime employment was expected at the time of employment. Employees continually express, as required, the sense of lifetime commitment to their organization, which is *tatemae*, and only reveal their true feelings, *honne*, on the day before they leave to take a job with another firm (Yokochi, 1989b). According to Marsh and Mannari (1971), quitting rates and piracy of managers indicated that there is actually considerable movement from one firm to another among Japanese employees. For example, during one decade, one-fourth of the Japanese manufacturing employees left their place of employment annually, and two-thirds of those did so voluntarily. Despite these facts, both Japanese managers and workers tended to believe and act as if they had permanent employment. Organizational loyalty was high. Anyone who was not loyal would be regarded as a person of lesser moral principles and deserving of punishment (Yokochi, 1989b). Promotions took place at regular intervals, but an "up-or-out" policy actually resulted in either continued promotion upward or early retirement (Kezai Doyukai, 1960). Many exceptions to lifetime arrangements could be found even in well-

known larger Japanese firms (Pucik, 1981). In an analysis of the personnel records of the Kikkoman Shoyu Company over 60 years beginning in 1918, Lawrence (1984) found considerable variation in the provision for lifetime employment, compensation based on seniority, and ideological identification with the firm as one's family. The practices and beliefs were transitory, rather than deeply fixed, and depended much on economic effects, especially the effects of World War II. The continuing recession in Japan in the 1990s led to a decline in lifetime arrangements in many firms. Although many of the practices and beliefs in lifetime commitments remain true for the largest and wealthiest Japanese firms and agencies, they have disappeared in smaller firms that are less secure economically, such as job shops that depend on maintaining contract work for the larger organizations.

Nonetheless, in comparison to the responses of successful U.S., Australian, and Indian managers, En gland and Lee (1974) found that successful Japanese managers were most likely to emphasize loyalty. Among the 12 nationalities studied by Bass, Burger, et al. (1979), the life goal of duty—dedication to ultimate values, ideals, and principles—was among the top three in importance for 46% of the Japanese and 34% of Indian managers at one extreme, and 7% to 9% of the German, Austrian, Scandinavian, and British managers at the other. Japanese workers tended to merge their company and family life. Thus whereas 56% of the Japanese workers in the early 1960s perceived the company to be at least equal in importance to their personal lives, only 24% of the North Americans felt the same way (Whitehill, 1964). According to a questionnaire administered by Whitehill and Takezawa (1968) to approximately 2,000 Japanese workers, 57% thought of their company as “a part of my life at least equal in importance to my personal life,” whereas only 22% of U.S. workers responded similarly.

### ***In-group Loyalty***

In collective societies, people see themselves as members of in-groups and extended families who protect their interests in exchange for their loyalty. Satisfaction for doing a job well that is recognized by one's peers is sought, in contrast to doing a job well by one's own standards. Job and family life are more closely linked (Hofstede, 1984). Collectivist Hong Kong Chinese students used equality in rewarding in-group members but equity (each according to his or her contribution) in rewarding out-group members. Individualistic American students, consistent with the universalism of reward for merit, used the equity to reward both in-group and out-group members (Leung, 1983).

The values of a culture affect individual expectations of organizational rewards (En gland & Koike, 1970). In the individualistic United States, workers believe they receive wages in exchange for their performance and seniority. However, in the collectivistic East compensation is considered to be an obligation of the employer, who is responsible for the employees' welfare; thus compensation is less likely to be related to the services performed than to each individual's needs. Under such circumstances it is difficult to introduce performance appraisal (Gellerman, 1967). In the same way, Russian students raised in a traditionally communal and collectivist society feel that needs should be heavily weighted when allocating bonuses. American students were opposed to considering needs (Giacobbe-Miller & Miller, 1995).

Loyalty to close friends takes on special relationships in a number of countries and can markedly affect patterns of influence. Particularism flourishes. For example, in the Philippines, *pakkisama*, which expresses all-encompassing friendship, results in intense loyalty to one's boss and the formation of cliques. In Greece, one speaks of *philotimo*—the strong bond of affection and loyalty between friends—that fosters the formation of cliques. In Nigeria, loyalty to other members of one's tribe transcends objective considerations. In this situation, as in those in which employers feel more obligated to satisfy the needs of their employees

than to provide rewards for merit, objective merit ratings, promotions, and salary recommendations based on performance become impossible, as ratings reflect tribal relationships rather than performance.

Ingelhart, Basanez, and Moreno (1998) obtained a multiple correlation of .86 among 43 countries for well-being and survival in countries on the MAS index that valued feminine caring rather than masculine assertiveness and those on the IDV index that valued individualism rather than collectivism.

## Personal Values, Motives, and Goals

---

Although managers tested in many countries tended to score high on achievement and recognition, Page and Baron (1995) reported that Scandinavian managerial assessments were also higher in commercial interests than were those of British and French managers. The British preferred a more structured environment; the French were more motivated by a flexible environment. Nowotny (1964) called attention to the differences between European and U.S. management philosophies at that time. Nowotny attributed the emphasis on stability, convention, quality, and diversity to the European respect for the past. U.S. management's focus on the future resulted in an emphasis on vitality, mobility, informality, abundance, quantity, and organization. But these differences lessened as U.S. management was made less secure by the growth in industrial and economic power of Europe, East Asia, and India and the loss of many whole industries to them, as well as by the dislocations and vast restructurings of U.S. firms. Certainly, U.S. management has become much more concerned about the quality of its products. Many more now work in mature firms that had been growing in the 1960s. In turn, European and Asian firms have adopted many of the practices of U.S. management in their own efforts to internationalize.

By 1998, formerly Communist countries differed considerably in how much they had shifted to market economies. The percent of firms in the private sector in Hungary was 80%, in the Czech Republic, 75%; and in Estonia, 70%; but in Belarus, only 20%. The speed of adaptation of European former Communist countries to market economies was shown by Franke (1999) to depend on their different cultures and modal values. Those with Western Christian cultures adapted more successfully than those with Orthodox Christian and Muslim cultures. For example, GNP between 1993 and 1995 grew in Roman Catholic Poland by 6.25% and Slovakia by 5.89%, while in Orthodox Bulgaria it grew by 1.54%, and in Macedonia it declined by 4.85%. Barrett and Ryterband (1968) found that managers from developing countries such as Colombia and India assigned less importance to meeting competition than did managers from the United States, Britain, and the Netherlands. Managers from developed countries placed greater stress on the objectives of growth and competition. Conversely, the maintenance of satisfactory organizational operations appeared to be more important to those from the developing countries. En gland, Dhingra, and Agarwal (1974) noted that for North American managers, organizational stability was a means to attain the objective of profitability; for Indian managers, organizational stability was an end in itself. When state-owned companies in formerly socialist Hungary became privatized, foreign-owned, reorganized, and reequipped in the 1990s, supervisors gained more authority but workers appeared to maintain control of how they operated on the job, according to a survey of 385 employees in 13 industrial firms (Whitley & Czaban, 1998).

### ***The Need for Achievement, Affiliation, and Power***

Illustrative of the many available studies, McClelland (1961) reported systematic differences among

approximately 200 managers from the United States, Italy, Turkey, and Poland in their achievement, affiliation, and power need scores. The rankings for the four countries, from highest to lowest, were as follows: achievement—the United States, Poland, Italy, and Turkey; affiliation—Italy, Turkey, the United States, and Poland; and power—the United States, north Italy, Turkey, south Italy, and Poland. Kanungo and Wright (1983) found that British managers had a greater need for achievement than did French managers. R. G. Hunt and Meindl (1991) showed that achievement was the most important work value for Chinese and Americans. The Chinese expressed stronger collectivistic values and the importance of friendships in the workplace. However, regardless of national differences, a high need for achievement contributed to entrepreneurial drive, as evidenced in analyses in Turkey (Bradburn, 1963), Nigeria (LeVine, 1966), Brazil (Angelini, 1966), Iran (Tedeschi & Kian, 1962), South Africa (Morsbach, 1969), India (Singh, 1969, 1970), and Trinidad (Mischel, 1961). McClelland and Winter (1969) were also able to demonstrate that a program that increased achievement needs also resulted in increased entrepreneurial activity by Indian and Mexican businessmen. McClelland (1961) analyzed the themes in children's books from 1925 and 1950 for achievement, affiliation, and power needs to show how they predicted subsequent motivation patterns in adult managers and later gross national product in 23 and 32 countries, respectively. National correlations of themes were negatively correlated with power distance (PDI) and uncertainty avoidance (UAI) and positively correlated with individualism (UAI) in the books from 1925 but not the 1950 books (Hofstede, 2001).

*Entrepreneurial Motivation.* In 1999, one in 12 Americans was attempting to start a business, compared to one in 67 Finns. The average rate of 6.9 start-ups per 100 businesses in the United States, Canada, and Israel was the highest; it was intermediate at a rate of 3.4 per 100 in Britain and Italy, and lowest at an average rate of 1.8 per 100 in Denmark, Finland, France, Germany, and Japan, in countries surveyed by the Global Entrepreneur-ship Monitor Study. Starting a business was seen as legitimate in some countries but was a cultural anomaly in many others (Campbell, 1999). Of course, many institutional factors made opening a new business possible, such as the availability of bank loans and government regulations. McClelland (1985) succeeded with a training program to stimulate need achievement to increase entrepreneurship in developing countries such as Mexico and India.

## ***Personal Goals***

In Exercise Life Goals (Bass, 1975e), 3,082 managers from the 12 nationalities surveyed by Bass, Burger, et al. (1979) rated the importance of 11 life goals to themselves. Although high percentages of managers everywhere ranked self-realization as first, second, or third, the Japanese were highest (74%) and the Indians were lowest (42%) in this tendency. Leadership was ranked first, second, or third by 51% of the Germans and Austrians and least frequently by the Dutch (20%) for whom expertise (50%) was most important. Expertise was lowest for the Italians (22%) than for any of the other 11 groups. Stereotypes to the contrary, the British managers were highest in emphasizing pleasure (29%), followed by the Scandinavians (26%), and the Dutch (20%). The Indians (6%), Germans (4%), and Japanese (2%) were the lowest in this regard.

When nationalities were compared, wealth—amassing a personal fortune—was most important to the Indian and North American managers and least important to the Japanese. Independence was most important to the Germans and Austrians and least important to the Indians. Prestige was most important to the Latin Americans and least important to the Japanese, for whom duty was most important. Service was most important to the Scandinavians (31%), French (30%), and Spaniards (29%) and security was most important to the Scandinavians (36%), British (34%), and Italians (32%).

According to a survey of 23 countries, Confucian-principled China, Hong Kong, Taiwan, Japan, and South Korea ranked highest in long-term orientation (LTO); Western countries were more short-term in goals; and in between were the developing non-Western countries of Zimbabwe, the Philippines, Nigeria, and Pakistan (Chinese Culture Connection, 1987). In poorer countries, LTO correlated  $-.27$  with power distance (PDI); in wealthier countries, LTO correlated  $.72$  with PDI. In poorer countries, LTO correlated insignificantly with individualism (IDV) compared to a correlation of  $-.77$  in wealthier countries. In 15 countries, LTO correlated  $.49$  with the propensity to save (Hofstede, 2001).

Kanungo and Wright (1983) surveyed managers' attitudes in Canada, France, Japan, and Britain to determine the job outcomes the managers sought. The British and French managers were most different. The British sought self-actualization, and the French sought security and good working conditions. The British-French distinctness was seen within Canada in a survey by McCarrey, Gasse, and Moore (1984) of the difference in work values between Anglophone managers on the west coast of Canada and their francophone counterparts in Quebec. The francophone managers attached greater importance to being loving and helpful. They also placed more emphasis on work that allowed them to be creative and imaginative. The anglophones attached more importance to work that provided independence and prestige and allowed them to be clean, neat, and tidy. According to England, Dhingra, and Agarwal's (1974) survey, dignity, prestige, security, and power were far more important to Indian than to American or Australian managers. AlHajjeh (1984) found that Middle Eastern managers placed more emphasis on security than did a comparable sample of Americans.

Smallest-space mapping of the personal goals of managers of various nationalities by Shenkar and Ronen (1987) showed that the meaning of a particular goal may be different in various countries. For instance, attaining higher earnings was seen as both an intrinsic and extrinsic goal in Western countries such as Canada, Britain, West Germany, and France but was a purely extrinsic goal for managers in state industries in China. Shenkar and Ronen attributed this attitude of Chinese managers at that time both to Confucian philosophy and to Maoist admonitions that material incentives are likely to lead to anticollective self-interest, power, and privileges.

*Business Objectives.* Lodge and Thurow (1999) obtained results for the performance of 114 firms from the United States, European Union, and Japan showing that they were significantly different in their objectives, which affected their performance. Profits were the main objectives in the United States and European Union. They were short-term objectives for the the U.S. firms and Long-term for the E.U. companies. The Japanese placed more importance on growth. Forced to have short-term objectives in order to satisfy investors, U.S. firms adopt a strategy of substituting capital for labor resulting in higher wages and greater efficiencies (Katz, Werne & Brouthers, 1999).

### ***Personal Values***

For 12 countries, Bigoness and Blakely (1989) extracted four factors from the rankings by managers of the importance of 18 Rokeach (1973) instrumental values. The four factors were: (1) supportiveness (cheerful, forgiving, helpful, and loving), (2) dependability (clean, obedient, polite, responsible, and self-controlled), (3) strength (broad-minded, capable, and courageous), and (4) intelligence (imaginative, independent, and intellectual). Overall there was considerable agreement among the managers from the 12 countries about the relative order of value of the factors: (1) strength, (2) intelligence, (3) dependability, and (4) supportiveness. Nevertheless, there remained sizable mean divergences of opinion according to nationality. Thus, consistent with Bass, Burger, et al.'s (1979) observation about the Japanese strong concern for peers and the French lack

of such concern, the Japanese managers were the highest of 12 nationalities in their relative ranking of the importance of supportiveness; the lowest were the French. Again, the Japanese tied the Brazilians in valuing dependability most highly; the Swedes were least concerned with the value of such dependability. Strength was of prime importance to the Brazilians and of least consequence to the U.S. managers. The Brazilians and Italians valued intelligence most highly; the Danes and Australians attached least value to intelligence. The Britons, Germans, Dutch, and Norwegians were at neither extreme on any of the four factors.

*Beliefs.* India is a country where many strongly held beliefs are counterproductive. Sinha, Singh, and Gupta (undated) obtained six factors from 20 items in a survey of 522 middle managers from eight organizations located in the widely separated Indian cities of Jamshedpur, Patna, Ahmedabad, and Harirar. The factors and the highest loadings on the factors were (1) selfishness—people try to get ahead at the expense of others (.68); (2) status and power—people in the society are highly conscious of their status and position (.73); (3) emotion-ality—people react emotionally rather than rationally to societal problems (–.61); (4) familism—people value family more than work requirements (.62); (5) tradition-alism—people have high respect for their tradition (.68); and (6) sociability—people seek and get help on social occasions (.74).

*Business Ethics.* In contrast to Europe and Japan, Vogel (1992) suggested that business ethics were unusually visible in the United States because of its distinctive institutional, legal, social, and cultural context and its individualistic approach to business ethics compared to other capitalist societies.

Americans are more concerned with the ethics of business because they have higher expectations of business conduct. Not only is more business conduct considered unethical but unethical behavior is more likely to be exposed, punished, and thereby become a “scandal” in America than in other capitalist nations. (Vogel, p. 36)

But according to an index of national business ethics, the Transparency International Corruption Index (Transparency International, 1998), in 26 wealthier countries, the index ranged from highest in Denmark (10.0) to lowest in South Korea (4.3). The Index score for the United States was 7.5. It was higher than 7.5 in the Nordic countries, Germany, Switzerland, New Zealand, Canada, Britain, Ireland, Singapore, and Hong Kong. Generally it was lower in poorer countries, ranging from highest in Chile (6.8) to lowest in Nigeria (1.9). For the 26 wealthier countries, the Transparency Index score correlated –.78 with uncertainty avoidance, –.55 with power distance, .47 with individualism-collectivism, and –.33 with masculinity-femininity.

Although the norms of ethical behavior vary in different capitalist societies, globalization is slowly forcing a convergence. For instance, 194 Russian managers and owners in private enterprises showed no difference in advocacy of Machiavellianism than American norms. But they did feel that Russian organizations fostered structurally opportunistic climates (Sommer, Welsh, & Gubman, 2000). In a 28-nation interview survey by Parboteeah and Cullen (2002) of the effects of national social institutions, a random and quota sample of 3,450 managers was asked the extent to which seven unethical behaviors could be justified. The behaviors were subsequently found to form a single factor. The highest loading, .72, was on “buy something you knew was stolen.” The next highest loading, .70, was on “cheat on tax if you have the chance.” Other unethical behaviors included “lying in your own interest” and “accepting bribes in the course of your duty” with loadings of .67 and .64 respectively. Hierarchical linear modeling (Bryk & Raudenbush, 1989) made it possible to intercorrelate variables across two levels of analysis, individual and national. Regression analyses of individual and national variables showed that in countries with greater social inequality, managers were more likely to consider that unethical behavior was more acceptable. Inequity could be reduced by breaking social norms, such as behaving unethically. In nations higher in religiosity and access to higher education, managers could more readily justify unethical behavior. From the same data, Cullen, Parboteeah, and Hoegl (2004) found that the willingness to justify ethically suspect behaviors in the 28 countries was related to cultural dimensions

proposed by Tropaars and Hampden-Turner (1998) of individualism, achievement, pecuniary materialism, and equality of opportunity. Contrary to expectations, hierarchical linear modeling indicated that national characteristics of individualism and achievement negatively predicted justifying unethical behaviors but equality of opportunity and pecuniary materialism were positive predictors of justifying unethical behavior.

### ***Masculinity-Femininity (MAS)***

MAS was Hofstede's (1980) Index of country norms about men and women's job preferences and the dominant role patterns of masculine assertiveness and feminine nurturing. Japan, Austria, Venezuela, Italy, and Switzerland ranked highest in masculinity (MAS) and Sweden, Norway, Netherlands, Denmark, and Costa Rica ranked highest in femininity. Women in the same occupations scored higher in preference for *social* goals like friendly atmosphere and cooperation in the workplace; men scored higher in preference for *ego* goals such as recognition and earnings. MAS correlated .84 with a factor of assertiveness-service, one of two factors Hofstede (2001) extracted from Exercise Life Goals completed by 3,082 managers from 12 countries (Bass & Burger, 1979). Assertiveness was high when managers ranked leadership, independence, and self-realization highest and service and duty lowest. Schein, Mueller, and Lituchy (1996) found that in both China and Japan, 361 male and 228 female students agreed that successful middle managers generally possess characteristic, attitudes, and temperaments ascribed to men rather than women.

*Hostile and Benevolent Sexism.* Facets of MAS are *hostile sexism*, the dislike of women who are seen as usurping men's roles, and *benevolent sexism*, an ideology of chivalry, protection, and affection for women who embrace conventional roles. Glick and Fiske (2001) used the Ambivalent Sexism Inventory to query more than 15,000 respondents in 19 countries. The highest six countries in hostile sexism, in order, were Cuba, South Africa, Nigeria, Botswana, Colombia, and Chile. In between were South Korea, Turkey, Portugal, Italy, Brazil, Spain, and Belgium. Lowest in hostile sexism were Japan, Germany, the United States, Australia, England, Australia, and the Netherlands. The order is almost the same for benevolent sexism, except that Japan and Germany moved to the middle and Italy moved into the lowest countries. Hostility toward career women, feminists, and seductresses appeared to be the belief that they were stealing men's power. Patronizing of women who serve men as mothers and wives and in romantic affairs was benevolent sexism. The hostile and benevolent beliefs were likely to influence the interpersonal relations of leaders and followers of both men and women.

### ***Uncertainty Avoidance (Aversion to Risk Taking)***

Risk differs in concept from uncertainty. We avoid risks when we have some knowledge of the probabilities of failure, harm, or negative outcomes. We avoid uncertainty when we lack knowledge about the outcomes (Cyert & March, 1963). We fear taking risks; we are anxious about uncertainties. At the country level, if we avoid risk and uncertainty we are, authoritarian, ethnocentric, rigid, dogmatic, superstitious, racist, and intolerant of ambiguities.

*Risk Taking.* Bass, Burger, et al. (1979) noted which of 12 nationalities were above or below the median on 18 indicators of the tendency to take risks and the preference for doing so when managers were engaged in

various training exercises. U.S. managers were least averse to taking risks; the Austrians and Germans were most cautious. Cummings, Harnett, and Stevens (1971) also ordered nationalities according to their preferences for avoiding financial or physical risks. Again, managers in the United States had the least aversion to taking risks. Managers in Greece, Scandinavia, and central Europe were the most risk-averse, while Spanish managers were in between.

Hornstein (1986) illustrated the propensity of North American managers to take risks in contrast to the Japanese managers' aversion to doing so. Only 15% of the American managers but 40% of the Japanese managers said they had never acted courageously during their careers. Ronen (1986) also concluded that North American managers are much more aggressive risk takers than are their counterparts elsewhere, such as in Indonesia, Burma, Turkey, and Egypt. Americans may misinterpret when Japanese fall silent in negotiations about a proposal with Americans. The Americans may perceive that the Japanese are not interested in the proposal when in fact they may just be thinking about it (Anonymous, 1989).

*Uncertainty Avoidance (UAI).* A somewhat different picture emerged in Hofstede's (1980, 2001) 50-nation survey of the avoidance of personal uncertainty and discomfort in unpredictable and unclear situations. Greece, Portugal, and the Latin American countries of Panama, Peru, El Salvador, Uruguay, and Guatemala were particularly high in this tendency. Most tolerant of uncertainty were the Southeast Asian countries of Singapore, Hong Kong, and Malaysia; the Scandinavian countries of Sweden and Denmark; and the Commonwealth-linked Jamaica, Great Britain, and Ireland. In the GLOBE project, attributions of outstanding leaders varied with societal uncertainty avoidance. Offerman and Hellman (1997) noted that in countries high in avoiding uncertainty, managers were more controlling, less willing to delegate, and less easy to approach. Also, they were less innovative. Champions were expected to promote innovation without violating organizational rules and norms (Shane, 1993, 1995). In countries tolerant of uncertainty, champions of innovation were expected to break rules to deal with organizational inertia (Shane, Venkataraman, & MacMillan, 1995).

Uncertainty Avoidance Index (UAI) scores for 26 countries correlated with dissatisfaction with family, work, health, and happiness and lack of well-being (Inglehart, Basañez, & Moreno, 1998). Ethical decision making was found to be different in countries high and low in uncertainty avoidance (Jackson, 2001). In a 1990–1993 World Values Survey (1994), a country's UAI was negatively correlated with normative willingness to trust others. In Sweden, low in UAI, 66% said people can be trusted; only 7% in Brazil saw people as worthy of trust (Hofstede, 2001). In 30 countries, UAI correlated negatively with a factor of independence from existing rules (Shane, Venkataraman, & MacMillan, 1995). Low-UAI countries revealed higher rates of innovation (Shane, 1993). Hofstede (2001) suggested that countries high in UAI are inclined to reduce uncertainty with rules, rituals, laws, faith, and fatalism. Furthermore, the ability to cope with uncertainty is an important source of power in countries high in UAI.

### ***Other Personal Traits***

Numerous other cross-cluster and cross-country similarities and differences in norms of personality have been reported. Consistent with the generally obtained differences between the East Asian and Anglo clusters, Gill (1983), using Cattell's Sixteen Personal Factors Questionnaire, found that Singapore Chinese managers described themselves as significantly more reserved, serious, conservative, assertive, expedient, trusting, group-dependent, and relaxed than did comparable North American or British managers. They also saw themselves as significantly less imaginative and tough-minded. Effective managers in Thailand, China, and the United States

all scored low in neuroticism and high in extroversion on the “Big Five” personality inventory, but only in the United States did effective managers score high in open-mindedness (Silverthorne, 2001). Scores on the Myers-Briggs Type Indicator for 206 Latin American and 875 U.S. managers were in line with expected Anglo–Latin American differences, according to Osborn and Osborn (1986), who reported that 78% of the Latin Americans described themselves as sensory-intuitives, while only 52% of the North Americans did so. The Latin Americans also saw themselves as more judgmental (87%) than did the North Americans (70%) and less perceptive. In addition, compared to North Americans the Latin Americans tended to express their desire for inclusion with and control of others and affection from them significantly more on Schutz’s FIRO-B. Management controlling skills in high–power distance (PD) countries like Malaysia and managerial interactive skills in lower-PD countries like the United States supported the positive relationship between self-awareness and managerial effectiveness (Shipper, Rotondo, & Hoffman, 2003). In their comparison of the attitudes of executives from five countries or clusters, Cummings, Harnett, and Stevens (1971) found Spanish managers to be fatalistic, somewhat suspicious, and conciliatory. North Americans were at the other extreme: self-determined, trusting, and belligerent. Scandinavians and central European executives were in between in these attitudes. Greek managers were highly suspicious and conciliatory but more like North Americans in believing they were the masters of their own fate.

In a study of 329 managers and technicians from 22 countries in South and Central America, Africa, Asia, and the Middle East, Gruenfeld and MacEachron (1975) found that managers from the less developed countries were more field-dependent than were managers from the developed countries. Gruenfeld and MacEachron concluded that since they were more field-dependent, those from the developing countries were likely to be more conforming to authority and more personal and attentive rather than impersonal. According to Yokochi (1989b), Japanese managers were unusual in the extent to which they repeatedly express appreciation for long-past services to indicate that they remain indebted for favors rendered to them. They also repeat apologies for their inadequacies. However, these are *tatemaie*, not deep-seated feelings (*honne*).

### ***Satisfaction of Needs***

Haire, Chiselli, and Porter (1966) surveyed approximately 3,600 managers from 14 countries on how important each of the needs in Maslow’s hierarchy was and how much each of the needs was fulfilled. Mozina (1969) used the same questionnaire to survey 500 managers from the former Yugoslavia, as did Clark and McCabe (1970) for more than 1,300 Australian managers and Badawy (undated) for middle managers in Saudi Arabia. In agreement with Bass, Burger, et al.’s (1979) findings, all these studies found that Maslow’s (1954) higher-level needs, such as for self-actualization and esteem, were judged important by managers everywhere. But generally, the fulfillment of these higher-level needs was deemed inadequate. The lowest-level basic needs were seen to be fairly well satisfied. The need for security, considered to be important, was relatively highly fulfilled. (No doubt this has been less true in recent years as a consequence of the downsizing of managements and the increase in industrial change.) Again, broad national variations emerged. Managers from the developing countries perceived all the needs to be more important to them than did managers from developed countries and reported a greater sense of nonfulfillment. At the other extreme, managers from the northern European countries tended to place the least importance on all the needs. Consistent with what was concluded in [Chapter 8](#) about the greater job satisfaction of those at higher levels in their organization, the managers’ perceptions of the fulfillment of their needs depended everywhere on their hierarchical rank in their organizations. Upper-level managers, especially in Japan before 1990, consistently indicated more fulfillment of all the needs compared to lower-level managers.

Peterson, Smith, Akande, et al. (1995) analyzed data reported by middle managers from 21 countries dealing with perceived role conflict, role ambiguity, and role overload. The mean data for each country were correlated with national scores on power distance (PDI), individualism-collectivity (IDV), uncertainty avoidance (UAI), and masculinity-femininity (MAS). Role stresses varied more by country than individual or organizational variables. Power distance (PDI) was negatively related to role ambiguity and positively related to role overload. Individualism was positively related to role ambiguity and negatively related to role overload. Rogers (1977) found in a U.S.-Canadian comparison that whereas both workload and decision making were equally frequent sources of stress for Canadian managers, decision making alone was the more important source of stress for U.S. managers. But even sharper differences appeared when English and French Canadian managers were analyzed by Auclair (1968). Male French Canadian managers placed a higher value on their role as the head of the family than did English Canadian managers. Consequently, the French-Canadian managers perceived more stress from the conflicting role demands of family and business. In comparison, the English Canadian managers placed relatively less value on their role in the family and experienced less conflict with the role demands of their business organization. Spector, Cooper, and Aguilar-Vafaie (2002), in a survey of 207 Iranian and 120 U.S. managers, found that the Iranians were significantly higher in mental job stresses and physical strains than the Americans. In France, an in-depth interview survey of 30 managers in the Paris area was conducted by COFREMCA (1978). What seemed particularly salient in the French managers' attitudes and values was the conflict between valuing their own work and their self-actualization as professionals, the lack of warmth and understanding in work relations, insecurity among the older managers, and competitiveness, particularly in large firms.

Indian supervisors may face various kinds of role conflict specific to the Indian scene. Although industrial supervisors were observed to be more production oriented than human relations oriented (Bhatt & Pathak, 1962). Indian workers expected their supervisors to do more in the way of settling personnel problems and grievances, clarifying work difficulties, and improving work methods and conditions. In other respects, as well, supervisors perceived that they were required to perform duties that were not legitimately part of their jobs, such as training new workers on the job, arranging wage agreements, and checking supplies (Sequeira, 1964). Yoga (1964) obtained such results in 11 Indian plants in three types of industries (textiles, food processing, and engineering). Nonetheless, Ivancevich, Schweiger, and Ragan (1986) found that a sample of approximately 300 Indian managers reported little difference from their approximately 175 North American counterparts in their felt global stress, job stress, or somatic symptoms of stress. If anything, the Indian managers felt less daily stress and were less anxious. In fact, it was a comparable sample of over 200 Japanese managers who felt significantly more global stress, more daily stress, more job stress, more somatic symptoms of stress, and more anxiety than did their Indian or North American counterparts.

*National Differences in Conflict Resolution.* Another source of failure may be due to differences in handling cross-national disagreements. Tinsley (1998) expected that Japanese managers would defer to status in dealing with disagreements, German managers would fall back on regulations and to a lesser extent try to integrate the interests of opposing parties, and American managers would seek personal gain and reaching a compromise that integrated the interests of the disputants. She provided Japanese, German, and American managers with a hypothetical management conflict and asked them to rate the importance to them of various ways to resolve the hypothetical conflict. As expected, compared with the Germans and Americans, the Japanese managers felt that they needed to consult with their higher-status superiors. Compared with the

Japanese and the Americans, the German managers preferred that they apply regulations but that, in doing so, it was important for them to integrate the interests of the parties in conflict. The Americans wanted to integrate conflicting interests even more than did the Germans. Tinsley suggested that American managers may become frustrated when trying to reach agreement with Japanese who wish to consult with their superiors and with Germans who argue for a resolution based on applying the rules.

*International Problem Solving, Conflict, and Cooperation.* Toshiba, Siemens and IBM brought together a total of a hundred Japanese, German and American scientists to an IBM facility in Fishkill, New York, to work together on a project to develop a revolutionary memory chip. And just as I was disturbed when lecturing to 200 Japanese managers who closed their eyes, the German research personnel were shocked at those meetings by the Japanese thinking about the issues by closing their eyes and looking as though they were sleeping. Liking to review ideas with others, the Japanese were pained by having to work alone in small windowless offices in Fishkill instead of the customary large “tank” room accommodating the whole group, where they could more easily consult with one another and discuss both research and personal matters. In Japan, their supervisor’s desk was in the same room; the supervisor walked around, looking over their shoulders, and was immediately accessible. The Germans were equally unaccustomed to working in offices with small windows where they could be watched by anyone. Compared to Americans, they are more likely to keep their office doors closed. English was a problem for the Japanese. The Americans complained that the Japanese did not make clear decisions and wanted to revise them constantly. The Americans felt the Germans planned too much. There was suspicion by some personnel that information was being withheld from the group, perhaps because they came from different and competitive firms. By 7 or 8 p.m., the Americans were gone, as were most of the Germans, but half the Japanese were in the hall in unplanned informal discussion. Despite the cross-cultural discomforts and problems, sufficient progress was made and the project continued into a second year (Browning, 1994).

According to Tinsley and Brett (2001), 94 American and 120 Hong Kong Chinese students differed in approaches to a simulated conflict. Compared to the Chinese, the Americans focused more attention on each party’s interests and tried to synthesize multiple issues. The Chinese focused more than the Americans on collective interests and authority. They were more likely to consult with higher-ups. The Americans reached more integrative outcomes and resolved more issues. In another simulation study, Brett and Okumura (1998) found that in cross-cultural “buy-sell” negotiations between 30 American and Japanese negotiators, 47 Americans negotiating with each other, and 18 Japanese negotiating with each other, the individualistic Americans espoused self-interest schemata; the hierarchical Japanese pursued power schemata in their tactics. Although Schmidt and Yeh (1992) found that British, Australian, Japanese, and Taiwanese managers shared common influence tactics, they differed in interpretations and perceived importance of the tactics. Deutsch’s (1949) theory of cooperation and competition was applied successfully in various countries such as Hong Kong to understanding constructive discussion between employees and management when they had cooperative goals. Empowerment, productive work, and stronger work relations followed (Tjosvold, Hui, & Law, 1995).

*Conflicts in the Former Soviet Union.* The Soviet manager in state enterprises faced fundamental conflicts in contradictory demands from an inflexible system of production quotas and rewards and punishments for performance. This began to be ameliorated by Gorbachev’s efforts to reform the system with glasnost (openness) and perestroika (restructuring), followed by Boris Yeltsin’s revolution in 1991 and continued under Putin. Central state planning was replaced by a market economy and privatization of many large state enterprises. Capitalism produced new corruption and conflict to replace the conflicts and defenses that were rooted in Russia’s Mongol, Byzantine, tsarist, and Soviet past with an entrenched bureaucracy and an

emphasis on secrecy that had long been part of the Russian culture (Pipes, 1974). The Soviet leader-follower relationship was reflected in Lenin's model of close-knit, mutually supportive working relationships with immediate subordinates whose advice might be sought but who were expected to conform to their superiors' dictates (Bass & Farrow, 1977a). Loyalty to and support for one's superiors were exchanged for the protection of workers from the larger outside system (Ryapolov, 1966). Leaders and their immediate subordinates become excessively dependent on each other to buffer the demands of the larger system (Granick, 1960). The need to "beat the system" produced mutual suspicion between superior and subordinate. Both faced cuts in pay to 25% below base salary if their performance was not up to expectations (Anonymous, 1970).

After Russia joined the market economy, managers in the private sector became more externally oriented, attending more to their markets and customers. Managers of state enterprises remained more focused internally on their own operations and production (Shama, 1993). They were perceived by their employees to continue to have more power than those in the private sector (Banai & Teng, 1996). Public opinion surveys in the 1990s suggested that less than 50% supported a market economy, normative democracy, and building a civil society. They want strong leadership. Private ownership is still seen to be accompanied by greed, stinginess, cruelty, bribery, and extortion (Samsonova, 1998).

Soviet central planning pitted the managers in state enterprises and their immediate subordinates against the arbitrary, distant, demanding central authority. To survive within the system, the managers and subordinates had to back up each other, for they had to engage in unauthorized activities, such as falsifying plans to meet quotas. For example, central planning overestimates of available supplies resulted in shortages of vital parts. The factory that needed the supplies had to hire *tolkhachi*, who lived permanently near the bases of supply, to obtain necessary materials, even shipping them by briefcase if necessary (Ryapolov, 1966). Assembled items were declared ready for shipment and distribution even though parts were missing. If a higher-up in the larger system wanted to "get" the plant director, the success of the director's cover-up depended on his immediate subordinates' loyalty to him.

*Conflicts in China.* Unlike his Soviet counterpart, who had to conceal productive capacity, hoard resources, sacrifice product quality, or falsify reports to meet inflexible production quotas from central planning, the plant director in the People's Republic of China, prior to the privatization of many enterprises, did not face the same demands from central authority. Rather, more such pressures were likely to arise from the plant's workforce, coupled with much greater flexibility to adjust plans on the basis of experience, even weekly. "Democratic" centralism in China involved massive participation by workers in the management of the enterprises (Richman, 1967). The post-Maoist reforms that moved China into a market economy added to the pressure on private sector managers, who now had to make a profit or be shut down. The pressure has spilled over to the managers of the remaining state enterprises.

### ***National Differences in Competencies and Behavioral Patterns***

Various abilities and patterns of behavior associated with leadership have been found to differ across countries. Cross-cultural differences have been observed in social perceptual skills, interpersonal competence, effective intelligence, and efficient work habits. Thus, Britons were found to be more realistic about their own performance than were Southeast Asians; they were more accurate in estimating how correct they had been in answering questions (Wright et al., 1977). When 359 managers from collectivistic Hong Kong and China and individualistic America were subjected to a laboratory and field experiment, results demonstrated that self-focused training improved individualists but not collectivists in self-efficacy and performance. On the other

hand, compared to individualists, collectivists profited more in self-efficacy and performance from group-based training (Earley, 1994).

*Use of Time.* Seven Korean, five Hong Kong Chinese, eight Japanese, and five American CEOs worked alone and in groups for about the same amount of time. The Hong Kong Chinese spent their time in short, fragmented activities, mostly much less than one hour per activity. This was in contrast to the Japanese and Korean CEOs, who concentrated more time in fewer, less fragmented activities, longer meetings, and contact with more employees and made more use of delegation than did their Hong Kong and American counterparts (Doktor, 1990).

*Social Perceptions: Empathy, Similarity, Projection.* Bass, Alexander, Barrett, and Ryterband (1971) calculated empathy and projection scores for managers from 12 national groupings based on the managers' rankings of their own life goals, as well as those of the other members of their training group. The similarity of their self-rankings was also obtained. With an index of 1.00 implying perfect empathic matching of estimates with actualities and zero implying no matching, the British (.35) and Japanese (.30) were highest in empathic matching and the Latin Americans (.03) were the lowest. The British (.62) and Dutch (.62) were highest in the projection of their own rankings onto others, and the Indians (.31) and Spanish and Portuguese (.34) were lowest. To some extent, the results were attributable to the usual similarity among the participants' self-rankings. The average similarity of participants in their self-rankings was only .15 in India, with its 16 major language groups and many religions and castes. It was even lower for the United States (.11), with its multiplicity of ethnic, racial, and religious groups, and lowest for Latin America (.05), where data included managers drawn from recent European immigrant groups from many countries, those of old Spanish or Portuguese stock, and mestizos and multiethnics. In general, in Europe, with its greater uniformity of religion, language, and centralized education, the average similarities ranged from .23 for France to .39 for Britain. Japan (.27) was also more homogeneous. Managers everywhere assumed themselves to be more similar to their colleagues than they actually were. The distortion was greatest for U.S. managers and Latin Americans. At the other extreme, the Spanish and Portuguese managers' projections of similarity were closest to their actual similarity.

*Self-Appraisals of Interpersonal Behavior.* A factor analysis of 60 self-ratings on Exercise Self-Appraisals (Bass, 1975f) of actual and preferred behavior by Bass, Burger, et al. (1979) revealed, for more than 1,000 managers, seven factors that are involved in interpersonal competence: (1) preferred awareness, (2) actual awareness, (3) submissiveness, (4) reliance on others, (5) favoring group decision making, (6) concern for good human relations, and (7) cooperative relationships with peers. With reference to the first factor, which deals with preferences for awareness of the feelings of others, self-understanding, accepting feedback from others, listening to others, and concern for the welfare of subordinates, the Spanish and Portuguese managers were the highest and the Germans and Austrians were the lowest among the 12 national groupings. The Germans and Austrians were also lowest on the second factor of actual awareness. On the third factor, submissiveness, Indian managers were the most concerned about rules and Japanese managers were the least concerned. The Japanese felt the least conflict about the more ambiguous organizational arrangements to which they are accustomed. (Unspoken rules must be understood; otherwise one is regarded as an "untrained person" [Yokochi, 1989b].) As for the fourth factor, reliance on others, the Indian managers saw themselves as most dependent on a higher authority; the German and Austrian managers saw themselves as the least dependent. The Italian managers saw themselves as being lowest in depending on others in problem solving, and, as expected, the Japanese were highest in this regard, as well as in the preference to imitate others when solving problems. As for the fifth factor, U.S. managers stood out in their preference for group decision making, whereas the Spanish,

Portuguese, and Italian managers were lowest. On factor 6, Concern for Human Relations, the Dutch were highest and the Germans were lowest. On factor 7, French managers were the lowest in their reported actual cooperative peer relations and the Dutch were the highest. On other specific ratings, such as the willingness to discuss feelings with others, the French managers again were lowest among the 12 national groupings and the Italian and Japanese managers were the highest.

Self-appraisals that discriminated faster-from slower-climbing managers varied from one country to another. For example, in France, Spain, and Portugal especially, the faster-climbing managers were more concerned than the slower climbers about their dependence on a higher authority.

*Cultural Awareness.* To understand and effectively relate to others, leaders need to be aware of cultural specificities in acceptable interpersonal relations (Javidan & House, 2001). In eastern European and Middle Eastern countries, where power distance is high, communication is top down. Subordinates expect that their superior knows more than they do and that they will be directed without being consulted. They want and expect guidance. They are less likely to challenge their superiors, and fear disagreeing with them (Adsit, London, Crom, et al., 1997). Where power distance is low, such as in Nordic, Germanic, and Anglo countries, participative leadership is endorsed and subordinates expect to be consulted by their leaders in two-way communications (Dorfman, Hanges, & Brodbeck, 2004).

*CEO Task Competence.* Hambrick (1989) reported on a 20-country Korn-Ferry survey of 1,508 primarily senior managers and CEOs about CEOs. Fifty-eight percent were CEOs, and 26% of senior managers were their direct reports. They were asked to consider what would be needed by CEOs a decade ahead. While 65% of the respondents from other countries regarded a finance background as important, only a little over half of the Japanese agreed. But over half of the Japanese felt that an R&D background was important. On the other hand, while over half of the Americans felt that experience in operations or production was important, just a little over 30% of the other nationalities agreed. Only about 20% of Americans called for foreign language training; elsewhere 65% did. Close to 30% of Americans felt that experience outside the headquarters country was needed by the CEO, while close to 75% of all other nationalities agreed about the need for such experience. In characterizing their ideal CEO for the year 2000, the Japanese—in contrast to the other 19 nationalities—placed a greater emphasis on technological and international capabilities than did the respondents from the United States, Western Europe, and Latin America. The respondents from western Europe but not from the United States agreed with the Japanese about the emphasis on international competence. But O’Roark (2001) pointed out the overriding importance of international competence for the Anglo American who is consulting professionally with foreign management.

*Other Desired and Actual Competencies.* In Bass, Burger, et al.’s (1979) analysis, the Japanese were highest in the desire to be objective rather than intuitive, and their preference for persistence was even more extreme relative to that of other nationalities. Furthermore, they strongly favored being proactive rather than reactive and preferred Long-term to short-term views. Moreover, the Japanese managers also saw themselves as very high (in comparison to the results for 11 other nationalities) in actual objectivity, persistence, proactivity, and Long-term thinking. On the other hand, the French tended to be most critical of themselves in their self-appraisals of their actual objectivity, persistence, proactivity, and Long-term thinking.

In Exercise Communication (Bass, 1975g), Leavitt’s one-way/two-way problem is completed. Senders verbally transmit a pattern of six dominoes when two-way communications are permitted. If communications are one way only, receivers must reconstruct the pattern without seeing the original and cannot ask questions. Consistent with their actual and preferred self-appraisals, the objective results of Exercise Communication for

12 nationalities showed the Japanese managers to be highest in the number of correct placements, in both one-way and two-way communications (Bass, Burger, et al., 1979). This finding is consistent with the higher mean scores on intelligence tests reported for the Japanese compared to other nationals (Hathaway, 1984). The faster-climbing Japanese managers, in particular, were able to achieve this degree of accuracy in the fastest time for one-way communications. Close behind them in accuracy with one-way communications were the Germans and the Austrians. Indian managers did the poorest; they were relatively slow and inaccurate. These results may be attributable to the Japanese familiarity with ideographic communication and to the fact that for Indian managers, English, the language of business, is usually their second or third language.

## Differences in Leadership Across Cultures

---

### *Requisites of Leadership*

House, Wright, and Aditya (1997) advanced the *cultural congruence* hypothesis. For effective leadership, there must be a match between the leader's values and behavior and the culture's values. Innovative leaders can depart somewhat but not too much from what is required of them by the culture. In an individualist culture like that of the United States, the leader can make more use of public recognition of good individual employee performance, whereas in a collective culture such as Japan's, it might cause the employee embarrassment to be singled out from his work group for praise. Dickson, BeShears, and Gupta (2004) offered interesting notions about the likely mechanisms underlying cultural congruence, such as the socialization of the leader to the dominant values of the culture or the leader's response to societal pressures. Additionally, self-selection and formal selection procedures may improve the match in values of the leader and the led. The individualistic Canadian may choose or be chosen to work in the individualist Netherlands more than in the collectivist Uruguay. Hofstede (2001) suggested that in masculine cultures like those of Japan, Austria, Venezuela, and Italy, to be successful, leaders need to be assertive; in feminine countries such as the Netherlands, Denmark, Norway and Sweden, leaders have to be modest. A content analysis of publications about managing directors and CEOs by Jackofsky and Slocum (1988) showed that in a high-power-distance country such as France, such leaders took autocratic initiatives. In Japan, high in long-term orientation, leaders had to practice patience. In Sweden, low in uncertainty avoidance and high in femininity, leaders took a lot of entrepreneurial risks and also showed concern for their employees' quality of life. According to Hofstede (1980) the high-uncertainty-avoiding (UAI) French and Germans preferred a boss who had an unambiguous style of resolving problems—by hierarchical means in high-power-distance (PDI) France and through consensus in low-PDI Germany. When power distance (PDI) and uncertainty avoidance (UAI) are low, as in the Anglo-American cluster, Scandinavia, and the Netherlands, participative leadership is practiced on the shop floor. When PDI is low and UAI is higher, as in Germany, Austria, and Switzerland, participation matches the culture with industrial democracy—legalized forms of worker representation in management. When the PDI score is high, as in Latin America and the Middle East, authoritarian and directive leadership is expected.

*Differences in Prototypes.* As noted earlier, there are both universalities and specifics in the requirements for leadership across cultures and countries. Images of the ideal leader, *prototypes*, tend to vary from one culture and country to another. Prototypes are more widely shared within strong cultures than weak ones (Hunt, Boal, & Sorenson, 1990). Using 59 possible traits of leadership, Lord, Foti, and DeVader (1984) found that the prototypical American leader was intelligent, understanding, honest, and determined. The

prototypical Japanese leader was fair, flexible, outgoing, and responsible (O'Connell, Lord, & O'Connell, 1990). Gerstner and Day (1994) reported similar differences for prototypes in Asian compared to American and European countries. At the same time, some prototypical traits generalize across countries. Instant communication, worldwide media, trade, travel, multinational enterprises, and the transfer of technology have increased the convergence of requirements for leadership on a worldwide basis. Even in widely disparate cultures, such as Zambia and Bangladesh, Ali, Humbalo, Khaleque, and Rahman (1982) found that managers shared common concerns about their salaries, political pressures, regionalism, communication breakdowns, and ways of coping with conflict. I have already alluded to the more general pragmatism of business and industrial managers compared to the idealism of leaders of social movements. A survey of 115 white (*pakeha*) male and female managers and 19 Maori male managers in New Zealand, reported by L. R. Anderson (1983), found that the degree of *pakeha*-Maori mix of their work groups did not influence how their leadership behavior contributed to the effectiveness of the work groups but only to the difficulty of its implementation. In a simulation experiment, Ensari and Murphy (2003) demonstrated that attributions of charisma in collectivistic Turkey and individualistic America occurred based on similar processes. However, in Turkey, forming a leadership impression was affected more by leaders' organizational performance outcomes than prototypical traits. In the individualistic United States, the impression of charisma was due mainly to stereotyped traits.

*Differences in Self-Management.* Receptivity to working in self-managed teams is greater in collectivistic than in individualistic countries, according to observations, interviews, and surveys of 378 work teams in 11 countries ranging from the individualistic United States to the collectivistic Indonesia. Receptivity was also greater where team members valued equity rather than status and power differences and believed that they had more control over personal and organizational outcomes (Kirk-man, Gibson, & Shapiro, 2001).

*Differences in Primitive Cultures.* Particularly in the less developed areas of the world as well as those with the strongest local traditions, there are still other important differences in what is required for leadership. Mead's (1930, 1935, 1939) anthropological comparisons clearly showed that what it takes to be a leader varies across primitive cultures. The aggressive, efficient, ambitious Manus leader in Oceania would have been rejected by the Dakota Indians, who valued generosity, hospitality, mutual welfare, and conforming to the group. Individualism, the lack of political integration, and lack of need to comply with leadership characterized the Bachiga of central Africa. Obedience, respect for the chief, and cooperative effort with little room for rivalry were the norms among the Bathonga. With their consciousness of position and conformity to rank in a clear hierarchy, the Samoans followed a completely different style of leadership from that pursued by the individualistic Inuits, who considered no person's importance relative to another. Leadership among the Iroquois was achieved through behavior that was socially rewarding to others, such as generosity, cooperation, and hospitality. But among the Kwakiutl, the ideal chieftain was one who could successfully compete financially against other chiefs. What appeared to be demanded of the leader was quite different among the Arapesh of New Guinea, who had no strict ownership of land or scale of success, and the Ifugao of the Philippines, where land ownership was concentrated and the landowner was the ideal of success. Thus it is not surprising that the patterns of leader-subordinate behavior in industrialized societies vary considerably across countries and across cultures. Although such extreme effects of cultural differences may not be seen in the modern industrialized world, nevertheless considerable differences emerge in what managers think is required for success in the top, middle, and lower levels of management

*Differences in Explicit and Implicit Theories of Leadership.* As we move from one culture or country to another, we see systematic differences in what is regarded as important for effective leadership and explanations for why this is so. An important source of differences in leadership among countries is a

consequence of these different explicit and implicit theories about leader-subordinate relationships. It was to be expected that the belief in participative management would originate in Scandinavia and North America—countries in which political democracy and the importance of the individual are deeply embedded. According to Lau (1977), East Asian cultures have a less differentiated view of reality: X does not cause Y; rather, X and Y affect each other. There is also less abstract thinking. The consequences are a less clear allocation of responsibilities and less organized planning in Chinese firms. At the same time, Confucian principles in China resulted in perceptions of managers as linchpins, mediating the effects of the work environment on their subordinates (Shenkar & Ronen, 1987).

Beliefs about leadership in Japan are embedded in a cultural matrix of beliefs about the important relations between members of a group. The concept of *amae*, dependence on another person's kindness and goodwill, is central to leadership in Japan. It places a debt on the person who is loved that must be repaid and binds the leader to the group. Subordinates would be angered by a leader who failed to provide *amae*. *Wa*, group harmony, that balances individual needs and desires with the good of the group and fosters mutual cooperation, would be lost. It is appropriate for superiors to look to subordinates for advice (Lee & Schwendiman, 1982).

Consistent with what has just been said was Sullivan, Suzuki, and Kondo's (1984) survey of responses by 100 U.S. and 266 Japanese managers to designed scenarios. The Japanese, more than the Americans, subscribed to an implicit social model to control performance rather than to an implicit model of the rational-economic individual. In the social model, the individual is thought to be submerged in the work group. The social entity—the group rather than the individual—must be assigned responsibility, monitored, and rewarded. At the same time, Japanese tradition called for leaders to be persons of exemplary moral courage, self-sacrifice, and benevolence. To this list was added the now widely accepted espousal of Charles Protzman's<sup>6</sup> requirement in post-World War II Japan that the leader be transformational in securing the faith and respect of those under him (Tsurumi, 1982).

Post-World War II Germany saw the rejection of the *Führerprinzip* of omniscient command and unquestioning obedience to orders espoused by the Nazis. As a counter, the Allied military occupation imposed industrial democracy which, coupled with the growth of participatory education, resulted in the current German norm for subordinates to expect to be consulted about decisions. Yet consistent with the earlier German tradition, once the leader has made the decision, subordinates expect to carry it out to the best of their ability. At the same time, the explicit Harzburg model (Hohn, 1962) appeared in post-World War II Germany—a model that was more consistent with the *Führerprinzip*. According to the model, the leader must be directive. However, the leader is required to delegate permanent areas of task responsibilities to coworkers, rather than to give short-term orders. Job descriptions must be carefully written. Subordinates must assume responsibilities within their prescribed area of consequence, along with accepting 315 organizational rules. The approach replaced patriarchal-authoritarian direction with bureaucratic-authoritarian direction. It allowed for little subordinate participation or upward influence. Only economic goals were seen as legitimate. The Harzburg model has been replaced among German scholars and managers with the espousal of participative management and emphasis on human relations (Grunwald & Bernthal, 1983). Nevertheless, along with its use in Austria and Switzerland, the popularity of the Harzburg model was evidenced in a survey by Topfer (1978), who found that 16% of 355 West German firms were using it at that time.

More implicit in India was the preference of many subordinates for a dependent personal relationship with their leader rather than a contractual one. Such subordinates sought a nurturant leader and accepted authority and status differences (Sinha, 1984). Endemic underemployment until the boom of the 1990s resulted in over-staffing, and leadership that had to take cognizance of legitimate inefficiencies. At that time, Sinha suggested that the effective leader in India started by being nurturant and then followed with how to get the work done. Much needs to be learned about how leader-subordinate relations are changing in India to reflect

the rising significance of India as a center of electronic manufacturing, research and development, and global communications. Triandis (1993) conceived nurturance as playing an important role in effective leadership in collectivistic cultures. However, Geben and Steinkamp (1991) found that while manager production orientation was positively related to a firm's economic success in Taiwan and Nigeria, patriarchal caring was contraindicated.

Modern Egypt is a rapidly industrializing, urbanizing amalgam of cultures—Pharoanic, Arab, Turkish, Levantine, and European. The favorite expression is the fatalistic “*inshallah*,” “If God wills.” On the one hand, an easygoing attitude about work, relationships, and accomplishments dominates leader-subordinate relations. On the other hand, Egyptian leadership in organizations has been strongly affected by Egypt's widespread use of large public organizations to pursue its development. These organizations follow the higher-structured and centralized bureaucratic patterns in socialist and other developing countries (Badran & Hinings, 1981).

*Differences in Trust.* Nationalities vary in their willingness to trust others and the way in which they deal with lack of trust. Trust is the key to the quality of relations between the leader and the led in different cultures. If the leader trusts the follower, the leader can be open with information. The leader is likely to be more closed if the leader distrusts the follower. With trust in the follower, the leader can be more democratic, participative, and delegative. If the leader is trusted by the follower, the leader can take more risks, share more information, and display more discretionary behavior.

Trust influenced the willingness of subordinates to work with democratic leaders, according to Williams, Whyte, and Green (1966), who found that the level of trust among Peruvians was generally low. The GLOBE project found distrust of managers to be widespread in the former Soviet bloc of nations. In Italy, trust may be publicly expressed but privately denied, for Italy's history has been characterized by oppressive surface regimentation, first by foreign occupiers, then by domestic autocratic governments. But a strong defense of the liberty of the individual and the family has been maintained. Outer and inner acceptance have been separated by making the world truly a stage in which the relations between the leader and the led play a dramatic part in Italy (Barzini, 1964). Within countries, organization and status affect the willingness to trust others. For example, Senner (1971) obtained results showing that Brazilian bankers were similar to American college students in that both groups were more trusting than were Peruvian white-collar workers. The bankers' levels of trust reflected their above-average socioeconomic status in Brazil. Likewise, Negandhi and Prasad (1971) found that Indian managers in U.S. subsidiaries in India showed more trust in their subordinates than did Indian managers in indigenous Indian firms.

*Traits Judged Important for Top, Middle, and Lower Management.* Bass, Burger, et al. (1979) analyzed the choices of managers in their selection, from a list of 25 traits, of the five most important traits and the five least important traits required for top, middle, and lower managers using Exercise Supervise (Bass, 1975c), developed from original lists by L. W. Porter (1959). Indexes reflecting the choices of 3,401 managers yielded significant variations across 12 countries in many of the attributes for the three management levels. For example, Dutch managers saw no difference in the *imagination* needed for lower and middle managers, but managers everywhere else called for more imagination in successively higher levels of management. Being *systematic* was judged most important for lower-level managers in Italy, Spain, Portugal, and Latin America but more necessary for middle managers everywhere else. Managers everywhere were expected to be more *careful* the lower their organizational level. But the Dutch thought it was most important for middle managers. The French judged it most important for lower and middle managers to be *sharp-witted*. The U.S. and British managers put a premium on being *resourceful*; the Japanese saw *intuition* as far more important for them than *logic*. *Sociability* was seen as important for top managers by faster-accelerating

managers in their careers more than by slower ones in the Netherlands, Belgium, Italy, Spain, Portugal, Latin America, and India. Slower-rising managers saw sociability as more important for top management in Britain, Scandinavia, and France.

In the previously mentioned Korn/Ferry International survey of senior management in 20 countries of the personal characteristics required of a CEO, in the United States, the most important were *ethicality*, *intelligence*, and *enthusiasm*. In western Europe, they were *enthusiasm*, *intelligence*, and *inspiration*. In Latin America, they were *ethicality*, *creativity*, and *intelligence*.

*Superior-Subordinate Relations.* Germany, Japan, the United States, and the former Soviet bloc illustrate the systematic differences that are likely to appear in different countries. Luther's concept of the "calling," to serve God by doing one's best in one's occupation, was a strong influence on the extent to which German subordinates expected to carry out decisions once they had been reached. The required informal mutual defense pacts that provided for the survival of both superiors and subordinates in the Soviet system have already been mentioned. For the Japanese, the organization assumes a particular importance in one's life. In turn, the importance of the organization affects what is required of Japanese superior-subordinate relations. The supervisor has different relevance to the worker in Japan than elsewhere. Not only is the supervisor likely to be more involved in the subordinate's off-the-job life, but the supervisor is accorded more status off the job. Whereas 44% of Japanese workers would offer their supervisor their seat on a crowded bus, only 2% of Americans said they would do so (Whitehill & Takezawa, 1968).

Van de Vliert (2003) reported that among 18,767 managers, those most likely to rely on their subordinates came from countries that were uncomfortably cold or hot and highly developed or underdeveloped

*Differences in Required Masculinity.* National boundaries produce different conclusions about the importance of masculinity to management. The stereotype of a successful manager was found by Schein (2001) to be male in the United States, Britain, Germany, Japan, and China. [Chapter 31](#) reported Bartol and Butterfield's (1976) finding that sex-role stereotypes biased the performance evaluation of U.S. managers' behavior and that masculinity was favored. But Israeli and Israeli (1985) found no such bias when the study was replicated with Israeli instead of American managers.

Consistent differences among 30 countries appeared in the strength of masculine and feminine traits. Williams and Best (1982) found instrumental traits linked with masculinity and expressive traits linked with femininity. [Chapter 31](#) noted that the U.S. data strongly indicated that both male and female respondents thought that masculinity (assertiveness, ambition, and task orientation) is required for success in management. Yet among 1,600 Australian high school students, Bottomley and Sampson (1977) reported comparable results only for male respondents. Unlike the boys, a majority of the Australian girls believed that the attributes of both men and women contribute to one's competence in dealing with leadership tasks.

In Hofstede's (1980) survey, masculinity scores (MAS) were high among IBM personnel in countries in which roles were clearly differentiated for men and women. In these countries such as Japan, assertive and dominant men, along with nurturing women, were favored. Work, money, material goods, and performance were emphasized, rather than play. There was admiration for machismo, for the successful achiever, for speed, and for size. In countries that were low in masculinity, like Sweden, there was endorsement of the attitudes that men can be nurturant, sex roles are fluid, there should be equality between the sexes, unisex and androgeny are ideal, the quality of life is important, work is a means to the good life, people and the environment are important, interdependence is valued, being of service is more important than being ambitious, and small and slow are beautiful. Highest in MAS mean scores were IBM respondents from Japan, followed closely by the Germanic cluster; Jamaica; the Latin American countries of Venezuela, Ecuador, Mexico, and Colombia; and Catholic Italy and Ireland. Lowest in masculinity were IBM personnel from the Scandinavian countries of

Sweden, Norway, Denmark, and Finland and from the Netherlands. More job stress was likely for leaders in countries with a high masculinity index. In addition, leadership was likely to be more caring and relations oriented in countries with personnel who are low in masculinity (high in femininity), and less in countries with personnel who are high in masculinity (Hofstede, 1980, 2001).

*Critique of MAS.* After noting that Australia and New Zealand scored only a little above the mean in Hofstede's masculinity-femininity (MAS) index, Shouksmith (1987) suggested that MAS was mislabeled, since the pattern of life in Australia and New Zealand is traditionally so masculine in orientation. Shouksmith suggested that the MAS dimension really describes the extent to which good living rather than work is valued, along with compatibility with coworkers. If one looks at the country-by-country results, one sees that the complex mixture of questioned attitudes resulted in the differences among countries due to different elements. The MAS index is derived from too many unrelated topics, such as sex roles, dominance in social relations, being humane, and performance orientation. The scale responses concern assertiveness, toughness, acquisition of money and materials, quality of life and people, and not caring for others. Low scores are derived from caring for the weak, warm social relations, and other traditionally feminine values. Japan's high masculinity index fits with its emphasis on the importance of work over leisure and the strong belief in sex-role differentiation. Sweden accepts the equality of the sexes, giving it its low masculinity index, and may have as strong an interest in recreation as does New Zealand.

High MAS scores generally indicate countries in which men are expected to be assertive and tough and women are expected to be tender and modest. If MAS in a country is high, a smaller percentage of women will reach positions of leadership. The low masculinity index score obtained for Sweden is reflected in the highest labor participation rate of females in the world. And in the past several decades, opportunities for higher-level positions in government for women have opened in Sweden. Over 40% of the Swedish legislature were women in 2000, as was the foreign minister. Although they are well represented in lower and middle management in private industry, as in many other countries, such as Britain, France, and the United States, the glass ceiling keeps their numbers in top management proportionately lower. The GLOBE project saw fit to measure gender role egalitarianism, assertiveness, performance orientation, and humane orientation separately (Den Hartog, House, Hanges, et al., 1999).

# Styles of Leadership

---

Considerable national and cultural differences have been found in required, preferred, and observed leadership that is autocratic or democratic, participative or directive, relations oriented or task oriented, considerate or structuring, and active or laissez-faire—the styles discussed earlier in Chapters 6 and 17 through 20. The cultural differences become even more apparent if the data are gathered from those who are most freely socialized within a given culture—that is, from those who endorse the core beliefs of the culture. Thus, Dorfman and Howell (1988) demonstrated that in Taiwan, directive leadership displayed by one's superiors correlated .44 with subordinates' satisfaction with work for subordinates who had strong beliefs in the key cultural values of the Chinese culture. The correlation was only .19 for those who did not have such strong beliefs in their culture.

## *Autocratic versus Democratic Leadership*

R. Likert (1963) argued that democratic leadership and System 4, as described in [Chapter 21](#), is most likely to be effective in any productive organization, regardless of the culture or the country. Despite the wide variations in leadership preferences and behavior, Likert's argument was that regardless of culture, there was a best way to organize and lead. The System 4 participatory approach was successfully introduced into Japan, whose management had ordinarily been seen as a benevolent autocracy (System 2) practicing System 3 consultation (Sakano, 1983). In support of Likert's contention, Misumi (1974) applied a System 4 strategy in 1970 in a large shipyard in Japan, using group meetings for group problem solving, goal setting, and decision making in an effort to reduce accidents among 4,000 workers. Accidents per man-hours worked ( $\times 10$ ) declined from 30 in 1969 to 12 in 1973.

Close rather than general supervision was found to be favored by workers in countries that are high in power distance and authoritarianism, such as Peru (Whyte, 1963) and Thailand (Deyo, 1978). Among North American workers and others in the Anglo-American cluster, however, the opposite was usually the case. Thus at the other end of the spectrum, as expected, 500 Australian managers from the Anglo cluster indicated their strong endorsement of democratic managerial beliefs, such as the capacity of subordinates to display initiative, the utility of sharing information, and the importance of self-control (Stening & Wong, 1983).

In the role playing in Exercise Supervise (Bass, 1975c), an equal number of contrived "passive," "moderately involved," or "vitaly interested" subordinates meet in a counterbalanced order with a contrived democratic, autocratic, or persuasive "supervisor." Although on a chance basis, 33% of the participants should prefer to work with a democratic supervisor again, Bass, Burger, et al. (1979, p. 167) found that 63% of French managers were most in favor of doing so and 40% of Japanese managers least in favor among 12 nationalities. The other 10 European, American, and Asian nationalities were in between in their favoring of the democratic leader. Latin Americans (19%) differed in their preference from Latin Europeans (33%). Likewise, North Americans (32%), Germans (33%), and Scandinavians (31%) differed from Britons (22%) in this regard. In this same analysis, the preference of the participants who played the supervisory roles to work again with passive, uninvolved subordinates was highest among Indian managers (47%) and lowest among the Japanese (12%).

*Power Distance.* Among the 50 countries in the IBM survey, those highest in reported Power Distance Index (PDI) scores included Malaysia, Indonesia, Singapore, and the Philippines from Southeast Asia; the Spanish-American countries of Mexico, Guatemala, Panama, Ecuador, Colombia, Venezuela, and Peru; India; the Middle Eastern countries; and the west African countries. At the lower end of the spectrum in the PDI were the Anglo, Nordic, and Germanic clusters of countries, Israel, and Costa Rica. Greater acceptance of an autocratic style of leadership was to be expected and found in the countries that were high in power distance and acceptance of a democratic style, in the countries that were low in power distance. Somewhat consistent with Hofstede's results was the conclusion reached by Redding and Casey (1975) that managers in Malaysia, Indonesia, Thailand, and the Philippines favored an autocratic style, those in Singapore and Hong Kong were somewhat less favorable toward it, and those in Western countries favored it the least. Al-Hajjeh (1984) concluded from a survey of 25 North American and 25 Middle Eastern managers that the Middle Easterners supported more autocratic leadership and the North Americans did the reverse. Compared to the North Americans, the Middle Easterners felt less positive about the capacity of subordinates and saw a greater need to provide them with detailed instructions. Gebert and Steinkamp (undated) found from 218 interviews with representative indigenous manufacturers in Nigeria in West Africa that economic success was thought to depend on discipline and obeying rules whenever possible. Kenis (1977) compared the attitudes toward leadership of 150 Turkish and 147 American first-line supervisors in bank branches in Ankara and Istanbul. The Turks favored more autocratic leadership, in contrast to the Americans who favored more democratic leadership. Kenis attributed his results to the authoritarianism inherent in the Turkish culture. In a country high in power distance, such as Mexico, direction,<sup>7</sup> coupled with supportive (caring) leadership, contributed directly to effective performance. In a country low in power distance like the United States, participation made a direct contribution to effective performance (Dorfman, Howell, et al., 1997). Eylon and Au (1999) found that MBA students in a management simulation were more satisfied with their jobs if they were empowered rather than disempowered. But only in low-PDI countries did they perform better. In a firm with operations in the United States, Poland, Mexico, and India, Robert, Probst, Martocchio, et al. (2000) found that continuous improvement related positively to job satisfaction in all four locations. However, empowerment, related positively to job satisfaction in the United States and Poland, was negatively associated with higher PDI in India but not in Mexico, also high in PDI. Huang (2003) found that empowerment and management openness worked to increase 136,018 employees' willingness to voice their opinions about organizational issues in 24 countries low in PDI.

Chapter 12 discussed the extent to which greater power differences between the leader and the led accent the greater potential for the leader to be authoritarian, directive, persuasive, or coercive. Smith, Peterson, Schwartz, et al. (2002) found in GLOBE data in 47 countries that in high-PDI countries, managers used more rules generated from above to handle daily events. Compared to U.S. employees, Chinese employees were shown by Bu, Craig, and Peng (2001) to be more willing to accept direction from supervisors. In line with this hypothesis, Mulder (1976) saw a large power distance between the leader and the led associated with the fear of disagreeing with one's superior. In Hofstede's (1980) survey, the same connections were revealed. Coercive, autocratic leadership was more common in countries in which the power distance between superiors and subordinates was high. When PDI is high, children greatly respect parents, elders, and teachers. Teachers initiate all communications. In countries with a high PDI, decision making is more centralized and authority is concentrated. Organizations are tall. Ideal leaders are directive, benevolent autocrats who rely on formal rules. Subordinates expect to be told what to do. Superior-subordinate relations are polarized and emotional. Subordinates are influenced by formal authority and sanctions.

More democratic styles are practiced in countries with low power distance. National elites are egalitarian rather than authoritarian. Authority is based on secular-rational arguments rather than tradition. Top leaders are younger rather than older. Children treat parents and teachers as equals. In work organizations, in countries

with low PDI, decision making is likely to be decentralized and authority is less concentrated. Organizations are flatter. Supervisors have a wide span of control, ideal leaders are resourceful democrats, practical, orderly, and rely on experience and subordinates. Subordinates expect to be consulted. Superior-subordinate relations are pragmatic. Subordinates are influenced by reasoning and bargaining (Hofstede, 2001, pp. 107–108).

*Authoritarianism.* Authoritarianism, as measured by the *F* Scale, influences the acceptance of autocratic rather than democratic behavior.<sup>8</sup> The *F* Scale has been administered to student groups in many different countries. As previously noted, Turkish students were likely to score higher and American students lower on the scale. Indian students usually scored high as well (Meade & Whittaker, 1967). Meade's (1967) experimental replication in India of the classic Lewin, Lippitt, and White (1939) study of leadership found that both productivity and satisfaction in boys' groups were higher under autocratic than under nonautocratic leadership in India.

In Arab and other Muslim countries, family and tribal traditions result in benevolent, paternal, autocratic leadership. The leader is expected to be a father who cares more about his own followers than outsiders. In Arab organizations, this is combined with bureaucratic leadership left over from colonial days, the promulgation of many rules—which are ignored due to favoritism—and personal connections. Traditionally, each new ruler made new rules to replace the old ones. Conformity to rules depends on the power and personality of the rule makers. The typical organization is a strong patriarchal authority. Leaders are either prophets who depend on their personal charisma or caliphs who must rule by coercive power (Dorfman, 1996). The most desirable leadership in Qatar and Kuwait, according to surveys of 179 middle managers and interviews with another 21 upper-middle managers, were charismatic, self-protective, and considerate (Abdalla & Al-Homoud, 2001). According to 300 Iranian middle managers (Muslim but not Arabic) in the GLOBE project, effective leadership was helped or hindered by being supportive, autocratic, planful, familial, humble, faithful, and receptive.

Sinha (1976) agreed that authoritarian leadership is optimum in Hindu India. Such leadership features task orientation, strong personal involvement and effort by the leader. More democratic processes are possible only after the structure has become firm for the employees and moderate productivity has been achieved. In support, Singh and Arya (1965) studied 40 sociometrically identified leaders in a village in India. Given the strong authoritarian norm, it was not surprising that leaders were found to be significantly more authoritarian than were nonleaders. Leaders preferred task-oriented leaders to other types, but both leaders and nonleaders rejected the self-interested leader. However, neither Kakar (1971) nor Jaggi (1977) could find similar support for favoring the autocratic mode in India. According to Fujiyama (1997), Korean business leaders favor hierarchical, authoritarian, and centralized leadership, unlike Japan's focus on consensus in reaching decisions after considerable deliberation. This enables Korean companies to take actions more quickly than can comparable Japanese firms. Variations have also been observed within Asia in the perceived power distance and in autocratic leadership behavior. The specific issues involved in a given country are likely to make a difference as well. Ishikawa (1986) compared the favored and perceived distribution of power of managers and employees in nine Asian countries. Employers viewed participation by workers more favorably in India and Japan than in Pakistan and Taiwan. Power distance regarding decisions about management policy, personnel, working conditions, and workplace issues generally was greatest in Thailand and least in Sri Lanka. In Japan, power distance was seen as being lower on workplace issues and higher on questions of management policy. In India and elsewhere, perceived power distance also depended on which issues were involved. But in general, workers in Taiwan perceived the strongest relation between one's position in the hierarchy and one's power.

The subscription to democratic leadership was found to be surprisingly high by Haire, Ghiselli, and Porter (1966) across the 14 countries they studied. But compared to U.S. managers, managers elsewhere indicated little acceptance of what would be required for such democratic leadership, such as agreement that employees

as well as supervisors have the potential to exhibit initiative, share leadership, and contribute to the problem-solving process. The researchers concluded, on the basis of data from the early 1960s, that introducing democratic leadership into most other countries at that time would be “a little like building the techniques and practices of a Jeffersonian democracy on a basic belief in the divine right of kings” (p. 130). The proposition still seems to contain some truth in 2006, although fragile democracies have struggled to be established in countries as diverse as Ukraine and Nepal and much of Latin America. Autocratic charisma was regarded strongly pejoratively by managers from countries that experienced autocratic charismatic dictators.

*Paternalism.* The degree of paternalism in a culture affects the acceptance of benevolent authoritarian leadership and taking care of employees and their families. Failure of subordinates to comply with the wishes of the patron is seen as disloyalty. Paternalism was a dimension of consequence in Georgia, Russia, Kazakhstan, and the Kyrgyz Republic (Ardichvili, 2001). The sense of paternalism was higher among Taiwan Chinese and Mexican employees than among U.S. employees working for the same company. Using data on employees in Taiwan, Mexico, and the United States, Dorfman and Howell (1988) emerged with a factor of paternalism. When paternalism was strong, employees subscribed to expecting job security and to be looked after by their company as a person, not only as a worker. Lincoln, Hanada, and Olson (1981) found that Japanese and Japanese-American employees in 28 Japanese-owned firms in the United States valued paternalistic company behavior more than did American employees of the same firms. A 30-year survey of the literature on leadership in Korea by Baik (1999) found paternalism, “hierarchical structures where elders, predecessors, and patriarchs exert significant influence in Korean society” still a norm. In comparison to 235 German managers, 306 Korean managers more strongly valued family, authority, and paternalistic leadership, according to a study by Park in 1984 reported by Baik.

Farmer and Richman (1965) rated a number of countries on paternalism, using a review of the literature and reports from experts. They concluded that Japan was most strongly paternalistic, as evidenced by policies of lifetime employment, age-grade lockstep promotions and salary increases, and the companies’ provision of housing, recreational facilities, and shrines for worship for their employees. Other countries that were high in paternalism included Egypt, Chile, Germany, India, France, Mexico, and Saudi Arabia. At the other end of the spectrum were the United States, Britain, the former Soviet Union, and the former Yugoslavia.

In developing countries, paternalism featured autocratic patrons and compliant followers. Power distance was high. Patrons were expected to care for workers and their families (Dickson, Den Hartog & Mitchelson, 2003). In indigenous Brazilian industry, the traditional worker identified with the *patrão*, the patriarchal owner, to whom he was a ward, not just a member of an organization headed by the patron. In rural Guatemalan factories, immediate supervisors were of local origin. As members of the *padrone*’s workforce, they had limited authority; they could only suggest, not order. On the other hand, if the workers were not unionized, the foreign engineer and the owner or his white-collar surrogates treated workers like children, physically abusing them as well as dealing directly with their complaints (M. Nash, 1958). In India, Sinha (1980, 1994) found that both Indian managers and subordinates preferred as leaders benevolent autocrats who were nurturing and paternalistic if the subordinates were obedient, respectful, and task-oriented.

### ***Participative versus Directive Leadership***

Smith, Peterson, and Schwartz (2002) found that western European managers preferred to rely more on subordinates for information about events than did managers from African countries, who preferred information provided by superiors and rules. A survey by Sirota (1968) of the attitudes of IBM employees in

46 countries toward supervision indicated their preference for consultation (the leader makes a decision after discussion with the subordinate) and *participative* joint decision making, although directive leadership was seen as being more common. In other studies, Israeli managers revealed more actual participatory leadership than they said they supported ideologically (Vardi, Shirom, & Jacobson, 1980). Australian managers were the reverse; they endorsed participatory practices ideologically but were actually less supportive of them in practice (Clark & McCabe, 1970). On the other hand, Australian managers more often chose *participation* among the Vroom and Yetton (1973) alternatives to handling problems than did managers from the Pacific Islands and Africa (Borttger, Hallein, & Yetton, 1985). Given the same Vroom-Yetton set of problems, Austrian managers, compared to American managers, chose group *participation* in making decisions. Consistent with these methods and results, German and Swiss managers also favored *participation*, in contrast to Polish and Czech managers, who were inclined to choose *directive* decisions (Reber, Jago, & Böhnisch, 1993). As would be expected from [Chapter 18](#), the managers who consulted were viewed most favorably by subordinates. Leaders who practiced a lot of persuasion, especially the ones with “no style,” were viewed least favorably, particularly in Britain. In Britain, participative managers were not seen as good counselors; many subordinates objected to the number of meetings they called (Sadler, 1970). Consistent with these results, Chaney (1966) found that whereas more productive U.S. scientists had more frequent communications with their superiors and their colleagues, the reverse was true for British scientists—the more productive ones had less frequent communications with their superiors. In Israel, participation suppressed social loafing; in the United States, participation increased social loafing. The difference was associated with more collectivism in Israel and more individualism in the United States (Earley, 1993).

An analysis by Sadler and Hofstede (1972) of IBM employees from Australia, Brazil, Britain, and Japan showed that the preferred style by the employees was consultative, 65% to 45%, but only in Brazil was there a sizable preference also for *participation* (29%). These results were consistent with data gathered through the Management Styles Survey in the United States, Spain, Sweden, Finland, and India (Bass, Valenzi, Farrow, & Solomon, 1975). Consultation was preferred over *participation* everywhere and was more frequently seen everywhere. In all the countries in the IBM survey and in those just mentioned *directive* supervision was in little favor with the vast majority of subordinates. Although as noted in [Chapter 18](#), the leader’s direction tended to correlate positively with the subordinates’ satisfaction with the leader, it did not do so as strongly as did participation. According to Bass, Burger, et al. (1979), the relative preference for participative leadership in decision making was highest among the Italians and the Japanese. Participative leadership was self-appraised (in exercise self-appraisal) as highest among the Italian managers and lowest among the Dutch and Japanese managers. Differences were found among eight countries in observed participation and direction by senior executives (Sweden was more participative; Israel was more directive). The differences were outweighed by which types of decisions were involved (Heller & Wilpert, 1981).

Howell and Dorfman (1988) found that participative leadership had stronger effects on the satisfaction and commitment of U.S. employees than on their Mexican counterparts. The correlations for the North Americans were .49 with satisfaction with work, .69 with satisfaction with supervision, and .65 with satisfaction with job performance. The comparable correlations for the Mexican employees were .26, .49, and .09, respectively. At the same time, as Dorfman and Howell (1988) hypothesized, *directive* leadership correlated between .38 and .50 with the Taiwan Chinese and Mexican employees’ satisfaction with the leader and commitment to the organization. For the North Americans, working in similar settings, the correlations of *direction* and the subordinates’ satisfaction were only .22 and .25 (Howell & Dorfman, 1988). Differences in the cohesiveness of the work groups could not substitute for the effects of differences in the leaders’ *direction*.

*Consultation and Two-Way Communication.* A multinational sample of IBM managers thought

they did more consulting than their subordinates thought they did. Of the 178 managers, 71% saw themselves as using a consulting leadership style, but only 29% of their employees agreed with them (Sadler & Hofstede, 1972). A contradiction probably contributed to the discrepancy. In Haire, Ghiselli, and Porter's (1966) 14-country study noted earlier, whereas 3,600 managers professed favorable attitudes toward participative leadership and sharing information, they also believed that the average individual preferred to be directed and wanted to avoid responsibility. Similar results were reported by Clark and McCabe (1970) for an additional 1,300 managers in Australia and by Cummings and Schmidt (1972) for a small sample of Greek managers.

These national differences in preferences for certain styles of leadership were seen with considerable consistency across studies. The percentages of managers in a country who preferred two-way over one-way communication in doing Exercise Communication (Bass, 1975g) correlated across nationalities .82 with Haire, Ghiselli, and Porter's (1966) survey measure of the propensity to share information and objectives (Barrett & Franke, 1969). Consultation is the most popular style of decision making among U.S. and Japanese managers. U.S. and Japanese managers were also the highest among those of 12 nationalities in seeing two-way communications as less frustrating than one-way communications. The relatively least frustrated by one-way communications were the Belgians, the Germans, Austrians, and the French. All the Japanese managers who were sampled preferred two-way communications, as both senders and receivers. Almost identical results occurred for the U.S. managers. The Dutch, Belgians, German, Austrians, French, and Indians seemed somewhat more tolerant of one-way communications as senders, but not as receivers (Bass, Burger, et al., 1979).

A. S. Tannenbaum (1974) contrasted the extent to which employees participated both informally and formally in decision making in Italy, Austria, the United States, Yugoslavia, and an Israeli kibbutz. As expected, subordinates and superiors were closest in agreement about their job satisfaction and mental adjustment in Yugoslavia and in the Israeli kibbutz, where workers formally participated in organizational decision-making processes. They were farthest apart in Italy, where employees did not participate in decisions, either formally or informally, despite Italian legislation supporting such participation.

*Legislatively Mandated versus Actual Participation.* According to the International Research Group on Democracy in Europe (IDE), the percentage of decisions for which formal rules of *participation* apply was seen to vary in what had been legalized as of 1981 within 12 European countries and Israel. The European countries that were the highest in these percentages were the former Yugoslavia (76%), Italy (66%), Norway (64%), and Sweden (61%). The countries that were lowest were Britain (21%) and Israel (23%) (IDE, 1981). Elden (1986) argued that in countries with highly legislated programs for industrial democracy, such as Norway, participative decision making in the workplace may be preached more often than practiced. In the former Yugoslavia, with its strong legislative support for the participation of workers through workers' councils, Kolaja (1965) observed that actually only about 40% of the decisions were instituted by workers and supervisors and 60% of the decisions were initiated by higher-level managers. This situation may be contrasted to that of the United States where, without such legislation, it was possible to find establishments that held participatory meetings in which blue-collar supervisors and workers initiated 52% of decisions and management was responsible for introducing only 48% of the ideas (Rosenberg, 1977). When Jacob and Ahn (1978) examined the participation of workers in six socialist and nine nonsocialist countries, they found that whether a country was socialist had little effect. Nor was the technological level of the workers in the different countries of any consequence. Rather, participation in influencing decisions depended on whether the management style, work culture, and formal industrial relations system of the country gave individual workers the feeling that they had the power to determine their work conditions.

Legally required formal codetermination in corporate decision making by worker representatives and management reduces the power distance in organizations and promotes democracy. Franke (1997) found

differences among 11 European nations, Israel, and Japan in the extent to which national legislation and practices provided workers with decision-making rights. In 1980, the nations ranged in ratings of industrial democracy from Finland (2.88) to Belgium (1.36). These ratings strongly correlated with economic growth rates of the countries between 1980 and 1990 corrected for their levels of economic development in 1980. (Those at lower levels in 1980 gained more.)

*Legislatively Mandated Participation and Perceived Influence.* Comparisons were made in the perceived influence of workers and supervisors among 12 European countries and Israel with surveys by the IDE (1979) where participation was nationally legislated. Although perceived influence by workers was lowest for the Israelis and highest for the Yugoslavs, legalized participation was not strongly associated with actual perceived influence on the decision-making process in most of the other European countries (IDE, 1981a, 1981b). In Israel and Belgium, workers felt relatively less influential in comparison to workers elsewhere in Europe about 16 decisions. In the former Yugoslavia, workers felt relatively more influential in comparison to workers elsewhere. Danish supervisors perceived themselves as being highest in influence compared to supervisors elsewhere; Belgian supervisors felt the least influential. German and French top managers thought they were the most influential, while Scandinavian and Yugoslavian top managers felt the least influential.

*When Participation Is Not Legally Required.* In a comparison by Lam, Chen, and Schaubroeck (2002) of American and Chinese American workers in a multinational bank in an individualistic culture, the workers were more likely to participate if they felt self-efficacious. In a collectivist culture, they were more likely to participate if they felt their group was efficacious. This was affirmed in a study of 402 Chinese and Indian banking and finance employees. Collective efficacy but not self-efficacy mediated the effects of transformational leadership on work-related outcomes. Transformational leadership had more of a positive effect on organizational commitment and job satisfaction when self-efficacy was high (Walumbwa, Lawler, Avolio et al., 2005). For 387 students of Australian and Chinese background, Weirter, Ashkanasy, and Callan (1997) showed that high self-monitors were more affected by the message than the personal charisma of the leader. Additionally, the Chinese high self-monitors were more affected than the Australians.

*Hierarchical Influences.* Top-down decision making accompanies the power distance that is prevalent in West Africa and in the Arab countries of the Middle East even in minor matters (Pezeshkpur, 1978), as well as in Turkey. Ottih (1981) observed a low level of delegation and participation by subordinates in decision making in Nigerian banks, where decision making was highly centralized as favored by management. Ergun and Onaran (1981) suggested that *direction* and negotiation were “natural” in Turkey. As mentioned before, Kenis (1977) concluded that Turks favored directive leadership. Nonetheless, in the survey of Turkish electric utility employees by Ergun and Onaran (1981), the employees reported similar satisfaction whether their supervisors were directive or participative. Correlations ranged between .32 and .42 in the satisfaction of subordinates and the tendencies of their supervisors to be more active in any one of five styles ranging from *directive* to *delegative*.

*Manipulative versus Participative Tactics.* Bass and Franke (1972) administered the Organizational Success Questionnaire to 1,064 university students from six countries in their native languages. The students were applying for summer jobs in other countries. The students’ nationality strongly influenced how they varied in their endorsement of political manipulative approaches to success in getting ahead in management, such as bluffing, rather than social participative approaches, such as openly committing oneself.<sup>2</sup> All six nationalities tended to favor the participative approaches and to reject the political manipulative ones. In addition, the Germans were highest among the six nationalities in their endorsement of openly committing themselves, but they were lowest in finding it important to share in decision making. The Swedes were highest

in endorsing the fostering of mutual trust and leveling with others and lowest in the political withholding of information, maintaining social distance, compromising for delay, and initiating but retarding actions. Students from the United States were highest in endorsing the establishment of mutual objectives and lowest in endorsing bluffing and making political alliances. The French were highest in supporting the participative arranging of group discussions and sharing in decision making, as in the making of political alliances.

Although they were relatively high in their willingness to share in decision making, the British were lowest in their endorsement of openly committing themselves and fostering mutual trust. They were also highest in their endorsement of withholding information for release when it would do the most good. The Dutch were next to the highest among the six nationalities in favoring the fostering of mutual trust; they were the lowest in endorsing the establishment of mutual objectives, leveling with others, and arranging for group decisions. They also were the highest in their support for maintaining social distance and initiating actions but then retarding their progress.

The participative endorsements for the six countries as a whole correlated .89 with Haire, Ghiselli, and Porter's (1966) managers' preferences in the same countries for sharing information and objectives. Furthermore, endorsement of the participative approaches for the six countries correlated .77 with the countries' national wealth, as measured by the per capita gross national product.

### ***National Differences in the Meaning and Practice of Participation***

*Personality Influences.* DeFrank, Matteson, and Schweiger (1985) surveyed 107 Japanese and American CEOs and found some personality differences between them that may influence their leadership style and how they look at participation and direction. The Japanese CEOs were less ambitious, hard-driven, and impatient (less Type A). However, compared to American CEOs, the Japanese CEOs reported feeling more stressed in their daily activities and less able to relieve the stress. They were also less satisfied with their pay, position, and discretionary freedom on the job.

*Personnel Practices.* To create better problem finding, important to the applicability of creative thinking, Japanese firms are likely to provide their scientific and engineering personnel in their first six months with positions in the sales department to give them an understanding of the firm's customers problems and needs. The next 18 months are spent rotating through manufacturing and engineering before taking up their work in R & D. Suggestions from all employees and problem finding are strongly encouraged. In contrast to 2.3 suggestions per employee annually from the typical leading U.S. firm, suggestion rates in the largest Japanese leading companies, each receiving more than a million suggestions per year, range from Mazda's rate of 126.5 per employee to Nissan's 38.5 per employee. Employees post perceived problems ("golden eggs") on a wall and their group and relevant others proceed to try to solve and implement them (Basadur, 1992).

### ***Country Differences in the Meaning and Practices of Participation and Direction***

*Japan.* Franke (1984) compared 149 Japanese managers' and 1,373 U.S. managers' tendency to endorse these same participative and political approaches. The Japanese significantly endorsed all the political approaches to a much greater degree than did the North American managers. Although they agreed that their success could be enhanced by participative decision making with subordinates, it was the Americans who were more in favor of leveling with others, openly committing themselves, establishing mutual objectives, fostering

mutual trust, and arranging for group discussions.

Some of these differences between the Japanese and Americans' endorsements of participative decisions may have been due to the extent to which such practices are discretionary for American leaders but institutionalized, as the *ringi* method in Japan. Participation may take on a different character in a country like Japan from what is ordinarily practiced elsewhere. In traditional Japan, negative votes in a group were rare. The members of a group faced loss of esteem, ridicule, and causing offense to others if they deviated from the "will of the group," as announced by the group leader. The leader, in turn, had to divine intellectually and emotionally "with his belly," *haragei*, what the group needed and wanted as a group (Kerlinger, 1951). Supervisory leaders play a more important role in Japanese organizations than in the United States (Smith & Misumi, 1989). To a Western observer, leader-subordinate relations in which complete subordinate obedience is given to decisions announced by the leader may seem authoritarian-submissive in style. Actually, leadership in Japan, as seen in the *ringi* method, is a blend of full consultation all around and a seeming intolerance for deviation when consensus has been reached. In the West, consultation is initiated by the leader, who asks for the subordinates' opinions and suggestions before deciding. In Japan, consultation, as seen in the *ringi* system, begins with *nemawashi*, the informal sounding out of opinions of colleagues about ideas, then formally submitting to one's superior what has emerged in consultation with them (P. B. Smith, 1984a). *Nemawashi* may also involve middle managers talking to subordinates individually about how upper management really feels about an issue before it is to be discussed in public by their group of subordinates (Yokochi, 1989b). Long-term planning and collective responsibility are the rule rather than the exception (Keys & Miller, 1984). Yet Japanese leaders can structure their relations with their subordinates to some extent rather than depend solely on tradition (Durphy, 1987).

Misumi (1984) noted several important features of *ringi*. First, many people, whether directly or indirectly involved, learn about the proposal. Consensus has developed among many in the organization before the decision reaches the top management. The experience and knowledge of all who are involved are applied to the decision, which enhances its quality. (Thus, Maguire and Pascale [1978] found that the quality of decisions in Japanese firms was correlated with the extent to which the decisions came from below. This was not true for American firms, in which the quality of the decision was better if more time was spent studying the issues.) Second, the wide involvement in the process of people at all levels in the organization means that the decision can be implemented quickly if it is authorized. (This was of great assistance in Japan's rapid change over the last century.) Third, the originator of the idea receives training in management development. Fourth, the *ringi* method fits large firms as well as smaller, family-owned, paternalistic companies. However, when Japanese supervise North American workers, they are less consultative than are American supervisors. Communication difficulties and cultural barriers inhibit implementing the *ringi* practice with American workers (Beatty, Owens, & Jenner, undated).

*China.* Lindsay and Dempsey (1985) suggested that leadership in state enterprises in China can only be described as "semiparticipative." It blends group criticism and group discussion without group decision making. There is an avoidance of strong public disagreements, a strictly patterned discussion flow, and a strong dependence on authority. In private enterprises, we need to add an understanding of the varieties of leadership and decision making in China. Tsui, Wang, Xim, et al. (2003) collected descriptions of the behavior of 550 Chinese CEOs provided by 1,500 professional employees and middle managers in their firms. The descriptions were converted into questionnaires, which were then factor-analyzed into six dimensions and clustered into four types of leadership styles. The dimensions were: (1) articulating vision (communicating a future to followers), (2) monitoring operations (setting context, shaping decisions, and controlling managerial and operational systems), (3) being creative and risk-taking (in thinking and formulating strategies), and (4) relating and communicating (maintaining harmonious interpersonal relationships with employees and

outsiders), (5) showing benevolence (doing personal favors, showing concern for the well-being of and demonstrating generosity toward employees and their families), and (6) being authoritative (emphasizing personal dominance over subordinates, centralizing authority, being the “father figure,” and making unilateral decisions). Many of these dimensions in the Chinese context go beyond their meanings in the West. For instance, showing benevolence is not necessary for achieving instrumental or immediate objectives, but is intrinsically valued. It reflects the Confucian virtue that superiors should treat subordinates with kindness. In return, subordinates should respect their superiors with filial duty, deference, loyalty, and obedience. (Consistent with these findings, an interview survey of 50 workers and 120 managers noted that managers in China offer favors, develop warm relationships with workers, loosen the operating rules, and request assistance from the workers and their families [Wall, 1989].)

The Chinese CEOs were clustered into four leadership styles according to their distance from one another on scores on the six dimensions: (1) *Advanced leaders* were highest on all except the authoritative dimension, where they were moderate in score. (2) *Authoritative leaders* were highest on the authority dimension but in between the other three types on the other dimensions. (3) *Invisible leaders* were lowest on all the dimensions except for being authoritative, on which they were moderate in score. (4) *Progressing leaders* were moderate on all six dimensions. To illustrate, S. M. Zhang of the Neptunus Group, an advanced leader, is highly intelligent and creative, incorporates Western practices with Chinese values, and is regarded as a hero. Yue Zhang of Shanghai Broad Air-Conditioning, an authoritative leader, is rule-driven, hardworking, and extremely task-oriented. His subordinates are intimidated and highly controlled by him.

*Russia.* Participative approaches in Russia’s largest textile factory resulted in a decrease in performance (Welsh, Luthans, & Sommer, 1993). This could be explained by Russian national norms favoring the use of authority and direction from above. According to numerous Russian opinion polls since the demise of the Soviet Union, their allegiance is to family and friends. Trust in outsiders is low. Compared to multinational polls showing Swedes as most trusting of their government, Russians are least trusting of their government. In 2003, 78% of respondents agreed that democracy is a façade for government control by rich and powerful cliques. A majority said that multiparty elections did more harm than good. In one province, 88% indicated they would choose order over freedom. Most said they would be willing to give up freedom of speech, press, or movement in exchange for stability, and 76% favored restoring censorship over the mass media (Pipes, 2004).

*Britain and France.* Decision-making processes take a different form in Britain than in France. According to Graves (1973), British managers do not consider all alternatives. Greater conflict occurs in regard to the value of various alternatives; nevertheless, once a decision is reached, there is more commitment to it. French managers place more weight on alternatives but may be less committed to the alternative selected for implementation. Subordinates’ felt pressure to participate in decisions may depend more on individual differences. It may be a more impersonal matter in Britain and more personal in France (Inzerilli & Laurent, 1983).

*Multinational Subsidiaries versus Indigenous Firms.* Heller and Wilpert (1981) surveyed the extent to which decision making was directive (with or without explanation), consultative, joint, or delegative among 625 boss-subordinate dyads in 29 firms in eight countries. The results varied by country from most directive to most participative. Israel was most directive, and Sweden was most participative. But the authors noted that the type of firm had to be taken into account. For example, more direction was found in indigenous German firms than in German multinational corporations. German subsidiaries of multinational firms headed by other nationals were the most participative. Similarly, Negandhi and Prasad (1971) obtained results indicating that

managers in North American subsidiaries in Argentina, Brazil, India, the Philippines, and Uruguay found it more comfortable to delegate than did indigenous managers in locally owned firms in the same countries. Whether employees in North American subsidiaries of Japanese multinationals were satisfied or tended to quit appeared to depend on whether the management was under more Japanese or American influence. Japanese employees were more satisfied with Japanese managers and practices than were U.S. employees (Yokochi, 1989b).

*Influences of Power, Legitimacy, and Expectations.* Although a participatory style may work well for leaders and with subordinates in low power distance, as in the United States where it is culturally legitimate, considerably less effective outcomes may be found in high-PDI countries in which participation is less expected and appreciated. For example, in Saudi Arabia, Algattan (1985) compared the effectiveness of participatory leadership on U.S. and mainly Asian and African workers. Participatory leadership was more effective with the U.S. workers and was related to their greater need for the scope of the task, growth, and inner locus of control in comparison to Asian and African employees. The *referent* power of U.S. supervisors, their esteem and popularity, enhanced the performance of their subordinates, but *legitimate* power was more important to Bulgarian supervisors in contributing to their subordinates' effectiveness. In Bulgaria, the supervisor was seen to have the right to control subordinate behavior (Rahim, Antonioni, Krumov, et al., 2000).

In a seminal field experiment, Coch and French (1948) found a marked increase in productivity by North American work groups that were permitted to participate in goal-setting decisions that affected them. This was in contrast to findings with control groups that were not permitted to participate. But the same experiment failed with Norwegian factory workers because Norwegian workers were thought to have a lower need for autonomy and did not see participation as legitimate to the extent that American workers did (French, Israel, & As, 1960). Locke, Latham, and Erez (1987) showed in laboratory comparisons that group participation in goal setting was unnecessary in the United States, where (serendipitously) the experimenter had been friendly and supportive when instructing the subjects. In Israel, the experimenter had been more curt. In Puerto Rico, when the manager of a new Harwood Manufacturing plant began to encourage employees to participate in problem-solving meetings, turnover increased sharply! It was found that the workers in Puerto Rico had decided that if the management was so ignorant of the answers to its problems that it had to consult employees, the company was poorly managed and unlikely to survive (Marrow, 1964b). In the same way, Israeli sailors were more satisfied with expected legitimate directive leadership than with participative leadership (Foa, 1957).

### ***Relations-Oriented and Task-Oriented Leadership***<sup>10</sup>

Considerable agreement across countries was reported by Blake and Mouton (1970) in what managers regard as ideal. Among almost 2,500 managers from the United States, South Africa, Canada, Australia, the Middle East, and South America in GRID seminars, most agreed that the "9,9 management style" (integrated concern with both production and people), as defined in [Chapter 19](#), was the ideal for their company. But much of the uniformity across countries could be attributed to indoctrination in the GRID seminars. There was more concern in general for productivity when managers described their own actual behavior. In the same way, Howell and Dorfman (1988), comparing Chinese, Mexican, and American employees in electronics manufacturing plants, concluded that supportive leadership generally had similar positive effects on satisfaction and commitment in all three samples. Moreover, the cohesiveness of the work groups could often substitute

for the supportive leadership in generating the satisfaction and commitment Ayman and Chermers (1983) and Kakar (1971) reached similar conclusions.

The relations orientation and task orientation (Bass, 1967b) of leaders and nonleaders have been studied in many different countries, including Poland (Dobruszek, 1967), Britain (Cooper, 1966; R. Cooper & Payne, 1967), India (Muttayya, 1977) and Hong Kong (Lomas, 1997). Lomas found that Hong Kong Chinese project managers, in comparison to their Western counterparts, placed more emphasis on personal relationships than on the task. Muttayya observed that among 275 diverse formal and informal Indian leaders and nonleaders that the leaders were more task oriented, as expected. Lindell and Arvonen (1996) obtained results indicating that Latin European managers were somewhat higher in task orientation than Scandinavian and Hungarian managers. Employee orientation was higher in Scandinavian than Latin European managers. Likewise, the importance of the vertical dyad linkage on the quality of superior-subordinate relationships was as applicable in Japan and elsewhere as in the United States (Wakabayashi & Graen, 1984).

Dorfman (1996) concluded from a review of the literature that the importance of task orientation and its contribution to subordinate satisfaction and effectiveness did vary somewhat from one culture to another. A third dimension needed to be introduced to account for the fuller orientation of the leader toward the task and relationships. Such a third dimension dealing with character and morals had to be added to P(roduction) and M(aintenance) to describe Chinese leaders in the application of Misumi's PM theory. According to Peterson (1988), PM theory, which was developed and validated in collectivist Japan, may be improved in the individualist United States with some modification of this type.

*The Japanese Example.* As noted earlier, the Japanese place a particular premium on the quality of relationships with others. A variety of empirical studies and case analyses have corroborated this finding. Among the 12 national groups studied by Bass, Burger, et al. (1979), the Japanese managers were relatively high or highest in preferred awareness of self-understanding, listening to others with understanding, and accepting warmth and affection from others. They were also highest in their willingness to discuss feelings with others and to cooperate rather than to compete with their peers, and in seeing the need for top management to be tolerant. At the same time, they remained relatively high among the nationalities in their actual and preferred task orientation relative to their human relations orientation, which admittedly was also strong in an absolute sense. The task centeredness of the Japanese managers appeared more acceptable than it would for British managers, according to White and Trevor (1983), for the Japanese were considered more committed, expert, and socially close (P. B. Smith, 1984a).

Task orientation was expected to be high in organization members in Japan, for it is directly connected with acceptance of the organization's mission and goals. Relations orientation was beyond discussion, for it was assumed on the Japanese scene that organizational survival and success depended on it as well as concerns for the task (Yokochi, 1989b). The same emphasis on task orientation was seen in Japanese-owned plants in Britain, the United States, and Hong Kong, even when a majority of supervisors were not Japanese (Smith, Paterson, Misumi, et al., 1992).

Bolon and Crain (1985) compared the responses of 40 Japanese and 39 U.S. managers and executives in how they would handle a problem subordinate. The Japanese were found to take significantly more steps in dealing with the subordinate. They invested more effort in trying to understand the situation. On the other hand, U.S. male managers (but not female managers) more often attempted to resolve the situation by firing the subordinate or forcing him or her to quit. When American, Indian, and Japanese managers were compared by Ivancevich, Schweiger, and Ragan (1986), it was found that the Japanese felt they obtained more social support from their bosses than did the Indian or American managers. For Indians and Americans, spouses and relatives were more important providers of such social support.

The greater emphasis on the human side of enterprise by Japanese compared with American managers in

large firms was seen in their differential response to intensified price competition. Americans cut their human resources expenditures while maintaining their capital equipment, plant, and material resources. They sought financial and legal solutions to deal with the competition rather than technical ones. Before the economic recession in the 1990s, the Japanese tried to save their human resources. They avoided layoffs, discharges, and wage reductions to reduce labor costs, although they did withhold bonuses. If personnel costs had to be cut, they reduced their own salaries and made use of quality circles and other “bottom-up” suggestions to reduce costs. They reduced the costs of production by increasing the flexibility of their operations. When they replaced workers with automation, they transferred and retrained the displaced workers. The Japanese approach required a high degree of coordination and good working relations among R & D, manufacturing, and marketing, as well as commitment, loyalty, and employees’ involvement (Tsurumi, 1983).

The Japanese attention to relationships was made more specific by Hall and Hall (1987), who pointed to the unusual degree to which the Japanese place a premium on listening and the value of agreement. Questions should not be posed unless they have answers or the answers can be found beforehand by asking the questions in advance of a meeting. Proposals should not be refused outright, but should be taken under consideration. If a proposal is finally rejected, the reasons need to be fully stated with politeness and apologies. The transformational factor of individualized consideration, as measured by the Multi-factor Leadership Questionnaire, emerges from a different set of items in Japan because such consideration is expected from one’s supervisor even though it remains unspoken. Guidance by the supervisor and acceptance by the subordinate is an unsaid rule governing their relationship (Yokochi, 1989a).

Westerners who interact with Japanese will be more successful if they pay attention to the need for patience. Impatient behavior will be interpreted as bad manners and a lack of sincerity. Uncontrolled emotion will be considered as weakness and in bad taste. But patience may not help the Western negotiator. Until the economic downturn in the 1990s, the Japanese remained ethnocentric in their domestic business activities in Japan itself. They made special efforts to buy Japanese products whenever possible rather than buying them abroad. They infringed on Western patents (not infringement, according to Japanese law) and continued to rely on more expensive Japanese suppliers. The “old-boy” networks were particularly strong in Japan and difficult for foreigners to penetrate.

### ***Initiation and Consideration***

Cultures differ in what is seen as considerate behavior. In the West, it is considerate for a leader to praise publicly but criticize privately. In Japan, criticism from a leader comes indirectly through a peer since direct criticism from the leader would cause the follower to lose face (Smith & Peterson, 1988). Substantial differences in the initiation of structure and consideration have been found among managers from different countries. For instance, Anderson (1983) did not find that consideration by leaders contributed to the effectiveness of managers in New Zealand as was usually found elsewhere. In the Bass, Burger, et al. (1979) 12-nation data for Exercise Self-Appraisal, although there was an overall trend to see the need to be more considerate by leaders at lower levels of management, the French and Latin countries regarded being considerate as relatively unimportant at all levels of management; Northern Europeans, British, and Americans thought it more important. On the other hand, consideration was emphasized by fast-rising but not by slow-climbing managers in Italy, Spain, Portugal, and the United States; it was deemphasized by those with accelerated careers in Belgium, Scandinavia, France, Latin America, and India. Tscheulin (1973) found positive effects of consideration on satisfaction for a German sample, as did Rim (1965) for Israeli nurses and industrial supervisors and Fleishman and Simmons (1970) for Israeli supervisors. But L. R. Anderson (1983) reported

the opposite for middle managers in New Zealand.

L. R. Anderson (1966a, 1966b) studied discussion groups composed of American and Indian graduate students. The leader's effectiveness, as rated by the American students, was positively correlated with both the leader's consideration and initiation of structure. But Indian students' ratings of leader effectiveness were correlated only with the leader's consideration scores. When the initiation of structure scores eliminated the coercive items such as "pushing for production," initiation of structure also correlated positively with leader effectiveness.

*Differences in Psychometric Properties.* Culture may affect the psychometric properties involved in measuring initiation and consideration. As noted earlier, the factor structures of leadership behavior descriptions in the United States, Britain, Japan, and Hong Kong systematically differed, especially in which questionnaire items correlated with initiation of structure (Smith, Tayeb, Peterson, et al., 1986). Ayman and Chermers (1982) emerged with a single factor instead of the two factors of initiation and consideration for European in contrast to U.S. managers, as described by their respective subordinates. When K. F. Mauer (1974) administered the Leadership Opinion Questionnaire to a sample of 190 mine overseers and shift bosses in the South African gold-mining industry, neither a varimax rotation nor an orthogonal target rotation of the two extracted factors approximated the findings of U.S. and Canadian researchers. An oblique target rotation produced a South African solution that was closest to the North American solution.

The correlation between the factors was much higher than that found in other studies. Nevertheless, Matsui, Ohtsuka, and Kikuchi (1978) were able to replicate and extend Fleishman and Peters's (1962) U.S. results with 79 Japanese supervisors. As with the U.S. results, they found that considerate Japanese supervisors (as seen by their subordinates on the Supervisory Behavior Description Questionnaire) were higher in self-inventoried benevolence on L. V. Gordon's Survey of Interpersonal Values. The supervisors' initiation of structure, as described by their subordinates, was lower if the supervisors reported themselves to be higher in valuing independence.<sup>11</sup>

### ***Laissez-Faire Leadership versus the Motivation to Manage***<sup>12</sup>

In data collected between 1968 and 1972, the preference to be more influential was high among managers from all 12 nations studied by Bass, Burger, et al. (1979). But it was highest among Japanese, Spanish, and German managers and lowest among French and Dutch managers. During this same period, the endorsement of active intervention by the leader, in contrast to laissez-faire behavior, was seen by Bass and Franke (1972) to relate to a country's rate of economic growth. Bass and Franke obtained a correlation of .93 in the ranking of six industrialized countries between the rate of economic growth of the country for the preceding nine years and the extent to which students from those countries endorsed a manager's being both more participative and more political to achieve success in a career.

Some consistency with these results was obtained by Keys, Edge, Heinz, et al. (1986), who compared the self-descriptions of 214 Korean, 101 Filipino, and 97 American middle managers about how active they were in their relations with others in dealing with various issues. The issues were expected to make a difference, since the Asians were more likely to be more collectivistic and the Americans more individualistic. The Americans reported themselves as being more likely than did the Filipinos or Koreans to threaten their subordinates to obtain compliance with requests. Americans also more frequently ordered subordinates to "do what I want done." Furthermore, the U.S. middle managers were most likely to say that they would disagree openly with their boss and remind the boss about matters if he or she procrastinated. However, the Korean managers were

most likely to indicate that they would confront their boss if treated unfairly, while the Filipinos were most likely to indicate a reluctance to go over the boss's head to a higher authority. Less collectivistic than the Filipinos or Koreans, the Americans were more likely to actively complain to their boss if their peers got out of line. They were most likely to remind their peers of rules and policies.

*Motivation to Manage.* Collectivism and individualism had different effects on the motive to manage others in hierarchical settings. Projective results on the strength of the motivation to manage within bureaucracies, as revealed by scores on the Miner Sentence Completion Scale (MSCS)<sup>13</sup> by foreign and U.S. students in American schools, were quite different. Consistent with the decline in American MSCS scores between 1960 and 1980 (Miner & Smith, 1982; Miner, Smith, & Ebrahimi, 1985), American students were found to score much lower than Asian or African students. Also, Ebrahimi (1985c) noted that the motivation to manage, as measured by the MSCS, was significantly higher in a combined sample of Japanese, Korean, Taiwanese, Philippine, Malaysian, and Chinese students and a separate sample of Thai students than in a sample of American students. Also, the MSCS scores were successively higher for students from India, Iran, Thailand, and Nigeria. Some of these differences could be attributed to personal differences among the students. The foreign students studying in the United States were likely to be more ambitious, adventuresome, assertive individuals, who were more highly socialized to Western mores and higher in class and education than those who remained at home. At the same time, the results suggested, these Asian and African students would fit more readily into management in the highly bureaucratized organizations in which they were likely to find employment when they returned home. Consistent with these results, Wachtel (1988) found that prospective managers from Mexico were higher in managerial motivation than were their American counterparts.

### ***National Influences on Transformational and Charismatic Leadership***

With few exceptions, transformational leadership is universal in its greater success and effects on positive follower outcomes in comparison with management by exception and laissez-faire leadership (Bass, 1997, 1998). Yet there are cultural contingencies. Yan and Shi (2003) set forth that each of Hofstede's (2001) five dimensions differentially relate to the adoption of Bass's (1985) original dimensions of transformational leadership and acceptance by followers. Jung, Bass, and Sosik (1995) argued that transformational leadership was more likely to appear in collectivistic than individualistic cultures. In the collective cultures like those of China, Japan, and Korea, individuals more readily identify with a group, share responsibility for goal attainment, try to maintain a harmonious group, and emphasize mutual interdependence in organizations. These behaviors are consistent with what a transformational or charismatic leader tries to accomplish.

Davis, Guan, Luo, et al. (1997) distributed the Multifactor Leadership Questionnaire in Mandarin to all managers and their subordinates in a state department store in central China. A 65% response rate provided 241 completed questionnaires. Stepwise regression analyses with transactional scores and then transformational scores were added as predictors of outcomes. An index of transformational leadership added significantly to transactional leadership scores in the prediction of effectiveness ( $R^2 = .43$ ); individual effort ( $R^2 = .65$ ), satisfaction with the leadership ( $R^2 = .31$ ) and intention to quit ( $R^2 = -.20$ ). Contrary to Bass (1997), Ardichvili (2001) found more country specificity than universality in transformational leadership in Georgia, Kazakhstan, Russia, and the Kyrgyz Republic. Koh (1990) reported the same kind of results for school principals in Singapore, which is also high in collectivism and mainly Chinese in culture. Chiu (1997) compared results obtained with 233 part-time MBA students working in collectivist Hong Kong and the

sample of individualist Americans used by Bycio, Hackett, & Allen (1985). He also compared in-group members in Hong Kong, those who looked out for the welfare for each individual member in the group, with out-group members. Hong Kong Chinese leaders were more likely to use intellectual stimulation and individualized consideration with their in-group members. American leaders were less likely than Chinese leaders to show individualized consideration to their subordinates. Compared to Americans, Hong Kong Chinese subordinates and members of the in-group were more likely to perceive their leaders as charismatic. Howell, Dorfman, Hibino, et al. (1994) reported that charismatic leadership correlated with subordinate satisfaction in Korea, Taiwan, Mexico, and the United States, but not in Japan.

Japanese leaders take full responsibility for organizational outcomes. They make extra effort to understand their followers' needs and feelings. In turn, they are treated with respect and trust. According to Yokochi (1989a), in collectivist Japan, managers at the CEO level and several rungs below are much more transformational than transactional. Their subordinates are likely to indicate on the Multifactor Leadership Questionnaire that their leaders take full responsibility for their actions (as a matter of tradition) and are generous in giving concrete guidance. The leaders are highly respected and trusted. The leaders encourage sacrifice by subordinates and at the same time make extra efforts to assure subordinates of their feelings and concern for the welfare of the subordinates and their families. Subordinates are challenged with new ideas and tasks. As noted elsewhere, it is the firm or agency, not the leaders, that provides unspoken rewards and promotions.

Yokochi (1989b) completed an MLQ survey of three hierarchical levels in 14 Japanese firms involving 66 executives, 44 managers, and 194 subordinates. She concluded that Japanese leaders take readily to transformational leadership as a consequence of their humanistic values and corporate goals. Intellectual stimulation is comfortable due to the culture's emphasis on continuous learning and pursuit of intellectual activities. Strong adherence to company management philosophy is attributed to the desire to emulate senior management behavior. Adherence to hierarchy does not mean autocratic leadership but is rather symbolic. The emperor is highly revered as a figurehead in a constitutional monarchy. Legitimate hierarchical orders are usually consensual; decision making is widely shared. The preference is for working in groups. Standing alone for personal freedom is not admired.

Pereira (1986) found similar results in collectivist India for 58 senior and middle-level managers from Larsen and Toubro, an engineering firm. Again, Echevarria and Davis (1997) in the collectivist Dominican Republic reported similarly high correlations of transformational leadership with effectiveness, satisfaction, and extra effort for 402 employees from two newspapers.

Walumba and Lawler (2000, 2003) collected survey data from 745 employees in banking and finance in China, India, Japan and Kenya. They confirmed that transformational leadership contributed to job satisfaction and commitment in all four collectivist countries. In low-power-distance countries such as Australia, transformational leaders are participative in style (Ashkanasy & Falkus, 2004). In high-power-distance countries, they tend to be more directive (Den Hartog, House, Hanges, et al., 1999). Howell and Dorfman (1988) expected charismatic leadership to have a considerable impact on Mexican and American employees' satisfaction with work and with supervision. Although the expected effects were positive on both samples, the impact of charismatic leadership was greater on the American employees. Correlations of .50 and .70 were found, compared to the Mexican employees, for whom the correlations were .29 and .57. Some of the darker history of charismatic Mexican political leaders may have been a drag on the Mexican results. This may partly explain why Ardichvili (2001) found more country specificity than universality in transformational leadership in Georgia, Kazakhstan, Russia, and the Kyrgyz Republic. Although Australia and the United States belong to the same Anglo-American cluster of countries, Australians put even more of a premium on equality and individualism. Transformational leadership had the same effects in both countries, but Australians varied more in attributing it to their leaders. Transformational factors in Australia are 0.7 to 1.1 lower in standard

deviation (Parry, 1994). However, according to Parry (1996), Australians, more than Americans, expect charismatic leaders to take an interest in the welfare of their followers—to be individually considerate. Australians expect a lot more from their leaders than do Americans. High status is not enough to create respect; respect has to be earned.

*Transactional Leadership: Contingent Reinforcement.* Transactional leadership has many elements that fit better with an individualistic society. Rather than endorsement of shared purposes and identification with group goals, leaders and subordinates are motivated by personal goals. Individual initiatives and self-interest are more important (Jung & Avolio, 1999). Early (1988) pointed to important cross-cultural differences in the effectiveness of contingent rewarding. He noted that since workers in individualist England did not value praise, criticism, or general conversation with their superiors, as did American or Ghanaian workers (Early, 1984), English workers would be less likely to be influenced by contingent rewarding. The English workers, particularly those in heavy industry, would distrust feedback from their supervisors (Blumberg, 1968; Goodman & Whittingham, 1969). In the same way, individualistic U.S. worker samples generated higher correlations between transactional contingent rewarding and measures of satisfaction with work and with supervision (.48 and .73) than Howell and Dorfman (1988) found in collectivist Mexican workers (.19 and .57). Likewise, the effects of contingent punishment were greater for the U.S. than the Mexican samples. Nonetheless, contingent reinforcement was found to have positive effects on satisfaction and organizational commitment in collectivist Taiwan (Dorfman & Howell, 1988). Similar correlations were found by Peterson, Peng, Hunt, et al. (1994) when they compared 447 middle managers and supervisors working in local city government (.54) in the individualistic United States with their 196 counterparts in city government in the collectivist Japan. While noncontingent punishment correlated negatively with job satisfaction in the United States (–.39), it had no effect in collectivist Japan (–.05).

The transactional factor of contingent reward is complicated in Japan by unspoken expectations of reward as well as obligations. For example, the failure to be promoted would be a consequence of failure to meet unspoken expectations. Strict rules of *tatamae* prohibit explicitly seeking rewards or professing open expectations of them. Unspoken needs are those that will be fulfilled with successful leader-follower performance. This *honne* is well understood, although not by those unaccustomed to the system (Yokochi, 1989a). Even more complicating is the fact that Japanese employees do not differentiate themselves from their supervisors and managers but see all collectively as members of the company. Promotion is from within the organization, so that shared common mottos, values, and goals are maintained by workers and management. Pay differentials are small and are decided (along with promotions) not by one's immediate superior but by the amorphous company, consistent with its standards, values, history, and traditions. Even more of a problem for the Japanese is management by exception, since it is difficult for them to appreciate such a supervisory-subordinate relationship. For them, it would be a matter of custom and tradition for a supervisor to be more concerned about the subordinate.

Howell, Dorfman, Hibino, et al. (1994) reported that contingent reward, praise, approval, and recognition by the leader for good performance universally generated follower commitment, satisfaction with supervision, and satisfaction with the leader. (This is not surprising since Antonakis and Avolio (2004) found that contingent reward such as recognition is both transformational and transactional.) Material rewards are transactional. However, contingent reproof and disapproval for poor performance had more of an impact in individualistic countries like the United States than in the collectivistic countries of Asia. The same should be true for management by exception. Parry (1996) set forth the idea that monitoring and controlling subordinates' interpersonal behavior is indicative of less effective leadership, more in Australia than in the United States. Subordinates are more cynical about authority and likely to reject influence based only on the status of the source.

# Leadership in the Multinational Firm

---

## ***Multinational Corporations (MNCs)***

International organizations, both collegial and hierarchical, have been around for a long time, dating back to the ancient world. Currently, executives, managers, and employees from the world's different nations work together in the United Nations, the World Bank, the World Court, and a host of other international agencies and private enterprises. Among these international organizations, much of the available research on leader-subordinate relations appeared in studies of multinational corporations that began with management and industrial activities in one country and spread to others as they went beyond importing and exporting to manufacturing, marketing, and research in the other countries through developing, purchasing and franchising subsidiaries organized for these purposes. Many MNCs have recognized that increasingly their sales and revenues are coming from foreign sales and services. For instance, Avon Products, a U.S. firm, was making 65% of its sales abroad by the mid-1990s (Henson, 1996).

*The Growth of MNCs.* Direct investment in development or acquisition of foreign subsidiaries or merging with other companies across borders came when import or export alone failed to meet supplies, sales, or service objectives domestically or as a result of the personal predilections of senior management of the MNC. An MNC may develop and provide funding for a new start-up subsidiary headed by a parent-company executive and some staff who will mainly hire and train host-country nationals. It may purchase a local firm for cash or stock in whole or in part. If integration with the parent company or domestic and other foreign subsidiaries is sought, parent-country or third-country executives, managers, and supervisors may be placed in key positions. MNC mergers involve creating one company out of two by one company taking over another across borders. Development of a foreign start-up contains the fewest cross-cultural problems and is likely to be successful. Mergers encompass the most cross-cultural problems and are least likely to be successful (Hofstede, 2001). Deals may fail as a consequence of misunderstanding one's own culture or the other party's culture (Kemper, 1997). Often, mergers and joint ventures face conflicts in the distribution of power and agreement about the criteria on which to judge performance. For instance, in Chinese and American joint ventures, the Chinese favor evaluating the technology; Americans favor evaluating operations (Zhao & Culpepper, 1997). Cultural proximity between the MNC and the subsidiary increased the chances for Dutch MNCs' success in start-ups, acquisitions, and mergers (Barkema, Bell, & Pennings, 1996) and likewise for Chinese joint ventures with foreign MNCs (Luo, 1999).

*International Strategic Alliances.* These are formal contracts or understandings between partner firms across borders. They provide linkages of resources for joint accomplishment of objectives. In 1983 to 1986, such cooperative arrangements were likely to generate cross-cultural conflicts. For instance, Americans want frequent interactions in alliances and explicit understandings in formal contracts; Japanese are satisfied with more implicit agreements. The Americans are comfortable with vigorous conflict; the South Koreans and the Middle Easterners find conflict distasteful. A survey of cross-border alliances with American firms had a failure rate of 70%. Nevertheless, Americans felt that alliances provided important information. European and Japanese firms emphasized the strategic needs met by alliances (Parkbe, 1993).

The United States dominated the multinational scene in the 1960s. European MNC parent countries included Germany, Britain, Sweden, and Italy. MNCs also originated in Japan, Korea, India, and Arab

countries as well as in Australia, South Africa, and elsewhere. Regardless of origins, MNCs become truly globalized, with shares owned, components assembled, markets, personnel, and research deriving increasingly from many countries. In 1991, 4.1 million Americans were working for foreign multinationals in the United States (Eunni & Post, 2002). Their headquarters are in Britain, the Netherlands, Germany and Japan. For instance, in 1992, Japanese nationals with subsidiaries in the United States employed an estimated 850,000 Americans and about 27,000 Japanese expatriates. About three-fourths of the 7,000 businesses were small or medium-sized. They were owned by 2,000 Japanese firms. They tried to minimize layoffs, provide 20% more pay, and hire as many women and minorities as their American counterparts. Americans participate as managers at all levels, but much more at lower levels. The Americans had to adapt to the more flexible Japanese management system (Tsurumi, 1992).

*Approaches to Management.* MNCs, such as General Motors (United States), L. M. Ericsson (Sweden), Mitsubishi (Japan), and Ciba-Geigy (Switzerland), originating as they did in different countries, vary considerably in their approaches to coordination, the balancing of requirements, promotion of host country nationals, decision making, and power relationships (Doz & Prahalad, 1984). On the one hand, we have seen, for instance, in the Exxon studies that forecast success as a manager (Laurent, 1970) and the Arab-American homogenization of perceived leadership styles within their multinational firms (Algattan, 1985), that multinational firms are a force for global convergence. At the same time, the GLOBE studies confirmed both the similarities and differences among managers from different countries (House, Hanges, & Javidan, 2004).

*Fitting the Culture.* Management and leadership in multinational corporations (MNCs) need to fit more with the host country than with the parent-country culture. For instance, Newman and Nollen (1996) found that among 176 business units in 18 Asian and Western foreign subsidiaries of a U.S. MNC, unit and subsidiary profitability as measured by returns on sales and assets was higher if practices in the unit matched whether the host country was high or low in Hofstede's (2001) dimensions. Nevertheless, the American MNC Procter & Gamble introduced a U.S. code of ethics into its Asian and African subsidiaries. The subsidiaries, unlike the ones in the United States, were all high in power distance, collectivism, uncertainty avoidance, and masculinity. P&G expected to see some adaptation in the subsidiaries of reduced collectivism and masculinity (Reeves-Ellington, 1995).

Management controls tend to reflect more the culture of the parent company's home-country culture. According to a study of 75 foreign acquisitions, American MNCs tend to emphasize more informal control and the use of teams; British and French MNCs tend to stress more formal control (Calori, Lubatkin, & Very, 1994). In general, the greater the cultural distance between the parent and host country, the more likely is control to be personalized and centralized (Harzing, 1999) and the more likely is the CEO to be from the parent country, according to a study of 287 subsidiaries of 104 MNCs in nine parent countries and 22 host countries by Harzing (1999).

The cultural adaptation of the parent-country manager to the host country may make a difference. A videotape of a Japanese parent-company national interacting with host-country national subordinate in the United States was shown to 223 employees of Japanese manufacturing firms in the United States. Management effectiveness and intentions to trust were positively related when the manager was shown as being culturally adapted to the United States (Thomas & Ravlin, 1995). Nationals of a country may differ in what they do when they are at home and when they go abroad. Takamiya (1979) observed that Japanese firms in the United States and in Europe were not providing lifetime job security or Japanese-style company welfare programs for their employees. Nonetheless, the Japanese firms abroad were found to be highly productive and to maintain the same high-quality standards they did at home. The success of the firms appeared to be more a consequence of their attention to production management and high-quality standards than to Japanese-style

human relations practices (Hayes, 1981). Pascale and Maguire (1980) came to similar conclusions from a study of 13 Japanese firms operating in both Japan and the United States. They found that the location of Japanese plants in Japan or the United States was more important to supervisor-subordinate relations than the fact that the management was Japanese. Absenteeism was lower in Japan; more was spent on employee benefits in the United States. According to a study of 126 firms, they were more likely to expand and diversify internationally if their top management team was younger, longer-tenured, higher in elite education, and more experienced internationally (Tihanyi, Ellstrand, Daily, et al., 2000).

### ***Parent, Host, and Third-Country Nationals***

Little has been reported about the specific leader-subordinate relationships of supervisors of one nationality and subordinates of another. They may be operating together at the headquarters in the parent country, in a host country, or in a third country. The leader or the subordinate may be a parent-country national (PCN), a host-country national (HCN), or a third-country national (TCN).

*Developing International Managers.* Oddou and Derr (1991) examined 55 Anglo American, Scandinavian, German, Dutch, and Latin European MNCs ranging in size from under 1,000 to over 200,000 employees. The functions internationalized in order from most to least were marketing, finance, manufacturing, R & D, and human resources. Fifty-three percent of the top 50 line managers had experienced at least one international assignment, as had 48% of the staff managers. The two most frequent means of developing international managers were moving PCNs to foreign offices and conducting international seminars with PCNs, HCNs, and TCNs. More needed to be done by developing international task forces and bringing HCNs and TCNs to a major parent-country national office. Additionally, to meet the needs for more expertise about the host countries and international issues, the firms planned to: (1) hire more HCNs, (2) use more specialized consultants, (3) increase use of HCNs in other countries, (4) send top managers to international seminars, and (5) create international networks with friendly firms. Company inattention to proper selection and training of PCNs was a particularly important source of failure. In another study of 105 MNCs, ratings of the reported lack of rigor of selection, training, and preparation of personnel for overseas assignment correlated .63 with personnel failure rates (Tung, 1979).

*Decision Making, Status, and Power.* Of considerable importance to the leader-subordinate relationship in the MNC is its method of decision making and the differential status and power of its PCNs, HCNs, and TCNs. Perlmutter (1969) saw three possibilities: (1) *ethnocentric*—the PCN in all respects and all decisions and methods is controlled by the PCN. PCNs monopolize the power and status; (2) *polycentric*—the organization is host-oriented. Local HCNs are seen able to make the best decisions. HCNs are more equal in power to PCNs; and (3) *geocentric*—the organization is world-oriented, and a balanced view of decision making takes account of local and national interests and the objectives of the multinational firm. Managerial positions are filled by people having the most talent, regardless of their national background. TCNs have as much status and power as PCNs and HCNs.

As a multinational organization matures, it moves from ethnocentric to geocentric organizational patterns. Presumably, cultural origins become less significant in the decision-making process with increasing maturity. Ethnocentricity may be maintained longer by Japanese firms. Polycentrism may be the only stage for some service firms, such as convenience foods franchises; geocentrism may be reached early in other industries that find comparative advantages in integrating activities in different countries to obtain their financing and

supplies, their research, development, and manufacturing, and marketing their products. But empirically, according to their CEOs, Japanese parent company headquarters exert little influence on leadership style in American subsidiaries. On the other hand, the leadership style in Japanese foreign subsidiaries are influenced by TCNs and HCNs in their corporate headquarters (Justin & Jones, 1995).

*Differences in Satisfaction, Perspective, and Valuation.* A job satisfaction survey completed by Peter (1969) for Shell, a British-Dutch multinational corporation, illustrated the significance of employees' identification as PCNs, HCNs, or TCNs. Non-Europeans were much more dissatisfied with the company's image than were Europeans. Moreover, among all the nationals, the PCN British and Dutch were relatively most satisfied with the company as a place to work and with opportunities to obtain responsibility and authority.

The managers' work location, their willingness to work abroad, and their experience in working abroad are likely to affect their attitudes. Positive experiences are likely to generate more favorable attitudes and satisfaction with foreign assignments. The turnover rates of American PCNs ranged from 16% to 40%, compared to 5% to 15% for Americans who remained in the United States (Eunni & Post, 2002). Their intention to quit the job in the foreign location was greater than to leave their organization (Birdseye & Hill, 1995). But Yeh (1988) generally did not find differences in power distance, avoidance of uncertainty, individualism, and masculinity when PCN and TCN managers (63 American and 356 Japanese) were compared with HCN managers (2,237 Taiwanese) working for firms in Taiwan.

Possibly reflecting MNCs in general, Swedish and Dutch MNCs top management teams have not internationalized as have their employees (Eunni, 2002). When a team is international in composition, the perspectives of the different members need to be understood. Members may vary in whether they are oriented toward the mastery of nature and its control with technology, are oriented to subjugation of nature with a predestined plan and unavoidable constraints, or are oriented toward living in harmony with nature and a balance of self and environment. Humans are seen as basically good or evil. If good, they can be trusted; if evil, they are untrustworthy. Their perspectives also differ if they come from countries high rather than low in PDI, UAI, IDV, MAS, and/or LTO. International teams need to *decenter*—change from blaming others for the differences and developing an understanding that the differences are due to different perspectives. Then they can *recenter*—build a common view of the situation to better deal with it (Maznevski & Peterson, 1997).

*Uniformity.* According to interviews with 248 HCNs and PCNs by Zeira (1975), PCNs and TCNs tend to impose parent-country headquarters' managerial patterns on their host-country peers and subordinates. This finding was corroborated by Al-Jafari and Hollingsworth (1983). But although an Arab organization, as such, would have been expected to operate more autocratically than a U.S. or European multinational firm, among 337 managers of 10 multinational organizations in the Persian Gulf region, both U.S. and Arab managers saw their organizations operating in a Survey of Organizations Systems 3 (consultative) mode and leaning toward Systems 4, an even more participative style (Al-Jafari & Hollingsworth, 1983).

According to headquarters' PCN personnel directors, multinational uniformity facilitated comparisons of managers in subsidiaries in different countries (Zeira, 1975). Uniformity was also thought to keep up the firm's reputation in different countries and to make it easier to introduce policy changes. HCNs disagreed. A majority thought that PCNs maintain uniformity of policies and practices for their own self-interest. The HCNs believed that the PCNs (and the TCNs) at higher management levels in the local subsidiaries were not motivated to make local improvements or to meet local needs. They thought that the PCNs' insensitivity to the expectations of local HCNs resulted in many conflicts. The HCNs were particularly critical of the tendency of multinational firms to centralize decisions, which made it impossible to adapt to the needs of the local marketplace. They mistrusted their PCN superiors and believed that their promotion to a higher level

was prevented by their not being nationals of the parent country (Zeira, 1975).

*PCN Benefits.* Because the PCNs are representative of their multinational corporations, they can achieve entry into the upper-class social life of the local communities beyond what they could reach in their previous positions at international headquarters at home. PCNs obtain special benefits as part of their compensation abroad. This makes it possible for them to enjoy a standard of living that is considerably higher than that of their local peers and higher than what they can expect when they return home.

*Why PCNs Fail or Succeed.* Despite the extra benefits of working abroad, the failure rates of PCNs are high. More than one third return from overseas assignments prematurely. The incidence of divorce, alcoholism, and drug abuse is high (Chesnow, 1984). PCNs may experience anxiety over their transfer, disorientation as a result of culture shock, social dislocation, anxiety about being separated from family and friends, and feelings of having been abandoned by headquarters. They may sense that they lack the necessary influence and local technical assistance. They may have physical problems. Reentry problems on returning home also need to be faced (Ronen, 1986).

A survey of 321 American managers on international assignment found a correlation of .71 between commitment to both the parent and host companies with how much discretion they had in their roles, .47 with adjustment to the host country, and .33 with how much they interacted with host nationals. They were committed to their parent company rather than their host country company to the extent they had predeparture training ( $r = .60$ ) and if they were not adjusted to the host country ( $r = .53$ ) (Gregersen & Black, 1992). Among 109 British managers, willingness to work abroad depended on the country to which they might be assigned. On a scale of 1 to 7, among 22 countries, they were most willing to serve in the Netherlands (5.11), France (5.01), northwestern European countries (4.67), North America (4.64), and Australia (4.40). They were less willing to serve in southern Europe (3.77), eastern Europe (2.84), South America (2.77), and Japan (2.71), and least willing to serve in Africa (2.36), China (2.21), and the Middle East (1.92). They were most willing to go abroad for a British parent organization (6.53) and least willing to go abroad for a Japanese parent organization (2.28). The willingness to accept a foreign assignment was correlated with viewing a life goal of independence as highly important and a life goal of security as less important.

The spouse's willingness to relocate, short-and long-term, was seen to be a function of individual, family, and organizational circumstances according to a questionnaire survey of 427 international managers and their 167 spouses by Konopaske, Robie, and Ivancevich (2003). A survey of 105 U.S. multinational firms by Tung (1979) suggested that the most important reasons for a PCN's failure to function effectively in a foreign environment were: (1) the inability of the manager's spouse and family to adjust to a different physical or cultural environment; (2) the manager's inability to adapt to a different physical or cultural environment; (3) the manager's emotional immaturity; (4) the manager's inability to cope with the larger responsibilities posed by the overseas work; (5) the manager's lack of technical competence for the job assignment; and (6) the manager's lack of motivation to work overseas.

Hechanova, Beehr, and Christianson (2003) completed a meta-analysis of 42 empirical studies involving 5,210 PCNs and TCNs demonstrating that general, interactional, and work adjustment were predicted by self-efficacy. The mean correlations ranged from .27 to .41. Path analysis indicated that the three adjustments reduced stress and increased job satisfaction with the foreign assignment. Finally, job satisfaction and lack of stress both contributed to organizational commitment, job performance, and intention to stay.

PCNs can fail because their customary back-home autocratic or democratic style of leadership may be a poor match for the host culture (M. G. Harvey, 1996). Or they can fail because they erroneously adopt the wrong leadership style for the host country. For instance, probably because of their low estimation of the capabilities and discipline of their Melanesian host employees in Papua New Guinea, an Australian firm

adopted a rational-economic, authoritarian, hierarchical leadership approach that was incompatible with traditional styles of Melanesian leadership. Performance and job satisfaction suffered, and the project had to be abandoned following large sunk costs (Ronen, 1986). In England, Holland, Belgium, and West Germany, most HCNs felt that to avoid failure, PCNs need to adapt their leadership style to fit the prevailing pattern in the host country, rather than to emphasize uniformity with the multinational parent country. PCNs need to understand the local nonverbal language and clients' and employees' expectations. A sore point is the larger benefit package often provided to the PCN than to HCNs (Zeira & Banai, 1981).

Stolin (1997) suggested that North American executives fail in selecting competent managers in Russia because the PCNs tend to choose those with whom they will be more comfortable, that is, those with a good command of English and a Westernized persona. Such managers may be less respected by subordinates than those who pursue a more Russian leadership style. For instance, in Canada and the United States, a manager's delegation is seen as a sign of trust and confidence. In Russia, it is perceived that by delegating, the manager is avoiding the risk that he is imposing on the subordinate.

*Repatriation.* Most PCNs experience problems when in returning to their parent country. Positions similar to their status and responsibility abroad need to be found. Visibility and promotional opportunities in the home office may be lost while the PCN is away (Gregerson & Black, 1996). There may be a loss of autonomy, career direction, and a feeling that the foreign experience was undervalued (Scullion, 1992). Reintegration into the firm was seen as more difficult by most expatriates than the original move abroad (Linehan, 2001). Many chose to resign from the organization and take jobs with other firms (Black & Gregersen, 1998).

*Conflicting National Values.* Despite globalization and convergence, large differences in national values can be continuing sources of stress and conflict when managers work outside their own country. Japanese value patience, harmony, and hierarchy; Americans value action, freedom, and equality. According to an eight-country multinational survey of 2,514 senior managers, 50.4% rated their top-management teams as insensitive to internal issues within their corporation and 27.8% as divergent in vision rather than sharing in vision of internal issues (McMahon & Myers, 1995).

The newly arrived Japanese manager in the United States may be shocked by American social diversity, violence and crime, poverty and homelessness, inadequate service, hasty deal making, legal minefields, lack of spiritual organizational quality, individual careerism, narrow job focus, political confrontation, and employee disloyalty. The Japanese manager may also be shocked by American assertiveness, frankness, egoism, glibness, and impulsiveness (Linowes, 1993). I asked a group of Japanese managers working for various firms in New York City about their biggest surprise in their American assignment. They all said that they were most surprised by how the American experience had changed their wives.

*Suggested Remedial Actions.* A survey of 402 corporate employees with overseas experience concluded that selection based on interviews and psychological analyses of the candidates and their families is likely to be more useful in placing employees in foreign assignments than is depending on training alone to provide employees with the means to cope with cultural problems and communication barriers (Dotlich, 1982).

At the same time, a phenomenon that may help PCNs in a foreign assignment is the socialization process in shifting attitudes from the norms of the parent country toward the norms of the host country. For example, Lee and Larwood (1983) found that a sample of 33 U.S. expatriate managers in Korea shifted significantly closer to the mean of 105 native Korean managers and away from the mean of 74 U.S. managers in the United States in favoring more nonmaterialism, less materialism, more security, less achievement, less competition, more reflectiveness, less activity, and more subjectivity in relationships.

Expatriate managers agreed that the adaptability of families, interpersonal and leadership skills, and technical and language competence are required for the success of PCN managers. They also pointed to the importance of respect for the laws and people of the host country (Gonzalez & Negandhi, 1967). In a policy-capturing analysis, Russelli and Dickinson (1978) identified, from among 75 attributes, what it takes to be successful in work in other countries: the acceptability of the assignment to the candidate and the family, skill in interpersonal relations, skill in planning and organizing, and linguistic and technical ability. Thirty-nine upper-middle managers in international divisions of their companies used these attributes to judge 60 profiles, half of which were of candidates for jobs in hardship posts, the other half in relatively comfortable foreign assignments. The acceptability of the assignment to the candidate and the family weighed more heavily in the decisions of the 39 managers than all the other attributes. Skill in interpersonal relationships weighed more heavily than skill in planning and organizing, proficiency in the language of the host country, and technical ability. Adaptability weighed more heavily than did technical ability and proficiency in the language of the host country.

*Staffing with HCNs.* A survey of PCN West German male middle managers in a German multinational corporation found them likely to doubt the competence of their HCN subordinates (more particularly in Latin America and Europe, rather than in the United States) but not the competence of their own peers or supervisors (Miller & Cattaneo, 1982). Consistent with this finding, more HCNs are used in developed countries than in developing countries, where qualified HCNs are less readily available. Nevertheless, when efforts are made to locate, select, and train HCNs, dramatic increases can be achieved in the percentage of HCN managers in a developing country, as was illustrated by Nestlé, the Swiss multinational firm, in its Ivory Coast subsidiary (Salmons, 1977).

Multinational firms can attract potentially more productive and accommodating types of HCNs into their ranks than can comparable domestic firms. For example, Vansina and Taillieu (1970) showed that highly task-oriented Flemish business school graduates preferred to work for U.S. or German companies than for their own Belgian organizations.

North American and European multinationals employ HCNs at all levels of management, particularly in developed countries. The reasons for management staffing with HCNs include familiarity with the culture, knowledge of the local language, reduced costs, and good public relations (Tung, 1979). TCNs are most likely to be used as a consequence of their competence and technical expertise. PCNs, likewise, are selected for technical competence and are more likely to be used when starting up a foreign enterprise.

Japanese multinationals are most likely to continue to employ PCNs for top-and middle-management positions in their foreign operations (Tung, 1982), in the belief that HCNs or TCNs will not be able to understand, transmit, and maintain the desired organizational culture and policies and communicate easily with the Japanese home office. However, the interest of U.S. multinational corporations in the local employment of HCNs, rather than PCNs, has increased, and their interest in training PCNs for work abroad has decreased. It is uncertain how this change in interest will influence the movement of local HCNs into the headquarters offices and into top-management positions (Latham, 1988), but it does suggest that fewer U.S. PCNs will be able to have experience in foreign assignments as they move up the corporate ladder—an important aspect of management development in any firm in the global market for suppliers and customers. In the long term, developing HCNs as managers is less expensive than continuing to depend on PCNs abroad, but it requires good communications, decentralization of decision making, and prospects of career advancement similar to those enjoyed by PCNs, thereby making the multinational more attractive to HCNs (Rosenzweig, 1994).

## Summary and Conclusions

The exponential increase in cross-cultural research in leadership in the past 25 years led Dickson, Den Hartog, and Michelson (2004) to suggest that it would be impossible to cover the topic with one chapter. I have tried and hope I did not leave out too much. Although internationalization proceeds apace as we become a unified global economy, cultural and national differences affect leader-follower relationships. Nevertheless, there is considerable universality in traits, origins, and requirements for leadership.

Countries and cultures can be clustered to provide the bases for useful classifications. The unit of study one uses to examine how nationality and culture affect leadership may be clusters of countries with cultural affinities, individual countries within the same or different clusters, and subgroups within countries. Different conclusions may be reached, depending on which unit is used. The cultural dimensions of consequence to leadership in a given society include traditionalism, particularism, collectivism, and idealism, compared to modernity, universalism, individualism, and pragmatism. In the same way, the needs for achievement, affiliation, and the power of subordinates and supervisors have different effects on leader-follower relations in different cultures. The meaning and practice of styles of leadership such as participation differ considerably when studied in China rather than in Britain or France.

Although some argue that there is one best way to manage, considerable evidence points to the greater effectiveness of autocratic leadership behavior in authoritarian cultures and of democratic leadership behavior in democratic cultures. The same is seen for direction versus participation, task orientation versus relations orientation, and initiation versus consideration. Within the multinational firm, leader-subordinate relations will be affected by whether the firm is ethnocentric, polycentric, or geocentric and whether the individuals involved are from the parent country of the organization, the host country, or a third country. The success rate of managers in foreign assignments can be improved considerably by assessment and training, as will be discussed next for leaders in general.

<sup>1</sup> Publicly owned manufacturing companies in the United States whose headquarters were in Britain, Japan, Germany, the Netherlands, France, and elsewhere were concentrated in such states as California, Connecticut, Illinois, Massachusetts, Michigan, New Jersey, New York, Ohio, Pennsylvania, and Texas.

<sup>2</sup> For additional coverage, particularly on leadership among children, in education, and in small groups, the reader should consult Triandis's (1980) *Handbook of Cross-Cultural Psychology*, volumes 4 and 5. For earlier research reviews, the reader may consult Harbison and Myers (1959), who published a collection of field studies on comparative management and leadership in various countries. This work was followed by Haire, Ghiselli, and Porter's (1966) survey comparison of managers in 14 countries. Available two-country or multiple-country comparisons made possible reviews by Barrett and Bass (1976), Boddewyn and Nath (1970), Nath (1979), and K. H. Roberts (1970). Other works of consequence include those by Farmer and Richman (1964), Fayerweather (1959), and McClelland (1961). Studies generally tended to be based on interviews, but Nath (1969) uncovered 20 survey reports, mostly of comparisons of students in two countries.

<sup>3</sup> See, for example, Haire, Ghiselli, and Porter (1966, 1980) and Ronen and Kraut (1977).

<sup>4</sup> An exception was seen in nonindustrial societies, where Greenbaum (1977), in an analysis of 616 societies, described in *Murdock's Ethnographic Atlas* (1967), found that whether the village head inherited or was elected or appointed to the post was unrelated to family, economic, or other societal factors.

5 In 1989, President George H. Bush may have changed this tendency to a considerable extent by beginning with the appointment of many more cabinet officers with governmental and political experience.

6 One of the U.S. consultants who introduced statistical quality control in Japan in the 1950s.

<sup>Z</sup> The convention was introduced in [Chapter 18](#). Participation (in roman) includes consultation (the superior decides); *participation* (in italic) is limited to joint decision making by superiors and subordinates. Direction (in roman) refers to initiatives by a leader that involve telling, persuading, selling, and bargaining; *direction* (in italics) is limited to telling and giving orders.

## PART VIII

---

# Development and Identification of Leaders and Leadership

---

# Training and Development

“Teach and institute leadership” was among W. Edwards Demings’s 14 principles of quality control. Moreover, the importance of leadership training was implicit in many of his other principles, such as the need to set up a climate for innovation and to remove barriers that rob people of pride in workmanship. Between 1980 and 1998, the Kellogg Foundation funded 31 community, high school, and college projects to test and support models of leadership development for young adults. Evidence was obtained that such programs were effective in developing the leadership potential of participants which persisted (Zimmerman-Oster & Burkhart, 1999). During the years that followed, Kellogg carried on the effort with higher education organizations, professional associations, and other institutions (Foster, 1998). The Kravis Leadership Institute identified 49 institutions with formal academic training in leadership. Of 10 of these, all had community service requirements and most offered specific courses in leadership (Ayman, Adams, Fisher, et al., 2003).

*Approaches.* Wren (1994) proposed a model course for teaching leadership drawn from history, political science, philosophy, psychology, and anthropology. McGill and Slocum (1994) suggested learning to lead from modeling mentoring, managing, and monitoring learning—“the most powerful ways that leaders can exert influence on the behavior of people in their organization” (p. 7). Leaders themselves learn in a variety of ways, such as (1) modeling themselves after esteemed persons; (2) adopting an implicit idea about what to do and trying to do it; (3) observing how to solve a problem as an opportunity for experience; and (4) seeking truth through observation, conceptualization, deduction, and/ or experimentation (Bennis & Goldsmith, 1997). Six organizations, including the World Bank, General Electric, and Shell International, were studied, from a total of 35 organizations, and identified by a surveying research team as having the best practices in developing leaders. These best practices were (1) leadership development has been aligned with corporate strategy; (2) leadership development has mixed educational and business interests; (3) the particular competencies and characteristics of successful leaders in their own organization have been defined; (4) development of leaders is emphasized, rather than recruitment from outside; (5) action learning and real-time business issues are the basis of leadership development; (6) leadership development is linked to succession planning; (7) leadership development is supported by top management throughout the success of the effort; and (8) evaluations of the leadership development effort, from quantitative to anecdotal, are ongoing (Fulmer & Wagner, 1999). B. Lee (1996) added that leadership development programs should focus on universal principles of vision, trust, and feedback, the core of personal change. It should be a continuing rather than a onetime process. The design of leadership learning in the postindustrial world must reflect advances in technology, globalization, and societal developments. The design should emphasize process, action, discovery, virtuality, and practical outcomes (Fulmer, 1997).

## Development of Leadership

---

C. M. Cox’s (1926) study of 300 eminent historical personages noted the appearance among them in childhood of leadership traits of intelligence, self-confidence, and assertiveness. Likewise, Barton (1984)

commented that as children, those who subsequently became community leaders displayed greater-than-ordinary role diversity, flexibility in dealing with others, and other signs of leadership potential.

*Nature or Nurture?* “Are leaders born or made?” has been the age-old question. Indeed, one’s genes contribute to one’s intelligence and activity levels, which in turn contribute to leadership. As noted in [Chapter 5](#), according to comparisons of identical and fraternal twins, heritability plays a significant role. Childhood experiences make their mark. Developing facility with language is of consequence to leadership. To some extent, leaders are “born” and developed at an early age. But at the same time, much can be done with children’s development, education, and training to “make” them leaders. Understanding the performance of leaders requires an examination of their family background, early childhood development, education, and role models, along with the social and political learning experiences, informal and formal, that they personally encounter as an adult that shape their performance as leaders.

*Personal and Sociological Differences.* Differences in individual development formed the basis of a theory of transformational leadership by Kuhnert and Lewis (1987), who proposed that such leadership reflects the mature adult development of personal standards and transcendental values in the leader. In contrast, those who pursue only transactional approaches have been arrested at lower levels of development that are built around their own needs, feelings, and interpersonal connections.

Rejai and Phillips (1979, 1988, 1996, 1998) studied the development of 135 revolutionary, 50 loyalist, and 45 military leaders from four centuries and four continents. They concluded that the three kinds of leaders were remarkably similar in sociodemographic backgrounds, psychological dynamics, and situational conditions regardless of time, place, culture, and national frontiers. The leaders tended to be (1) native-born men; (2) born into a political or military family; (3) mainstream in ethnicity and religion; (4) well educated; (5) urbanized, cosmopolitan, and widely traveled; (6) stimulated by relative deprivation of the values and status they sought; (7) culturally marginal in norms; (8) vain and egotistical; (9) either a nationalist or an imperialist; and (10) verbally and organizationally skilled. Nevertheless, some differences also appeared. Revolutionaries were more likely to be from the middle class (50%) than the upper (20%) or lower class (30%). They were motivated by a sense of justice, subscribed to a spartan lifestyle, and resisted colonization and occupation. Loyalists were uniformly nationalistic and patriotic but lacked a commitment to social justice. They were mainly upper or middle class. Their fathers held prestigious occupations. Military leaders were likely to be born in rural areas before becoming urbanized. They distinguished between their own people as good and other people as bad. In more recent times, they were most likely to come from the middle or lower class.

*Organizational Differences.* A 1997 survey of 540 organizations, ranging in size from 50 to 2,000 employees or more, obtained findings indicating that “leading edge” firms, compared with ordinary firms, spend more money on training and tend to be leaders in technology. They are more likely to make use of newer practices such as 360-degree feedback, individual feedback, mentoring, and coaching. Successful organizations, compared with unsuccessful organizations, use more learning technologies and are influenced more by innovative training. The health care industry had the highest rate of employee training (82%). Ninety-three percent of the 540 organizations engaged in management and supervisory skills training, and 63% provided for executive development. The management and supervisory training were almost equally split between inside and outside courses, but executive development was mainly outside. Management and supervisor training included conducting employee appraisals, implementing rules and policies, managing projects and processes, planning, and budgeting. Computer literacy and applications were also important. Executive development included leadership, envisioning, strategic planning, policy making, and goal setting (Anonymous, 1998).

Changes in management and leadership development need to reflect the challenges of the postindustrial world, the changing marketplace, and new technologies. Globalization and the changing workforce will require more sensitivity to diversity and community and more interpersonal competence (Conger, 1993a).

## Developmental Issues in Leadership

---

### *Stages in Developing Leaders*

Chapter 30 alluded to the persistence of leadership tendencies from childhood to adolescence and from adolescence to adulthood. This chapter looks at the factors that contribute to such persistence. Adult development appears to follow along the lines described in theories of childhood development. For instance, the constructive developmental theory of Kegan (1982) focused on a series of developmental experiences in adolescence and adulthood. Kegan and Lacey (1984) showed that the theory could be applied to adult leadership development. As do children, adults continue to learn to integrate new information into schemata of subjective and objective reality that influence their maturing behavior. As an individual develops, subjective understanding becomes objective. Development occurs in stages of differentiation and integration of empathy and principled decision making. At lower stages, little empathy is shown for another person's perspectives and feelings. The individual is self-oriented. At the middle level, the individual is guided by principles of relationships and interaction with others. At maturity, the individual is guided by principles of integrity, fairness, and trust. The theory explains the emergence of transformational leadership (Kuhnert & Lewis, 1987). Lucius (1997) validated the theory empirically for 32 military cadet undergraduate juniors. Four interviewers rated the cadets' demonstrated initiatives, peer rankings of esteem, and the cadets' responses to the Rest (1986) Defining Issues Test of stages in moral development. Constructive development significantly correlated .34 with the cadets' demonstrated initiatives, .35 with their esteem, and .34 with their moral development.

The succession, tenure, and performance of owners and coaches of National Basketball Association teams appear to go through stages of disruption, learning, and stagnation. Disruption is most prevalent when coaches are changed during the season (Giambatista, 2004). According to Quinn (1988) and Dryfus and Dryfus (1986), managers and leaders evolve in five stages, from novice to expert. The *novice* learns facts and rules to be followed. With some experience, the *advanced beginner* in the second stage starts to pay attention also to basic norms and values in the situation. In the third stage, *competence as a leader*, the complexity of the task is appreciated, and a large set of cues is recognized. Calculated risks are taken. Reliance on rules begins to disappear. In the fourth, *proficiency*, stage, rules, calculation, and rational analysis are replaced by an unconscious, fluid, and effortless flow. Finally, in the fifth or *expert* stage, the leader uses a holistic recognition based on a full understanding of the situation. Cognitive maps are mentally programmed. The leader has an intuitive grasp of the situation and can change strategies as cues change.

### *Family Influences*

The Adams family illustrates family influence in the dynasties of leaders who continue for a number of

generations. John Adams, founding father and second president of the United States; his son John Quincy, the fourth president; his grandson Charles Francis, congressman and diplomat; and his great-grandson Henry played leading roles in politics, literature, and journalism (Brookhiser, 2002). The two presidents Roosevelt, Theodore and Franklin, and Franklin's wife, Eleanor, were cousins from an elite New York family. They fought against the economic privileges of their own class, championed reform and progressivism, and transformed the political landscape of America. Franklin and especially Eleanor also played important roles in the creation of the United Nations. Other American dynasties have been the Kennedys—brothers John, Robert, and Edward, their father (an ambassador) and grandfather (a mayor), and their sons (state and federal representatives); the Longs of Louisiana—Huey, Earl, and Russell (governors and senators); and the Bushes—Senator Prescott Bush of Connecticut; his son the forty-first president, George Herbert Walker Bush; his grandson the forty-third president, George W. Bush; and George's brother, Florida governor Jeb Bush. The Nehrus and Gandhis are well-known examples from India. In dynastic dictatorship, political power and position are passed on to spouses, siblings, and children, as occurs in hereditary monarchies. Family influence in Britain was examined by C. J. Cox and Cooper (1988). They found that successful British managers in larger "blue-chip" organizations came from high-status public school (that is, U.S. private school) and "Oxbridge" backgrounds; those in smaller and local firms attended grammar (U.S. public) and professional schools. Of course, the British hereditary monarchy ensures family influences on its royalty.

Each girl in H. H. Jennings's (1943) sociometric analysis<sup>1</sup> was asked to describe the different members of her family and to name the member whom she most closely resembled. The leaders (in terms of sociometric choice and offices held) were found to identify themselves with the member of the family whom they described as sociable, reliable, and encouraging. Nonleaders identified themselves with the family members who they said tended to express discouragement, anxiety, and worry.

*Birth Order.* Childhood and adolescent relationships at home result in tendencies of some to emerge as a leader during these formative years. Of significance are birth order, family size, family socioeconomic status, and parental treatment. Some studies, such as Day's (1980) analysis of promotion of 116 health care professionals, found that being either firstborn or lastborn was conducive to advancement, compared with being born in between. To explain such results, theorists attributed different personality developments to the eldest and youngest children and those born in between. Compared with his or her siblings, the oldest child in a family was thought to be less dominant, less aggressive, less self-confident, and less inclined toward leadership because of the inexperience and insecurity of the parents with their firstborn child and the need for the oldest child to adjust from an only-child family to a family in which attention toward children is divided (Goodenough & Leahy, 1927). Nonetheless, the firstborn has the advantage of more early interaction with adults and adult language. As was noted in [Chapter 31](#), firstborn children are also likely to be given family responsibilities earlier and are expected to mature faster. In comparison with their siblings, youngest children were reported to be more disobedient, more persistent, and more likely to be pampered and helped when help is no longer necessary, as well as disregarded when family or personal decisions are to be made (Hurlock, 1950). In all, taken by itself, it would seem that birth order may or may not make a difference, depending on other aspects of family life, such as the family's income, parental expectations, a full-time working mother, and so on. In low-income families or families with working mothers, the firstborn, particularly girls, tend to be given considerable responsibility for caring for their siblings early on.

*Family Size.* Maller (1931) found that the tendency of a child to work in a group for a group goal, rather than alone for an individual prize, is greatest among children with three or four siblings and is less among children of smaller or larger families. Cooperativeness was rated highest among children from families with the optimal number of children, but persistence was greatest among children from the larger families.

*Treatment by Parents.* Jane Addams, Clara Barton, the Mayo brothers, William E. Gladstone, Robert E. Lee, Woodrow Wilson, Benjamin Franklin, and George Washington are among the many historical leaders whose lives illustrate the significance of either a mother or father in determining the career of the future leader (Bogardus, 1934). Among more recent political leaders, parents, particularly mothers, have had a strong positive influence on the development of the leadership potential of their children. Using the Multifactor Leadership Survey (Bass & Avolio, 1991) and the Life History Survey (Owens & Schoenfeldt, 1979), Avolio (1994) obtained significant correlations of .20 and .19, respectively, between their parents' interest in the development of 182 leaders from various sectors of a community and the leaders' inspirational and individually considerate leadership. Leaders are likely to have had parents who allowed more independence and freedom and were less punitive and critical (Snell, Stokes, Sands, et al., 1994). A review in Britain by C. J. Cox and Cooper (1988) found that as children, successful managers had to make use of their own resources and take responsibility for themselves and others. Often they were separated from their parents for schooling or other reasons. Again, Cox and Jennings (1995) found that successful senior executives and self-made entrepreneurs tended to have had a childhood of adversity. Mary Kay Ash, founder and CEO of Mary Kay Cosmetics, is an American example. However, a comparison of children reared in orphanages with children reared by parents suggested that parental interaction was important in fostering childhood leadership behavior. H. H. Anderson (1937) found that nursery school children who were living with their parents interacted more with others and initiated and attempted more leadership than did children from a nursery in an orphanage. But I did not find a statistically significant relationship between college students' success as leaders in initially leaderless discussions and the extent to which each of their parents had been considerate of them or had initiated interactions with them when they were children (Bass, 1954a).

B. M. Bishop (1951) noted that when interacting with a neutral adult, children tend to transfer to the new situation the pattern of interaction they have developed with their mothers. If their mothers are directive, interfering, and critical, the children tend to be inhibited, reluctant, or noncooperative in their interactions with others. If negativism and rebellion against authority are fostered in interactions with parents, they will be reflected in aggressive behavior against others, such as fighting, threatening, and boasting. Or they may result in a withdrawal into fantasy. The normal maturing child can accept parental and school authority and is cooperative with his or her family and teachers (L. B. Murphy, 1947).

Children from homes in which the children participate in decisions were found by A. L. Baldwin (1949) to be more active, socially outgoing, intelligent, curious, original, constructive, and domineering. C. T. Meyer (1947) concluded that sociability and cooperativeness were greater when parents were clear and consistent, explained decisions to their children, offered opportunities for decision making, had rapport with their children, and better understood their children's problems. Summers (1995) added that warm, supportive, nurturant, conscientious parents who set rational expectations give rise to offspring who are mature for their age, socially responsive, friendly, purposive, and achievement oriented, all characteristics of potential leaders. On the other hand, authoritarian, demanding, physically punitive, and un-sympathetic parents give rise to children who are withdrawn, discontented, distrustful, and lacking in social responsibility. Indulgent, neglectful, overprotective parents who deny their children opportunities to experience risks and mistakes commensurate with their maturity seem to restrict their children's development. Such children may, as adults, exhibit irresponsibility, carelessness, overconfidence, and other characteristics that are likely to interfere with their success as leaders. Experiences of success and failure that promote the learning of social skills, of what can and cannot be done in most groups, are missed by such children.

Parents who neglect or ignore their children create a pattern of behavior in children that is also likely to interfere with their leadership potential (except possibly in an antisocial group, such as a group of delinquents). Such children often exhibit symptoms such as stealing, lying, cruelty, and other attention-getting behavior. Rejected children are often distrustful, are strongly motivated to seek praise, and feel persecuted and indulge in

self-pity (Bass, 1960). Conformity was more the norm in 1960 than in 2005. At that time, respect for authority was taught more by parents. Questioning of authority is now more common.

Conflicting demands by the mother and father promote behavior in their children that is detrimental to the children's effective and successful interaction with others. The most nervous behavior in children occurs when parents issue conflicting negative demands. Disobedience is greatest when parents issue conflicting positive demands (Meyers, 1944). Consistency from parents and the high standards set by them may be important clues to the early development of future leaders.

*Attachment to Parents.* Attachment theory holds that attachment figures, usually parents, create either a secure or insecure model of relations of self and others. Relations are seen as positive by secure children and negative by insecure children (Bowlby, 1982). Securely attached individuals generally trust others and are comfortable with being close to others. Secure children, as adults, are more likely to exhibit transformational leadership. Popper, Maiseles, and Kastelnuvo (2000) demonstrated this with 86 Israeli cadets in three courses for police officers. The correlation, corrected for social desirability, was .31 between secure attachment and the combined transformational leadership score for charisma, intellectual stimulation, and individualized consideration, and ranged from .21 to .36. For those insecurely attached to their parents (ambivalent, dismissive, and fearful), the comparable correlations ranged from 2.04 to 2.30. Popper (2000) assumes that *socialized* charismatic leaders will be adults with secure attachments as children. They are likely as adults to be more self-assured and self-esteemed. *Personalized* charismatic leaders are more likely to have had an avoidant attachment from their parents. As adults, they do not have a keen interest in others. They are reluctant to maintain intimate relationships. If narcissistic, they seek admiration, which does not require closeness and intimacy.

*The Importance of Strong Mothers.* In the late 1980s, about 25% of American children were being raised by one parent—in 90% of these cases by the mother, who was divorced or had never been married. The divorced or unwed father may still play an important amicable role, but one may speculate that if single parenthood results in a strong mother and a weak or absent father, the pattern replicates the family conditions that gave rise to many prominent world-class leaders, whose fathers were weak, absent, or died early. Many of the modern U.S. presidents' fathers were business failures. The importance of maternal authority was noted in [Chapter 31](#) (Bronfen-brenner, 1961). Dominant mothers whose sons remained attached and close to them figured in the lives of Presidents Warren Harding, Calvin Coolidge, Franklin D. Roosevelt, Harry Truman, Dwight Eisenhower, Lyndon Johnson, Richard Nixon, Bill Clinton, Douglas MacArthur, Winston Churchill, Henry Ford, and Robert Moses, as well as many Mafia leaders (Odom, 1990) and Benedict Arnold. Consistent with this, interviews with 30 CEOs who were selected because of their success as business leaders found that they tended to have strong role models. Most of these models were their mothers, not their fathers (Piotrowski & Armstrong, 1987). V. and M. G. Goertzel (1962), reviewing case histories in *Cradles of Eminence*, found that 109 mothers of 413 eminent men and women of the twentieth century were described as dominating, overwhelming, determined, and strong-willed. But only 21 fathers were so described. Rather, 384 of the fathers were described as failure-prone, improvident, alcoholic, and/or deserters of their families. Freud was quoted as saying “A man who has been the indisputable favorite of his mother keeps for life the feeling of a conqueror, that confidence of success that often induces real success” (Jones, 1953, p. 5). For 24 British prime ministers between 1804 and 1937, 15% and 66% had lost a father in childhood due to death or divorce. The same was true for only 2% of the population as a whole (Iremonger, 1970). Zaleznik (1992) noted that the leaders he analyzed suffered from “father deprivation” due to the father's detachment, absence, or unavailability.

*Parents as Models.* W. A. Anderson (1943) showed that parents' leadership behavior was a model for their children. In a rural New York area, Anderson found that the social participation of an individual is a family tendency. If the father participated, so did the mother. If both participated, the children usually did also. Keller (1999) showed for 78 college seniors (a majority were women) positive correlations between their prototypical or implicit model of leaders and how they described their parents' leadership behavior. The correlation with their idea of a prototypical leader's charisma and how they described their mother's charisma was .32. For their father, the comparable correlation was .28. For the trait of tyranny, the correlation with the implicit leader was .31 for the father and .27 for the mother. For the trait of dedication, the figures were .31 for the father but only a nonsignificant .08 for the mother. For the trait of sensitivity, the figures for father and mother were positive (.16 and .10).

*Family Status.* To add to what was said in the preceding chapter about the importance of socioeconomic background to the emergence of leaders in different countries, the father's occupation and background make a distinct difference in whether their sons emerge as loyalist political leaders such as Ngo Dinh Diem, Fulgencio Batista, Lázaro Cárdenas, and Jacques Necker, or as revolutionary political leaders such as Ho Chi Minh, Fidel Castro, Pancho Villa, and Maximilien Robespierre.<sup>2</sup> A comparison of 50 loyalist leaders with 50 revolutionary leaders by Rejai and Phillips (1988) found that the loyalists' fathers were much more likely than the revolutionaries' fathers to have been government officials, military officers, bankers, industrialists, professionals, or members of the landed gentry. Children from higher-class family backgrounds were also likely to have had a wider range of experiences. Prior to the advent of universal education and class mobility, upper- and middle-class family backgrounds were ordinarily requisite for the emergence of leaders even of the proletariat. As was concluded in [Chapter 4](#), socioeconomic status contributes to one's emergence as a leader, and, as was noted in [Chapter 33](#), the middle and upper classes generally provide a majority of the world's future managers. Until recently, America's labor leaders seldom came from working-class backgrounds. Leaders of the "workers' " revolutions, from Lenin to Castro, came from middle-class, not working-class or peasant, backgrounds. Orlans (1953) observed that many of our great presidents (such as Washington, Jefferson, and both Roosevelts) came from an aristocratic class, from a background that provided them with a great deal of opportunity to examine and evaluate new ideas as well as the freedom to pursue a political career. Despite the high status of one's family, children can feel *relatively* deprived in what they want. Such children may grow up to become more successful as leaders than those who are overprotected and pampered.

*Parental Standards.* Avolio (1994) reported that the moral standards of parents correlated .16 and .20 with inspirational and considerate leadership when their children became leaders as adults. Day (1980) compared 58 health care professionals who were promoted and 58 who were not. Those who were promoted were much more likely to express a recurring theme in interviews about having had a family background that emphasized a strong work ethic. Gibbons's (1986) in-depth interviews with transformational and transactional managers found that the transformational executives were much more likely to describe parents who set high educational standards and provided a family life that was neither extremely lavish nor extremely disadvantaged. And in the just-mentioned study of 30 CEOs, Piotrowski and Armstrong (1987) found that of those who discussed their childhood, most said that they had had favorable family conditions during childhood and adolescence. In line with these findings, Hall (1983) observed that charismatic leaders were given more responsibilities as children and felt a lot of respect from their elders. As may be seen most clearly with Charles de Gaulle's childhood, conviction, ideology, and the need to restore *la gloire de la France* were instilled in him by his early family life just after the ignominious defeat of France by the Germans in 1870. The values and goals of the future French leader were strongly affected for life (Hoffman & Hoffman, 1970).

Leadership was more likely to be displayed by elementary-school boys whose parents instilled high standards

as well as granted them responsibilities and scope for independent action (Hoffman, Rosen, & Lippitt, 1960). Consistent with this finding, Klonsky (1983) noted that occupants of leadership positions on boys' teams had parents who made more demands for achievement and provided more discipline accompanied by more maternal warmth. Girls who became team leaders were given more responsibilities by their families but less parental warmth. Parental ambitions may also direct the child toward social success and influence. A family atmosphere of high-quality relationships with parents and siblings also makes a difference (Bass, 1960). Leaders are more likely to make the transition into adolescence without the pains of separation from family, without a sense of becoming isolated, and without the need to compensate for feelings of helplessness (Levinson & Rosenthal, 1984).

### ***Opportunities in Childhood and Adolescence***

Murphy (1947) suggested that adult performance in groups was likely to be affected by children's security or anxiety, developed in their relations with other children in school. The emergence or reinforcement of authoritarian or democratic tendencies was a matter of respect for others fostered in school or neighborhood, frustration or happiness in peer groups, and/or feelings of being respected or excluded from school and social groups.

Practice in leadership is afforded by both school and outside activities. Such experiences in solving problems can enhance a person's esteem with other members of the group. They provide opportunities to interact with the opposite sex in a socially approved manner and enable the individual to learn more about following, cooperation, competition, and leading others. Adolescence affords the developing leader the opportunity to learn to change his or her behavior as situational demands change to maintain success and effectiveness in interactions with others. Social proficiencies learned during adolescence can foster an individual's success in interacting with others as an adult. Social and athletic proficiencies may make a difference in an adolescent's success as an adult leader, depending on the adult environment. The social graces, etiquette, and grooming learned in childhood and adolescence may also prove significant. Finally, experiences in extracurricular activities and dating afford opportunities to practice and transfer leadership and to see the success or failure of different attempts to lead (Bass, 1960). Gibbons's (1986) transformational managers had a lot of experience as leaders in high school and college. Likewise, Hall (1983) noted that charismatic leaders reported more childhood experiences as leaders. Extracurricular experiences in high school tend to predict subsequent leadership activities in college and in military academies (Yammarino & Bass, 1989a). Participation in varsity sports in the naval academy is also predictive of subsequent success as a naval officer (Atwater & Yammarino, 1989). Parents' and teachers' guidance and enlarging of responsibilities can be important to the developing leader. The encouragement of intellectual self-exploration and increasing equalization of power relations with parents and teachers will also contribute (Bass, 1960).

*Marginality.* After examining the childhood environment of 15 twentieth-century world-class charismatic leaders, Willner (1968) concluded that almost all were socially and psychologically at the margins of several classes, religions, or ethnic affiliations. For example, Kemal Atatürk, the founding father of modern Turkey, grew up at the borders of the Christian Greek and Muslim Turkish cultures. The 15 leaders were also likely to have plural identifications that gave them multiple perspectives, a more flexible view of society, and ways of communicating with and responding more convincingly and empathically to a broad spectrum of people. This heterogeneity in background was likely to be augmented by a wider range of experience, by the mobility of the family, and by the exposure to various environments during childhood and adolescence.

# Educational Institutions

---

## *Primary and Secondary Education*

Illustrating the shaping of future leaders was Britain's educational system. The leaders and administrative officials of the British Empire at its zenith received from their public schools, such as Eton and Harrow, a general education in self-discipline, teamwork, and group loyalty that created an aura of command and habits of superiority with "a facade of crisp decisiveness." Their classical education included nothing about modern science, technology, modern languages, or the social sciences. Little attention was paid to innovation and creativity. Skill in and capacity for social role taking, a sense of self-esteem and a need for achievement were sufficient to create reasonably effective leaders and officials for the world arena (Burns, 1978). The 1,200 members of the Indian Civil Service, most of them British, were of this elite. Their public school and university education had imbued them with a contempt for moneymaking and corruption, pride in the ideals of fair play and open justice, and the sense of duty to make improvements and maintain an efficient and properly recorded administration. "They were Plato's guardians—a caste apart, bred and trained to be superior" (Lapping, 1985). But they were also handicapped by the class consciousness instilled in them by family and schooling.

The satisfaction of future leaders with their educational experiences in school correlated with all four components of the leaders' transformational leadership, ranging from .19 to .24 (Avolio, 1994). Higher occupational attainment was predicted by very high academic standing and positive attitudes towards high school teachers (Snell, Stokes, Sands, et al., 1994). Large-scale efforts to provide leadership training for high school students have been conducted by the American Management Association, the Center for Creative Leadership, the 4-H program, and other organizations that are interested in the development of young people. Athletic teams, interest clubs, and student government provide leadership experiences. A formal source of leadership training and practice in high school is the 3,000 Junior Reserve Officer Training Corps programs (Funk, 2002).

It was among educators in primary and secondary school settings that evaluative research on leadership education first appeared. For example, Fretwell (1919) gave elected leaders in junior high school responsibility for managing athletic and playground activities. A leadership club was formed to plan and discuss the activities. Fretwell concluded that such experience provided opportunities for leadership and initiative. In the same way, Mayberry (1925) observed that participation in student government provided training in social purpose, initiative, and cooperation.<sup>3</sup>

*Controlled Experiments.* Eichler and Merrill (1933) asked each member of high school classes to rate the others on leadership. Experimental and control groups were paired on the basis of the ratings. Experimental groups were given lectures on leadership methods or participated in discussions about leadership. New ratings were then collected. The experimental groups gained more than the control groups in such ratings of leadership, but not to a significant degree. Similarly, G. G. Thompson (1944) studied nursery school children under two programs. In one, the teacher acted in an impersonal manner and gave help only when needed. In the second, the teacher took an active part in play and helped the children to adjust to one another. The children in the second group showed significant gains in ascendance, social participation, and leadership. McCandless (1942) studied two residential groups of boys in a training school. Both began with adult

supervisors, but the experimental group became self-governing. Sociometric ratings of intermember popularity were highly correlated with dominance at the beginning. Four months later, the most dominant boys lost in popularity in the experimental group but not in the control group. Zeleny (1940b) compared recitation and group discussion as methods of teaching sociology. Students in the discussion classes gained more in dominance and sociability than did those in the recitation classes and recorded slightly greater gains in knowledge of the subject. Again, Zeleny (1941, 1950) gave student leaders instruction in techniques of leadership and guided practice in the use of these techniques. Students found the training interesting and thought it helped them adapt better to the social demands made on them.

## ***Higher Education***

*Importance of a College Education to Career Success.* A college degree, a college education, and socioeconomic status are confounded in their effects on the subsequent emergence of persons in managerial and leadership positions. Nevertheless, there is value in the actual education beyond just being identified as a college graduate. In the Management Progress Study (Bray, Campbell, & Grant, 1974), 274 college graduates who had been hired for first-level management jobs at AT&T and 148 who had been hired without college degrees participated in a three-day assessment center. The college graduates were judged by the assessors to have a higher potential for middle management. After 20 years, the modal college graduate had reached the third level of management, but the modal noncollege graduate had reached only the second level of management. Furthermore, those who had come from better-rated colleges were at a higher level of management (Howard, 1986). This finding was consistent with a correlation of .32 between the ranking of the universities from which 80 Japanese graduates came and the appraisals for their potential for promotion that they received after three years (Wakabayashi & Graen, 1984). Altemeyer (1966) compared engineering and science majors with students in the fine arts during their four years matriculating at Carnegie Mellon University and found that the engineering students, who were likely to be future leaders in industry, increased in analytical ability but decreased in imagination. The reverse was true for the arts students.

Education for leadership is implicit although not always explicit in higher education. College catalogues often mention as one of their important missions preparing the future leaders of society. Cleveland (1980) argued that “equipping minds for leadership ought to be what’s ‘higher’ about higher education.” According to the results of a survey,

Between 500 and 600 campuses are paying attention to developing their students as leaders, either in the classroom or in extracurricular activities and programs [that] ... originate either in a student development office or in direct student initiative. The academic courses ... draw mainly on social psychological and management studies ... and the liberal arts ... humanities and social sciences. (Spitzberg, 1987, p. 4)

Community leadership education is often an important aspect in two-year community colleges (Gardner, 1987).

*Examples.* LeaderShape, a curriculum-based leadership development program, was conducted in 2002 for 2000 participants at 31 colleges and universities across the United States. A pre-post study by Thoms and Blasko (undated) at Penn State–Erie University showed that LeaderShape increased general transformational leadership skills and the ability to create organizational vision. An unusual leadership educational effort focused on gifted children to help them to perform better as leaders. Familiarity with the characteristics of leaders, creativity, and divergent thinking were followed by role playing, observing, and analyzing the leadership of

others. Then came practice in exercises and real-life leadership experiences (Black, 1984). At the College of Wooster, in addition to formal course work, students spend three to five days observing national leaders on the job. A consortium of universities in North Carolina conducts a fellows program that includes summer internships and attendance at an annual leadership training program at the Center for Creative Leadership. Mentoring programs are provided at the University of California at Irvine. The ethical responsibilities of leadership are stressed in a sequence of courses at the University of San Diego (Spitzberg, 1987). Harvard's John F. Kennedy School of Government sponsors leadership education with faculty scholars and government leaders in residence. Binghamton University's School of Management offers a three-course sequence on the individual, the group, and the organization at undergraduate and graduate levels. An integrated four-year undergraduate leadership studies program is offered at the Jepson School of Leadership Studies at the University of Richmond. In addition to coursework in leadership, Claremont McKenna College provides a job shadow program for students to learn leadership by following around business, health care, or government managers and executives on the job (R. E. Riggio & H. R. Riggio, 1999).

College student leadership data from 10 institutions were followed from 1994 to 1998. Self-reports from 875 students participating in leadership courses and activities sponsored by the Kellogg Foundation were compared with students from nonparticipating colleges. The results indicated that participating college students increased their ability to set goals, sense of personal ethics, and willingness to take risks, along with leadership motivation, skills, and understanding. Also increased were multicultural awareness, community orientation, and civic responsibilities (Astin & Cress, undated). Top American universities such as Stanford, Harvard, and U.C. Berkeley offer programs in leadership (Riggio, un dated).<sup>4</sup> Olson (undated) described 49 undergraduate programs in leadership at institutions such as Rice, Kansas State, and Northwestern. Five programs offered majors, 21 offered minors, and 23 offered concentrations and certificates. Telephone interviews about 10 of the programs indicated that: (1) all but one had been established in the 1990s; (2) all were interdisciplinary, comprising three or more courses; one, at least, experiential; another, a capstone seminar to integrate the coursework; and (3) community service was required in all 10 of the programs. Student internships were included in 80%; senior projects were required in 50%; and faculty-student research was conducted in 40% of the programs. Some common practices in the 10 undergraduate programs were (1) self-assessment and reflection, (2) skill building, (3) problem solving, (4) intercultural understanding, (5) outdoor leadership, (6) self-initiated and self-sustained learning, (7) mentoring, (8) community involvement, and (9) public policy. In 1992, the Jepson School of the University of Richmond was the first to start a Bachelor of Arts in Leadership Studies. It integrated cognitive, affective, and behavioral leadership learning with a developmental component of leadership effectiveness. Studies combine academic knowledge with experiential learning during four years in which the student progresses from novice to expert (Klenke, 1993).

*Professional School Education.* Increasingly, schools, of business, education, administration, social welfare, health, and government are providing graduate education in leadership and related behavior and skills to increase the students' capacity to exert personal influence, make proper use of power, motivate others, negotiate and mediate effectively, and take initiatives. The American Assembly of Collegiate Schools of Business completed a ten-year project to assist schools of management in pro-grammatic efforts in this regard (Zoffer, 1985). Orpen (1982) showed that MBAs had achieved a higher level of position and salary after five years than had a matched sample of non-MBAs. Hurley-Hanson, Wally, Sonnenfeld, et al. (2003) examined the career attainment of a first cohort of 540 managers and a second cohort of 968 more recent arrivals in the same firm. The prestige of their school forecast career attainment in the first but not the second cohort. However, possessing an MBA was associated with career success. Baruch and Bell (2003) obtained survey responses from more than 300 managers indicating the value they had received from graduate management education. Competencies and skills gained were associated with internal and external criteria of their career

success. Nonetheless, whether the 100,000 MBAs annually awarded and the education associated with the MBA degree are of consequence to careers remains unknown. The schools face increasing competition from one another, as well as from distance learning—instruction over the Internet—and in-house corporate training programs (Jones, 2000). Their value is still questioned (Pfeffer & Fong, 2002).

Crawford, Brungardt, Scott, et al. (2002) reviewed more than 40 university degree programs and found that colleges and universities were increasingly serving non-traditional students. They were also making more use of distance learning.

*Executive Education Programs.* The business schools at Harvard early in the twentieth century and the University of Pittsburgh in the 1940s pioneered postgraduate executive education programs. They are now commonplace in colleges, universities, and individual free-standing institutions in the United States and abroad. Experienced executives are on campus for extended periods of time. Military, government, and nonprofit executives attend these programs along with business executives. The Center for Creative Leadership provides one-week or longer courses in leadership to more than 20,000 managers and executives in the United States and abroad each year.

*Military Institutions.* The U.S. military academies invest a considerable amount of their students' time in education for leadership. Students begin by learning to work effectively in highly disciplined subordinate roles before being given positions of increasing leadership responsibility. These opportunities for leadership are experienced in their campus lives and in summer field and sea settings. These experiences add to the formal study of the subject, observational study, self-study, and reflection. The students' development as leaders is appraised periodically, and feedback is provided for remedial efforts (Katz, 1987; Prince, 1987). The intellectual content in the teaching of leadership in the behavioral science departments of the U.S. military academies requires the students to use higher-order cognitive skills such as the discovery of conflicting assumptions and values. Students need to apply logic to identify what is happening in the task facing the leader in a problem or case, account for what is happening, and formulate and apply what the leader should do in the situation (Shulman & Jones, 1996). Atwater, Dionne, Avolio, et al. (1999) followed 236 Virginia Military Institute cadets from entrance to graduation. Data from the first year on cognitive ability, physical fitness, and prior leadership experience predicted who subsequently rose to be formally appointed leaders in the fourth year and to be effective leaders. Physical fitness and moral reasoning increased with time, but self-esteem did not. These results were consistent with empirical findings in the U.S. Army, Navy, and Air Force military academies.

### ***Adult Continuing Education and Development***

Education for leadership occurs in the context of the current stage of development in which the leader is found. On the basis of analogies from developmental learning over the adult life cycle, Bryson and Kelley (1978) suggested that adult leaders go through stages, just as children do. Ideally, a developmental learning process occurs in which capacities and skills that are gained in one stage should prepare the adult leader for new and bigger tasks and responsibilities in later stages. An adult should learn to be a leader by receiving appropriate feedback while serving as a leader and be promoted to higher levels of leadership responsibilities because of past performance as a leader and promise of future performance.

The development of executives is a logical progression over time. The nature of this progression and how to manage it needs to be understood. The progression of abilities needs to be specified. There should be a

conceptual linkage between leadership at lower levels of an organization and at more senior levels. The executive's development can be conceived of as a process of acquiring successively more complex cognitive maps and other necessary competencies over time. As the skills required for successful operation at a higher level are accumulated, the executive becomes ready to move to that level (Jacobs & Jaques, 1987). However, there may be innate limits on the conceptual and cognitive skills that can be developed through education and experience.

### ***Continuous Learning***

Increasingly recognized is the need for managers and leaders to engage in continuous learning, both for their own sake as well as for their organization. Learning and teaching are part of their job, particularly if they are in industries with rapidly changing technologies, processes, products, services, and markets or in agencies facing new regulations, new problems, and new demands. With managers likely to engage in several successive careers and two retirements (in countries without mandatory retirement) instead of one organization over the working years, maintaining learning skills will be essential for continuing career success. Continuous learning is helped by a development orientation (Maurer, 2002), belief in self-efficacy (Maurer, 2001), taking advantage of new on-the-job challenges (Ohlott, 1998), and realistic knowledge of one's own competencies (Maurer & Tarulli, 1994). According to a survey of 906 managers in 50 different positions in a telecommunications firm, competence in continuous learning is needed, particularly about networking, company service, technical problem solving, and dealing with information and subordinates. Frequent and important tasks were seen most to require continuous learning. Information gathering and synthesis, dealing with subordinates, and technical problem-solving design correlated most highly with the need for competence in continuous learning (Maurer & Weiss, 2003). Continuous learning and the ability to learn quickly have become essential for career success with the need to make several career moves as a result of the reduced opportunity to rise in one organization over one's working life (Hall & Mervis, 1995). Competence in continuous learning calls for a development orientation, motivation to expand one's skill or knowledge (London, 1983), and being challenged by the opportunity to learn new ideas and ways (Dweck & Leggett, 1988). There is a need to know one's strengths, weaknesses, and need for self-development and to do one's best (Maurer & Tarulli, 1994). One must be able to replace routine old-role behavior with more complex new-role behavior (Hooijberg & Quinn, 1992). One must also be aware of new competencies required in rapidly changing environments, know how to learn these new competencies, and embed the knowledge in the organization to increase its adaptability (Briscoe & Hall, 1999). Continuous learning contributes to increased productivity and the ability to meet organizational goals (Van Velsor, 1998).

Paradoxically, the additional power that accrues with rising status in the organization may increasingly inhibit continued learning. Rising power may bring about reduced negative feedback from colleagues. It may also bring about greater monopolization of discussions and decisions by the leader, induction of fear in others by the leader's aura of power, distancing of relationships with others, isolation from below, and exemption from appraisal by others. All these problems can be avoided by the rising executive's consciousness of them and their effects (Kaplan, Drath, & Kofodimos, 1985).

Technical and professional competence often tend to be valued over competence as a supervisor and leader. The successful engineer who moves into a management position or the successful teacher who becomes a school principal frequently continues to focus on the technical aspects of the work to be done and does poorly in getting colleagues to function at their full potential (Kotter, 1985b). Subsequent progress in management appears to be much more a matter of general higher education than specialization in business, engineering,

social science, or the humanities. For example, little difference in the level achieved after 20 years at AT&T was found among those who entered the firm with different educational majors (Howard, 1986). Although engineering majors earn higher grades than do nonengineering majors while they are midshipmen at Annapolis, they do not appear to perform any better as leaders when they subsequently serve as naval officers (Yammarino & Bass, 1989).

### ***Virtual Leadership Training and Development***

Most managers have been introduced to computer-mediated communications technology, but many managers and executives still need to develop specific skills in using computers, the Internet and intranets, as described in [Chapter 29](#), when they want to engage in distance learning, use specialized new programs in computer decision making, and lead virtual teams, to avoid being dependent on more computer-literate assistants. It is now common for executives, when traveling, to carry their own laptop computers with them or to use publicly available computers. Many such training programs are available on the Internet and company intranet and can be used by managers as they have the time to do so. Testing and feedback can also be provided online (Spreitzer, 2002).

*Development of Leaders to Use Computer-Mediated Communications.* Virtual leaders, as detailed in [Chapter 29](#), have to learn how to quickly diagnose what is happening based on a limited amount of information from a follower and to be of assistance if needed (Thompson, 2000). Informal learning from chance, unscheduled encounters with followers, such as in the lunchroom, is lacking. Lack of such spontaneous interactions makes it necessary for the virtual leader to learn how to keep abreast of what is happening in the distant follower's site and to develop a close personal relationship with the follower (Cooper & Kurland, 2002). The virtual leader may find it useful to make more unplanned e-mails and telephone calls inquiring about how things are going (Spreitzer, 2002). Virtual leaders must eschew joking and sarcasm to avoid being misunderstood by the distant follower. The leaders need to carefully verify their interpretations of communications to avoid ambiguities. They and their distant followers need to learn how to use and interpret symbols in e-mails that can be used to express emotions (Spreitzer, 2000). Leaders must develop a willingness to spend more time in reaching consensus with followers because it may be more difficult to reach closure (O'Mahoney & Barley, 1999). Virtual leaders can be developed by giving them assignments to be members of a virtual team. They can learn how to use computer mediation for brainstorming and decision making. They will need to learn to give discretion to distant followers and do without continuous monitoring of followers. But they can learn to use archived recordings of virtual meetings to assess follower contributions and progress. Organizations and virtual leaders need to formulate and control privacy policies so followers are assured that computer-mediated communications are safe for sharing concerns. Organizations can provide distant personnel with company portals and intranet to provide access to all necessary information about career opportunities. Virtual leaders need to establish expectations for distant followers about the criteria for judging their performance. Mutual trust between leaders and distant followers is essential (Spreitzer, 2002).

*Developing Leaders of Virtual Teams.* According to reviews by Cascio (2000) and Spreitzer (2002), to build cohesive virtual teams, the leader must learn how to create a shared mental model to provide a shared sense of purpose (London, 2000). Virtual leaders help virtual team members to overcome a sense of isolation by beginning communications about the team, its mission, and its members and their competencies (Cascio, 2000; Moreland, 1999). The leaders need to transmit a clear, inspiring vision and ensure that members are

kept up to date on what is going on in the organization. Group norms must be set to guide interactions. The leaders need to have learned and transmitted a role model for establishing and adhering to the rules and expectations for working together, about schedules, and appropriate response times. They also need to be sensitive to cultural and individual differences and how the team can take advantage of these differences.

## Career Issues

---

### *Individual and Organizational Alignment*

The education and development of adult leaders require the combined efforts of the individual and the organization. The development of adult leaders is largely a matter of self-development, abetted by opportunities provided by the organization. An individual needs a personal awakening to enhance effectiveness as a leader. Our leadership is an expression of who we are. Thus, to grow as leaders, we need to grow as persons (Cashman, 1998). Federal Express provides a program, LEAP (Leadership Evaluation and Awareness Process), to aspiring managers to examine their interests and aptitudes for management (AMA, 1990).

*Avoiding Obsolescence.* Both individual motivation and organizational stimulation are involved in the avoidance of managerial and professional obsolescence. An individual's need for achievement and opportunities for organizational participation were the two most important among 12 possible determinants for avoiding obsolescence, according to a survey of 451 U.S. Air Force officers and civilian personnel (Shearer & Steger, 1975). To avoid obsolescence, Shearer and Steger deemed experience to be more important for managers and continuing education more important for professionals. Managers also need to maintain clear perspectives about their organization. For instance, those who work in senior civil service positions in the government must understand the historical, social, and political context of their jobs. The Federal Executive Institute for training senior managers places a heavy emphasis on this objective (Wood, 1985).

*The Need for Flexibility.* Careers need to fit purposes that are aligned with the organization's strategic direction. At the same time, managers should be flexible in the face of shifts in opportunities and conditions. They need to be flexible about making tentative choices and evaluations that are subject to revision, to engage in multiple small careers at low levels, to experience a few plateaus in career advancement, to continue on to new challenging assignments, to take risks, and to experience small failures (Gaertner, 1988).

The alignment of career and organization has become much more difficult as organizations change internally to cope with the changes occurring in a turbulent environment and societal change. As Conger (1993b, p. 203) noted, organizations are facing "heightened competitive pressures." Genentech reduced the time from ten to seven years to introduce the first engineered successfully therapeutic anticancer drug, which rose to over a billion dollars in sales, but it soon faced 18 firms hoping to gain FDA approval to introduce competing drugs. From 2001 to 2003, it instituted extensive organizational, strategic, and cultural changes to position its hematology business unit for continuous and rapid growth (Ahn, Adamson, & Dornbusch, 2004).

Many people experience difficulties in their attempts to adapt their careers to organizational restructuring, downsizing, delayering, hierarchical flattening, teaming, and outsourcing. No longer can they count on one career with one organization. They need to take charge of their own careers by being more versatile in their skills, accepting change, remaining flexible, and being ready to adapt to new technologies and job requirements. They can expect a career of working sequentially for a number of different organizations. The

informal employment covenant between organization and employee and the loyalty to each other has been corroded. "Responsibility for career development must lie with the individual, not the organization" (Brousseau, Driver, & Larsson, 1996, p. 52).

*Career Planning.* Effective career planning is interactive. Career development is enhanced by the joint efforts that develop leaders' resilience in the face of adversity. An organization can encourage such resilience with feedback and positive reinforcement. The developing leader needs career resilience, career insight, and career identity. These are furthered by creating and implementing a vision of his or her future in the context of expectations about the organization's future. Contingency plans are needed to maintain flexibility (London, 1985). Thus 77 middle managers who were judged by a higher-level committee to be more adaptive to changing role demands demonstrated more openness to different ideas and used simpler decision-making processes than did those who were judged to be less adaptive. They were higher in self-esteem and presumably more likely to attempt leadership (Morrison, 1977).

Expectations reflect promotion to higher levels or the failures to do so. For example, the expectations of all 270 managers whose careers at AT&T were studied measured annually over 20 years declined sharply during the first five years of employment. However, after the fifth year, the expectations of those who subsequently attained fourth-to sixth-level executive positions by the end of the 20-year period turned around and began a steady movement upward. The expectations of those who attained only third-level positions after 20 years remained about the same after the fifth year, while the expectations of those who ended their 20 years at the first or second levels of management continued to decline steadily after the fifth year (Howard & Bray, 1988).

### ***Leader-Subordinate Relations***

The prospective leader's behavior develops in concert with those who are directly above and below him or her in the hierarchy. The leader may develop different inter-locking behaviors with each of his or her subordinates. Along with a general normative relationship, the roles played by both will be worked out for designated situations (Graen, 1976). The quality of this leader-member exchange early in one's career contributes to one's successful movement up the corporate ladder later on. Early promotion is an important predictor of future success (E. H. Schein, 1985).

*Latitude and Challenges.* Of particular consequence will be the latitude granted subordinates, the leader's support of subordinates' activities, and the leader's attention to subordinates' development (Graen & Cashman, 1975). Challenging assignments provided early contribute to one's success at subsequent stages of one's career as a manager (Vicino & Bass, 1978). Bray and Howard (1983) found that only 30% of the college recruits at AT&T who were predicted to reach middle management actually attained it eight years later if they had not experienced a challenging job early on. Of those who had been predicted to fail to reach middle management, 61% attained it if they had earlier experienced a more challenging job.

*Quality of Relation.* The superior-subordinate exchange develops into a role relationship that may rigidify or be flexible, depending on a variety of individual and organizational factors. Some people engage in role-making experiences; others do not. The quality of the relationships becomes even more important to one's success in a career than one's initially tested ability. According to a 13-year panel study by Wakabayashi and Graen (1984) of 85 Japanese college graduates, those who had higher-quality vertical superior-subordinate exchange relationships in their first years of employment, as reflected in their speed of promotion and bonuses,

were most likely to demonstrate greater progress at seven and 13 years of employment. Those with a lower tested ability on entrance to their firms could make up for it in their advancement by early higher-quality dyadic relationships.

*Travel Experiences.* The importance of travel experiences to the development and personal change of political leaders has been overlooked. When Rejai and Phillips (1988) contrasted 50 loyalist political leaders with 50 revolutionaries, they found that travel experiences reinforced the politicization of the loyalists that had begun at home and in school. For the revolutionaries, travel was radicalizing and transforming, and helped them to develop standards against which to measure their own countries. However, travel may become of less consequence in a world linked by television and instant communication.

### ***Career Paths***

As already noted, careers depend on both the individual and the organization. In some kinds of organizations, only one route is open. One must enter at the bottom to climb to the top. For example, entry into the U.S. military officer corps requires admission to and graduation from a military academy, ROTC, or an officer candidate school. Promotion is from within; a direct transfer from civilian life to a high-level position in the military is not possible (except during wartime). Career paths in business and industry are much less circumscribed. As noted in Chapters 31 and 32, women and ethnic minorities who become senior executives are less likely to rise through the ranks of line management and more likely to emerge into top management from staff, technical, or professional careers inside or outside the organization. Union leaders can come from the rank and file, from staff professional service, or directly from the outside (Schwartz & Hoyman, 1984). Educational leaders ordinarily begin as teachers. Loyalist political leaders are much more likely than revolutionary leaders to have been employed in governmental service early on (Rejai & Phillips, 1988).

*Careers of U.S. Presidents.* Currently, voters pay little attention to the job experience of candidates for the most important job in the world, president of the United States. Although candidates talk much about it, voters are more attentive to the emotional uplift provided by the candidates, party identification, and the credibility of their promises. Nonetheless, 10 of 14 presidents since 1898 who had been state governors were elected, compared to four who had been in Congress. Presidents who have had experience as state governors tend to earn higher ratings for their performance as leaders and crisis managers than do those who have served as senators or representatives.

*Career Mobility.* Mobility is valued. Managers measure their success in terms of their rate of mobility and advancement. They fear stagnation if they remain too long in one position (Veiga, 1981). Rapid organizational change has led to more movement of managers within and between organizations (Brousseau, Driver, Larssen, et al. 1996). It used to be unusual for a manager to be fired. Poor performers “were locked in an office and the key thrown away until retirement.” Now, with organizations in a more turbulent and competitive market, managers may find themselves out of a job. Unemployed, they may need to start a new career in another organization or start their own organization. But mobility may be deterred for many individual and organizational reasons. Older people may feel less mobile and more concerned about their job security (J. Hall, 1976). They are likely to perceive themselves as less marketable. Company benefits that cannot be transferred will hamper the consideration of job changes (Albrook, 1967). Community ties also inhibit one from moving away, which may be required when one changes jobs. Other deterrents to geographic

mobility are a spouse's career requirements and children's educational needs. Veiga (1983) studied the mobility of 1,216 managers in three manufacturing firms. The average time the managers spent in a particular position, as expected, was affected by their own perceived marketability, the value of company benefits, and the importance of job security, and somewhat less by their and their families' ties to their communities. Dissatisfaction with their current position, as expected, increased the managers' willingness to consider changing employers. Likewise, in a study of 283 managers by Campion and Mitchell (1986), such dissatisfaction predicted the managers' resignation from managerial positions and from the organization. But quitting was also predicted by lack of socialization into the firm, lack of adjustment, unmet job expectations, and being under more stress. With a survey of almost 4,000 U.S. Air Force personnel, a good percentage of whom were noncommissioned officers, Watson (1986) showed that both opportunities elsewhere and commitment to the U.S. Air Force were important. The lack of commitment and the availability of civilian opportunities together correlated .74 with thoughts of leaving the Air Force and searching elsewhere. The lack of commitment and thoughts of leaving combined to correlate .79 with intentions to leave the Air Force, and these intentions correlated .71 with actual quitting.

Mount (1984) surveyed 483 managers of a multinational corporation who were working in the same metropolitan area about their job satisfaction and whether they were establishing their career, advancing in it, or maintaining a well-established career. Managers who were getting established were more satisfied than those who were further along in their careers.

*Career Change.* Low current satisfaction may be a reason for changing careers. For example, engineers who are seeking more important and better-paying positions shift into line management or become responsible for training, quality control, or research. The change is ordinarily a promotion within the same organization (Bain, 1985). They are more likely to switch into management if they have entrepreneurial, affiliative, and assertive interests. They are less likely to switch if they have strong investigative and artistic interests (Sedge, 1985).

Better opportunities may cause people to change careers. Thus, whether U.S. Air Force officers intend to remain in service or become civilians depends on how attractive they viewed civilian life and how oriented they were toward their occupation (O'Connell, 1986). Personnel may become alienated from their current organizational and professional responsibilities as a consequence of violated and unmet expectations; loss of satisfaction with colleagues; and changes in their own beliefs, interests, values, and maturation (Korman, Wittig-Berman, & Lang, 1981). But Schein (1996) argued that the choice of career is a matter of motivation. Persons are anchored to careers by personal interests and values. The work itself may be the anchor. They prefer to advance in a career in their own technical or functional competencies. Management may be the anchor, as they are motivated by being able to take calculated risks and achieve common goals. They may be anchored in a preference for stability and security, be willing to conform, and be socialized into an organization's values. They may enjoy entrepreneurial activities and moving from project to project. They may prefer a career that provides autonomy and independence. They may be dedicated to a cause or pure challenge and winning in competition. Or they may want a career that makes for a satisfying lifestyle.

*Careerism.* Managers who were on a career plateau (a long period without promotion) were found to have timed their career moves less adequately than did those who did not experience such plateaus (Veiga, 1981). For the highly ambitious, it is argued, career development is enhanced by the ability to move within three to four years into different areas of management and leadership in different organizations. Such movement is seen to pay off in more rapid advancement to higher organizational levels. For the ambitious, concern for career advancement takes precedence over loyalty and commitment to their current organization (Feldman, 1985). Such careerism is a serious threat to organizational effectiveness. Feldman sees in it anticipatory dissatisfaction

with jobs that do not contribute to the advancement of one's career, lack of involvement in one's job and loyalty to one's organization, increased job turnover, inauthentic interpersonal relationships, and absorption in self-interest.

*Career Success.* Career advancement in an organization may be due to unusual talents, reputation for excellent performance, or sponsorship by a champion in senior management. Some managers are singled out early for rapid promotion. They are high flyers who are identified as having a lot of managerial talent. Since they have been identified as talented, subsequent self-fulfilling prophecy maintains their high-flying evaluation. Their career moves are planned for them to reach senior management while still young (Hirsh, 1985). McCall (1998) agrees that developing managers into high flyers is a responsibility of leadership, which must to provide opportunities for learning on-the-job through challenging assignments and experiences so that their talents can grow. Baltes and Dickson (2001) theorize that leaders with successful careers, when faced with limited resources, will optimize their choices. For instance, they reward subordinates selectively for meritorious performance. Faced with functional losses over time, such as losses in market share or of valued employees, they compensate with impression management. Or there is the example of the young employee promoted rapidly from line employee to senior management who walks into the CEO's office and asks, "Okay, Dad, what do I do next?" Career success can be a matter of family connections.

*Career Failure.* Careerism may result in fast-track rapid promotions and short-term job assignments but derailment later at higher levels because of failure to develop competencies to perform at higher levels of management and to align self-interests with the needs of the organization (Kovach, 1986). According to a comparison by their superiors of 86 successful senior managers and 83 who had been derailed, Lombardo, Ruderman, and McCauley (1987) found that the termination of career advancement was seen to be due to personal flaws that did not show up quickly as the fast tracker moved from one assignment to another but became visible only when higher-level complexities were faced. These managers may not have been politically astute, able to think strategically, or able to make high-quality decisions in the face of ambiguous conditions, or they may have lacked leadership competencies. Also, the derailed managers were more likely to be abrasive, untrustworthy, and unstable. Early remedial action, feedback, coaching, and mentoring might have helped some of those who were sidetracked. Along with personal development, haphazard, short-time job-hopping needs to be discouraged. Instead, systematic moves are needed to increase one's experience in various aspects of an organization, with successive broadening increases in responsibility lasting up to two years (Reibstein, 1986). Leaves of absence can prove costly to a manager regardless of the reason, whether due to illness, family responsibilities, education, or the call to active duty of a military reservist or a member of the National Guard. Among 11,815 managers, leaves of absence subsequently resulted in fewer promotions and smaller salary increases (Judiesch & Lyness, 1999).

*Costs to the Organization.* Careerism among an organization's personnel can create a heavy burden, in both the private and public sectors. For example, careerism was seen by Hauser (1984) to degrade the effectiveness of the U.S. military services. In peacetime, there is an absence of lateral entry from higher-level civilian positions into the military, which results in a shortage of credible challenges to whatever is the conventional wisdom in the military. Careers tend to be short. The ideal officer is a generalist, not a specialist. Transfers are frequent; advancement is rapid for many. Coupled with early retirement, the transitory aspects of military careers contribute to conformity and avoidance of risks. These tendencies are further reinforced by the military's centralization of evaluation and "whole man" concepts of promotion.

A career in a bureaucracy can be hurt by one bad mistake. Career-oriented managers have to avoid "rocking the boat." Few dare to be whistle-blowers who may be ostracized or lose their jobs. As a consequence, the

organization may suffer from failure to uncover a serious problem.

## Value of training and Development in Leadership

---

The Kellogg Foundation invested heavily in its National Fellowship Program under the assumption that leadership skills can be taught, learned, and developed. Leaders can benefit from exposure to diverse ideas, cultures, and approaches to problem solving and time for disciplined reflection (Sublett, 1995–96, pp. 1, 2). The widespread belief in leadership training was noted by Alpander (1986), who found that more than 80% of the first-level supervisors in 155 Fortune 500 companies are asked to attend in-house training programs of one to four hours at least once a year; 75%, programs that last 5 to 12 hours; and 37%, programs that last 13 to 40 hours. Almost all the supervisors participate in such a longer program at least once in five years. Thirty-four low-performance Indian employees and their 12 supervisors showed improvements in pre-post assessments from a program that featured an awareness effort followed by personal workshops for the low-performing employees and training for the supervisors in mentoring, counseling, and supervision. The employees improved in overall job performance, discipline, adaptability, morale, interpersonal relations, and self-esteem (Subramanian & Rao, 1997).

Without taking the trouble to examine the available research, critics continue to argue that leadership training lacks theoretical or empirical grounding, is seldom evaluated, and is faddish, depending more on faith than on facts (Rice, 1988). Following a comprehensive review, Latham (1988, p. 574) strongly disagreed:

The scientific leadership training literature is not dominated by fads. ... [S]elf-regulation techniques, Leader Match, role motivation theory, LMX, and double-loop learning have been systematically evaluated for more than a decade, and their evaluation is on-going ... these leadership training programs are grounded in theory ... the training programs have been subject to repeated investigations; and ... the training has been evaluated empirically. Many of the evaluations included follow-up data collected from three months to five years subsequent to the training. Moreover, the dependent variables for evaluating the training programs included observable behaviors.

Numerous scientific comparisons of trained and untrained managers have been completed to ascertain the extent to which the trained but not the untrained managers changed their attitudes and behaviors, used what they learned, and contributed to more effective operations of their organization. Nevertheless, it may be that the perception that there has been little evaluation of leadership training is due to the large amount of training that occurs and the extent to which most such training is evaluated cursorily by asking the trainees how satisfied they were with the experience. So although the number of published research comparisons is large, it seems small in contrast to the actual amount of training that is provided. The large body of published research provides confidence in the theoretical underpinnings and factual substantiation of the conclusions reached. We have come a long way from the earliest reports of leadership training in industry and the armed services, which were primarily statements about the value of leadership training, descriptions of programs, and discussions of problems.<sup>5</sup>

### ***What about the Bottom Line?***

Are the returns on investment worth the costs of training? Keith and Gresso (1997) found a higher objective

profitability for the firms among 57 Fortune 500 organizations that used newer training methods. Watson Wyatt Worldwide (Anonymous, 1999) completed an analysis of the increase in market value for three and five years of 405 large companies linked to their improvements in their human resources, much of it associated with their leadership. Greater shareholder value accrued 10.1% from improved recruiting excellence; 9.2% from improvements in clear rewards and accountability; 7.8% from enhanced teamwork, workplace collegiality, and flexibility; and 4.0% from the increased integrity of its communications. But increasing the amount of general training programs and 360-degree feedback resulted in reduced market value. General training was thought to prepare trainees for their next job rather than their current one.

What do managers say they want from a training session? An unexpected answer was obtained by one study. Using Kirkpatrick's 1959 rubric for valuing training (content applicability and importance), Lingham (2003) found, to his surprise, according to regression analysis, that managers regarded gaining new knowledge as four times as important as the applicability of the learning.

## Assessing Organizational and Individual Needs

---

Whatever the education or training effort, its effectiveness in improving leadership performance depends first on identifying what needs improvement and then demonstrating or helping trainees or students learn how to change their perceptions, cognitions, attitudes, and behavior. Experiences must be provided in which the trainees can exhibit the appropriate leadership. Instructors, observers, and other trainees can give the trainees feedback about the adequacy and effects of their efforts (Bass & Vaughan, 1966). But much hinges on the correct identification of the trainees' needs for learning. Moreover, there are two other necessary prelearning conditions: the trainees' desire to know and the trainees' sense of role (Akin, 1987). The organization will benefit if the leadership training begins at the top and works its way downward. Karseras (1997) suggests that this is even more important when transformational rather than transactional leadership is being taught. Dealing with what learning is needed has to be continuing. Competence in the activity is an important aspect of performing well as a manager, according to 906 incumbents in 50 different managerial positions in a telecommunications company. Leadership training calls for more than just learning concepts but concepts that are put into practice in observable behaviors that can generate feedback from others (Howard & Wellins, 1994, p. 33). Needs assessment must reflect the extent to which the organization has been delayed, networked, and increased in horizontal relations (Bartlett & Goshal, 1997).

*Top-Down and Bottom-Up Approaches.* The assessment of needs can be initiated in the organization from the top down or from the bottom up. An illustrative top-down approach began with informal meetings with senior management to identify the training and developmental needs of British social work managers. Priorities were then established among the 15 identified skills by the 66 managers below them. Sharp differences had to be taken into account between the openness of the subordinate managers and their superiors (Leigh, 1983). The training requirements for transformational leadership by high-flying middle managers in financial institutions in London were identified by 20 senior training managers. They cited the need for enhancement of coaching skills, creativity, production and communication of vision, generation of trust and respect, and a balance in risk taking (Karseras, 1997). An illustrative bottom-up approach began in a large Texas human resources agency with a survey of 636 subordinates' evaluations of the supervisory styles of their immediate superiors. From these evaluations, a plan for improved supervision was extracted (Russell, Lankford, & Grinnell, 1984). The importance of using both superiors' and subordinates' assessments of needs was seen in a survey of approximately 7,000 first-and second-level white-and blue-collar supervisors that found

the supervisors to be overly confident about their own human relations skills (Bittel & Ramsey, 1983). Supervisors have biased perceptions of consideration; subordinates' descriptions tend not to be as favorable as the supervisors' self-descriptions (Weissenberg & Kavanagh, 1972; Bass & Yammarino, 1989). At the same time, the supervisors were much less confident about how well they could stimulate improvements in productivity.

Training officers differ considerably about the appropriate source of the assessment of their needs of their higher-ups or their subordinates. The previously mentioned 155 training officers in different Fortune 500 companies were surveyed by Alpander (1986) concerning the training needs of first-line supervisors. A third of the respondents thought that the need of a given supervisor for training should be decided by his or her immediate boss; 18% felt the decision should be made by higher-ups; and 14%, by the staff. Others mentioned volunteering and various forms of joint decision making. Clearly, some combination of sources makes the most sense. Peterson and McClear (1990) conducted a multilevel, multi-method approach of felt needs for training, starting with 23 senior managers who completed career plots for themselves and listed critical incidents of effective and ineffective middle managers that showed they were more in agreement than they thought. In both methods, they averaged 50% of their time using human skills and the other time split between using technical and conceptual skills. The average human skills at work for critical incidents were judged as close to 60%, with 40% again split between technical and conceptual skills. The results were consistent with a survey of the 449 usable responses of midlevel and lower-level managers. They ranked "acting consistently and inspiring subordinates" among the first three most important training needs. Included by management levels in the first ten training needs in importance were emphasizing performance, communication, planning, and organizing.

*Needed Contents of Training and Development Programs.* Although one might argue that some of the contents of most or all of the preceding chapters should be included in leadership training, the programs are much more limited. For instance, Alpander asked the training officers to indicate what should be and has been included in first-line supervisory training programs. According to the officers and 155 respondents, the content actually included in their own first-line supervisory training programs was as follows: how to feed back the results of performance evaluations to employees (92%), how to delegate (90%), how to improve listening skills (83%), how to improve personal leadership effectiveness (80%), and how to encourage and obtain subordinates' participation in decision making (74%). At least 70% also identified as most representative of the content of their training program: how to make the work environment conducive to self-motivation, how to improve the quality of the product, how to ensure that established goals are perceived as realistic and relevant by employees, how to assign specific duties to employees, and how to assist employees to understand their role in relationship to the company's overall objectives.

Programs to teach particular concepts and models of leadership such as those described in earlier chapters clearly include content about the concepts and models being taught. Many of these will be discussed later. Joynt (1981–1982) expressed an additional educational requirement for managers: they need to learn how to do research and become "intelligent consumers." They need to be able to examine which theories are relevant and applicable to their own circumstances and which are not.

*Accentuate the Positive.* Thirty years before Martin Seligman (1998) pointed out the advantages of positive psychology in place of emphasizing the negative approach to stimulating and guiding behavior by reducing needs, Don Clifton stressed concentrating on one's strengths rather than weaknesses. Building on personal strengths rather than managing around weaknesses was a direction in training supported by interviews with 2 million managers in 63 countries by the Gallup Organization. Remediation of weaknesses is not strength-building. The greatest room for growth is not in the areas of greatest weaknesses, but rather in

strengths. Strengths include talents that often appear early in life. They reflected what we will strive for, what we do best, what work gives us the most satisfaction, and what we can learn most quickly. Gallup provided a standardized instrument, the StrengthsFinder, to assess strengths in terms of 34 themes from *achiever* to *woo* (the desire to win over other people to your side) (Buckingham & Clifton, 2001).

Luthans, Luthans, Hodgetts, et al. (2001) accented the positive in a formalized program (PAL) of four components of would-be effective leaders: realistic optimism, emotional intelligence, confidence, and hope. *Confidence* and self-efficacy from previous successes and vicarious modeling of other successful leaders moved leaders to choose stretch goals, perseverance, and resilience. From *hope* came a sense of agency or determination to succeed in achieving selected goals and the belief in the ability to generate alternative ways to reach the goals.

According to Schneider (2001), *realistic optimism* called for (1) being lenient about past failures to meet expectations and accepting what cannot be changed; (2) appreciation for the present, concentrating on the positive aspects of the current situation; and (3) opportunity seeking for the future. The leader's assignment was a challenge rather than a problem. Seligman (1998) added that when faced with a severe challenge the leader needed to deal with self-defeating beliefs by identification, reflection, and diagnosis to prove the belief inaccurate according to reliable information or to replace the disturbing belief with a more constructive, accurate one.

*Emotional intelligence* was considered in [Chapter 5](#) as a complex trait. But it can also be a state of mind. Faced with problem situations, leaders can learn to cope effectively by using emotional intelligence. Goleman (2000) suggested that emotional intelligence was central to effective leadership. Emotionally intelligent leadership, self-aware and empathic, creates a climate of trust.

### ***Extraneous Factors***

Training may not be needed as much as a change of facilities, resources, or organizational policies. Organizational policies and practices may be at fault, not the performance of individual leaders. The burden for improvement should not be shifted to individual managers, who will be frustrated only because their attempts to improve themselves do not matter as long as the organization as a whole remains unchanged (Dreilinger, McElheny, Rice, & Robinson, 1982).

## **Off-the-Job Leadership Training and Development**

---

Off-the-job leadership training can be obtained from didactic and experiential training. Didactic training includes lectures and readings. Experiential training includes discussions and role playing. Games and simulations can be used along with management in-baskets to provide scenarios of mock or real situations. Computer-assisted interactive programs can be applied, as well as much less structured sensitivity training. Stimulated by social learning theory, behavior role modeling can provide an integration of didactic and experiential approaches.

### ***Lectures and Discussions***

Among the methods to be examined here, lectures are the least popular with training directors (Carroll, Paine, & Ivancevich, 1972). Nonetheless, a meta-analysis of the effectiveness of management training programs by Burke and Day (1986) found that lectures had a positive value. Discussion groups are relied on heavily in most leadership programs even when many lecture, film, and other didactic presentations are used. Lectures (or their off-the-job leadership training surrogates—films, audio programs, videotapes, video discs, Web-based programs, and television) can arouse audiences, provide information, and stimulate thinking. These prepared programs have the advantage of making use of master lecturers and performers, carefully worked-out scripts, and standardization and development based on evaluative tests.

Audiovisual aids to lectures have improved greatly in the past half century. Close detail can be shown. Animation and special effects can be put to good use. Music and artwork can provide desired emphases. Interviews with real model leaders can be presented. But without an interactive program, the easy interaction of discussion is absent. A broad range of leadership cases is found in the library of 80 films at Hartwick College drawn from great works of drama, philosophy, history, and biography. Participants write down the leadership issues and themes they observe, which are then discussed (Clemens, 2000). Films and videotapes are also prepared with vignettes to illustrate behaviors fitting with concepts of leadership such as the four factors of transformational leadership (Bass & Avolio, 1992).

Most comparisons of lecture versus discussion approaches to instructing leaders to change their ways of behaving suggest that lectures and surrogates are more effective if combined with guided discussion of the issues in small groups, particularly if attitudes have to change before the new ways of leading are accepted and adopted by trainees. Discussion provides experience in working with others to reach decisions (L. A. Allen, 1957). The experience can promote the potential leadership of the members by preparing them to use group discussion to reach effective decisions. Again, Riegel (1952) suggested that case discussions, in particular, can provide experience in objective ways of thinking about common leadership problems. The need to study issues in terms of possible causes and effects is emphasized. Trainees exchange and evaluate each other's solutions to such problems. They develop an awareness of the need for more than single, simple answers to complex problems.

Maier (1953), among others, demonstrated the effectiveness of training using problem-solving discussions. He compared the performance of 176 trained supervisors with 144 untrained ones. The supervisors with eight hours of training in groups were found to be more likely to bring about acceptance of change in their groups. Argyris (1965) used lectures and case discussions in the laboratory training of senior executives. No significant change followed the lectures, but some measures of skill in interpersonal relations improved after the case discussions.

Discussions may be ineffective poolings of ignorance, or they can be adequately stimulated, directed, and provided with resources to promote learning. Mann and Mann (1959c) compared the effects of free-discussion groups and task-directed groups on behavior as described by members. Members of task-directed discussion groups changed significantly more than did those in free-discussion groups in friendliness, desirability as a friend, leadership, attainment of goals, cooperativeness, and general adjustment. Nevertheless, numerous reports failed to confirm the expectation that discussions were more effective than lectures. Early on, DiVesta (1954) compared lectures and group discussions as vehicles for training in human relations and found them to be equally effective. However, the discussion groups did show slight gains in favorable attitudes toward initiating structure. Mahoney, Jerdee, and Korman (1960) compared case analyses, group discussions, and lectures as methods for training in management development and likewise found no significant difference among the methods. All the groups gained in a test of knowledge as a result of practice.

*Both Discussions and Lectures Can Be Useful.* Experiments have focused on the wrong issue. Discussions and lectures are suitable for different objectives, different situations, and different personnel. As a

result of a research survey on leadership training, Filley and Jesse (1965) developed a set of hypotheses setting forth the conditions under which more didactic, *trainer-oriented*, training and more discussion-like, *trainee-oriented*, training are effective. Burke and Day's (1986) meta-analysis found that both lectures and a combination of lectures and discussions could be useful in management education. House (1965) studied the attitudes of 43 managers toward trainee-oriented (more discussion) and trainee-oriented (more lecture) training and found that 24 preferred a combination of the two methods, while 12 preferred trainee-oriented and seven preferred trainer-oriented training.

Discussions reinforce lectures. Discussions are useful when a lecture needs clarification and amplification. Learning from a lecture or surrogate is facilitated if it is followed by small "buzz groups" to share opinions, raise questions, and consider alternatives. The conclusions of each buzz group can be shared with the other buzz groups and the trainer. This promotion of two-way communication increases trainees' motivation and enables them to test their understanding. Teleconferencing makes it possible for one instructor to lecture or to conduct training discussions with groups of leadership trainees at different sites. However, what is needed for such teleconference training is ways to maintain the trainees' attention in the absence of personal contact with the trainer. The trainees have to be willing and able to communicate back to the distant trainer and to learn from what has happened in other groups. High-quality graphics are also required, and a face-to-face meeting with the trainer is desirable (Smeltzer & Davey, 1988).

## ***Role Playing***

Various methods of social and behavioral adjustments, developed by psychiatrists and social and clinical psychologists, were adapted to the training of leaders. Psychodrama and sociodrama, originated by Moreno (1955) in the 1930s, require participants (alone or with other actors) to act out various leadership problems under different conditions of audience participation in discussion groups (Lippitt, Bradford, & Benne, 1947). Role playing is a variant. It requires one member to play the role of leader and other members to play the roles of followers. The purpose of playing a role, rather than reading or talking about a solution to an interpersonal problem without a script, is to improve learning and retention and to promote transfer from the learning situation to the leadership performance on the job. Bradford and Lippitt (1952) suggested that interpersonal skills may be hard to teach by providing only verbal or intellectual reasons for behaving in a certain way without actually helping to produce the ability to behave in the desired way. Didactic approaches, by themselves, may reduce successful leadership behavior by adding to anxiety rather than to understanding.

*Benefits.* Role playing quickly became one of the most popular leadership training methods. Many possible uses were seen for it. Trainees could practice what they eventually had to do. Role playing could serve as a diagnostic technique. Group discussion following the role playing might focus on examining specific interchanges experienced in the role plays. Different ways of solving problems could be tested by role players. Other trainees could gain vicariously from observing the success or failure of various attempts during role plays. Standards could be set for handling specific situations (J. R. P. French, 1944b).<sup>6</sup>

As expected, Lonergan (1958) and Lawshe, Brune, and Bolda (1958) observed that participants in role playing tended to regard it as beneficial in increasing their understanding of human relations problems. Furthermore, the latter found that about twice as many participants preferred the leader role to the follower role. Similarly, Mann and Mann (1959a, b) demonstrated that experience in role playing improved role-playing ability, as judged by the individual, other role players, and observers. When they compared ratings of participants' behavior during role playing and group discussions, they found that the participants improved

more in interpersonal adjustment after role playing than after group discussion.

Role playing appears to add to leaders' skills in dealing with human relations problems. For example, Solem (1960) arranged for small teams drawn from 440 supervisors to meet either in 22 case discussion groups or in 23 multiple role-playing exercises. They role-played or discussed one of two problems concerning either the assignment of a new truck to a crew of utility repair personnel or how to change a work procedure. When role-playing the new-truck problem, a participant took the part of the crew's supervisor and another acted as a repair employee. In the new-truck case discussion, the teams talked about solutions to the problem. The change-of-work-procedure problem was handled similarly as a role play or case discussion. Among the role-playing teams, 46% developed integrated new solutions to the problems. That is, instead of assigning the new truck to the employee with the oldest truck, they replaced the oldest truck but enabled each employee to switch to a newer truck. But only 15% of the case discussants did likewise. More integrated solutions were also developed for the role played change-of-work procedures than for the case discussion.

*Contingencies.* The positive effects of role playing depended on a variety of circumstances. For instance, Lawshe, Bolda, and Brune (1959) studied five groups under different conditions of feedback. They found that role playing and subsequent discussion increased the participants' sensitivity and orientation toward employees when the participants were required to criticize their own performance and when the human relations point of view was presented to them in a strong, emotional manner. Similarly, Harvey and Beverly (1961) found that role playing had a significant positive effect on changes of opinion, but authoritarian participants gained more from role playing than did those who were not authoritarian. However, Elms and Janis (1965) found that counter-norms were accepted to a high degree only under conditions of overt role playing (as opposed to nonovert role playing) and only if large monetary rewards were paid. Trittippoe and Hahn (1961) studied participants in role-playing groups and problem-solving groups. Both observers and followers rated participants higher in role playing if they also rated them higher in problem solving. In turn, those who were rated higher in both were rated higher in leadership and class standing.

Some experiments that were less favorable to role playing were also completed. Mann and Mann (1960) compared the experience of participants in role-playing and task-oriented groups. Contrary to their hypothesis, they observed that participants in the task-oriented problem-solving groups changed more in leadership and general adjustment than those in the role-playing groups. In addition, Hanson, Morton, and Rothaus (1963) found that role-playing situations involving the evaluation of followers' personality traits induced a critical posture in the leader and a submissive role for followers, whereas working on a problem in goal setting and planning permitted followers to be more active. In a study of 200 military officer trainees, Tupes, Carp, and Borg (1958) noted that the ability to play roles was not related to ratings of leadership effectiveness but to personality scores. In the aforementioned experiments, both role reversal and multiple role playing were used extensively.

*Role Reversal.* When supervisors appear to be unable to appreciate the views of subordinates, they may be asked to play the role of subordinate while someone else plays the role of supervisor. Supervisors in such role reversals may gain insight into what is affecting their subordinates. Furthermore, having to verbalize an opposing position promotes the shift toward that new viewpoint (Bradford & Lippitt, 1952; Speroff, 1954).

*Multiple Role Playing.* An audience is divided into small teams, and each team member receives instructions to play a particular role. Following the role plays within each team, the audience reassembles and shares experiences (Maier & Zerfoss, 1952). The different teams can be given different instructions, and the effects of these differences on what occurs during the interactions among the players are then revealed during the critique by the audience after the groups reassemble as a whole.

*Role Playing Combined with Video Feedback.* Video feedback of role plays has become commonplace in leadership training. Illustrative of the use of video replay was a training program of American overseas advisers. They viewed a video of their interactions with an actor who was trained to play the role of a foreigner. The trainees' performance was critiqued as they watched the video. Learning was more effective and was retained longer in the videotaped role-playing group than in a control group that only read the training manual about the same issue (P. H. King, 1966).

Ivancevich and Smith (1981) compared role playing and videotaped feedback with a lecture and role playing without videotaping and with a control group without training. They evaluated the performance of 60 sales managers in dealing with their sales representatives in clarifying goals, openness, giving information, and supportiveness in simulated goal-setting interviews before and after training. In addition, surveys of the 160 sales representatives three months after training found that improvement had indeed been greatest for the managers who were trained with video feedback in clarifying goals and supportiveness. But role playing without video feedback was as successful as role playing with videotaped feedback in improving openness and the giving of information. And according to the representatives, both training groups of managers did equally better than the control group in giving feedback and challenging the representatives. The sales representatives in the trained groups also did better than the sales representatives of the control group of untrained managers in increasing orders they received per sales presentation, but no differences were obtained in the new accounts generated by the sales representatives of the trained and untrained groups of managers. In all, video feedback following training appeared to do as well as or better than traditional role playing in improving the managers' performance in its effects on the sales representatives. Both trained groups of managers generally showed such improvements in contrast to the untrained control groups of managers. Videotaping provides models for role plays. Models in supportive environments are important for learning desired performance from role playing (Sims & Lorenzo, 1992).

*Availability.* Role plays can be packaged for self-administration by the role players.<sup>7</sup> For example, Shackleton, Bass, and Allison (1982) provided participants with a booklet of self-administering instructions that made it possible for them to experience and obtain results comparing the five leadership styles: *directive*, *negotiative*, *consultative*, *participative*, and *delegative*—presented in [Chapter 18](#). Packaged video programs and interactive computer programs can create highly realistic settings and role requirements for training.

## *Simulations and Games*

Facsimiles of real organizations and managerial work are created figuratively and literally as reproductions that sample real or fictitious processes. Organizational games are simulations with rules in which one can compete with opposing players against standards. The simulations and games can be used as learning experiences, assessment, and research.

*In-Baskets.* Participants are given a booklet that essentially reproduces the contents of a manager's in-basket, along with some general information about the organization in which the manager is located. Each participant has to decide what actions to take to dispose of the items before leaving on a trip (Frederiksen, 1962a, b). Good performance is associated with a good sense of priorities, planning ahead, and the appropriate use of available information (Zoll, 1969). Discussions can be held about the responses to the in-basket items. Butler and Keys (1973) reported comparisons between 33 first-line supervisors who took a traditional course on the fundamentals of supervision and 30 supervisors who carried out a series of group discussions based on their handling of in-basket items. The traditional course resulted in no significant improvement in tested knowledge on the How Supervise? (File & Remmers, 1971) or the Supervisory Inventory on Human Relations (Kirkpatrick, 1954). But the in-basket discussion group improved significantly on both instruments. Commensurate with the significant gains in knowledge registered by the in-basket participants in the next several months back on the job, their subordinates reported more changes for the in-basket discussion participants in their behavior as supervisors, particularly in their "people orientation" and in innovation on Marvin's (1968) Management Matrix. Little or no such change was found for those who took the traditional course on the principles of leadership. Cases can be recast into in-basket tests and games. For example, ED/AD/EX, used in training programs in the United States, Spain, and India, incorporates interpersonal, strategic, and value aspects of the environment in which a school principal has to operate (Immegart, 1987).

*Games and Simulations.* Organizational, institutional, and business games are living cases. Trainees must make sequential decisions and then live with them (Leavitt & Bass, 1964). Outcomes from leadership performance have fairly rapid consequences. Success and failure are more fully objective and observable than is true for role playing in general. More than 30,000 executives participated in one or more of the hundred or so business games that appeared in the first five years following the introduction by the American Management Association of its Top Management Decision Simulation in 1956 (L. Stewart, 1962). The Carnegie Mellon game was an early example of a business simulation of three soap companies working in competition with each other in a common market. These prototype business games and most of their successors confront teams of players with sets of decisions that require them to decide at each successive play how much to budget for raw materials, plant, equipment, advertising, research, and labor. Computer assistance helps register the distribution of players' quarterly expenditures and investments for each company as well as calculate their stock prices and return on assets (ROA) as they compete. Players usually need to make decisions on what prices to set for their products, whether to borrow money, and whether to build plants. They may negotiate with "suppliers" and "union officials." When the game is used for leadership training, teams may compete against one another or against a computer model. Videotapes were made of the elected presidents of 27 "companies," each with eight MBA students who took other management positions. The simulated companies ran for 12 quarters. Companies with transformational presidential leadership produced higher ROAs. A bankruptcy could be attributed to poor presidential leadership.

Organizational simulations such as UPPOE create leadership problems. For instance, player-managers literally have to obtain the cooperation of player-workers to produce, for a “market,” paper products made by cutting, assembling, and stapling. Players can be hired and fired; they can speed up, slow down, or strike. Tangible products and raw materials can be processed, bought, and sold (Bass, 1964).

*MG 101.* Closer to real management is MG 101, an undergraduate course created at Bucknell University (J. A. Miller, 1991, 1995a). Half the course time and grade is spent in the usual readings and lecture-discussions of an introductory management class. In coordination, the other half is dedicated to twice-weekly laboratories. Technical manuals are provided in accounting, finance, marketing, operations, and personnel, supported by guest lecturers. Each company organizes itself to choose and complete a real community service, such as designing and constructing a county storage and distribution center for food and clothing. Or the company chooses a business project that will be financed to produce and/or sell real items, such as T-shirts, calendars, or coffee, profitably. A business plan is prepared and presented to a board of directors for approval. The activity is completed with the presentation of a final report to a large audience of students and faculty. The course was begun in the early 1980s; by 1995, more than 4,000 undergraduates at Bucknell and other institutions had completed it (J. A. Miller, 1995b).

*The Looking Glass.* The Looking Glass, developed by the Center for Creative Leadership (McCall & Lombardo, 1982), is a carefully constructed simulation of the organization of a real glass manufacturer. It attempts to reproduce faithfully in simulation the required arrangements among the managers of the real company. Relevant financial data and information about products are included and must be factored into communications and decision making. Up to 20 executive positions are filled in the top four levels of the simulated glass manufacturer. The training involves a period, such as a day, to complete the simulation exercise and a subsequent period for individual and group feedback. Learning is enhanced by systematic feedback of the performance of participants in the simulation. But here there is a need to “teach for transfer,” with structure to support the transfer to the back-home job of what has been learned in the simulation, according to Kaplan, Lombardo, and Mazique’s (1985) six-month follow-up evaluation back on the job. Howell (1991) presented a case of a class of MBA students who were managing the Looking Glass Company when, unknown to Howell (the instructor), one student decided on his own to be so disruptive that he would be “fired.” Howell discussed what was learned from the case and the feedback afterward.

*War Games.* These have been used by the military to identify hypotheses and challenging assumptions as well as for training (Killebrew, 1998). War games can vary from board games and computer games to complex simulations with high fidelity and real soldiers in training to engage trained soldiers acting as enemies. An example is the Joint Readiness Training Center (JRTC) at Fort Polk in Louisiana. Whole U.S. Army infantry battalions spend 11 days and nights in the field in a “battle” with a highly trained “enemy.” It is almost like real combat except that hits are registered electronically, determining “wounds” and “kills.” The platoons have to move into defensive positions, defend them, and then attack. If they are airborne battalions, they may parachute or helicopter into the area. Each platoon and unit at higher and lower levels is shadowed by a trained observer-controller, who provides coaching and feedback. After-action reviews are held frequently (Avolio, 1999).

*Evaluations.* Despite the widespread use of games and simulations, evaluations of them are hard to come by. However, Raia (1966) showed that a business game, simple or complex, can add more to performance on a final examination about case problems than can discussions and reading about the cases. In addition to providing training opportunities for participants, simulations and games can generate valid research about the processes used by the players and the results can suggest real-life outcomes depending on the fidelity of the

simulation—that is, how accurately it matches real life.

## ***Programmed Instruction, E-Learning, and Computer-Assisted Instruction***

*Programmed Instruction.* With this application, instruction is programmed into concrete steps. Trainees must generate or choose the correct answer to a question before proceeding to the next question. Efforts have been made to use programmed instruction to teach effective human relations. For example, the American Management Association has sponsored PRIME, a programmed textbook for training supervisors. Other examples are “cultural assimilators,” programmed texts that have been developed and evaluated to teach leadership and good human relations relevant to a designated culture (Fiedler, 1968).

It is difficult to write an effective program if what is to be taught involves shades of opinion, sensitivity to fuzzy socioemotional issues, and unclear ideas about the order of steps in which learning can take place (Bass & Barrett, 1981). Nevertheless, Hynes, Feldhusen, and Richardson (1978) obtained positive results in a controlled experimental study of a three-stage program to train high school students to be better leaders. Programmed instruction, coupled with lectures, yielded improvements in understanding and attitudes in the first stage, whereas experiential approaches failed to do so in the second and third stages. Positive effects have also been obtained with cultural assimilators (Fiedler, 1968).

*Electronic Learning (E-Learning).* This is learning using the Web, computers, virtual classrooms, distance learning, and/or digital collaboration. In the twenty-first century, e-learning has become the new form of correspondence course. Videotapes and films can be included as part of computer-regulated programs and can be incorporated in training as stimuli, response alternatives, and feedback.<sup>8</sup> For instance, Decision Point: A Living Case Study is an interactive computer program that provides the trainee with a high-fidelity audiovisual simulation of the different phases of managerial experiences. It begins with the trainee being offered and accepting a position with a firm to help manage its marketing problems. Political issues arise, along with personnel grievances, conflicts among departments, and questions of credit policy. Ten decisions need to be made. In each instance, four alternatives are provided. A written debriefing is provided by the computer about the adequacy of each of the chosen decisions, along with explanations.

Preston and Chappel (1988) contrasted randomly assigned groups of undergraduates to computer-based training, computer-based training with videotaped vignettes, and group discussions with the videotaped vignettes. They found that any one of the three training methods could improve performance on tests of knowledge about principles of leadership equally well. DeRouin, Fritzsche, and Salas (2003) have offered research-based guidelines for learner control and learnerled instruction in e-learning. Learner control can include pacing, number of examples and practice, sequence of topics, and course content and context. The amount of control should be limited to that required for effective instruction. Too much control, requiring too many decisions, may distract the learner from the subject matter to be learned. Guidelines include: (1) Learners need to spend enough time to understand how much control they have. (2) Learners need to understand that learnerled instruction is challenging. (3) Help needs to be provided by self-tests and feedback. (4) Learners differ in ability and experience and how well they can e-learn. (5) Learners should be allowed to skip rather than add extra instruction about the same content. Instead, the extra time should be spent on new instruction. (6) Learners should be allowed to choose their own real contexts for examples. (7) Learners need to be able to navigate backward and forward through the training program, with key links connecting directly to all the nodes or segments. (8) All the information necessary to solve a problem in a node should be provided in that node. (9) Connections between nodes may need to be explained with text to be understood. (10) Formatting needs to be consistent throughout the program. E-learning at the workplace or school may promote self-

regulated lifelong learning.

*Computer-Assisted Instruction (CAI)*. Hausser, Blaiwes, Weller, and Spencer (1974) described computer-assisted instruction (CAI), a technically advanced version of programmed instruction, to teach interpersonal skills to U.S. Navy commanders. Using the PLATO system and an instructional programming language, TUTOR, Hausser and Spencer (1975) applied CAI to interpersonal skill training in feedback, communication, goal setting, problem solving, decision making, effective rewards and punishments, and the use of power and authority. Compared to controls who received the same pre-and posttest assessments and were involved in the same duties as recruiting officers, those who were trained with CAI learned considerably more. By 1985, a survey of Fortune 500 firms indicated that more than half of them were already beginning to make use of CAI (Hassett & Dukes, 1986).

## ***Behavior Modeling***

Behavior modeling involves instructions for mastering a skill demonstrated by a competent model (live or video) of mental and physical practice, follow-up, and over-learning to assist long-term retention. It is based on social learning theory. In contrast to the more “mindless” Skinnerian operant learning or the emphasis on insightful discovery in learning, Bandura (1977) argued with experimental support that learning is facilitated if learning models are provided with information in advance of the consequences of engaging in a specific behavior. Action can be taken with foresight. People are more attentive and active in organizing what is to be learned if they are provided with models to follow. In observational learning, anticipation of a reinforcer influences not only what is observed but what goes unnoticed. Learning from the model is increased when the consequences of the model’s behavior are highly valued. To illustrate, videotapes of a positive model of leadership, obtained by Pescuric and Byam (1996) from interview information about the skills to be learned, were followed by a one-to-one practice and feedback on how well the skills were used. Groups of learners discussed how they would use the skills on the job.

Goldstein and Sorcher (1974) showed how, in theory, this approach could be applied to training first-line supervisors. Pilot experiments followed. Results were generally supportive (Kraut, 1976).<sup>2</sup> For instance, in an experiment by Latham and Saari (1979), for two hours each week for nine weeks, 20 supervisors engaged in training that dealt with (1) orienting a new employee, (2) giving recognition, (3) motivating a poor performer, (4) correcting poor work habits, (5) discussing a potential disciplinary action, (6) reducing absenteeism, (7) handling a complaining employee, (8) decreasing turnover, and (9) overcoming resistance to change. Each session followed the same plan after an introduction of (1) a film showing a model supervisor effectively handling a situation, followed by a set of three to six learning points that were shown in the film immediately before and after the model was presented; (2) group discussion of the effectiveness of the model in exhibiting the desired behaviors (to promote retention); (3) practice in role-playing the desired behaviors in front of the entire class; and (4) feedback from the class about the effectiveness of each trainee in demonstrating the desired behaviors. The learning points shown in the film were posted in front of the trainee who played the role of supervisor. Points to use when handling a complaint included (1) avoiding responding with hostility or defensiveness; (2) asking for and listening openly to the employee’s complaint; (3) restating the complaint to achieve a thorough understanding of it; (4) recognizing and acknowledging the employee’s viewpoint; (5) stating one’s position nondefensively, when necessary; and (6) setting a specific date for a follow-up meeting. Positive reactions to the program were sustained over an eight-month period. In contrast to 20 supervisors in a control group, the experimental trainees scored significantly higher on a test of the knowledge necessary to

transfer the principles learned in class to different types of job-related problems. The experimental trainees were also more effective in role plays resolving supervisor-employee problems and in earning higher evaluations of their job performance from their superiors one year after training than were the supervisors in the control group. They had been equivalent in rated performance with the control group one month before training.

Burke & Day (1986) concluded from a meta-analysis of evaluative studies, and a review by Latham (1989) showed that behavior modeling was an effective management training method. However, Yukl (1998) pointed out the many limitations of the research and applications. He suggested that behavior modeling was likely to work better for learning concrete behavior in a specific situation rather than developing flexible, adaptive behavior in a variety of situations. More studies are needed about whether the learning facilitated actual behavioral change back on the job.

*Computer-Assisted Behavioral Modeling.* Because behavioral modeling has discrete components and pursues a systematic series of steps, it lends itself readily to computer assistance. CAI behavioral modeling programs have been developed to help train supervisors. In these programs, supervisors operate interactively with a computer to learn how to orient new employees, deal with resentment, resolve conflicts, inform the union of a change, and terminate employees (Development Dimensions International, 1983).

*Caveat.* Fox (1989) unearthed 13 reports of the positive effects of using behavioral modeling to improve supervisory skills. Yet despite its effectiveness in promoting the learning of leadership behavior, behavioral modeling may produce varied and unwanted results. Manz and Sims (1986a) contrasted three separate modeling interventions for leadership behavior. Videotapes provided models of contingent-reward leadership, contingent-reprimand leadership, and goal-setting leadership for randomly selected students assigned to 10 leader-subordinate dyads. A fourth control group did not view any tape. Pre-post measures of the three styles of leadership behavior and the controls' performance were obtained. Overall, modeling generated significantly more improvement than was observed under the control condition. As expected, the subordinates' satisfaction with the leader increased with increased contingent reward (.61) and increased goal setting (.35) but not with the increased contingent reprimand. Moreover, the coefficients from path analyses showed that the contingent-reward model directly promoted contingent-rewarding leadership behavior (.21). However, the contingent-reprimand model not only resulted in increased reprimanding (.16) but also *reduced* contingent rewarding (-.55) and goal setting (-.43). Finally, the goal-setting model failed to enhance goal-setting leadership significantly and increased reprimanding leadership (.22). Thus the theoretical basis for the modeling has to be considered in determining whether behavioral role modeling may be productive or counterproductive. Hakel (1976), Locke (1977), and McGehee and Tullar (1978) cautioned against its un-critical adoption.

### ***Training in Specific Leadership Skills***

In addition to behavioral role modeling to cope with specific leadership problems, there is much training in the skills that are necessary to fulfill a leader's responsibilities adequately. Goldstein (1980) noted the continuing work on the training of raters and the improving of performance evaluations by supervisors. He also found that much of what is available for evaluating training in leadership skills, such as how to handle disciplinary problems, is anecdotal. But illustrative of controlled experimental evaluations of such training was a small sample investigation by Douglas (1977), who examined the efficacy of the systematic training of group leaders using operationally defined leadership skills in a group interaction. Compared to the leaders in an alternate placebo group, those who were trained to use both the reflective-supportive (considerate) and the command-

response (directive) styles employed these styles consistently and appropriately. The trained leaders also used the associated verbal responses more consistently and appropriately than did the leaders under the placebo condition. As with Manz and Sims's (1986a) results, another finding was that the effects on the leaders' behaviors overlapped regardless of the theoretical orientation, which suggests that when leadership skills are being taught, there are likely to be spillover effects across skills and orientations. Training leaders in one skill, such as how to use a particular verbal response style, may reduce or increase their ability to use another leadership style. Conceivably, leaders can simultaneously increase their integration of their task and relations orientation (as advocated in [Chapter 19](#)).

## ***Sensitivity Training***

It was at a social workers' conference on leadership in 1946 that Kurt Lewin and his graduate students at the Massachusetts Institute of Technology stumbled serendipitously into sensitivity training. The conferees found the students' observations about the interpersonal processes that occurred during the conference to be more valuable to the conferees' learning than the formal leadership topics that the conferees had discussed. The idea took root that all participants in discussion groups could become observers and that the sharing of their observations would provide insight into leadership processes in general. In addition, participants could learn about their adequacy in interaction with others and what they might do to improve. Subsequently, the learning process was facilitated by eliminating the formal agenda before a group convened (Bradford, Gibb, & Berne, 1964).

The group leader became a trainer. And, on the surface at least, the trainer abdicated the leadership role. The social vacuum that was created as a consequence of beginning without an agenda or a group leader revealed the individual participants' differences in ability and willingness to attempt and succeed in initiating structure. The ambiguous situation gave participants the opportunity to try out new ways of carrying out various task and maintenance leadership activities that were of use to the group. The feedback from the other participant-observers reinforced the new attempts that worked well and indicated the inadequacy of other, less successful attempts to lead. For this reason, the situation was seen as a "laboratory," a place for experimenting.

Trainers established themselves as ambiguous authority figures, provided group members with the information needed to analyze group processes, and encouraged participation and openness. They did not structure the group discussion; instead, they threw the entire burden of initiative back on the group members. Feedback sessions were used to suggest that the participants' demands for direction and structure from the trainer inhibited the examination of group processes and the development of insight into role relationships.

*Theory.* Theoretical supports for sensitivity training and its variants are diverse. In addition to Lewin's (1939) topological existentialism, they include analytic theory, Bion's (1948, 1961) fight-or-flight analyses, Moreno's (1955) sociopsychological focus, Berne's (1964) transactional analysis, Perls's (1969) gestalt therapy, Maslow's (1965) humanistic psychology and Argyris's (1976) single-and double-loop learning. In *single-loop learning*, leaders as well as followers seek little feedback from their environment that might confront their fundamental beliefs and behavior. The beliefs are self-sealing and self-fulfilling. There is little testing of them. Leaders learn only about what is comfortable for them to discuss. In *double-loop learning*, they are willing to confront their own perspectives and invite others to do so. They work through blind spots. They can learn through listening and reflecting on questions around their assumptions about their roles in the organization and their own and the organization's goals.

*Variants of Sensitivity Training.* Numerous variants have been developed. Sensitivity (or laboratory) training using the T-(for training) group, focused on inter personal learning during the 1950s and onward. The encounter group, which arose in the 1960s, provided a more intensive experience in openness; the self-examination of hostilities, defenses, and feelings; self-awareness; and personal growth. Also in the 1960s, personal growth programs took on a life of their own to improve self-awareness and overcome personal obstacles to developing competence in leadership (Yukl, 1998). To increase transfer of training to the work situation, team building engaged people who work as a group, along with their supervisor, as a T-group in sensitivity training, but with issues relevant to work and organization.

Sensitivity training may begin with a task and structure, then gradually become less structured. A marathon nonstop training weekend may be used. Two or more trainers who meet with a much larger than ordinary cluster group may be employed. Many organizations developed unique programs, incorporating some aspects of the sensitivity training laboratory (Morton & Bass, 1964). Actually, many of the elements of sensitivity training, such as participation and feedback, have found their way into training and human resources management in general. They also can be seen in numerous self-development programs, ranging from group therapy to the physically demanding Outward Bound challenge programs. Sensitivity training has also been instrumented so that no trainer is needed. In such a case, all instructions come from written materials or directions, or directors outside the training group (Blake & Mouton, 1964). Sensitivity programs may require three hours to three weeks. They may run with once-a-week sessions. The numerous variants of sensitivity training all attempt to accomplish one or more of the following changes in attitude or behavior by the trainee-leaders: (1) greater sensitivity to the needs and desires of followers; (2) greater openness and sharing of information; (3) greater sharing of decision-making responsibilities with followers; (4) more intimate, friendly, and egalitarian interaction with followers; and (5) less structuring, personal dominance, and pushing exclusively for productive output.

*Instrumented and Packaged Sensitivity Training.* The standardization of techniques can increase the reliability and reduce the variability of results with sensitivity training. Groups can undergo standardized processes that involve instrumented, self-administered, repeated questionnaires for data gathering; analysis; discussion; role plays; in-basket simulations; cases; audiotaped or videotaped instructions; and other types of experiential exercises for sensitivity training. The instruments either create a process similar to a T-group, or focus on more specific socioemotional learning experiences. Seven standards are proposed for developing such “ready-to-use” learning programs: (1) a scientific review of what is known about the processes; (2) identification of the behavioral dimensions of consequence that are to be the subjects of learning; (3) effective reinforcement; (4) reliable and valid measures of change; (5) adequate follow-up; (6) the control of necessary antecedent conditions and associated consequences; and (7) adequate norms (Bass, 1977).

Blake and Mouton (1962a) pioneered the instrumentation of sensitivity training, the “most radical innovation in T-group training” (Weschler & Schein, 1962): they removed the trainer. The managerial grid training (Blake & Mouton, 1964) that emerged was widely adopted as a substitute for sensitivity training with trainers. Self-administered instrumental training was seen to give trainees greater responsibility for learning. It was expected to be more likely to be transferred. It gave participants more respect for systematic data analysis. It was cheaper to conduct (Shepard, 1964). Its content fit with theory and research on the need and ways for supervisors to integrate task-and-relations orientation.

Berzon, Reisel, and Davis (1969) evaluated a 10-session instrumented audiotope program for self-directed personal growth groups entitled Planned Experiences for Effective Relating (PEER). They reported a positive change in self-concept. Worden (1976) found that although no immediate personality differences could be detected between the experimental and control subjects, 25 of 67 youths who were subjected to PEER reported, in a six-month follow-up, that they had made use of leadership skills learned in PEER. Similarly,

Vicino, Krusell, Bass, et al. (1973) evaluated the effects of PROCESS (Krusell, Vicino, Manning, et al., 1971, 1982), a program of eight exercises (12 in the 1982 revision), self-administered by booklet, for personal and interpersonal development. A field experiment using a holdout control procedure yielded results indicating that the undergraduate participants improved their concept of themselves, were more able to see themselves as their peers did, and reacted favorably to the total experience. Similar results were obtained with 219 members of a women's religious order.

It would seem that less expensive instrumented approaches can be substituted for the more expensive T-group without much loss of effect. Whether either approach should be included in a leadership training program must take into account the question of whether the learning, even if it has salutary effects on the individual trainee, can be applied in the real-life setting to which the trainee returns. If not, it may be that Bamforth's (1965) solution of incorporating sensitivity training and process learning into on-the-job activities is more efficacious.

*Learning Outdoors.* In 1941, a large merchant shipping line asked Kurt Hahn to set up a training program to try to reduce the poor survival rate of young sailors. He created an outdoor training program structured to help individuals discover and realize the potential of their inner resources, to reflect the dangerous environment in which they operated (Anonymous, 1995a). The leadership and team development of four six-man teams of Norwegian naval cadets were enhanced considerably by four days of experience in sinking boats and survival experience with limited resources. They were challenged with a variety of military and social problems (Polley & Eid, 1990).

The Office of Strategic Services assessment staff (1948) set up outdoor physical problems for assessment purposes that were adapted to sensitivity training, team building, and personal growth. Problems for the group and its leadership included figuring out how to safely cross a deep stream or how to get the entire group over a high wall without a ladder. Each member of the group might take a turn falling off a wall, depending on the group to break the fall. These kinds of outdoor situations were adopted for sensitivity training.

In sensitivity training outdoors, participants face psychological but not physical risks such as cliff climbing with ropes, so they have novel experiences they did not realize they could do. The novel tasks and the unusual environment make for readily remembered events for discussion and feedback about performance under stress. Focus is on management competencies. Connections are made to the workplace (Anonymous, 1995b). To increase the scope and realism of training, groups are taken to the outdoors, where physical problems need to be considered. Obviously, military training groups and sports teams practice outdoors. A wilderness experience can provide safe risk taking. Team building for an intact management team was expected to accrue from the cohesiveness developed from learning to trust others, sharing risks, and overcoming challenges. Personal growth was expected to accrue from increased confidence in success in dealing with risks (Williams, Graham, & Baker, 2002). Also expected was development of commitment to the organization and awareness of mutual strengths and weaknesses (McAvoy, Cragun, & Appleby, 1997) and improved conflict management (Wagner, Baldwin, & Roland, 1991). Outward Bound is an example of a physically challenging outdoor program that involves a group in increasingly difficult physical activities such as cooperating in scaling a wall, crossing a stream, or rappelling down a cliff in real or simulated wilderness conditions. Feedback after the activity discusses feelings and behavior with implications for leadership and organizational life (Yukl, 1998). Evaluations have reported improvement back home in participants' self-concept (Marsh, Richards, & Barnes, 1987), teamwork (Baldwin, Wagner, & Roland, 1991), and retention of personnel (Gall, 1987).

*Evaluations of Sensitivity Training.* Most of the research concerned with the effects of sensitivity training has attempted to determine whether change has occurred. Although testimonials do not constitute evidence of consequence, Wedel (1957) surveyed 333 former participants in sensitivity training and found that

they tended to regard the training as valuable in improving their human relations skills. Nonetheless, critics continually questioned whether these objectives were being met in sensitivity-training programs. Studies of the impact of sensitivity training on trainees' attitudes, perceptions, and behavior yielded a mix of results. Likewise, the detailed examination of the impact of sensitivity training on the groups and organizations to which the trainees returned resulted in a complex of conclusions concerning the costs and benefits of the training. Cohesiveness may be increased, but performance may be impaired. It may be difficult to transfer what is appropriate in training to what is appropriate back on the job (Bass, 1968). Generalizations about the effects of sensitivity training are made difficult because of its many variations.

*Changes in Trainees' Attitudes.* Although the results have been somewhat mixed, the majority of evaluations have indicated that sensitivity training results in significant changes in interpersonal attitudes: more favorable attitudes toward subordinates, a stronger human relations orientation, and greater awareness of interpersonal dynamics. For example, Bunker and Knowles (1967) and P. B. Smith (1964, 1975) reported significant changes in the attitudes of participants as a consequence of laboratory training. Schutz and Allen (1966) found that the effects of laboratory training resulted in more changes in the attitudes and personality of those in the experimental group than of those in the control group. Tests administered before and six months after training indicated more changes in feelings and behavior toward other people and toward themselves and more changes in the perceptions of others' behavior and feelings toward themselves than occurred for control groups. The participants indicated greater friendliness, sensitivity, and tolerance toward others after training. When Golembiewski and Carrigan (1970) conducted a mild reinforcement session one year after the initial sensitivity training of managers, they found that changes in attitudes persisted over a period of 18 months for the group that received reinforcement. But Belasco and Trice (1969b) reported that the changes associated with training alone were small, whereas training combined with testing was more effective in producing changes. The most significant changes were in morale, self-concept, and role expectations. Asquith and Hedlund (1967) administered a before-and-after questionnaire to 20 management trainees in a chemical firm. They noted that although improvements in attitudes toward human relations practices were obtained, the participants exhibited no significant changes in attitudes toward consideration, initiation of structure, supervision, or management. Blake and Mouton (1966) studied managers and union officers from the same plant and found that instrumental sensitivity training resulted in significant improvements in the attitudes of both groups. But H. B. Stephenson (1966); Biggs, Huneryager, and Delaney (1966); and Asquith and Hedlund (1967) all obtained results indicating that laboratory training produced no significant changes in attitudes toward leadership behaviors, as measured by such instruments as the Leadership Opinion Questionnaire (LOQ).<sup>10</sup> Similarly, Kernan (1963) obtained before-and-after responses to attitude and personality items from two experimental groups and a control group but found no significant changes in the attitudes or personalities of those in the T-groups or the control group.

*Changes in Trainees' Perceptions.* In line with the primary objective of training to increase perceptual sensitivity, a content analysis by R. H. Solomon (1976) found leaders' statements of the effects of the laboratory training of undergraduates to include increased personal awareness, improved interpersonal relations, and improvements, as well as frustrations, in their leadership skills. Bass (1962b) asked members of a training group to record their self-rated moods at five different intervals during sensitivity training. He found that skepticism decreased and depression increased for a while and then leveled off, but anxiety did not increase as expected.

Several studies were concerned with changes in self-concept and in perceptions of others. T. Gordon (1955) found that leader-trainees tended to describe their behavior in terms that were similar to their conception of an ideal leader. They stated that laboratory training produced changes toward greater conformity with such ideal

behavior. Burke and Bennis (1961) reported that perceptions of actual self and ideal self were closer at the end than at the beginning of training. Bass (1962a) noted significant increases in perceptual sensitivity to interpersonal relations after training. Sensitivity was positively related to peer ratings of influence in the group. But Greiner, Leitch, and Barnes (1968) were unable to demonstrate that instrumented sensitivity training produced significant changes in trainees' perceptions. Likewise, Kassarian (1965) reported no significant changes in orientation toward self or others as a result of sensitivity training. A central problem here is that as trainees become more sensitive to the issues and dimensions of consequence, they also become much more modest about the adequacy of their attitudes and behavior. Thus, after a week of feedback from colleagues in instrumented sensitivity training workshops about their own concerns for people and productivity, there is a sharp decline from preworkshop self-ratings about the extent to which the trainees are 9,9, highly concerned in an integrated way about the productivity of people and their well-being. Among 647 participants, 59.8% saw themselves as 9,9 before the workshop but only 13.4% saw themselves as 9,9 at the end of the week (Blake, 1986).

*Changes in Trainees' Behavior.* Typical of improvements reported were those found by Boyd and Ellis (1962). Each trainee's supervisor, two of his peers, and two of his subordinates were interviewed in the sixth week and again in the sixth month following training at the Hydroelectric Power Commission of Ontario. Controls were also interviewed in the same manner. Improvements were noted in 64% of the sensitivity trainees but in only 23% of the controls. The trainees changed more than the controls in increased listening; better interpersonal understanding; better contributions at meetings; increased tolerance and flexibility; and, to a lesser extent, self-confidence and effective expression. Similarly, Bunker (1965b) questioned trainees and their coworkers one year after participation in a laboratory training program. The coworkers reported that the participants gained significantly more than did a control group in interpersonal skills, openness, and understanding of social relationships. Likewise, Morton and Bass (1964) studied 97 managers who listed more than 350 incidents of behavioral change during the six months following an instrumented laboratory experiment in management development. The most frequently mentioned changes dealt with improved working relationships and self-understanding.

M. B. Miles (1965) obtained results showing that sensitivity training resulted in the unfreezing of participation and greater receptivity to feedback. Change was also found in consideration and initiating structure (M. B. Miles, 1960). Buchanan and Brunstetter (1959) used T-group methods to train 60 engineers in supervisory positions. Afterward, subordinates evaluated the supervisors from the trained group as being more desirable supervisors than they did those from the control group. R. Harrison (1962) asked participants in laboratory training to describe themselves and 10 associates before and after training. The trained group increased the number of interpersonal and emotional words they used to describe themselves but not others.

In another study, R. Harrison (1966) found that 115 laboratory trainees, three months after training, used more terms indicating their awareness of interpersonal relations and fewer terms expressing the manipulation of behavior. In a similar fashion, Oshry and Harrison (1966) administered before-and-after tests to middle managers. The items in which changes occurred suggested that after training, the managers viewed themselves as more human and less impersonal, saw a closer connection between meeting personal needs and getting work done, and understood that they were a significant part of the problem, yet saw no connection between their new perceptions and how to translate them into action. These effects were strongest for those who participated most intensely in the laboratory training.

Harrison and Lubin (1955b) studied person-oriented and work-oriented participants in homogeneous and heterogeneous training groups. Person-oriented members were rated as behaving more expressively and warmly and as forming stronger ties to their homogeneous group. Contrary to the hypothesis, work-oriented members were perceived as learning more than person-oriented members. Members who preferred low structure

exceeded those who preferred high structure in “understanding self” and “understanding others.” The members of the high-structure group believed themselves to be capable and active in discussion but avoided the examination of interpersonal relations. Although a majority of studies have shown that sensitivity training can induce changes in behavior, the effects appear to be moderated by the personalities of the trainees.

*Effects on Group and Organizational Performance.* The preceding studies were designed to determine whether sensitivity training results in changes in the attitudes or behavior of the trainees themselves. The most pragmatic criterion of the effect of training, however, is whether it results in changes in the performance or responses of the groups supervised by the leaders who have received sensitivity training. Unfortunately, the outcomes are complex and multiple. Thus when Blake, Mouton, and Fruchter (1962) factor-analyzed various measures of instrumented T-group outcomes, they found that group cohesion and group accomplishment loaded on separate factors. T-groups could increase cohesion at the expense of productivity. Blake, Mouton, Barnes, and Greiner (1964) studied the management of a large petroleum company engaged in instrumented training. They concluded that the employees’ productivity increased as a result of changes in the managers toward a 9,9 leadership style after they were trained. Miles, Milavsky, Lake, and Beckhard (1965) found that sensitivity training resulted in both changes in managers’ attitudes and the improved productivity of departments. Beckhard (1966) and Kuriloff and Atkins (1966) also attributed improved operating efficiency to the effects of T-group programs. Unfortunately, the controls in these studies were inadequate. The research was conducted during a long economic up-swing when business profits were increasing in general.

*The Trainee and the Back-Home Organization Differences.* Zenger (1974) made a strong case for integrating the assessment of managers with their training. L. R. Anderson (1990) suggested that high self-monitors could be more successful if they were taught how to improve their social and task skills and learn how their own behavior affects their followers. They needed to learn about team building, process consultation, and ways of improving their relations with others. For instance, high self-monitors would be expected to profit more as leaders from Hersey and Blanchard’s training in situational leadership. On the other hand, Anderson suggested that low self-monitors will profit more from changing their organizational environments. They should do better by training to change their relationships upward and downward to be compatible with their own dispositions. Learning about leader match (Fiedler & Maher, 1979) is illustrative.

Lennung and Ahlberg (1975) compared the gains of 17 managers who received sensitivity training with an untrained control sample five to seven months after training. Most striking were the greater variances of the trained compared to the untrained samples in attitudes, awareness, and observed and objectively measured behaviors. This variance suggested that the effects of training depended on individual differences and differences in the work and organizational situations to which trainees returned. Schein and Bennis (1965) studied a complex of organizational and personal variables related to perceived and observed change following sensitivity training. Verified change was defined as change reported by the trainee and two associates in the organization. The security and power of the trainee’s position in the organization and unfreezing by the trainee during training were significantly related to verified behavioral change. Prior anticipation of change by the trainee was negatively related to verified change.

*Composition of the Training Group.* The composition of sensitivity training groups has figured strongly in evaluative experiments. Illustrating this type of experiment, Harrison and Lubin (1965b) studied participants in groups that were homogeneous or heterogeneous in the personal attributes of the members. The finding that most learning occurred in heterogeneous groups was interpreted as suggesting that members’ feelings of cohesiveness and emotional satisfaction may not be appropriate criteria for evaluating the effects of

training groups, since ordinarily, much more conflict tends to be experienced in heterogeneous groups once the polite facades have been removed. On the other hand, a number of commentators and a survey of participants and their superiors by Williams (1982) strongly advocated the need for a women-only management course in which many of the more subtle issues of socialization, discrimination, harassment, and influence can be discussed more openly than when both men and women are participants and instructors.

*Attributes of the Trainer.* Psathas and Hardert (1966) obtained results indicating that trainers in sensitivity training groups formulate implicit norms that indicate to members what the groups' norms should be. Thus the trainers play a significant role in determining the groups' values and norms. According to C. L. Cooper (1969), participants in sensitivity training tended to identify with the trainers when they thought the trainers were attractive. As a result, they became more like the trainers in attitude and behavior as training progressed. Zigon and Cannon (1974) found similarly that students in group discussions whose appointed leaders were seen as genuine and respected were more likely to transfer what was learned in the groups. Rosen, Georgiades, and McDonald (1980) found that the gain in a multiple-choice examination of leadership knowledge and principles among 39 groups of U.S., British, and Canadian trainees from the profit and nonprofit sectors was correlated with the instructors' experience (.31) and professional academic training (.20), specific training to teach the course (.65), and the status of the instructor as an outside professor or consultant (.59). Also contributing to the gain were the support provided by the organization (.38), the price paid for the course (.37), and the number of hours allocated to the course (.45).

Bednar and Heisler (1985) contrasted 38 more effective and less effective industrial training instructors who described their own communication styles. The instructors' effectiveness was judged by their management and professional trainees. Instructors who were judged more effective saw themselves as more open, dramatic, animated, and relaxed than those who judged themselves less effective. They also thought they left more of a lasting impression about what they had said and how they had said it.

*Casualties.* The trainer was likely to be particularly important to the outcomes of sensitivity training. Much of the rationale for instrumented self-guided training is based on the known variance in outcomes that are due to differences in trainers' motivation and skills. The amount of learning was similarly affected by trainers. Lieberman, Yalom, and Miles (1973) studied 206 trainees led by different types of encounter group trainers. They found that casualties among trainees were greatest (12%) when the trainers were autocratic, aggressive, charismatic, and convinced of their own beliefs. Other types of trainers with high casualty rates were impersonal, uncaring trainers (11%); highly controlling trainers (10%); and laissez-faire trainers (8%). On the other hand, there were few or no casualties when the laboratory was trainerless and conducted by instrumented audiotape or when trainers were benevolent, caring, group-oriented, or participative. Learning was also likely to be greater with such trainers. Learning correlated 2.33 with casualty rates, contrary to the expectations of those who see value in making the learning a highly stressful experience.

*Caveat.* Many published studies of sensitivity training have ended in mixed evaluations. Problems remain in the transfer of sensitivity training to the back-home situation. Sensitivity training also raises ethical concerns.

*Mixed Conclusions.* Friedlander (1967) compared four work groups that participated in team training with eight similar groups that did not. The trained groups improved in problem solving, mutual influence, and personal involvement more than did the control groups. But there were no significant differences in changes in interpersonal trust, the approachability of leaders, or the evaluation of training sessions. Weschler and Reisel (1959) studied a sensitivity training group over a period of one year. An emotionality index increased steadily through 30 sessions, but group productivity varied from week to week. Less salutary effects of sensitivity training on effectiveness and productivity were seen by Mosvick (1971), who analyzed eight

studies of scientists and engineers that used control groups. In four of the studies<sup>11</sup> the subjects were trained by lectures and discussions. In the four other studies,<sup>12</sup> the groups were given T-group training. Mosvick found that the standard methods of training in human relations were more effective than were the T-group methods with technically oriented supervisors. Similarly, in a massive analysis of field data, D. G. Bowers (1973) found strong indications in 23 organizations of less positive effects of T-group training on the subsequent improvements of the organization's performance, in contrast to survey feedback without the T-group experience. Despite the plethora of empirical research on the effects of sensitivity training, Goldstein (1980) complained about the absence of an adequate theory to account for the various results, such as those reported by P. B. Smith (1975, 1976), who had concluded that it is not known if the effects occur in all types of groups, why effects are detected with some measures but not with others, and why certain effects occur at all.

Additional evidence suggested that sensitivity training may improve the relations within a group at the expense of impairing the group's subsequent performance of a task. For example, Deep, Bass, and Vaughan (1967) studied 93 business students who were assigned to simulated companies to play a business game. Some had undergone sensitivity training as intact groups 15 weeks earlier, while others came from diverse sensitivity training groups. The intact groups performed significantly more poorly than did those composed of separately trained members, but they described themselves as higher in cooperation and openness. In the same way, Stinson (1970) studied five control groups, five groups trained as intact teams, and five composed of members assigned to different training groups that were equated on the basis of gross profits earned in a prior business game. The fragmented and control groups outperformed the intact groups in gross profit but declined in cohesiveness, whereas the intact groups were highest in cohesiveness but lowest in productivity. Likewise, Underwood (1965), in a study of 15 training and 15 control groups, found that the T-groups changed more than did the controls, but training had an adverse effect on productivity. Hellebrandt and Stinson (1971) reported similar findings.

To a considerable degree, the belief that organizational productivity increases as a result of sensitivity training tends to rely on inadequately controlled studies. When controls are more adequate, sensitivity-trained groups and their trainees may prove no different or less productive than control groups (Weschler & Reisel, 1959). Subsequent group learning and problem solving may be lower under some previously sensitivity-trained leaders but not among others (Maloney, 1956). Reviews by House (1967, 1968) and findings presented by Goodall (1971) agreed that sensitivity training induces changes, particularly in attitudes, but it can also induce anxiety, confusion, and uncertainty.

Buchanan (1969) found that only two of 66 analyzed studies made adequate use of control groups. However, from a review of the literature, Campbell and Dunnette (1968) concluded that laboratory training did change behavior in the laboratory, but there was less conclusive evidence for the transfer of such training to the job situation. P. B. Smith (1975) was able to collect a sufficient number of studies that had satisfactory controls, repeated measure designs, and a minimal duration of 20 hours of training. Unfortunately, the pretest sensitization of participants and the raters' awareness of who participated in training could still not be controlled in most of these studies. Although Smith found 78 reports of significant effects of training on one or more scores after training, only 31 studies employed designs that assessed the persistence of the effects. But 21 studies did report long-term effects, supporting the conclusion that a high degree of cohesiveness usually appeared at the end of sensitivity-training groups (Stinson, 1970). However, the impact on productivity is more problematic, depending on individual differences (Cooper & Levine, 1978) and the back-home circumstances to which the training is to be transferred (Argyris, 1969; Bass, 1967c).

*Problems in the Transfer of Sensitivity Training.* Pugh (1965), among others, called attention to the problem of transferring what is learned in the artificially contrived T-group setting to the real world. Thus Oshry and Harrison (1966) found that the new diagnostic orientations that middle managers learned during

sensitivity training could not be converted into action back on the job because the managers saw no clear connection between their new perceptions and their jobs. To promote the positive transfer of training, Bass (1967c) advised that in parallel with sensitivity training groups, simulations of the back-home organization involving supervisory, managerial, and organizational issues should be brought into the training laboratory. Bamforth (1965) went farther. As a consequence of the failure of the within-plant T-group members to transfer their learning to on-the-job problems, Bamforth changed the role of the T-group trainer to that of a consultant to regularly functioning, formal work-group meetings. In these meetings, he helped the groups to recognize their boss-subordinate difficulties, anxieties about using or not using authority, relationships with colleagues, role classifications, difficulties in communication, resistance to the disclosure of initially unrecognized dynamics, and other sociopsychological problems. To prevent fade-out of the effects of an off-site team-building program, A. R. Bass (1983) organized regular private follow-up meetings between the supervisor and each subordinate. The 135 participants who had such individual follow-ups with their supervisors exhibited less loss of learning than did 71 controls who did not have such individual follow-up meetings.

*Ethical Concerns.* K. F. Taylor (1967) charged that sensitivity training is based on questionable objectives: development of group cohesiveness, confidence in compliance with the norms of the training culture, and disruption of the trainees' personal integrity. Similarly, Lakin (1969) questioned the ethical basis of laboratory training on the ground that untrained and improperly trained trainers are often employed. Also, the method takes advantage of group pressure to impose the trainers' values on the trainees, uses scapegoating, and demands for consensus and conformity to accomplish its objectives. It invades the individual's privacy. The sensitivity-training experience can be a highly stressful one for some participants. It may result in psychological casualties. However, these are infrequent and controllable with an ethical training staff. But the slight risk of such occurrences needs to be offset, from an ethical point of view, by large benefits for most other participants (Cooper, 1975).<sup>13</sup> Sensitivity training is a double-edged sword: participants can learn how to be more empathic and understanding of others, but they can also learn how to be Machiavellian, how to disguise their true feelings, and how to promote a false sense of confidence in their leadership.

## On-the-Job Leadership Training and Development

---

According to Hultman (1984), since leaders are action-oriented, the educational methods used should stress action, not theory. The methods employed should reflect the participants' working conditions. Particularly if the leaders and managers have considerable power, opportunity must be afforded them for reflection on their style of leadership. The leaders and managers may confuse power with leadership and fail to lead others because of their power and interest in maintaining their power (Maccoby, 1982). In the same vein, J. G. Anderson (1984) argued that leaders can learn to identify their own work-place behaviors that help or hinder them in reaching their goals. They can be systematically aided in this endeavor with appropriate methods. Leadership learning and development may occur during the performance of regularly assigned duties and may be as effective as formalized training programs.

Training for leadership in any organizational context can be provided in many different ways. Individuals may receive training on or near their jobs. They may be coached by their immediate superiors. They may be given guided job experience on a planned basis. They may train as understudy-assistants to those in a higher position. They may serve a formal management apprenticeship or internship. They may rotate through a variety of jobs by planned transfers. They may be placed in a special trainee position or be given special project

assignments. They may be provided feedback from surveys and process consultation. They may learn leadership from self-study, special assignments, on-the-job coaching, mentoring, and attendance at meetings of professional associations (Phillips, 1986). Most important, they can learn from their experiences.

### ***Learning from Experience***

It is evident that much learning can accrue from experience. J. B. Hunt (2000) commented on how much the travel experiences of John Quincy Adams, Frederick Douglass, and Jane Addams as young adolescents or young adults had influenced their perspectives, self-confidence, leadership skills, and sense of purpose. Other world-class leaders significantly affected in similar ways by their travels as youths were Franklin and Eleanor Roosevelt, Mahatma Gandhi, John F. Kennedy, Theodore Roosevelt, Benjamin Franklin, and John Kerry. Parks (1996) found that 72% of more than 100 leaders oriented toward the public good had had travel experiences as young adults. Bennis and Thomas (2002) suggested from interviews with 43 leaders that a pivotal experience was crucial to their careers, sometimes with a mentor, sometimes climbing a mountain or doing some other extreme physical activity.

Members of the English Institute of Personnel and Development are encouraged to document and reflect on their key learning experiences. These are shared with peers to foster their personal development by exposing them to wider perspectives and new ideas (Beardwell, Evans, & Collard, 1998). Among the experiences managers listed as major influences in their development were working with a wide variety of people, early overall responsibility for important tasks, achieving results, leadership opportunities, wide experience in many functions, being stretched by immediate bosses, and having a manager who acted as a role model early in their careers (Margerison, 1980). According to Lombardo (1986), 86 senior executives who were interviewed were able to list 286 key events in their careers that generated 529 lessons. The findings from these lessons, as well as from interviews with more than 300 executives, suggested that although everyone appears to value learning from mistakes, successful executives admit making them. Unsuccessful executives try to hide or deny their failures or blame them on others. It is necessary for successful executives to understand what went wrong, to accept the consequences, and to avoid similar circumstances in the future. High performers drew many more lessons from these events than did low performers. They learned skills and attitudes that they needed to overcome obstacles to complete their work. Involvement with others forced an examination of their personal values. Failures led successful managers to confront their own limitations. Five types of assignments were seen to have special importance for the development of managers: project assignments, line-to-staff shifts, start-ups, fix-its, and assignments involving a major change in scope.

*Developmental Opportunities.* Rudman, Ohlott, and McCauley (1988) surveyed 346 midlevel managers and executives from nine Fortune 500 companies to identify and classify the on-the-job developmental opportunities they had experienced. The 103 descriptive items were correlated with global ratings of the jobs' developmental potential and then factor analyzed. Particularly important to development were a supportive boss and opportunities to establish personal credibility. Having to deal with intense pressure and with responsibilities for down-sizing were also seen as important opportunities. These sources of development were linked to from 5 to 31 specific lessons unearthed by Lindsey, Holmes, and McCall (1987) that were learned from the opportunity. For example, learning how to be comfortable with ambiguous situations appears to accrue from the lesson learned in holding a job for which there is an absence of strategic direction.

Interviews and questionnaires with 41 New York Telephone managers revealed numerous on-the-job events

and developmental opportunities that provided important lessons. A quarter to a half of the respondents mentioned increased responsibilities, special projects, exposure to role models, self-initiated activities, and learning from negative experiences as being most salient for their learning of skills and broader perspectives (Valerio, 1988).

Copeman (1971) collected detailed experiences from 109 CEOs about the experiences they felt had contributed most to the development of various competencies, such as their ability to negotiate or formulate policies. On-the-job assignments, such as taking charge of a division or serving as assistant to the president, were often mentioned. Similar results were reported by Davies and Easterby-Smith (1984) for 60 British managers. A study at Honeywell (1981) indicated that on-the-job experiences were the primary source of development of much managerial knowledge, skill, and ability, including effective decision making, problem solving, communication, delegation, empathy, resolution of conflicts, knowledge about business, knowledge of the products, business, trends, and knowledge of costs. Baxter (1953) found such on-the-job opportunities for learning to be as effective as formal supervisory training.

To examine the development of junior-to senior-grade U.S. Army officers, Mumford, Marks, Connelly, et al. (2000) assessed the leadership skills of officers who were serving at six grade levels. They tested knowledge about leadership, complex problem-solving skills, solution construction, creative thinking, and social judgment. It was assumed that it might take as much as 20 years of experience for a senior officer to develop the skills to solve a novel, ill-defined organizational problem. Also assumed was that the kinds of experiences that promoted learning at one hierarchical level could be different from those at another level. Such level effects were seen when expertise learned at a lower level was required for dealing with complex problems at a higher level. Twenty types of experiences were identified, ranging from combat and negotiation to administration and systems maintenance. For instance, between junior and midlevel officers, the increase in required complex problem solving involved in boundary spanning correlated .32 with performance. For the changes between midlevel and senior level, the correlation was .29. Higher scores in creative problem solving, social judgment, systems skills, and expertise in leadership were seen as officers moved into more responsible assignments. As Mumford, Zaccaro, Harding, et al. (2000) theorized, different aspects of expertise and leadership skills need to be mastered at different grade levels. Senior officers generally require more in dealing with critical incidents and creating higher-quality solutions to ill-defined leadership problems.

*Relevant Experience.* Not just any experience will do. Bettin and Kennedy (1990) rated the previous work and training experiences of 84 U.S. Army captains rated for relevance to their current positions. Relevance of experiences was found to be the most important predictor of their current leadership performance. Time in service and number of positions previously held did not matter. Avery, Tonidandel, Griffith, et al. (1999) used the statistics from the 1997–1998 National Basketball Association's Official Guide and the NBA Register to determine the effect of four types of experience of 29 NBA coaches on the percentage of games won by their teams, controlling for team ability from rankings of team members. Regression analysis indicated that the previous years of experience in coaching NBA teams was relevant ( $p < .06$ ) but the years coaching non-NBA teams was unrelated to games won in the 1997–1998 season. The coach's years of experience as a player was also predictive of games won ( $p < .02$ ). Another significant predictor was years of experience in the stressful playoffs ( $p < .01$ ).

McCall and McCauley (1986) summarized other features of jobs that help develop leaders. Important characteristics are assignments with broad responsibilities, troubleshooting assignments, early experience in leadership positions, and staff positions at corporate headquarters. Also valuable are assignments with project task forces and newly created departments. In addition, career development is enhanced by working in the mainline functional areas that are central to the organization's business (Kotter, 1982a). Moreover, although moving among important job assignments is essential, sufficient time has to be spent in an assignment for it to

contribute to the development of one's career (Gabarro, 1985).

Lindsey, Holmes, and McCall (1987) examined the extent to which job assignments differ in their developmental potential by identifying the kinds of experiences that more than 400 executives said provided them with lessons and changed them. For instance, one experience the executives thought made a big difference in their development was their move into staff jobs, such as business or product planning, that forced them to develop new ways of thinking about some strategic element of the business. These jobs often involved exposure to top executives and the executives' assignment to corporate headquarters. (This is despite the tendency to view staff positions as less powerful and important as stepping-stones to higher line positions.<sup>14</sup>)

*Learning and Development from Challenging Assignments.* Jobs enhance development if they are challenging. Challenges can be set up as assignments for learning leadership (Lombardo, 1985), since experience seems to be the best way to learn leadership (McCall, Lombardo, & Morrison, 1988). Exxon managers whose entry-level jobs provided such challenges were more likely to be seen as meritorious six years later (Vicino & Bass, 1978) than were those whose jobs did not provide such challenges. In the AT&T assessment program (Bray & Howard, 1983), candidates with assessed potential were more likely to reach middle management if they were assigned challenging jobs. In a questionnaire survey of 118 managers, McCall and McCauley (1986) found that assignments involving overcoming the past and dealing with inadequate, resistant staffs contributed to perceived growth as a manager. The less experienced the manager, the more the assignment was seen to have the potential for development.

McCauley, Ruderman, Ohlott, et al. (1994) created and validated the Developmental Challenge Profile (DCP), which assessed the jobs of 692 managers for the components which were challenging and developmental for the managers. It was assumed that on-the-job learning was most likely to occur when managers were faced with these components. They provided learning opportunities to try out new behaviors and to reframe old ways of thinking or acting. Novel, ambiguous situations and situations with incompatible demands are illustrative, as are demands to take action with feedback about the action. Challenging situations can also provide motivation to learn to be more competent, to earn a significant reward, or to avoid a negative outcome. The most central of the 15 factored scales of developmental challenges were developing new directions, inherited problems, problems with employees, managing business diversity, job overload, influencing without authority, and lack of top management support. The scales correlated with reports of on-the-job learning and how the job incumbents felt about them.

Challenges can be too great. Assignment to a difficult boss appeared to detract from a job's developmental value for a manager. Challenging assignments may fail in their utility for development because of inadequate feedback and an insufficient variety of assignments (Lindsey, Holmes, & McCall, 1987).

*Meta-challenge.* Vaill (1996) postulated a learning premise that might be called a "meta-challenge." Given the rapidity of change in the physical, economic, political, and social forces on organizations in many industries, managerial leadership is not learned, it *is* learning. In real time, a condition is faced by the leader that is problematic for the objectives being pursued. Changes in conditions and objectives as well as resources may be difficult to predict. Leaders need to adapt their skills as each new problematic situation evolves. Leaders are continually confronted with new problems, ideas, techniques, possibilities, and limits and must remain in a learning mode to deal with them. They need to avoid the error of military planners who ignore new developments and plan for the last war. Learning from each *new* experience followed by feedback, review, and reflection may contribute to insight, wisdom, and intuition.

## **Action Learning**

In the 1930s, Reginald Revans (1982) pioneered action learning, which combined training with learning from experience and carried it forward into the 1990s. Barker (1998) profiled Revans's career from a physics student assisting Einstein, Thompson, and Rutherford to management consultant and business school dean. With action learning, projects in the field are coordinated with skill-training seminars conducted by a facilitator. For instance, the managers in training may role-play how they might have better handled problems that arose in the field. Action learning concentrates on developing interpersonal and cognitive rather than technical skills for dealing with complex organizational problems. Seminars are held periodically to discuss, analyze, and learn from the project experience. New skills learned in the seminar compete with the old habitual routines, so the transfer from training sessions needs repetition and generalization, promoted by asking participants to write down new situations in which the transfer will be effective (Yukl, 1998, p. 481). The Federal Aviation Administration organized the Leadership Linkages program, which promoted action learning by providing FAA supervisors with a choice of six of 13 structured projects to be completed in conjunction with skills learned in classroom leadership training. An experienced manager coached and advised the supervisor about the project task and gave insights and feedback to the supervisor. Afterward, both debriefed the performance (Marson & Bruff, 1992).

The after-action review in the military of leaders with the groups they lead illustrates using experience as a basis for learning. The review is a debriefing by all those involved that looks back at an experience. It is a discussion directed toward examining how the leader, the group, and its individual members could improve by providing each other with positive and negative feedback about what they did well and what they could improve on in their skills and actions. They might consider the most effective way they could have reacted, what skills and equipment were missing, and how good the coordination with units was. Lessons can suggest new training efforts.

*Learning from One's Superior.* Superiors are likely to have a positive influence on their subordinates' managerial styles (Marshall & Stewart, 1981), as was noted earlier in describing the "failing dominoes" effect (Bass, Waldman, Avolio, & Bebb, 1987). Subordinates are more likely to model their own leadership style on that of their superiors if they perceive their immediate supervisors to be successful and competent. Aspiring military cadets are likely to select for role models those superiors whom they believe are charismatic (Clover, 1989). Also, they parallel their superior's occupational values if they think their superiors are considerate (Weiss, 1978). At Illinois Tool Works, managers were trained to train others in leadership skills (Cusimano & Stalcup, 1993).

### ***Job Rotation***

One of the oldest and most favored developmental programs used by business, industry, and the military rotates managers and management trainees through a set of job assignments, each held from six months to several years. The jobs provide experience in and familiarity with various functions of the organization, various markets, and various locations. Personnel may rotate as assistants to managers and executives in charge of different units, or they may take charge themselves as they move from one unit to another. Yukl (1998) noted that rotation tends to follow a pattern regardless of the developmental needs of the learner and be similar for each rotating manager. Or the rotation may be more carefully individualized to satisfy familiarization as well as organizational purposes. Rotation may come with promotion. It may be limited to high flyers.

Rotation can have negative effects. Nonrotators and supervisors may resent the continued burden of training newcomers to their unit. It may entail heavy personal and moving costs and relocations of families, particularly if overseas assignments are involved. It may occur at the expense of initially poor performance as the rotator learns the new work. The change of management could also be detrimental to the unit (Cheraskin & Stevens, 1994).

## ***Coaching and Mentoring***

*Coaching* refers to guidance and feedback about specific knowledge, skills, and abilities involved in a task, the performance of a job, and the handling of assignments; *mentoring* refers to advising and guiding education, relationships, and career development. A coach is likely to be one's immediate superior or a consultant or staff member, although peers can coach each other. Staff professionals and subordinates may also serve as coaches.

A mentor is likely to be an immediate supervisor of the protégé but may be found at higher levels in the organization or outside the organization among those with more experience and influence than the protégé. Immediate supervisors serve as mentors for their protégés in about half of all mentoring programs. Peers may mentor one another. For instance, one director in a British firm may pair with another to provide a focus on personal development (Beardwell, Evans, & Collard, 1998).

Some of the differences in coaching and mentoring are that coaches provide support and help managers and executives to analyze, improve, and practice; mentors provide career advice and opportunities for skill development on the job, identify needs for improvement, and promote the protégé's reputation (Yukl, 1998, p. 102).

Coaches and mentors need to respect their protégés and have self-awareness, credibility, and empathy. They need to listen actively and react verbally and nonverbally that the protégés are being understood. They need to ask questions to verify understanding and to encourage further explanations (Anonymous, 1997). The relationship with the coach or mentor may be informal or formally assigned. Of a random sample of 246 corporate staff interviewed by telephone by Douglas and McCaully (1997), 60 formal coaching and mentoring programs were reported in 52 firms. In 22 firms, the programs were for new managers; in 18, they were for high flyers. They were less frequently arranged for senior managers. Larger firms were more likely to use them.

*Effective Coaching.* The administrations of Ronald Reagan and George H. W. Bush (1981 to 1992) ran up huge budget deficits, as has the administration of George W. Bush since 2001. In 1999, partway through the Bill Clinton administration, Larry Summers—a world-class academic economist but a novice in financial markets and rough around the edges—replaced the financially astute fiscal disciplinarian Robert Rubin as Secretary of the Treasury. The succession was greeted with a 200-point drop in the Dow Jones Industrial Average. Yet much of the large surplus seen in 2000 at the end of the Clinton administration could be attributed to Rubin and his coached successor and protégé, Summers (Hirsh, 1999).

Coaching is likely to work well if the learner can identify with the coach and the coach provides a good model, if both the coach and the learner are open and trusting with each other, if both accept responsibilities fully, and if the learner is provided with suitable rewards and recognition for his or her improvement (H. Levinson, 1962). In addition, coaches are more effective if they set clear standards, appreciate their learner's interests and abilities, practice delegation coupled with appropriate follow-up, and encourage learners to complete assignments (Good-acre, 1963). Coaching thrives in a climate of confidence in which trainees respect the integrity and capability of their coaches. Coaching is expected to take greatest advantage of the possibilities of individualized instruction. It can concentrate on the specific problems that learners find hardest to deal with.

It can attend to the specific performances that learners find hardest to improve. It may provide the kind and quality of feedback that can have a great impact on learning (Mace, 1950).

Mills (1986) asked 207 subordinate managers to use a 25-item questionnaire to describe the coaching practices of their immediate superiors. The practices that emerged emphasized (1) self-development and self-discovery, (2) offering constructive ways to improve, (3) conducting regular coaching interviews, (4) good listening, (5) delegating and challenging subordinate managers to perform, (6) and setting realistic standards. All these coaching behaviors contributed to the subordinate managers' satisfaction with the coaching. Coaching was likely to be ineffective if relations between the coached learner and the coach were ambiguous because the learner did not trust the coach; the coach regarded the learner as a rival; the learner's need for dependence was ignored; the coach was intolerant or did not allow sufficient time for coaching; the coach withheld information to maintain power or to feel more secure; or the coach was hostile toward the learner (Tannenbaum, Kallejian, & Weschler, 1954).

*Experimental Evaluation of Coaching.* Several experiments provided evidence that, as expected, coaching could improve leadership performance. Wexley and Jaffee (1969) compared 10 control groups, 10 groups with approval of the leader "as is" after the first session, and 10 groups with early coaching of the leader. Both observers and followers reported significant changes in the coached leaders in the direction of greater human relations orientation. Maloney (1956) reported that group cohesiveness and participation but not group learning were improved when a leader followed a precisely coached method for implementing discussion.

Some individuals profited more from leadership training than did others. Klubeck and Bass (1954) studied 140 women from seven sororities who were divided into 20 groups composed of one member from each of the seven sororities. The groups engaged in leaderless discussion problems. Observers rated each girl on leadership, influence on the discussion, and other behaviors. The average leadership ratings were used to rank the women from first to seventh in each group. Between the first and second leaderless group discussion sessions, some of the women were given private instruction on how leaders behave. Women who were initially ranked higher in leadership profited more from training than did those who ranked lower. Coached women who initially ranked third in their groups gained significantly more than did those who received no coaching. Coached women who initially ranked sixth in their groups did not gain significantly more than those without coaching.

Edelstein (2001) described the success of a 12-session yearlong coaching program for 37 executives. But no control was reported. After 360-degree assessment with and feedback from the Management Factors Survey and discussions with staff and boss, learners developed a plan (which was also shared) for their current position or for transition to a position of increased scope and responsibility. Plans were implemented with logs of activities and experiences. The executives were coached in flexibility to manage as situations varied. Following experience with their revised management behaviors, they were again assessed 360 degrees and surveyed on the perceived benefits of the program. The pre and post-360-degree assessments showed statistically significant increases from 4% to 9% in avoiding premature closure, soliciting and openness to feedback, taking a corporate perspective, working as a team player, learning from experience, synthesizing data and finding solutions, delegating effectively, and utilizing empathy constructively. The increase in making good decisions was problematic. All the executives said the experience was valuable to extremely valuable. None said the coaching failed to change their managerial behavior, but 3% said the change had faded over time. Consistent change was perceived by 83%.

*Effective Mentoring.* In a majority of cases examined, the mentors of the protégés are their immediate supervisors (Roche, 1979; Burke, 1964; Ragins & Sandstrom, 1990). The other mentors may be of higher

rank or in the same or different units of the organization. Kram (1983) described the process involved in 18 mentor-protégé relationships as beginning with phased-in initiation, followed by cultivation, separation, and redefinition. During the process, the mentors provided protégés with sponsorship, exposure and visibility, coaching, counseling, protection, friendship, and challenging assignments. The mentors acted as role models and as a source of acceptance and confirmation.

The intention of 607 state government supervisors to be mentors and the barriers involved were not affected by whether they were men or women. Willingness to mentor (strong intentions and weak barriers) was correlated with educational level. Age was unrelated to perceived barriers. Nevertheless, older supervisors revealed little intention to mentor. Supervisors with experience as mentors or protégés were more willing to mentor. Internal locus of control, upward striving, and quality of the relationship with prospective protégés contributed to the willingness to serve as a mentor (Allen, Poteet, Russell, et al., 1995).

Mentoring tends to be paternalistic in that it provides a role model for the protégé to follow (Levinson, Darrow, Klein, et al., 1978). Mentors use their greater knowledge, experience, and status to help their protégés and do more than merely act supportive or give advice. They may assist in the organizational visibility and advancement of the protégés by informing higher-ups about how good a job the protégés are doing (M. C. Johnson, 1980; Shapiro, 1985).

A survey of 1,736 managers at Kaiser Permanente Medical Care Program found that women were more likely than men to have mentors, perhaps because they had more desire for a mentor. Woman with mentors perceived more sponsorship, guidance, and networking. Men with mentors saw more opportunities for contact with senior management. Promotion of protégés with less than four years and more than 10 years of tenure was enhanced if their mentor was of the opposite sex (Bachman & Gregory, 1993).

Sosik, Godshalk, and Yammarino (2004) completed WABA analyses of 217 pairs of mentors and protégés who worked full-time in firms in 11 different industries. The protégés were also part-time MBA students. Data were collected by mail from the mentors and directly from the protégés. Almost half the mentors were supervisors of the protégés. Measures of the mentors' transformational leadership (by self and protégé) and learning goal orientation, expected career success, career balance, and developmental relationships were also collected from mentors and protégés. The results indicated that transformational leadership of mentors, learning goal orientation, expected career success, expected career achievement, and developmental relations were based on differences between individuals. But differences between the dyads were also involved. Mentors and protégés were in agreement about the mentor's transformational leadership.

*Benefits of Mentoring.* Of 122 persons who had recently been promoted, two-thirds indicated that they had mentors (M. C. Johnson, 1980). Mentored personnel earned higher overall compensation than did those without mentors (Roche, 1979). Personnel with mentors in a large health business firm believed they had more career opportunities, promotions, security, and recognition than did those without mentors (Fagenson, 1989). Zey's (1984) more than 100 interviews with middle and senior managers found about a third reporting that their careers had benefited from the opportunity. The popularity of mentoring reflects the interest, both of individual employees and of their organizations, in the career development of individual employees (Clutterbuck, 1982b; Collins & Scott, 1978).

Mentoring can help to retain subordinates. It is likely to increase the subordinates' self-esteem and satisfaction with their work and with the progress of their careers. Shelton (1982) noted that protégés were recognized as more promotable by organizational leadership. Mentoring can also help protégés to cooperate in joint efforts (Hunt & Michael, 1983) and to use their intelligence more fully to make a contribution to the organization's success (Fiedler & Leister, 1977a). Mentoring provides time for some executives to develop an understanding of the mixed messages they are receiving about their roles and performance. Mentoring is particularly helpful to executives who have recently shifted from technical or professional positions to

managerial business positions (Hyman & Cunningham, 1998).

The mentors' own advancement is facilitated if their replacements are considered to be adequately prepared to step into their shoes. Advancement is also facilitated if the performance of developing subordinates is used as a criterion for evaluation and reward by the mentors' superiors (Jennings, 1967a). In addition, mentors accumulate respect, power, and future access to information from individuals they have helped to develop. They spread their influence elsewhere, both inside and outside their organization, through their former protégés. Successful mentors are also likely to gain esteem among their peers (Kram, 1980). Mentoring can be a creative, satisfying, and rejuvenating experience for the mentors (Levinson, Darrow, Klein, et al., 1978).

Mentors can inform protégés about how the organization works (Johnson, 1980) and about the uses of power, integrity, and the artistic and craftsmanlike elements in effective management (Zaleznik, 1967). They can help women protégés, in particular, to integrate their career and family responsibilities. Mentors are particularly important to the success of the careers of women managers without family connections in the firm (Kram, 1980). At the same time, mentoring appears to be more helpful in the early careers of young managers and college faculty members from higher socioeconomic backgrounds (Whitely, Dougherty, & Dreher, 1991). A survey of 1,320 faculty members (43% female, 57% male) was conducted by van Emmerick (2003). Fifty-eight percent had mentors. Having a mentor was significantly but weakly related to intrinsic job satisfaction (.17), career satisfaction (.13), increased personal accomplishment (.11), lack of emotional exhaustion (.10) and depersonalization (.11). Regression analyses showed that after controlling for sex, hierarchical level, working status, role conflict, and work pressure, the modest relations remained significant. In a sample of 1,334 U.S. Army officers, 81% reported having had at least one mentor. Of these, 85% had provided career or job guidance; the remainder, psychological or social support. Immediate supervisors formed 68% of the mentors. In a two-year period, mentoring was found to contribute to commitment and reduced turnover (Payne & Huffman, 2005).

*Conditions for Effective Mentoring.* Numerous publications (see, for example, Tyson & Birnbrauer, 1983) have laid out the prescriptions for good mentoring. But there have been some changes in the past 30 years that need to be taken into account. Earlier, more women needed mentoring and the mentors were more often men. Cross-sex mentoring was the rule rather than the exception. More women mentors have now become available as they have risen in rank and seniority, and same-sex mentoring may now be more effective. As Clawson (1980) observed in 38 superior-subordinate relationships, some mentor-protégé arrangements work well, while others do not. Effective mentoring requires executives who can tolerate emotional interchanges and who are able to accept conflict as a dispute over substance, not as a personal attack (Zaleznik, 1967). Sosik and Lee (2002) theorized that effective mentorship depends on the mentor's ability to help solve complex social problems that occur in a protégé's career.

In addition to being sufficiently empathic to the needs of protégés, according to Levinson, Darrow, Klein, et al. (1978), mentors should be older and have about eight to 15 years more experience than their protégés. The authors argued that a greater disparity in age results in a generation gap that interferes with mentoring, while less disparity gives rise to a peer relation rather than a mentoring relation. Bowen and Zollinger (1980) suggested that mentors should be of the same sex, if possible (although female mentors were likely to be scarce at that time). Nevertheless, male mentors reacted more favorably to female protégés, particularly if the female protégés were unmarried, but they were more willing to act as mentors toward married than unmarried men. Mentors were also more favorable toward protégés whom they regarded as good in job performance.

Hunt and Michael (1983) argued that mentors should be highly placed, powerful, and knowledgeable. They needed to be executives who would not be threatened by their protégés' potential to equal or surpass them. Such mentors would be more effective, since individuals value the positive feedback they receive from those they esteem much more than that from those they do not value (Bass, Wurster, & Alcock, 1961).

Protégés place a premium on feedback from mentors who are higher in authority and whom they believe are experienced, knowledgeable, and esteemed (Bass, 1985a).

Successful competent and considerate mentors were believed to serve as role models for their protégés. Results from studies of leader-subordinate modeling (Adler, 1982; Korman, 1976) suggested that protégés would model themselves after mentors if they regarded the mentors as competent and if they believed their mentors were in control of the protégés' paths to valued rewards and to organizational advancement. Furthermore, protégés were more likely to model the leadership styles of their mentors if the mentors were easy to identify with and personally attractive to the protégés (Bass, 1985a). Sosik and Godshalk (2000) found that mentors who overrated their transformational leadership, compared to their subordinates' ratings of them, exhibited less effective mentoring than those mentors who were more accurate in self-awareness. Mentors had to take the protégés' feelings into account as a valued person sharing the relationship (Gold & Roth, 1999). In addition to self-awareness, to be effective mentors needed to be familiar with the networks of influence in the organization to be able to serve as sponsors of their protégés (Ibarra, 1993). In two organizations with mentoring, the best time for mentoring was seen to be early in the protégé's career. But for 129 former protégés, only modest benefits were seen by them, nor did they increase with how long the relationship lasted. However, the benefits were greater if the mentor was influential and in greater contact with higher-ups (Arnold & Johnson, 1997).

Clawson (1979) listed the characteristics of superiors that were likely to contribute to the subordinates' ability to learn a lot from their superiors. Effective superiors who acted informally as coaches and mentors more often were relations oriented and even tempered, tolerated ambiguity, valued the organization, liked the protégés, and respected the protégés' intelligence. Effective superiors saw themselves as teaching, setting examples, being directive and instructive, providing clear feedback, and avoiding being too critical. The superiors, as effective coaches and mentors, took the time to understand their subordinates, listen with understanding, and provide new perspectives, and they sponsored subordinates with higher management. Clawson's subordinates were likely to say they learned a lot from their superiors if they, the subordinates, were also more relations oriented, if they respected and liked their superior and perceived themselves in the role of a learner dealing with relevant assignments. Subordinates showed their interest by responding enthusiastically and adaptively to the superior's guidance; similar requirements and benefits were suggested for effective cross-sex mentoring (Clawson & Kram, 1984)—women managers were thought to need and benefit more from mentoring from men (Warihay, 1980). (Perhaps this is less of an issue in 2008.) Women managers found male mentors useful because the women were less likely than were men to have access to information networks (Rosen, Templeton, & Kirchline, 1981). They still may need to learn their way around a male-dominated organization with male-oriented norms and standards of behavior (Noe, 1988). However, more recently, when 138 MBA students returning from international internships were mentored by either men or women, the protégés were less likely to receive task-related, social-related, or career-related support if they differed in sex or nationality (Feldman, Folks, & Turnley, 1999). While women still experienced less benefit from formal mentoring than did their male counterparts, they did earn more afterward if they had male rather than female mentors (Ragins & Cotton, 1999). Career mentoring was more beneficial to early career progress for those from higher socioeconomic backgrounds.

*Formality of Programs.* Mentoring programs may be formally organized or remain informal. In the formal program, mentors are matched with protégés by third parties. Informal matching occurs when mentor and protégé select each other. Ragins, Cotton, and Miller (2000) surveyed 1,162 protégés working as engineers, journalists, and social workers who had been mentored in formal programs or informally. Informal mentoring was much more beneficial. Informal mentors provided more coaching, challenging assignments, and increases in the protégé's visibility. They were more likely to become supportive friends, facilitate social

interactions, and act as role models. Protégés were more satisfied with their informal mentors and received more compensation than formally mentored protégés. Ragins and Cotton (1999) suggested that informal mentoring was favored because protégés chose, as their mentor, a person whom they thought was expert and well connected; protégés and mentors could more readily identify with each other; and mentors could choose protégés they thought had more potential. Additionally, informal mentoring could last for years, while formal mentoring lasts for less than a year; mentors may choose to join the formal effort because of commitment to the organization, not the protégé. Full trust may be missing in the formal relationship. Formal programs tend to concentrate on short-term career goals; informal relations, on long-term career objectives. Ragins, Cotton, and Miller (2000) pointed to the need to formally recruit skilled and motivated mentors, train the participants, and create a satisfying organizational environment for the mentoring relationship. Cunningham (1993) suggested that in order to be successful, a formal program needs to have top management support, careful matching of mentors and protégés, an extensive orientation program, clearly stated responsibilities for mentors and protégés, and criteria for the frequency and duration of contact between them. These points were supported empirically by Lyons and Oppler (2003), who found that the satisfaction of 565 protégés with a formal mentoring program in a U.S. federal agency was determined more by the frequency of meetings and feedback about assignments than by demographic data.

*E-Mentoring.* The availability of e-mentoring or virtual mentoring has increased mentoring opportunities, flexibility, and maintenance of the relationship. Mentors and protégés do not have to be in the same location; more mentors can be available. The distractions of visual cues can be avoided. Cross-sex and cross-racial relationships can be more comfortable (Hamilton & Scandura, 2003).

*Mentoring Personal Development.* Learning to learn about self-reflection, self-disclosure, self-direction, self-reliance, and relationships in the work situation can be mentored (Uhl-Bien, 2003). Their expansion in meaning recognizes leadership beyond the formal and informal to include relationships with the organization and the environment (Hunt & Dodge, 2001). Personal skill development includes communicating effectively, listening attentively, solving problems, and creatively achieving better working relations. Landau and Scandura (2002) conducted a multivariable survey of the effects of mentoring on personal development learning, relational job learning, and personal skill development of 440 employees of a nonprofit hospital. More than three-fourths of the respondents were women and over half currently had mentors. Just under half of the mentors were the immediate supervisors of the protégés. Landau and Scandura concluded from regression analyses, in agreement with Kram & Hall (1996), that mentors were valuable resources for learning organizations. Mentoring provided vocational support positively related to relational job learning. Vocational support from mentors helped protégés increase their understanding of the context of their jobs, reduced the ambiguity of their roles in the organization, and increased their job satisfaction. Landau and Scandura inferred that protégés challenged by assignments that increase their exposure to other people in their organization develop a better understanding of the organization and, at the same time, increase their visibility. However, personal learning was not advanced with mentoring. Skill development depended on role modeling. Mentors needed to be proactive in fostering personal learning. Some kinds of mentoring were not beneficial to personal learning and yielded negative outcomes (Scandura, 1998).

*Counseling.* In addition to receiving coaching and mentoring from superiors and peers, subordinates may obtain counseling from staff professionals in individual and group sessions. Smith, Organ, and Near (1983) considered this behavior to be good organizational citizenship. Furthermore, leaders and managers can learn from colleagues and their own subordinates as well as from others whom they may encounter in their work (McCall & McCauley, 1986). The careers of leaders within the organization may be influenced by consultants,

advisers, HR staff, and sponsors who are not necessarily coaches or mentors. Advisors can provide specific information and facilitate the solution of specific problems; sponsors can use their power to provide opportunities for experiences that are necessary for advancement (Wood & Hertz, 1982).

### ***Other Developmental Relationships***

McCauley and Young (1993) pointed to other developmental relationships useful to a manager. Colleagues in a developmental relationship with a manager may serve in roles as (1) *assignment brokers*, who can arrange challenging assignments that will fit the learner's developmental needs; (2) *counselors*, trusted individuals who can help deal with emotional issues and personal feelings such as frustrations or fear of failure; (3) *feedback providers* of information on how well the learner is doing in developing a skill or changing behavior; (4) *role models*, to emulate; (5) *friends*, for support; (6) *cheerleaders*, for encouragement; and (7) *reinforcers*, to provide rewards for progress toward developmental goals. A reinforcer may serve (1) as a "sounding board" for strategic decision making and for managing decisional uncertainties, (2) as a coach of a newly appointed supervisor who has never supervised before, (3) to help managers deal with stress, and (4) to help a team resolve conflicts fairly (Foxhall, Chamberlin, and Smith, 2002). Counseling psychologists may advise managers about the managers' mentoring or coaching.

## **Giving and Receiving Feedback**

---

The considerable hortatory literature about giving and receiving feedback can be summarized as suggesting that feedback should be about the recipient's observed behavior, not the recipient's personality, motivation, or intentions. The receipt of adequate feedback from others and from one's environment requires that the recipient solicit or be open to accepting it. Often the reverse is true: managers are prone to close out opportunities for learning when faced with difficult and threatening problems (Argyris, 1982). But instead of shutting out, ignoring, or denying such inputs, it is important to examine in what ways changes can be made to improve the situation. Feedback, coupled with personal reflection, can be used to expand self-awareness and to strengthen relationships with colleagues (May & Kruger, 1988). Survey feedback can be used to communicate performance expectations, set development goals, establish a learning culture, and register the effects of organizational change (Tornow, London, et al. 1999–2000). Facticeau, Facticeau, Schoel, et al. (1998) found an insignificant correlation of .14 between acceptance of subordinate and peer feedback of 49 supervising managers of a large public utility. On the other hand, the correlation was .54 between the perceived usefulness of subordinate and peer feedback.

Yukl (1982) fed back more specifically observable leadership behavior in 23 categories using subordinates', peers', and superiors' descriptions of what they regarded as optimal behavior for effectiveness in the position occupied by the leader. Again, the focus of training was on the discrepancies between actual and desired behaviors. A similar strategy was adopted by Bass and Avolio (1989) for feeding back to managers, on an item-by-item and factor-by-factor basis, their transformational and transactional leadership as seen by their subordinates. The salutary effects obtained will be discussed later. For three successive years, a sample of 148 Xerox managers received feedback on 44 behaviors from their subordinates on their management of tasks, management of change, communication, leadership, and delegation, as well as how much they involved their employees and helped to develop them. Eighty-three percent of the managers used the feedback to create

action plans for improvement. Subsequently, their management style was judged by their employees to be improving (Deets & Morano, 1986).

Feedback activities are not always beneficial. A meta-analysis by Kluger and DeNisi (1996) found that performance appraisal feedback in one-third of the cases decreased performance. Atwater, Waldman, Atwater, et al. (2000) found that the performance of only 50% of the managers receiving feedback improved. Atwater, Brett, and Waldman (2003) concluded from a review of feedback studies, mainly from subordinates to their supervisors, that feedback could improve self-awareness of supervisors' and customers' loyalty. But negative feedback was more likely to reduce effort and organizational commitment and decrease satisfaction with the raters. Cynics were more likely to reject the results. A total of 142 supervisors received feedback about their work-unit climate, communications, and management relations from 1,450 military personnel. This was followed by action planning. When resurveyed a year afterward, the supervisors with initially higher ratings had improved; those initially lower had not.

## ***Survey Feedback***

Feedback about leadership performance on the job is crucial if learning from work experiences is to occur. This is why survey feedback from peers, subordinates, and clients, as well as superiors, based on standardized questionnaires, can play an important part in leadership development. Such feedback has been practiced for half a century in leadership training and education programs. R. D. Mann (1961) found more change in supervisors of experimental than of control departments as a consequence of survey feedback. D. G. Bowers (1973) reported that survey feedback promoted more improvement than did other developmental interventions such as sensitivity training or individual consultation.

*360-Degree Feedback.* Military organizations began making use of formal ratings by superiors of their subordinates in the early nineteenth century, and educational and business institutions began later on. Peer (buddy) ratings were found to be good predictors of performance by the military in World War II. It was the advent in the late 1930s of the human relations movement and group dynamics theory that called attention for leaders to get feedback from their subordinates, not only for research but also for the leaders' own edification (Lewin, 1939). However, there are still many executives who cannot accept the idea of their subordinates rating them. It was the military who made research use of superiors', peers', subordinates' and self ratings of the same leaders in a single survey report (Penner, Malone, Coughlin, et al., 1973). Comparisons of subordinates' and self-ratings of leaders were fed back to leaders in a single report (Bass, 1976). Attention was focused on which data and discrepancies were important to try to change and how change might be attempted and evaluated. R. J. Solomon (1976) showed that such feedback could result in the improved performance of library departments supervised by department heads who received the feedback. The feedback instrument, Profile, was one of 16 multirater leadership survey programs evaluated by Van Velsor and Leslie (1991). To round out feedback, Church and Wacławski (1996) suggested that the ratings of direct reports (subordinates) also need to be added to peers' and superiors' data.

Feedback of ratings of a single focal leader from superiors, peers, subordinates or clients, and self, 360-degree feedback, became popular. For example, feedback information was obtained for 538 senior service providers from 4,446 coworkers and supervisors and 1,617 clients. Each source of the multiple ratings revealed different rates of rater response and ratee acceptance (Church, Rogelsberg, & Wacławski, 2000). Each type of rater could provide a different perspective on a variety of criteria of the focal person's performance. The learning of the focal person accrues from feedback before and after self-awareness obtained from self-ratings

and the survey feedback from others. Anonymity of subordinates and peers is maintained by feeding back to the focal person only the average and variance in ratings from subordinates and peers.

Facteau, Facteau, Curtis, et al. (1998) argued that 360-degree feedback will work only if the focal person finds the feedback valid. Otherwise, there is little chance than they will want to make changes in their behavior. Although we might expect that high self-monitors could manipulate the ratings, such was not the case. Higher ratings were not obtained by focal persons who attempt to manipulate others (Warech, Smither, Reilly, et al., 1998).

Dalton (1998) and Tornow and London (1998) listed the characteristics of effective 360-degree feedback: (1) Raters and ratees have been trained. (2) A plan for development can be constructed. (3) Following the plan will depend on the ratee's boss. (3) The ratee must be ready to receive the feedback. (4) Results can be used for coaching, mentoring, training, and self-development. (5) A question remains as to whether the collected information should be shared or remain anonymous by reporting only group results to all but the ratee. (6) Adequate sample sizes make for reliable measurements. (7) There is adequate support at higher management levels (Dalton, 1999; Nowack, Hartley, & Bradley, 1999; Tornow & London, 1998). Waldman, Atwater, and Antonioni (1998) question whether many organizations use 360-degree feedback for political reasons and to create a favorable impression about their human relations. Ratings are biased if it is thought they might be used for personnel decisions instead of personal development. A supervisor may detract from his unit performance by relaxing requirements in order to maintain favorable ratings. Care needs to be taken in creating the feedback measurements and the training of the raters.

*Electronic Facilitation.* A near-360-degree program, Profile, was the computerized feedback of subordinates, anonymous descriptions of their leaders' *directive*, negotiative, consultative, *participative*, and delegating behavior; the leader's power to decide relative to the subordinates; and various perceptions about the organization and the group in which they worked.<sup>15</sup> The subordinates' satisfaction with and perceptions of the effectiveness of the leaders' performance were also appraised. The leaders' self-perceptions were obtained on the same variables. No peer ratings were obtained. Feedback by individual counselors or in workshops provided the leaders with a profile of the data and discrepancies from norms among their own, subordinates', and normative descriptions of their performance (Bass, 1976).

Web-based rating and scoring facilitates 360-degree survey assessment and feedback of ratings of the same leader from subordinates, peers, superiors, and self to appear in the same report to the leader. MLQ ratings are computer-scored on effectiveness and satisfaction with the leader and items of leadership factors ranging from leadership behavior that is idealized laissez-faire (Bass & Avolio, 2002). Over 5,000 managers and professionals in diverse business, military, and educational organizations in the United States and abroad have received MLQ feedback (Bass & Riggio, 2005) and is the underlying measurement for the program, the Full Range of Leadership Development (Avolio, 1999).

## Expected Effects of Leadership Training and Education

---

### *Application of Theory*

Following Ellis's rational theory of therapy, an example of theory-based training was conducted by R. E. Johnson (1980), who showed, with a controlled training experiment, that beliefs in "rational leadership" could be inculcated. Theories of vision, organizational learning, cultural consequences, and transformational

leadership may be the basis of a leadership training effort. However, as Tetrault, Schriesheim, and Neider (1988) pointed out, it is necessary to separate the question of the utility of the training effort based on a theory and the validity of the theory. It is possible to observe a training program that improves the performance of the leaders even though it is based on an invalid theory or a theory about which positive evidence is lacking. In research reports, training procedures can seldom be described in complete detail. For this reason, it is difficult to determine the particular methods that participants have learned in the training that they may use to gain and hold a position of leadership. Nonetheless, a number of studies have shown that direct training in the techniques of leadership can improve trainees' leadership and effectiveness in groups.

### ***Training to Improve Leaders' Attitudes, Skills, and Knowledge***

Early leadership training programs<sup>16</sup> stressed increasing the supervisor's human relations knowledge, skills, and ability, especially with reference to problems of interaction among his or her subordinates, as one of the basic goals of training. A meta-analysis by Burke and Day (1986) almost two decades ago found mixed results for the effects of management training, and only 2 of 70 evaluations considered organizational performance as a criterion of effectiveness. Rummler and Brache (1995) suggested that emphasis in developing individual leaders had shifted toward improving organizational performance. By 2000, 16 newer management development studies were found by Collins (2001) that focused on the effects of leadership development on organizational improvement that implicitly resulted from individual leadership improvement. The contents of leadership development have shifted with globalization, rapid technological change, organizational delayering, and restructuring. It is not surprising that she found strategic leadership to be the most popular, 33%, among the 54 published research studies she located. Next most frequent was employee development (20%). Only three of these published reports were of negative findings. (But for both journal editors and investigators, there is an unfortunate propensity to publish only positive findings.) Most depended on survey evaluations, but five were qualitative. Training evaluations dealt with improving attitudes, knowledge, self-perception, decision making, broader patterns of leadership behavior, and discussion leadership.

*Attitudes and Knowledge.* Katzell (1948) found that 73 supervisors scored significantly higher on a test of human relations attitudes (How Supervise) after an eight-week training course. Canter (1951), using the same test, studied supervisors in insurance companies. He found significant gains in scores on how to supervise, general facts about and principles of supervision, and estimates of the group's opinion. He also found that large gains in understanding the psychological principles of supervising others and better insight into subordinates' attitudes were obtained through supervisory training. Similarly, Good-acre (1955) and Neel and Dunn (1960) administered tests of knowledge of human relations practices to members of training groups; significant gains in knowledge were obtained in both studies. But Hand and Slocum (1970) reported no change in knowledge of human relations, self-actualization, motivation, interpersonal relations, or participation as a consequence of a training program for middle managers.

Results obtained by R. D. Miller (1969) indicated that leadership training also improved attitudes toward the importance of the leadership role. Papaloizos (1962) reported that about one-third of the participants in a human relations training program exhibited favorable changes in attitude toward subordinates. Following similar training, Mayo and Dubois (1963) found that the gain in leadership ratings was correlated positively with final course grades but not with other criteria. Likewise, Cassel and Shafer (1961) gave students direct training in human relations and leadership. Test scores revealed significant gains in leadership and social insight but not in socio-metric preference or personality tensions and needs. But House and Tosi (1963) found that a

40-week training course produced no important advantages for management trainees in job satisfaction and other measures of performance over a control group. Because of the substantive and process differences in the contents of different leadership and human relations training programs, no single generalization about their efficacy is possible.

*Self-Perceptions.* As noted before, programs that provide feedback purported to increase the accuracy of a leader's self-image. Trice (1959) reported significant changes in self-perception in a trained group but not in a control group. Members of the experimental group who changed the most described themselves as more flexible after training. In a study of human relations training for middle managers, Hand and Slocum (1970) obtained results indicating that acceptance of oneself and others was significantly improved in a immediate posttest, but the significance had disappeared 90 days later. To improve self-perception was the objective of several democratic leadership training studies. Although Gassner, Gold, and Snadowsky (1964) found no significant increase between the actual and ideal self for members of either the experimental or control groups, they found that the experimental group increased significantly in knowledge of democratic leadership, but the control group did not.

*Decision Making.* Decision making was also often targeted for improvement. For instance, employing 83 undergraduates trained in human relations techniques and 75 who were not, Madden (1977) reported that leaders who received human relations training made significantly more accurate postdiscussion decisions than did untrained leaders, but they were no different in their satisfaction with the decision-making process.

*Broader Role Patterns.* Hooijberg and Quinn (1992) described a leadership development program in which leaders were taught to abandon routine roles in favor of broader ones that provided for more autonomy and bigger jobs for their subordinates and themselves. The leaders considered the customary way they did things and how they could become more effective. For instance, they could have more time for themselves for planning ahead if their subordinates could decide for themselves what supplies were needed to do their work or how absences could be handled through cross-training. The new patterns were to be tried for a period of time and then reexamined in a follow-up workshop.

*Discussion Leadership.* Training can also improve the likelihood that discussions will be effective. Maier (1953) demonstrated that discussion groups with skilled leaders produced better decisions than did those with unskilled leaders. Maier (1950) studied groups of foremen with a leader and three followers with and without training. The leaders of the 44 experimental groups were given eight hours of lectures, discussions, and role playing, whereas the leaders of the 36 control groups were untrained. Maier found that the trained leaders had more success than the untrained leaders in inducing their groups to accept change and compromise. Subsequently, Maier and Hoffman (1960a) demonstrated that groups with trained leaders produced discussions of higher quality than did those with untrained leaders. Again, Maier and Hoffman (1964) and Maier and Solem (1962) found that leaders who used a problem-solving approach helped their groups achieve higher-quality solutions than did leaders who applied financial incentives or concentrated on a solution. Barnlund (1955) demonstrated that trainees who were given discussion leadership training regulated participation more and exhibited a greater ability to resolve conflict in group discussions. Mere practice as a discussion leader also made a difference. Jennings (1952b) studied two groups of 20 production supervisors over 16 training sessions. The experimental group was subdivided into discussion groups to solve case problems. At the end of the first session, the emergent leaders were removed and placed in a separate group. Thus new leaders were forced to emerge in the second session. These leaders were also removed and placed in the leadership pool. Successive sessions permitted the rise of new leaders. In the control group, the appointed discussion leader presented a problem and helped the group arrive at a solution. Six months later, more

members of the experimental group than of the control group were rated above average in effectiveness as leaders.

## Training and Education in Leadership Styles

---

Training and education programs, both off the job and on the job, have been developed and evaluated to train individuals to be more successful leaders on the job. The University of Michigan's pioneering survey research feedback programs reduced autocratic and increased democratic leadership behavior. Likert (1977b) summarized the many completed evaluations of the approach Vroom and Yetton (1973) created and subsequently evaluated programs that teach when various forms of participation or direction are rationally more appropriate. Blake and Mouton's (1964) Managerial Grid Training and Hersey and Blanchard's (1982a) situational leadership programs centered on the development of improved task and interpersonal relationships. Fiedler and Mahar (1979b) developed a program to train managers to deal with the situations they face as a function of their scores on the Least Preferred Coworker (LPC) questionnaire and summarized 12 validity studies of the efficacy of the program. Numerous programs, beginning with Fleishman's (1953b), focused on increasing the consideration of supervisors and evaluations of the efforts. Miner (1965) trained managers in how to increase their motivation to manage. The Full Range of Leadership Development program is an attempt to develop transformational and transactional leadership (Avolio, 1999).

### ***Training in Democratic Leadership***

Eichler and Merrill (1933) and Zeleny (1941) found that students gained from direct training in democratic leadership and ways to improve human relations. In the same way, A. K. Healy (1962) noted that training in democratic leadership enabled schoolchildren to gain in carrying out the leadership role and in their sociometric scores. The status of sociometric isolates was improved in the democratic setting, as was academic achievement. Similarly, Spector (1958) obtained significant improvement in human relations attitudes among U.S. Air Force cadets as a result of such training. Bavelas (1942) trained three adult leaders in the democratic leadership of community center activities; three controls received no training. The trained leaders greatly reduced the number of leader-initiated activities and the giving of orders and increased the number of activities in which children exercised responsibility, but the control group made no such changes. Under trained leaders, the children showed more interest, enthusiasm, and initiative in planning projects.

Lippitt (1949) gave community leaders in intergroup relations a two-week workshop in democratic leadership, group discussion, role playing, and sociodrama. Both the participants and the observers reported that the trainees became more proficient in handling problems of intergroup relations as a result of the workshop. Likewise, Maier and Hoffman (1961) demonstrated that supervisors who were trained to pursue democratic solutions led groups to a more effective and creative solution of a problem in changing work methods than did those without such training. Similarly, Baum, Sorensen, and Place (1970) found that workers said they had increased in actual and desired organizational control after their supervisors had completed a course about the need for more democratic control.

### ***Training in Participation and Direction***

*Participative Leadership Training* Sensitivity training was seen by Argyris (1969) as key to the development in leaders of receptivity to participative leadership. Sensitivity training, according to Argyris, moves people to become trusting and open, to experiment with their own ideas and feelings, and to own up to them. Moreover, such people can help others to become more so. Without sensitivity training, supervisors will be more inclined to remain directive in their leadership. The argument is that those who have been through sensitivity training will be more comfortable with participative approaches with their subordinates. But others believe that sensitivity training can produce more manipulative leaders as well (Bass, 1967c).

Training efforts to promote participative or directive leadership were described by A. J. Franklin (1969), Herod (1969), and House (1962). Franklin administered a test of knowledge of group theory to groups of disadvantaged youths. Test scores after training were related to the groups' cohesiveness, but not to a significant degree. Herod (1969) demonstrated that a group-centered training program for college women resulted in the enhancement of participative leadership practices after training. At the end of four months, however, the leaders had regressed to their original positions. House (1962) trained one group in a participative style of leadership and another in a directive style. The more directive method, along with elevated course requirements, was associated with a significant decrease in trainee absences and a significant increase in the number of trainees who completed the course. In an evaluation of the Hersey-Blanchard situational leadership model, 60 executive managers completed a training course about when it was appropriate to tell, sell, participate, or delegate. After completing training, they scored significantly higher on a situational leadership examination than did a control group (Hersey, Angelim, & Carakushansky, 1982). By means of a controlled experiment with workshop supervisors, Crookall (1989) obtained positive results in a more comprehensive evaluation of a group of correctional inmates trained in situational leadership, in contrast to a control group.

*Vroom-Yetton Deductive Model.* [Chapter 22](#) described Vroom and Yetton's deductive model for choosing which leadership style to use. Seven decision rules provided guidance to the leader on how directive or participative to be. The Vroom and Yetton training program encourages trainees to see the discrepancies between their way of dealing with a set of standardized cases and the rational model's solution. Detailed analyses are also provided to trainees in answer to such questions as: What circumstances cause the trainee to behave in a directive fashion, and what circumstances cause the trainee to behave participatively? What rules of the model do trainees violate most frequently and least frequently? Jago and Vroom (1975) also provided feedback to the focal trainees with data from their subordinates about how they think their superior would respond to each Vroom-Yetton case problem.

The Vroom-Yetton model has been found useful in teaching leaders to use different decision processes in different situations and as a way of increasing effectiveness of decisions. Training involves teaching trainees how to analyze various situations to choose the amount of direction or participation that is likely to produce that best decision. Managers who are trained to use the model are more likely to select an appropriate decision-making style (Field, 1982; Vroom & Jago, 1978). The model requires learning to make it useful in everyday situations (Wexley & Latham, 1981). Performance aids can be provided. Personal computer programs furnish instant profiles of rules violated by a decision, feasible alternatives, and qualitative effects of the decision for sets of problems of the expanded Vroom-Jago (1988) model. Nonetheless, questions about the Vroom-Yetton training model remain because of its extensive dependence on leaders' self-reports (Schriesheim & Kerr, 1977b). Field (1979) added a number of other problems that weaken confidence in Vroom and Yetton's conclusions, including the effects of social desirability, the lack of external validity, and the biases of experimenters (see also Tetrault, Schriesheim, & Neider, 1988).

### ***Training in Task and Relations Orientation***

*PM Leadership Training.* For P(erformance)-M(aintenance) leadership training, the ideal leader is “an adaptive perceiver of employees’ needs and a diagnostician of how these needs can be met. Feedback processes from employees to their supervisors are central” (Peterson, 1989, p. 34). Supervisors must focus on whether their behavior is experienced by employees as having sufficient planning, performance, and maintenance content. Misumi (1985) reported that a program to teach Japanese shipyard supervisors his theory of performance-maintenance (PM) leadership stressing the need for both task and relations orientation resulted in a reduction of accidents at work. Cognitive discrepancies on P and M scores between self-ratings and others’ ratings decreased. Although the morale and PM scores of nontrained supervisors dropped because of deleterious changes in the company, the PM scores of the trainees did not. Their superiors judged that the performance of 56 of the 71 trained supervisors showed considerable to substantial improvement.

*Leader Match Training.* According to Fiedler’s contingency model, the leaders’ effectiveness depends on the leaders’ LPC scores and on whether the situation is favorable. Since LPC is seen as a kind of invariant personality attribute, it follows that leadership effectiveness can best be increased by teaching leaders how to make situations more favorable to themselves. Fiedler, Chemers, and Mahar (1976) developed a self-paced programmed instruction workbook, *Leader Match*, that teaches leaders how to (1) assess their own leadership style based on their LPC scores, (2) assess the amount of situational favorability, and (3) change the situation so it matches their style.

Fiedler and Mahar (1979b) reviewed 12 studies that demonstrated the validity of the training effort. Five studies were conducted in civilian organizations, and seven in military settings. The performance evaluations were collected from two to six months after training. Some included measures before and after training. The performance evaluations of 423 trained leaders were compared with those of 484 leaders without Leader Match training randomly assigned to control groups. Partially supportive results were obtained. In Fiedler and Mahar’s (1979b) field experiment with 190 ROTC cadets, Leader Match training was administered to the cadets before they attended four weeks of advanced summer camp, where they were selected at random to serve in several different leadership positions for 24-hour periods. An analysis was completed of officers’ and peer evaluations of the cadets’ performance. The 155 male and 35 female cadets with training tended to perform better than did the 176 male and 39 female cadets in the control group.<sup>17</sup> A meta-analysis by Burke and Day (1986) lent some confidence that Leader Match generalized in its effectiveness across situations, as measured by superiors’ ratings. In a study of the effects of leadership training on productivity and safety, Fiedler, Bell, Chemers, and Patrick (1984) combined Leader Match training, which emphasizes the need to change situations, and behavioral modeling training, which teaches leadership behavior that is independent of the situation. No attempt was made to separate the effects of the two types of training. The two training methods together increased productivity and decreased accidents. A five-year follow-up evaluation showed a continuation of the positive effects of the combined training on productivity and safety (Fiedler, Wheeler, Chemers, & Patrick, 1988).

*Caveat.* Schriesheim and Hosking (1978) were troubled with Leader Match because they found too many problems in the contingency model itself to warrant using it for remedial actions by specific individuals in specific situations. And Jago and Ragan (1986b) used a computer simulation to show that Leader Match was inconsistent with the contingency model. But Chemers and Fiedler (1986) argued that the wrong assumptions had been made. Jago and Ragan (1986b) disagreed. Kabanoff (1981) also noted that Leader Match was inconsistent with the contingency model and suggested alternative explanations for the results of using Leader Match. Rice and Kastenbaum (1983) inferred that the positive effects of Leader Match are due to its sensitizing leaders to the possibility that they can change their situations. Leader Match, like many other kinds of training,

may exert its positive effects because it bolsters the confidence of leaders who receive the training. Frost (1986) evaluated Leader Match against an alternative training method and a control group. As with other studies, experienced managers who received Leader Match training changed their situational control in accordance with the Leader Match prescriptions. In the alternative method, trainees were also taught successfully how to change their situation control, but no mention was made of their LPC score or its implications. The performance of the trainees in this alternative condition improved in the same way as did the performance of those who received regular Leader Match training. Frost suggested that the results were due to increases in the leaders' confidence, not to feedback about their leadership style (LPC) around which Leader Match training is organized. Frost concluded, from the results of his aforementioned experiment, that for experienced managers, at least, behavioral modeling or other methods of teaching that require leadership behavior that is independent of the situation are likely to be more effective than is Leader Match.

*Leader-Member Exchange Training.*<sup>18</sup> LMX training is aimed at improving the dyadic exchange relations of leaders with members of the group. A controlled experiment completed by Graen, Novak, and Sommerkamp (1982) showed that supervisors who were specifically trained in maintaining high-quality leader-Member exchange relationships, in contrast to supervisors who received a placebo experience, improved the productivity of their subordinates more than 16%; their subordinates' motivation and loyalty were increased, and their role conflict and role ambiguity were reduced. Similarly, Scandura and Graen (1984) found that LMX training compared to a control group improved the level of reciprocal understanding and helpfulness between supervisors and subordinates. As a consequence of LMX training, initially outgroup subordinates perceived increased support from their supervisors. The weekly productive output and job satisfaction of the subordinates were also increased.

Cogliser & Scandura (2003) suggested that LMX relations could be improved in the line of hierarchy between each leader and each follower if (1) each leader develops and communicates to followers a vision consistent with the organization's; each follower becomes a leader in the next level below and passes the vision on to the followers in the level below; (2) the leader's behavior is consistent with the organization's values; (3) the leader's values are consistent with the organization's and are communicated clearly to the followers; (4) each leader has a teachable point of view that is communicated candidly with followers; (5) each leader is a role model for followers; and (6) at every level, each leader and follower become more effective in their relationships.

### ***Training in Consideration and Initiation of Structure***

Efforts here have been twofold, to show, first, that supervisors' attitudes toward initiation and consideration, as measured by the LOQ, can be changed with training and, second, that this change can also be measured by the Leader Behavior Description Questionnaire (LBDQ). As was noted in [Chapter 20](#), coercive elements were involved in earlier versions of the SBDQ and the LBDQ. As a consequence, reductions in initiation and increases in consideration were sought in training.

The results of numerous controlled experiments using the LOQ and the LBDQ to measure improvements have been mixed. Comparisons were difficult because of the extent to which the training itself varied in emphasis, quality, and extent, for there is no single standardized program about how to teach leaders to change their initiation and consideration. Stroud (1959) reported that after training, supervisors were described by their superiors as more considerate. Fleishman (1953b) and Harris and Fleishman (1955) examined the initiation and consideration scores of 39 International Harvester supervisors following a training program. The

supervisors' consideration scores increased in means and variances, but the supervisors maintained their heightened consideration scores only if they returned to superiors who were similarly higher in consideration. At the same time, the questionnaire was administered to a control group of supervisors who had not taken the course. Compared to the controls, the trainee group exhibited more of a reduction in initiating structure and more of an increase in consideration.

Fifty supervisors of an Australian government railway department were randomly selected and assigned by Tharenou and Lyndon (undated) to receive training, and 50 were similarly selected and assigned to a control group. A two-week residential course trained participants in the skills of planning and relating. Measures of consideration and initiation were obtained before and after training from the supervisors, as well as from 100 male subordinates of the supervisors. Compared to those of the untrained controls, the trainees' self-rated and subordinate-rated consideration and initiation were both increased. Similarly, Deitzer (1967) studied experimental and control groups of district sales managers in an insurance company before, four weeks after, and 12 weeks after a training program to increase consideration and initiation of structure. The experimental group outperformed the control group after training on all criterion variables—the number of new agents recruited, the volume of new policies sold by the agent working under the manager, and the like. The managers' consideration was positively related to the volume of sales, both 4 and 12 weeks after training; the managers' initiation of structure was related to sales 12 weeks later. However, Bendo (1984) failed to find any significant changes in the LBDQ scores of 126 supervisors who were subjected to Leader Effectiveness Training, a standardized training program. However, in the aggregate, training programs can increase considerate behavior in leaders, as measured by the LBDQ. And when the measurement of initiation includes coercive behavior as with the SBDQ, reductions in initiation can be brought about with training.

Savan (1983) contrasted trained and control groups of supervisors and found that a simulation exercise dealing with initiation and consideration conducted between immediate pre-and postmeasurements failed to shift LOQ scores. Nevertheless, six months after training, there was a notable improvement in the job performance of the trained supervisors compared with the control group. On the other hand, Painter (1984) measured the LOQ scores of public welfare supervisors and their subordinates' descriptions of the supervisors on the LBDQ two months before and after training in interpersonal skills but failed to find any significant effects of the training. Likewise, in a similar pre-post LOQ measurement of 40 restaurant managers and LBDQ assessments of them by their 380 subordinate employees, Anghelone (1981) was unable to find much change in the attitudes or performance of the managers as a consequence of a management training program.

Hand and Slocum (1972) conducted a training program to raise supervisors' consideration scores; 18 months later, they found the supervisors' job performance more highly rated as a consequence. Biggs, Huneryager, and Delaney (1966) found that a two-week training course resulted in more favorable attitudes toward consideration and less favorable attitudes toward initiating structure. Carron (1964) also obtained data indicating that supervisors became less strongly oriented toward structuring and authoritarianism as a result of a training effort. Schwartz, Stillwell, and Scanlon (1968) studied two groups of insurance supervisors, one of which whose score moved toward more consideration and less emphasis on production after training and the other of which moved toward more initiation of structure. And although Herod (1969) and M. B. Miles (1965) obtained results from a training program that produced a more considerate attitude toward group processes, they found no significant change in attitudes toward consideration and initiation of structure. Carron (1964) noted that although attitudes toward initiation of structure and authoritarianism decreased immediately after training, no significant changes were apparent 17 months later. Ayers (1964) found that feedback did little to enhance the effects of training, as measured by changes in attitudes toward consideration and initiation of structure. Similarly, H. B. Stephenson (1966) observed that the training of 449 management trainees in management development produced no significant change in their attitude scores on the LOQ initiation of structure and consideration.

Stogdill (1970) developed a set of films, each depicting one of four different patterns of LBDQ-XII leadership behavior: consideration, initiation of structure, tolerance of freedom, and production emphasis. The films were shown to 35 sorority presidents. Each film was followed by a discussion period that was designed to induce insight into the whys and wherefores of the patterns of behavior. Leaders were described by five sorority members before training and three months after on the LBDQ-XII. The results suggested that leadership behavior was more logically related to the performance of groups after training than before. Stogdill and Bailey (1969) showed the four films to small groups of boys in three vocational high schools, along with a fifth film on representation. After seeing each movie, the groups discussed the supervisor's behavior. The investigators found that the discussion of the movies exerted a favorable effect on the groups' responses to supervision. In another experiment, Stogdill, Coady, and Zimmer (1970) attempted to influence students' attitudes toward the different supervisory roles by using the films. The results suggested that discussion of the films affected the students' adjustment to supervision. Insight and understanding facilitated favorable responses to supervision.

*Training Motivation to Manage.* By means of a lecture, Miner (1961b) successfully increased the favorableness of the attitudes of 72 research and development supervisors, as measured by the Miner Sentence Completion Scale,<sup>19</sup> to accepting responsibility for their leadership role above and beyond their professional roles. He further reported that training resulted in more favorable attitudes to supervisory work. He obtained a small positive correlation between favorable changes in attitudes to and changes toward more effective supervisory performance (Miner, 1960b, 1965). Finally, both college students and business managers who took a course with Miner (1965) improved their attitudes toward the acceptance of responsibility and authority and the willingness to initiate remedial action. Five years later, the business managers who had taken the course had significantly better promotion records than did a control group.

Miner (1988) reviewed previous research on training to increase the motivation of managers and noted its uniqueness in emphasizing how to deal with ineffective subordinates. He further argued that the effectiveness of other training programs, such as Leader Match or behavioral modeling, as seen in Frost's (1986) experiment, depended on their sensitizing trainees to the management role.

### ***Training in Transformational and Charismatic Leadership***

Although specific behavioral skills can be taught in training and actresses have been taught how to display charismatic behaviors in laboratory situations (Howell & Frost, 1988), the emphasis in developing charismatic-transformational<sup>20</sup> leaders needs to be on education and development, not on skill training alone (Avolio & Gibbons, 1988). Gibbons (1986) reported that in contrast to managers who were transactional, managers who were nominated by their colleagues and described by their subordinates as transformational on the Multifactor Leadership Questionnaire said that their performance primarily reflected their whole integrated person, not specific skills taught in brief workshops that may or may not fit their deeply held values and self-concepts. Transformational leadership requires a broad educational process. Such leadership cannot be manipulated; it must be a joint search for truth by the teacher and the students in which the students are moved "to higher stages of moral reasoning and hence to higher levels of principled judgment" (Burns, 1978, p. 449). The *persona* or *aura* of a leader who is more likely to be seen as charismatic can be learned by being optimistic and passionate in generating enthusiasm, using the body language of a charismatic with appropriate gestures and stance, and inspiring appropriate emotions in followers (Richardson & Thayer, 1993). Fidel Castro learned to imitate Benito Mussolini's speech making in gestures and stance to captivate his audiences.

Feedback is essential in programs of education in transformational leadership, as in many other management development approaches. In this instance, the feedback from colleagues is about one's transformational

performance as a charismatic, inspirational, individually considerate, and intellectually stimulating leader and how much one practices the transactional processes of contingent reward and management by exception (Bass & Avolio, 1989). Discrepancies between self and colleagues and self and norms are used to generate ideas and plans for improvement. In an illustrative program, feedback of MLQ results was used to increase the transformational leadership behavior of 250 executives and their direct reports (including the chief executive officer and top four levels of management) of a large Canadian financial institution (Howell & Avolio, 1989). In this program emphasis was also placed on examining the organization's culture as it is and envisioning what it and its goals and objectives should be.

Concentration on developing followers was seen by Dvir (1998) as making the difference between charismatic and transformational leadership, though they have many attributes in common. Charismatic leaders, particularly self-serving ones, are interested in exploiting their subordinates, not developing them, while Dvir saw that the development of followers is at the core of transformational leadership. Followers are developed into leaders. Bass (1985a) found charisma to be the largest among the factors in transformational leadership, accounting for 66% of it. House and Shamir (1993) preferred to see the two concepts integrated as charismatic-transformational. In the education and training effort, meaning is provided about organizational considerations. Long-term strategies are articulated, along with how implementation is to be achieved. New organizations are considered, along with rearrangements of social roles and networks (Tichy & Devanna, 1986). Personal and organizational visions are shared, along with their planned implementation in organizational planning simulations or by a review and discussion of testimonials of what leaders have said about how they do it (Kouzes & Posner, 1985).

*Experimental Evaluations.* Controlled experiments have been completed in correctional institutions, industry, colleges, and the military. Crookall (1989) compared the transactional and transformational leadership training of shop work supervisors of the Canadian correctional service. The supervisors were employed for their trade skills and supervised the shop work for inmates, who are ordinarily low in education and motivation. Twenty of the supervisors completed a three-day program on the Hersey-Blanchard situational leadership model (Hersey & Blanchard, 1977). Another 20 supervisors received three days of education about transformational and transactional leadership (Avolio & Bass, 1989). Still another 20 supervisors served as an untrained control group. The situational leadership training was seen by the supervisors and their bosses as a review of good basic supervisory practices; the transformational leadership training was considered to be more of a personal development experience. Three months before training and three months after training of the supervisors, the inmates were rated on their work habits and productivity. Both groups of inmates with trained supervisors significantly improved, but not those of the control group. The length of the inmates' voluntary stay in the shop programs increased by 50% for both sets of trained supervisors and remained unchanged for the control group. Pre and post changes in inmates' case descriptions prepared by their case managers who did not know about the training experiment registered significant improvement in the inmates' personal growth and development, but no changes occurred for the control group. However, only the transformational program significantly improved the inmates' citizenship behavior and respect for the supervisors. No significant reduction in disciplinary offenses was reported in any of the three groups, although the inmates' supervisors reported the need to intervene less often as a consequence of training. They also reported less contraband, sabotage, and complaints from inmates about the staff. In addition, transformational leadership education resulted in dramatic changes in some of the supervisors. One supervisor changed from a chronic complainer to a problem solver. Another had inmates asking to be assigned to him for the first time in ten years. Complaints about another supervisor for being boring and repetitive were no longer made. And a fourth supervisor broke with the tradition of his discipline to take the lead in introducing computerized equipment.

The results of this experiment suggest that transformational leadership education is not a substitute for situational or transactional leadership training. Rather, as is argued elsewhere (Bass, 1985a), transformational leadership can augment transactional leadership. Training in situational leadership can profitably be followed by education in transformational leadership. Gillis, Gitkate, Robinson, et al. (undated) completed an MLQ questionnaire study in the same correctional system using 35 shop work instructors, 143 inmates, and seven managers of the instructors. The managers reported that supervisors with transformational training were more effective in obtaining extra effort from the inmates. Inmates who rated their supervisors as transformational rather than transactional had more positive attitudes and work motivation. They were also more punctual. As expected, supervisors rated as laissez-faire generated lower inmate motivation and job involvement, and less extra effort.

Barling, Weber, and Kelloway (1996) conducted a oneday training workshop in transformational leadership for nine managers, along with four booster sessions on a monthly basis. They were compared with a control group of 11 managers. All were rated by their subordinates before and after the training of the nine managers. A multivariate analysis of variance accounted for significant effects in subordinate ratings in transformational leadership when trainees were compared with controls.

Kirkpatrick and Locke (1996) conducted an experiment to simulate visionary and charismatic leadership for 282 student participants. High-quality envisioning increased trust in the leader and shared attitudes with those in the vision, and had a minor impact on participants' performance. Implementation of the vision with task cues also had an impact on performance, but charismatic communications influenced only affected perceptions of charismatic leadership.

Popper, Landau, and Gluskinos (1992) evaluated the effectiveness of a three-day training program in transformational leadership for Israel Defense Forces cadets with surveys over 18 months. Most of the cadets said that the program was inspiring and important and that they would try to implement what they had learned when they became commanders. This was followed up in a controlled experiment by Dvir (1998). As part of an Israeli infantry officer course, the experimental cadets completed workshops in transformational leadership while the controls completed an eclectic leadership program as usually taught by consultants and trainers. As the 49 cadets assumed the role of platoon commanders, data were collected about their performance from themselves, their 46 company commanders, their 89 NCOs, and 724 recruits. Objective tests were completed after the training of 40 of the 49 platoons, each led by one of the trainees as platoon commanders responsible for the development of the performance of their recruits. The platoons led by the experimentals were significantly better on all the objective tests: written light weapons, practical light weapons, physical fitness, obstacle course, and shooting after exertion. The recruits led by the experimentals, but not the controls, correlated significantly in the development of attitudes closer to those of the NCOs. The attitudes of the experimentally led recruits shifted toward a more collectivistic orientation, active engagement in the task, perceived effectiveness of the platoon commander, and perceived similarity to the leader.

*Organizational Vision Training.* Thoms and Greenberger (1998) provided training in organizational vision, a component of transformational leadership. The 111 participants were 58 men and 53 women, all but two at management levels ranging from first-line supervisor to CEO. Visioning ability was judged from writing about a future image of the organizational unit the participant managed. Visioning ability correlated with positivism and future time perspective. Mean results improved from 3.5 to 4.0 from before to after the training for the trained managers, compared to a group of 50 control participants who attended a management program of the same length in personnel law. The controls' mean results changed from 3.4 to 3.5. The differences between the changes in the trainees and the controls were highly significant.

## Motivation to Learn Leadership

---

Trainees are motivated to attend, to learn from training courses, and to transfer the knowledge, skills, and abilities (KSAs) they have learned to their work when they see that positive transfer from training to their job will be beneficial to them. It has further been suggested that trainees will be motivated to learn about leadership if (1) they are confident about using what they have learned, (2) they are aware that the new KSAs are appropriate to their job, (3) they believe the new KSAs would be helpful in dealing with job demands (Noe & Schmitt, 1986), (4) they respect the reputation of the trainers or the training organization, and (5) they value the managerial training courses and would recommend them to peers (Facteau, Dobbins, Russell, et al., 1995). Also important to trainee motivation are perceived task characteristics that facilitate or block the transfer of training such as new equipment. Social support may also make a difference (Noe, 1986). Particularly salient is the support or lack of it by the trainee's immediate superior (Clark, Dobbins, & Ladd, 1993). Additionally, trainees' belief in their self-efficacy mediates the effects of training (Saks, 1995).

Switzer (2003) surveyed the motivation of 93 managers of a large nationwide insurance company before training. In agreement with hypotheses, pretraining motivation correlated .48 with the perceived reputation of the training program; .39 with perceived managerial support; and .55 with self-efficacy. Noe's (1986) model of requirements for effective training suggested that leadership trainees need to believe in the assessments of their strengths and weaknesses. They must value the outcomes of training and believe they can achieve the outcomes. They must believe that the training fits with the resources they have available on the job and that the organization will support them if they make use of their learning. Differences in trainees' motivation figured in Gruenfeld's (1966) report that participants who paid part of their tuition devoted themselves more intensely to the program, found it more difficult, and benefited more, as measured by a rating scale and test of values. Avolio and Bass (1998) demonstrated that 66 managers improved MLQ subordinates' ratings from before to after a training program, but only on those transformational leadership factors they said they would try to improve.

## **Stages**

Motivation and readiness to learn about leadership and development as a leader can be seen to evolve in stages. Borrowing from the Prochaska, DiClemente, & Norcross (1992) model of stages in the therapeutic process, Harris and Cole (1999) proposed a four-factor model of stages for which they developed a 21-item factored survey questionnaire: (1) *pre-contemplation* ("I don't have any leadership development needs"), (2) *general contemplation* ("It might be worthwhile to work on improving my leadership skills"), (3) *specific program contemplation* ("Maybe this leadership development program ... will help me to become a better leader"), and (4) *action* ("I am actively working on my leadership shortcomings"). Between 75 and 80 managers and engineering project heads in a manufacturing division in an MNC in the southeastern United States completed the survey as they attended different sessions of the training program. Using five anchors from 1 = strongly disagree to 5 = strongly agree, the mean responses for the four factors were as follows: precontemplation = 1.76; general contemplation = 4.25; specific program contemplation = 4.20; and Action = 3.68. Readiness to change correlated -.56 with pre-contemplation, .70 with general contemplation, .63 with specific program contemplation, and only .29 with action. Only those at the specific and general contemplation stages tended to specify needing to learn about managing conflict, budgeting, quality management, visionary leadership, and team building but not stress management.

*The Learning Organization.* Senge (1990) described the ideal learning organization. Motivation to learn and adaptivity to changes in conditions arise when (1) previous fragmentary thinking becomes systematic thinking, (2) personal visions are continually clarified and reality is seen objectively, (3) competition between members becomes cooperation in helping each other to excel, (4) reactivity becomes proactivity, (4) thinking about inquiry and advocacy becomes open to influence by others, and (5) shared visions arise through dialogue. The members become communities of commitment (Kofman & Senge, 1993). Newkirk-Moore and Backer (1998) studied the commitment to strategic planning of 157 small financial businesses as gauged by the frequency senior managers in the firms attended strategic management training programs. The frequency of attendance was significantly related to greater return on stockholders' equity.

# Programmatic Applications

---

PepsiCo, General Electric, Hewlett-Packard, and ServiceMaster were cited by Cohen and Tichy (1997) for having the best practices for leadership development in training and education programs both on and off the job similar to those presented above.

## ***Management Development Programs***

Management development programs usually refer to the total long-term off-the-job and on-the-job educational process; management training refers to shorter courses. A full-blown program may accomplish much more than what may be possible with shorter independent training courses. Thus Guetzkow, Forehand, and James (1962) reported that a one-year management development course changed behavior significantly more than did training courses of short duration.

Management development programs serve other organizational functions. Recruitment of personnel is facilitated if prospective applicants know that such a program is available. An organizational growth strategy can be maintained efficiently when candidates for newly opening positions are already in training. In turn, the growth strategy provides for more possibilities for promotion as a source of reward for managers at lower levels and may reduce defensive competition for promotion (Luttwak, 1976). Two of the many available management development programs are LeaderLab and Full Range of Leadership Development.

*LeaderLab.* The purpose of this program is to provide leadership training in action learning with realism, simplicity, relevance, the actions of leading, and the intellect and emotions involved, and the time to plan, act, reflect, and learn to learn. The program is aimed at dealing with the leadership challenges of rapid change, diversity of people and views, and developing a shared sense of purpose. Participants develop an action plan to improve their leadership, then return after three months to review their progress. Participants keep a journal. A process advisor remains in contact. A partner in the course and another partner back home help with troubleshooting, analysis, and guiding the process forward (Burnside & Guthrie, 1992).

*Full Range of Leadership Development (FRLD).* This is one program among many that have been created since the 1940s to teach leadership, deriving from a particular set of concepts. Other examples include the GRID (Blake & Mouton, 1964), Likert's (1967) Systems 1 to 4, Fiedler's (1967) program and others presented in previous chapters on styles of leadership. FRLD illustrates some of the common characteristics to be found in these programs, such as well-researched concepts that need to be differentiated by trainees, a theory to explain their connections to performance and satisfaction, measurements of progress, and feedback. FRLD has the theory, empiricism, and empirical support for differentiating between transformational and transactional leadership. FRLD introduces the MLQ model in a basic two-to three-day workshop, after which trainees are provided with their own nine-factor, 360-degree feedback of their transformational, active, and passive transactional leadership behaviors. They are provided comparisons of their own ratings with norms and ratings by others above, below, and at the same organizational level. Focus is on the discrepancies between their self-rated profile of ratings and others' ratings. Lectures, discussions, and coaching assist the participants. Each participant prepares a leadership development plan and its implementation to practice on the job some of the

learnings from the workshop. Also, they examine the obstacles that need to be overcome before they can implement their plan in their organization. In two to three months, they return for an advanced two-day workshop. This second workshop begins with sharing experiences about what new leadership behaviors they tried and how they were received. Exercises on transformational factors come next; participants in small discussion groups give feedback to one another on the factors. This peer feedback is followed by lectures and readings on ways to be more intellectually stimulating. The workshop concludes with each participant making a presentation on videotape that aims to inspire those in the envisioned organization the participant hopes to lead in two to five years. A selection of these tapes are then reviewed and commented upon in an assembly of the participants.

In the past 15 years, the FRLD program and modifications have been conducted in a variety of organizations in various locations from North America and Europe to Australia and Singapore, and industries ranging from insurance firms and automobile manufacturing conglomerates to cable companies and NGOs. In all, several thousand managers and executives in many different countries have completed the program (Avolio & Bass, 1991, 2002).

Self-ratings of transformational leadership increase from before to after training. Transactional management by exception decreases. However, those initially lower tend to show more improvement. When 43 participants from health care, education, business, government, and nonprofit agencies in a public workshop were asked afterward if FRLD had met their personal objectives, 54% said “a great deal” and 37% said “fairly much.” Similar results were obtained in response to whether FRLD had met their career objectives and their objectives for community leadership. All but 3% felt that FRLD was worth their investment in time and energy. When 213 participants were asked at the end of the overall program how satisfied they were with it, 92% were satisfied a great deal or fairly much and 89% agreed that the leadership could be applied to their development. Among 87 participants, their subordinates’ ratings from before to after FRLD, idealized influence, inspirational leadership, and intellectual stimulation factor scores increased significantly, but not individualized consideration. Management by exception and laissez-faire leadership decreased. Those with initially lower transformational leadership increased more than those with initially higher transformational leadership ratings.

For 66 trainees who returned for a follow-up session from six months to two years later, their subordinates reported significant improvements in transformational leadership data, but only on those factors that the 66 had said in their plans they wanted to improve (Bass & Avolio, 1996). The largest improvement was in the reduction of transactional management by exception and passive-avoidant leadership. Critical incident reviews following training mentioned increased inspirational leadership (e.g., communicating a clearer sense of mission), increased intellectual stimulation (e.g., determining opportunities in challenges), and increased individualized consideration (e.g., developing the ability to lead in others) (Avolio & Bass, 1993, 1994). Between 1998 and 2002, 86 managers in New Zealand completed the FRLD program. An increase of 10% to 15% in their leadership effectiveness was reported (Parry, 2003). For a review of research and applications of FRLD, see Avolio, (1999).

### ***Specialized Leadership Training and Education***

Much specialized effort has been devoted to training programs about how to lead scientists, engineers, technicians, entrepreneurs, military personnel, nurses, schoolteachers, sales personnel, and so on. The MBA curriculum at universities is another specialized program aimed at preparing students for general business leadership. Entrepreneurial motivation has also been promoted through achievement training. Other specialized programs prepare leaders to work with labor union members and minorities and in other cultures.

Many of these specialized efforts are now discussed briefly.

*Science and Engineering Leadership.* Many new supervisors enter a technical firm with insufficient education in science, so remedial programs are made available for them. Although supervision and leadership often become major responsibilities for engineers and scientists as they progress in their organizations, their preparation for these responsibilities is left until they have graduated from their professional schools and are at work. Considerable evidence has been obtained that such postgraduate efforts are generally efficacious. Moon and Hariton (1958) gave 50 engineering supervisors 30 hours of instruction on methods of self-improvement and greater job efficiency. Lectures were followed by role-playing sessions in which each participant acted out problems in human relations. A questionnaire administered to 67 subordinates of the trained group and to 67 subordinates of untrained supervisors indicated greater improvement for the trained group in understanding subordinates as individuals, expressing recognition for good work, giving subordinates an opportunity to express their side of a story, and showing more interest in employees' progress. Carton (1964) administered training over a six-month period to 23 scientists in supervisory positions using lectures, discussions, and role playing. A battery of tests was administered to the experimental group and a control group immediately before and after training and again 17 months later. The experimental group decreased significantly in authoritarianism and initiation of structure, whereas the control group did not. Mosvick (1966) examined four different training methods in a study of 55 engineers in supervisory positions. Three attitude scales and two behavioral measures were administered to experimental and control groups before and after training. Members of the trained group showed significant improvement in behavior and their ability to analyze a simulated communication conflict situation but not in their attitudes.

*Educational Leadership.* A school principal's leadership is strongly connected with the school's educational effectiveness. "Principals remain key individuals as instructional leaders, initiators of change, school managers, personnel administrators, problem solvers and boundary spanners for the school" (Portin & Shen, 1998, p. 34). But it is a difficult position, fraught with potential conflicts of goals. Principals are supposed to maximize their teachers' ability to teach and students' ability to learn, but they also have to deal with other diverse priorities, such as student discipline, safety, the physical plant, and the satisfaction of the students' parents, as well as national testing, state government regulations, and school board mandates. Their accountability is increased, but their authority is downgraded. Their compensation may not match their responsibilities. Many ask to return to teaching or to leave the school system.

Turnover and population expansion require preparation of new assistant principals and principals. The shortage of principals in many California school districts, such as Glendale and Santa Monica, resulted in specialized training programs to foster the professional growth of teachers and future principals. Similar developments have occurred in New York State; the Academy of Leadership of the Center for Leadership Studies at Binghamton University assessed and trained teachers and staff members in the Full Range of Leadership Development for Broome and Tioga Counties (Bass, 2000).

*Military Leadership.* U.S. military officers form an elite profession with its own code and customs and its own politics and culture. They study, train, and prepare for armed conflicts, ranging from terrorist attacks to conventional national invasions. They maintain a worldwide surveillance of military threats (Morganthau & Horrock, 1984). The amount of required training in the military is also greatly increased by the demand that the military continue to be at the cutting edge of new technology, as well as by the steady stream of military personnel to civilian life who need to be replaced.

There is a heavy continuing investment in leadership training for military leaders at all levels to compare with controlled untrained comparison groups. Typical examples have compared U.S. Army squad leaders who

received leadership preparation training with a control group of leaders who did not. The trained leaders received higher effectiveness ratings, their squads showed higher spirit, and their followers scored higher on proficiency tests. Descriptions by followers indicated that trained leaders initiated more structure, exercised better control of field exercises, and demonstrated more adequacy in briefing and giving information. Their subordinates were less willing to reenlist, however, and showed less favorable attitudes toward the army (Hood, Showel, & Stewart, 1967). Again, infantry graduates of schools for noncommissioned officers exceeded a control group in their rate of promotion and number of awards, but not in leadership evaluations (Rittenhouse, 1968). In another typical analysis, films of leadership situations followed by group discussion were used to train military leaders. The groups that discussed the films were more effective than the control groups in solving leadership problems (Lange, Rittenhouse, & Atkinson, 1968). Many other examples of effective military leadership training have been discussed in earlier chapters as demonstrations of various principles of consequence (see, for example, Eden & Sham, 1982; Fiedler & Garcia, 1987).

Over a thousand cadets are trained each year in the four-year leadership program at the U.S. Military Academy at West Point. Among a number of innovative courses are those dedicated to intellectual procedure (McNally, Gerras, & Bullis, 1996). To enhance the cadets' cognitive skills in leadership, they learn 22 theories of leadership and apply each of them to a case requiring military leadership. Being an intelligent, thoughtful, and reflective leader is encouraged. The cadets need to identify what is happening, account for it, and formulate the action that the leader should take. Cases are actual experiences of the military faculty. The importance of understanding subordinates, peers, superiors, and the organization is encompassed in a set of systems. Individual systems focus on attribution theory (Kelly, 1955). The group system discusses organizational socialization (Van Maanen & Schein, 1979), cohesion (Cartwright, 1965), group development (Bennis & Shepard, 1965), and group decision making (Vroom & Yetton, 1974). The leadership system concentrates on the differences between transformational and transactional leadership (Bass, 1985). Integration efforts follow.

*MBA Education.* Education for up to two years that leads to the Master of Business Administration is broadly based in institutions that follow the guidelines of the American Assembly of Collegiate Schools of Business. In these schools, students receive instruction in applied behavioral science, management information systems, business policy and planning, applied mathematics, and applied economics, as well as in the functional areas of production, human resources management, marketing, finance, and accounting. MBA programs have increased dramatically since the mid-1950s, when approximately 3,200 MBA degrees were awarded per year. By 1998, more than 102,000 were being awarded annually in North America (Pfeffer & Fong, 2002). Similar rapid growth has followed in Europe and elsewhere (Anonymous, 1991; Berger & Watts, 1992).

Herbert (1972) found no clear effect of MBA education on job performance. But according to Herbert (1977), 82 supervisors of MBAs and non-MBAs gave MBAs better reputational ratings on technical skills, initiative, responsibility, motivation, judgment, and problem solving but not on better human relations or supervisory skills. The results were not affected by whether the rates were in staff or line positions. Jenkins, Reizenstein, and Rodgers (1984) surveyed 110 presidents of Fortune 500 companies and 124 personnel directors from the same firms, along with 450 business school alumni, 93 deans, and 302 faculty members. They found that 57% to 60% of the respondents believed the program should focus strongly on quantitative analysis and that an even greater percentage supported an emphasis on decision making. But 32% to 45% of these samples thought that MBA programs should deemphasize short-term decision making in favor of Long-term strategic planning. The percentage who were satisfied with the extent to which leadership skills were developed among MBAs ranged from 36% to 50%. The deans, personnel directors, and alumni were more satisfied, and the presidents and faculty members were less satisfied. Satisfaction with MBAs' interpersonal skills ranged from 28% to 46%; those in the business community were less satisfied and the academics more

satisfied. Only pluralities of 21% to 43% were satisfied with the managerial skills of MBAs.

Interviews with 600 senior executives tended to be consistent with the foregoing findings. Seventy percent thought that business school education was pretty good, and 49% regarded the MBA degree as somewhat or very important to getting ahead in their own company, although 86% thought that too much theory and too little application were taught. However, Pfeffer and Fong (2002) questioned whether business schools will survive without major changes. They argued that the curricula have little relation to what is important to business. The greater success in business of graduates can be accounted for by the characteristics of the students admitted to the schools. The curricula lack the focus on practices found in other professional schools. Academic research has little effect on business. Needed are ways of integrating academic knowledge with active experience.

*Executive Development Programs.* Executive development is a career-long process. Zaccaro (1999) suggested that basic to any healthy organization is a climate that nurtures leaders and prospective executives. Any developmental program must attend to the cognitive and social capacities and skills required by executives for effective leadership and work performance. The cognitive competencies needed by executives include intelligence, analytical reasoning, flexible integrative complexity, and verbal and writing skills. Executives need to be able to deal with organizational contradictions, as well as with cognitive and behavioral complexity (Streufert & Swezey, 1988). As detailed in [Chapter 20](#), the required social competencies include social reasoning, behavioral flexibility, and competence in persuasion, negotiation, and managing conflict. The ideal executive is open, curious, disciplined, flexible, self-efficacious, and a calculated risk taker, with a need for achievement and socialized rather than personalized power. Executive development is a slow process. Development of competencies should be focused on the requirements of the next higher level of position in the organization. According to interviews with 40 executives by Kaplan, Drath, and Kofodimos (1985), the criticism received and accepted by the executive is affected by job demands and the power of the executive. The need for mastery, the acceptance of criticism, and earlier history of success determine whether the executive will attempt to change. Improvement in performance will depend on the open flow of information, the ability to look inward, the ability to accept criticism, and the ability to change (Kaplan, Kofodimos, & Drath, 1987).

Formal university executive development programs lasting a few weeks to a semester or more are popular in the industrialized world. They are helping countries from Chile to Norway and formerly Communist countries to cope with the global marketing economy. Course content parallels that to be covered in the MBA program with variations, depending on the management level of the trainees, the length of the program, and whether a certificate or degree will be awarded. The programs can be made more effective with commitment from outside sponsors to continued executive development and its importance to executive career planning, the use of assessment centers<sup>21</sup> to provide individualized developmental guidance, effective needs analysis, computer networks to link executives in their offices with university faculties, more attention to executive leadership and self-development, and an international perspective, along with custom-made programs for individual organizations (Watson, 1988). Executives need to be prepared for discontinuous change and the adoption of a “leap ahead” strategy (F. J. Brown, 2000). Zsombok (1993) designed a program for senior managers working for the U.S. Air Force that incorporated a model of effective team strategic decision making. Included in the program were envisioning time horizons, avoiding micromanaging, and using diverging and converging in situational assessment. Comparisons of trained with control groups have been promising.

Executive development programs are not for future senior executives alone. Many managers are enrolled in such programs to make contributions to strategic planning and help their organizations change from traditional ones to ones more suitable to meeting competition, taking advantage of new technological advances and the best human resources practices (Hoffman, 1996).

*Fellowship Programs.* Illustrative and mentioned earlier is the Kellogg Fellows Program, which is international in scope. The fellows are established leaders from governmental, educational, nongovernmental, and philanthropic institutions and agencies. They are committed to advancing social change. Kellogg supports them for a number of years to help them access individuals, organizations, and programs for further development of the leadership skills to improve people's lives in their communities and to broaden their understanding of community change (Webb-Petett, undated).

*Entrepreneurial and Achievement Motivation.* Building on earlier theory and research about the need for achievement, McClelland and Winter (1969) designed workshops to instill a greater need for achievement in entrepreneurs. These workshops were conducted in developed as well as in developing countries such as Mexico and India. Black entrepreneurs in South Africa were also singled out for attention. Increasing the entrepreneurs' need for achievement was expected to increase their willingness to expand their spheres of activity and their willingness to take on more challenges and responsibility.

The workshops involved showing how the need for achievement is revealed in its projections in the Thematic Apperception Test and how one could increase the achievement thematic content in responding to the test. Generalization about achievement and entrepreneurial activities followed. Positive effects of the training were reported (McClelland & Winter, 1969). Since the need for achievement is of consequence to management in general, achievement training has been applied to managers. Illustrative were results reported by Boer (1985) in a study of the effects of achievement training on the performance of South African factory management teams (in contrast to control teams who were not trained). Labor productivity was increased and turnover and absenteeism were reduced in the trained but not in the control groups.

*Leadership of Minorities and Women.* "Awareness" training, mainly for white male managers about special issues of working with women, blacks, and the disadvantaged, became commonplace following the passage of affirmative action legislation (Anonymous, 1968b). In some instances, heightened awareness produced overreactions and backlash (L. A. Johnson, 1969). An extensively evaluated program was reported by Bass, Cascio, McPherson, and Tragash (1976). Following the identification of five factors differentiating issues of awareness of managers about affirmative action for black employees (Bass, Cascio, & McPherson, 1972), PROSPER, a self-administered program, was developed. The booklet for PROSPER that each participant received began with a pretraining assessment on the five factors. Next, a case of an insubordinate black engineer was presented, and the participants had to make in-basket decisions. Each participant then was assigned a role as one of five different managers in a firm gathered to discuss the case; each of the roles was built around one of the five factors. The participants verbalized favorable positions on one of the factors while they heard favorable information about the others. Significant increases in the scores for more favorable attitudes toward working with black employees were achieved by 2,293 managers. After three to five months, 298 managers still showed some of the increase on all five factors. Cascio and Bass (1976) further analyzed the specific role-playing effects of PROSPER and found that the results were in the direction of expectations. PROFAIR, a comparable attitude change program for supervisors of women (Bass, 1971), was developed out of a survey of attitudes toward working with women.

Special programs to train black leaders were illustrated by Katz and Cohen's (1962) *assertion training* to increase self-confidence among blacks. Beatty (1973) completed a study about the training of black supervisors and the importance of their superiors' expectations. Assertiveness training for women became popular in the 1970s. For example, Heinen, McGlauchin, Legeros, and Freeman (1975) increased the self-awareness and self-confidence of 19 of 20 women managers with such training. Numerous other programs to train women as leaders have been conducted, predicated on the supposition that women have unique problems which could be effectively resolved only through changing the organizational culture. Woman as leaders need to adjust to the

organization as well. Nevertheless, a survey of 101 female and 121 male managers by Alpander and Gutman (1976) indicated that both sexes perceived similar training needs. Hart (1975) designed and evaluated a training program in leadership for adult women based on Hersey and Blanchard's life-cycle theory. Training that focused on interpersonal skills, leadership theory, lifestyles, and the importance of motivation to being a leader resulted in increasing the self-esteem and self-confidence of the trainees in contrast to the controls. Compared to the controls, the trainees also perceived themselves as better able to make decisions, as more active, as more in control of their lives, and as having a greater knowledge of listening skills.

*Development and Training of Labor Leaders.* The role of union leaders handling relations with management was presented in [Chapter 13](#). As organized labor membership in the United States has declined in the past half century, so have empirical studies of union leaders. An example of a recent study was by Skarlicki and Latham (1997), who examined the effects of training 25 union leaders on how they administered principles of organizational justice, according to 177 union members. The leaders were perceived to have increased in fairness, while the members were perceived to have increased in citizenship behavior involving the union. Forty-five years earlier, despite generally favorable attitudes toward their union local, only half of 140 rank-and-file members felt that the local was fair in assigning jobs; 18% felt it was unfair (Davis & St. Germain, 1952). Barkin (1961) noted the greater difficulty organizers had in persuading workers in the rural South to form a union compared to those in urban areas. Uphoff and Dunnette (1956) found that among 1,251 union officers, activists, and members, the members were less fully committed to the union movement. Before 1945, a majority of union leaders came from middle-class backgrounds; after 1945, 60% came from working-class backgrounds. The leaders were likely to be better educated than the rank and file but of the same religion and political affiliation. Although they might begin as blue-collar workers, leaders move on to union positions early in their careers to become professionals (Mills & Atkinson, 1945).

Samuel Gompers and John L. Lewis are the two leaders who shaped the labor movement in the United States. Their development is instructive. Gompers, as a boy, emigrated to the United States with his Dutch-Jewish working-class family from the East End of London to the Lower East Side of New York City. With only four years of education, Gompers began working as an apprentice shoemaker at the age of 10. At age 14 he joined his father as a cigar maker and as a member of the Cigar Makers' International Union (CMIU). He remained in the union, but since it enrolled only skilled cigar makers, Gompers formed the United Cigar Makers, which included the less skilled. It became the largest local of CMIU in 1875, when the latter agreed to enroll members of families of varying skills who did their work at home in tenement apartments leased by the cigar companies. (The firms bought the production from the families.) The craft unions encouraged training members and provided apprenticeship programs in their crafts (Mandel, 1963; Neumann, 2004). That same year, Gompers became an official unpaid but successful organizer. He continued to work in a cigar-rolling factory. His education was furthered by the custom of cigar makers' taking advantage of their quiet workplaces to hire a reader who read aloud to them from books and newspapers about current political conditions, labor conditions elsewhere in the world, and political economics. He overcame a speech impediment to become a prominent orator. He found employment again only after having been blacklisted by many employers. Unlike the national Knights of Labor, which encompassed many diverse social and political causes, he rejected the socialist movement and political agitators, and focused narrowly on "bread-and-butter issues" of wages, work hours, and benefits. In 1886, he helped found the American Federation of Labor, which aimed to control job opportunities and conditions in each craft. Each craft had its own organization. Under his leadership, the AFL had 1.7 million members by 1904. Although theoretically open to all, its membership was limited to white males. High dues built up strike funds to assist striking workers. But he required that any strike proposal be approved by secret ballot in the shop organization as well as the local union, and he came down hard on "wildcat" strikes. He tended to avoid strikes when possible, as well as involvement in political actions such as

legislation for old-age pensions, employers' responsibility for worker safety, and compulsory health insurance.

It was left to the creation of industrial unions such as the mine workers' and automobile workers' unions to organize around all workers in the same industry rather than the same craft. The most prominent leader in organizing industrial unions for 40 years was John L. Lewis. He was the eldest of six sons, born in 1880 to Welsh immigrant parents from coal-mining families. He had only a seventh-grade education, but he continued his education with extensive reading. He joined his father and brother working in the coal mines at the age of 15. His father was blacklisted for union activities and eventually took a job as a jail custodian. In his youth, Lewis also acted and managed a local theater and a baseball team. His acting skills stood him in good stead during his many negotiations and public appearances. Before he was 27 years old, he had also tried farming, construction work, and small business. Joined by his family, Lewis built a local power base of Welsh immigrant coal miners. He became a member of the United Mine Workers in 1907 and in 1909 became a successful union organizer. In the next 11 years, he became the secretary-treasurer and delegate to the UMWA national convention, and in 1917 he was elected president of his union local. In 1920, he was elected president of the UMWA, in which office he served until 1960, retiring at the age of 80. He successfully unionized many of the nonunion coal regions. He was a founder of the Congress of Industrial Organizations (CIO) and was instrumental in the organizing of many major industrial unions, such as the United Steelworkers of America (USWA), Communications Workers of America (CWA), and United Auto Workers (UAW). He regularly advised U.S. presidents and the U.S. Congress, and challenged America's corporate leaders. He improved health care for miners and their families with a fund that built eight hospitals and many clinics in Appalachia, paid for from UMW contracts with the coal companies that set aside royalties for a workers' pension fund.

Lewis was a charismatic leader. He had self-taught rhetorical skills and readily quoted from the Bible, Shakespeare, Plato, and Homer. His grandiloquent oratory made him a most effective political spokesman. He was a 230-pound bear with a volcanic personality. He was a fearsome adversary, cunning, ruthless, and opportunistic, had a colossal ego, and felt his supporters wanted someone like him who could stand up to the bosses of big business. He was autocratic and considered a demagogue by many. He was a despot who expelled his rivals from his organization. But he actually pursued moderate objectives, including the right to organize labor unions, shorter work hours, prohibition of child labor, equal pay for men and women doing the same comparable jobs, and steady employment.

He was admired by business leaders and Republicans in the 1920s but switched to the Democratic Party when President Franklin Roosevelt was elected in 1932 with a policy promoting and legalizing collective bargaining. By 1937, Lewis had succeeded in unionizing the two largest firms in the United States, General Motors and U.S. Steel. But in 1940, when Roosevelt ran for a third term, he switched back to the Republicans. His popularity declined after 1937 and even further during the war years and afterward, when he practically shut down American industry with national coal strikes, since American manufacturing, transportation, utilities, and home heating were fueled mainly by coal. When he called out the miners in 1943, during the middle of World War II, 87% of a national sample said they had an unfavorable opinion of him. Between 1943 and 1946, there was much loss of public and political support for labor as a consequence of the strikes, which was ultimately reflected in the decline of national union membership. States passed "right to work" laws and Congress, the antilabor Taft-Hartley Act. Nonetheless, following federal intervention, the miners' incomes and benefits were substantially increased by the strike settlements (Dubofsky & Van Tine, 1986).

*Training Leaders for Foreign Assignments.* Preparing managers for overseas assignments is costly, but the lack of such preparation is more costly (Tung, 1979). On the basis of surveys and interviews, Zeira (1975) suggested that multinational firms need to equip parent-country nationals and third-country nationals to serve as managers abroad. They need adequate knowledge of the complex human problems of international

enterprises. They need self-confidence to adapt their leadership behavior to the needs of the subsidiary. Education, training, and assignments are needed early in a manager's career to learn the critical nuances in international business. As parent companies expand into increasing numbers of countries, there is a need to train the executives who have to visit numerous countries for short periods of time in cross-cultural sensitivity as well as briefings on the specific countries. Those who work in multinational councils and projects need similar general as well as specific cultural training (Ezzedean, Swiercz, & Holt, 2003).

Tung (1979) found that 26 of 105 U.S. multinationals ran training programs to prepare personnel for overseas assignments. About half these programs used environmental briefings, cultural orientations, and language training. A few used culture assimilators, sensitivity training, and field experience.

Universities provide courses and curricula. Illustrative is the Global Leadership Program at the University of Michigan. Teams of students spend two weeks in a designated country to identify business opportunities. They tour businesses and meet with corporate and business leaders, visit homes and marketplaces, and use public transportation. On their return, they prepare reports. At many universities, student interns spend a semester in a foreign country to develop a business plan for a foreign firm as an action learning experience.

Seminal experiments were completed in the 1960s. Mitchell and Foa (1969) studied American leaders with non-American followers. They found that leaders were rated as more effective when they were trained in the norms of their followers. Chemers, Fiedler, Lekhyananda, and Stolurow (1966) demonstrated that training leaders in the culture of a foreign nation, as opposed to training them in the geography of the nation, resulted in higher levels of group performance and rapport in tasks involving subjects from two different cultures. L. R. Anderson (1965) trained leaders in their own culture's style of leadership or in the style characteristic of another culture, and then assigned them to intercultural task groups. Those who were trained in other cultural styles led groups that were more effective in creativity tasks but not in negotiation tasks. In line with Fiedler's contingency model, Chemers (1969) found that intercultural training tended to modify the situation in the direction of making it more favorable for the low-LPC (task-oriented) leader, who then showed more consideration than did the high-LPC (relations-oriented) leader.

*Training Community Leaders.* Training community leaders is a well-established strategy. In the late 1990s, the number of community leadership programs approached 700 (Fredericks, 1998). Among their purposes were to foster critical thinking in the public domain and to examine alternative solutions to civic problems (Reed, 1996). In five counties of New York State, the problems included youth violence, declining water resources, waste management, urban/rural competition for resources, overstressed family resources, dealing with neighborhoods at risk, and empowering community leaders (Avolio, Bass, Miles, et al., 1994). Rossing and Heasley (1987) described a design for rural and agricultural leadership training programs. Similarly, Miller (1986) detailed West Virginia University's plan, in which its faculty contributes directly to the community. Community development was the objective of Ohio's cooperative extension leadership workshops (Long, 1986). The Kansas Community Leadership Initiative aimed to help directors and board members of 17 local community leadership programs gain new insights and skills in personal relationships, as well as to foster improvement in leadership programs (Wituk, Warren, Heiny, et al., 2003). Increased numbers of civic leaders was a goal of 72 California civic leadership development programs (Azzam & Riggio, 2003). While 85% of community leadership programs have structured classroom instruction, they also provide familiarization visits with community institutions and meetings with prominent citizens. In addition, they work on community problems and projects. They are a form of action learning (Conger & Toegel, 2004). Leadership development programs have also been designed to prepare retirees to become volunteer community leaders (Brungardt, 1996).

*Contributions to Networking.* Community leadership training programs have been sparked by a

national effort of the U.S. Chamber of Commerce to furnish cross-fertilizing education and training grounded in workshops for prospective leaders from a single community. The trainees are drawn from local industry, government, unions, law enforcement agencies, agriculture, hospitals, and volunteer and welfare agencies. In addition to the informational learning that is possible, important lasting networks can be established across organizational boundaries that will benefit the community and its development. For instance, such a leadership educational program was provided to 227 rural citizens of Montana. Classroom and on-site experiences were both useful in enhancing the leaders' self-image, skills, and understanding (Williams, 1981). Brown and Detterman (1987) agreed and added that participation in community leadership classes promoted increased contacts among the community leaders. In turn, Rossing and Heasley (1987) noted that involvement in public affairs was promoted by such community leadership training.

There is evidence that communities with more civic involvement and stronger local leadership have better schools, lower crime rates, more effective government, and greater sense of personal ownership (Rossing, 1998). Training programs are needed to replace retiring civic leaders. Program alumni remain active in the civic affairs of their communities. They help followers without the training experience to take on initiatives and become project leaders (Daugherty & Williams, 1997).

Azzam and Riggio (2003) surveyed by telephone 72 of 83 directors of civic leadership programs in California. The oldest program had been started in 1980. The average age of the programs was 10.7 years. Almost half of the participants came from the private sector (48%) while most of the other half came from the nonprofit (23%) and government sectors. Twenty-one percent of the programs concentrated on orientation visits and visits to local institutions. Seventy-six percent received both classroom instruction and orientation (close to the national pattern). Meetings were held usually once a month for 12 months. Alumni were followed up with newsletters (28%) and social events (45%). Alumni associations were formed by 38% that might engage in long-term projects, raise money, and advise the program.

## Evaluation of Leadership Training and Education

---

### *Evaluative Impressions*

Information was provided by Russon and Rainelt (2004) about the desired and unintended outcomes of 55 leadership development programs sponsored by the W. K. Kellogg Foundation from the 1930s onward and alternatives to approaches, methods, and data collection. By the 1960s, attendance at leadership development programs was routine for both novice and experienced managers. The National Industrial Conference Board (1963) surveyed 1,074 recently recruited college graduates who had attended management development programs sponsored by their employees. About 40% of those who had hoped that the programs would prepare them for promotion felt disappointed and regarded the programs as of little value to themselves or the company. They preferred instruction that would prepare them for the tasks of specific jobs rather than for better human relations and general management. Organizational experience made a difference. Executives with experience had a different point of view. K. R. Andrews (1966) received 6,000 replies from executives who had attended one of 39 different university programs in management development. Although about 85% saw no relationship between attending the courses and their subsequent advances in salary, the benefits they most frequently mentioned were increased understanding of self and others, greater tolerance for differences in opinion, and heightened awareness of alternative solutions to problems. Structured lectures and didactic

teacher-led classwork were regarded as more valuable than unstructured group discussions and informal contacts with faculty and students. The National Industrial Conference Board (1964) surveyed 167 firms' experience with management development. In evaluating the effectiveness of such programs, 57% of the firms expressed the belief that the programs were valuable, but only 14% reported evidence in support of this belief.<sup>22</sup>

## ***Evaluating Changes***

*Attitudes and Self-Reported Changes.* Leadership training of some sort figures strongly in most management development programs, although training is likely to be provided in many other nonsupervisory management functions. In fact, M. W. McCall (1976) suggested that too much emphasis has been placed on leadership training and not enough on the many other varied aspects of a manager's work, although the opposite can also be argued.

Despite the previously noted evidence to the contrary that training fails to shift Leadership Opinion Questionnaire scores (Anghelone, 1981; Savan, 1983; Painter, 1984), numerous other examples of successful changes in attitudes as a consequence of longer-term development programs have appeared. For instance, C. W. Nelson (1967) conducted a training course for top-level managers in a plant, who in turn conducted a similar course for their lower-level managers. Nelson found that not only did significant changes in attitude occur, but that a retest one year later showed that the effects persisted. Similarly, E. H. Schein (1967) demonstrated that a two-year course in management education produced a significant change in attitudes toward human relations. Valiquet (1968) reported a significant change in attitudes and behavior among managers who participated in a one-year training program. R. S. Barrett (1965) found significant change in attitudes, but not in performance, following the completion of an executive development program. Blake's (1960) study of a management development program in Norway found that the 67 participants reported a greater understanding of other people, themselves, and social trends and more self-confidence in dealing with superiors, peers, and subordinates. Waaler (1962) studied another 194 executives in a management development program in Norway. Participants from the firms with the "best" programs, when compared with those in firms with the "poorest" programs, reported greater nearness to, warmth toward, and understanding of their employees; more informality with employees; greater predictability of behavior; more frequently letting employees know what to expect; and reduced pressure on subordinates.

Training to overcome resistance to change by developing a better understanding of change is key to bringing about organizational change. Vision 2016 was a program to directly train 2,000 senior government officials in Botswana that indirectly impacted 50,000 citizens. The program concentrated on developing "knowledge checks" to ensure that managers and their subordinates understood the change program and its implications (Washington & Hacker, 2003). Executives need to be prepared for discontinuous change and the adoption of a "leap ahead" strategy (F. J. Brown, 2000).

## **Factors That Affect Training Outcomes**

---

Personal attributes of trainees, the composition of the training group, follow-up strategies, the behavior of the trainer, the congeniality of the environment to which the person returns, and the criterion outcomes themselves affect training results.

## ***Criteria of Effective Training***

The strength of the effects of training that are found depends on the criteria employed to assess the effects. Burke and Day (1986) completed meta-analyses of the results of 70 managerial training studies. They contrasted four types of criteria employed in the studies: subjective learning, objective learning, subjective behavior, and objective results. Subjective learning was obtained from the trainees' self-reports about what they thought they had learned from the training. Objective learning was based on tests or measurements of learning during and after training. Subjective behavior was taken from self-reports about the trainee's performance after training, and objective results were based on independent measures of the trainee's performance as a consequence of training. For all four criteria as a whole, the authors concluded that managerial training is moderately effective, and that the effectiveness of training methods can be generalized to new situations.

When the measured learning outcomes were subjective, the effects were all positive for general management, self-awareness, and human relations training. Nonetheless, self-awareness and human relations training generated stronger effects of subjective learning outcomes than did general management training.

When learning outcomes were measured objectively, positive effects were also obtained for all four types of training. But training in motivation emerged as relatively most effective and training in problem solving as relatively least effective.

With subjective behavioral outcomes, the effects of general management, human relations, and self-awareness training were again all positive, and self-awareness was the greatest in this regard.

When objective results were used as criteria, the effects of training were again all positive, and human relations training showed the strongest of these positive effects.

When subjective learning outcomes were the criterion, positive outcomes were seen to have been achieved with sensitivity training, behavioral modeling, and lecture–discussion–role play or practice. Similarly, positive effects on objective learning criteria were obtained for lecture, lecture–discussion, and lecture–discussion–role play or practice. Against subjective behavior outcomes, positive effects were obtained for lecture and lecture–discussion, Leader Match, sensitivity training, behavioral modeling, and combinations of these methods. Sensitivity training and behavioral modeling demonstrated the strongest positive effects.

In all, it would seem that regardless of how training outcomes are measured, the average study reveals a positive effect. However, different types of training will emerge as stronger or weaker in effect, depending on the outcome measures employed.

## ***Follow-Up Reinforcing Practice and Feedback***

To transfer to the job what has been learned during training, trainees need to be given continuing opportunities to practice what has been learned. This practice, in turn, needs to be coupled with feedback or self-reinforcement about the trainees' practice efforts. The need for reinforcing booster programs is well recognized (Avolio, 1999). One of many examples was provided by Wexley and Nemeroff (1975), who described a self-feedback mechanism for promoting the transfer of leadership training to the job. For six weeks following training, supervisory trainees completed a daily behavioral checklist to record their supervisory behaviors. On each day, they noted whether they had (1) praised subordinates, (2) thanked subordinates for suggestions, (3) told them how they would be followed up, (4) called subordinates together to discuss mutual

assistance, (5) given help as requested, (6) assigned jobs without interfering until the jobs were completed, (7) consulted individually with trainees on the job to review progress, and (8) arranged for trainees to try out and evaluate the effects of newly learned behaviors.

### ***Congruence of Training and the Organizational Environment***

By the 1950s, organizational factors had been recognized to have an important impact on the effectiveness of supervisory training. These included the organizational climate, the trainee's immediate superior, and upper management. Zaleznik (1951) explained the failure of a human relations training program to help trainees solve their work problems as due to an inadequate initial diagnosis of supervisory difficulties and to the irrelevance of the training to the problems. Sykes (1962) conducted a case study of a firm in which participants in a management development program regarded the training as unsuccessful because top management was unwilling to correct grievances and unsatisfactory conditions. Again, a deterioration in human relations resulted from an attempt at supervisory training when a program conflicted with unionism, when recruitment for a program was inadequate, and when a program itself was seen as an effort to indoctrinate a captive audience (Form & Form, 1953).

Supervisory training to increase considerate behavior resulted in a much greater shift in some trainees' behavior when organizational conditions were taken into account (Harris & Fleishman, 1955). Baumgartel and Jeanpierre (1972) queried 240 managers from 200 different industrial and commercial firms who had participated in a management development program. The respondents indicated whether they could apply what they had learned in training depended on (1) the freedom they had to set personal goals, (2) consideration by higher management of the feelings of lower management, (3) the organization's stimulation and approval of innovation and experimentation, (4) the organization's desire for executives to make use of information given in management courses, and (5) free and open communication among management groups.

*Immediate Supervisor.* Most important to whether training modified behavior back on the job was the trainee's immediate supervisor. F. C. Mann (1951) found that supervisors who changed more as a consequence of training in leadership (1) received more encouragement from their superiors, (2) expected greater personal benefit from training, (3) felt more secure in their relations with their superiors, and (4) felt that they had a greater opportunity to try out new ideas on the job. Consistent with this finding, Hariton (1951) observed that supervisory training increased employees' satisfaction when the supervisors were encouraged by their superiors to use the principles they had learned in training.

Slightly later, Harris and Fleishman (1955) reported that supervisors who were trained in a human relations orientation appeared to experience role conflict when they returned to their jobs to work under superiors who exhibited a markedly different pattern of behavior. Supervisors who returned to their work after human relations training tended to endorse a more considerate attitude toward employees, and to be described by employees as high in consideration if the superiors of the supervisors endorsed considerate attitudes and behaved in a considerate manner. There was a nonsignificant tendency for supervisors to be described as high in initiating structure when their superiors exhibited a similar pattern of behavior.

Supervisors who returned from training to work under a superior who was low in consideration and high in initiating structure (including being coercive) experienced the greatest role conflict, as measured by the discrepancy between their observed behavior and their ideas about how they ought to behave. No such relationship was found for control supervisors who had not taken the training course in human relations. Thus, the supervisors' leadership behavior tended to be highly conditioned by the attitudes and behavior of

their superiors (Fleishman, Harris, & Burt, 1955).

Haire (1948), W. Mahler (1952), and many others since have argued that for leadership training to be effective, the entire management of the organization should be subjected to the same or a similar program. It is self-defeating to train lower-level managers in an approach to leadership that is incompatible with that of their superiors.

*Other Organizational Constraints.* Despite the generally observed positive effects of leadership training programs, the effects can be constrained or nullified by various organizational conditions, according to an interview study by Campisano (1984). The content of the program may be irrelevant to the daily activities of the supervisor or may suffer from redundancy. Furthermore, the interviewees stated that technical competence and management structure were more critical to performance in their organization than was training in leadership skills. Steele, Zane, and Zalkind (1970) reported that perceived pressures from associates, particularly peers, reduced the trainees' involvement (according to consultants) as their activities changed 20 months after instruction. On the other hand, Carroll and Nash (1970) reported that 45 foremen in a management development program thought the training was more applicable to the job if they were more highly motivated toward promotion, were more satisfied with the organization, and had sufficient freedom to perform their functions.

Training must often be supported by other specific organizational actions to result in the desired effects. Specific organizational practices, congruent with the training effort, need to be developed and institutionalized on the basis of a comprehensive analysis of organizational, managerial, and technical/professional needs (Dreilinger, McElheny, Robinson, & Rice, 1982). Thus a supervisory training program to reduce employee absenteeism actually lowered absenteeism only when quantitative data about the absences of the supervisors own subordinate personnel were fed back to supervisors following training (Mann & Sparling, 1956). Similarly, training programs for women managers require buttressing by encouraging senior managers to be supportive of female middle-level managers and by helping husbands to understand the importance of their support in ensuring the success of their wives on the job (Brenner, 1972).

*The Need for Programmatic Integration.* Van Velsor (1984) summarized what is needed for leadership training and education to have an impact. The organization must show that it supports what is to be learned. The trainee must be willing to participate in the training. The need for training must be perceived. The program should deal with relevant problems and should provide sufficient interaction with peers and valid feedback. Follow-up activities should include postsession debriefing, maintenance of alumni groups, consultation, follow-up training as needed, and reward for improvement and the application of what has been learned. The promotion of the trainees should be integrated with their development and focused on individualized needs that are aligned with those of the organization (Cunningham & Leon, 1986).

Day's (1980) interview survey of 116 health care professionals showed that the professionals tended to connect promotion with training. Of those interviewed, 67 percent noted that following promotion, their organizations made an effort to prepare them for their new responsibilities with training (mostly on-the-job training). At the same time, Alpander's (1986) survey of 155 corporate training officers found that less than 1% reported a direct relationship of promotion to undergoing supervisory training. However, 52% reported some indirect contribution of training to the trainees' subsequent advancement. But 31% reported that training was of little or no consequence to promotion.

At the upper level of an organization, Hall (1986) noted the difficulties involved in connecting executive succession with the learning of individual executives. Most planned executive development focuses on tasks rather than personal learning. Classroom activities, rather than the exploitation of learning from experience, are emphasized. But such learning from educational and personal experiences needs to be integrated into planning

for succession.

Bunker (1986) attributed the success of management training in Japan to the firms' subscription to the proposition that their employees need to be developed before the firms can make a profit. Except for firms that suffered during the depressed economy in the 1990s, employees and their development are valued. Japanese firms see themselves as educational institutions engaged in learning with their employees. "The company is the business school!" Training is "just in time," that is, it is systematically provided just as managers need new skills to take on new roles. Much attention is paid to socialization to the organization. New recruits of Japanese firms receive up to eight weeks of initial residential training. This training is followed by extensive job rotation during the next two years to develop familiarity with various functions and departments. Later on, training is provided to deal with obsolescence and burnout, along with new challenges. Training provides the basis for employees at all levels to fit into and make contributions in a consultative organizational culture.

## Summary and Conclusions

---

Leadership education begins early in childhood and continues through adolescence and adulthood. Early developments contribute to a leader's subsequent success. Of importance are one's parents, the standards they set, and the challenges they provide, commensurate with one's maturation. Equally important are the leadership opportunities and experiences one has in childhood, adolescence, and adulthood. Education also plays an important role. Leadership training and education need to be designed around what will be required when trainees and students take on leadership responsibilities.

Experiential training approaches have been favored over highly structured didactic lectures alone for leadership education and training, but new kinds of highly structured experiences, such as those provided by behavioral modeling, have demonstrated the desired training effects. Nevertheless, sensitivity training or its variants, such as team building, continues to be widely practiced. Considerable research is available about its effects.

Research indicates, not unexpectedly, that the effectiveness of training, particularly sensitivity training, depends on the trainee, the trainer, the composition of the training group, follow-up reinforcement and feedback, and particularly whether there is congruence between the training and the organizational environment for which the trainee is being prepared. Positive results depend, to some extent, on opportunities for the transfer of learning into appropriate organizational settings.

Training proceeds both off the job, such as in special seminars and workshops, as well as on the job in action learning, coaching, mentoring, and various forms of performance feedback, including 360-degree survey feedback. Well researched are the evaluations of programs to teach the various styles of leadership presented in earlier chapters. Coaching, on-the-job leadership training by the learner's immediate supervisor, and mentoring of junior by senior executives are widely practiced. Special attention is also given to examining ways to train leaders to work effectively with minorities and the disadvantaged. Specific programs prepare people for foreign assignments. Numerous leadership and management training and education programs have their benefits and limitations.

In all, meta-analyses of available evaluative studies have provided evidence that leadership and management training, education, and development are usually effective. Effective training and education add to valid assessment in fostering effective leadership and management.

<sup>1</sup> See [Chapter 10](#) for more details.

<sup>2</sup> Loyalists, in the sense used here, were those leaders best known for their efforts to maintain old, unreconstructed regimes. Revolutionaries were leaders best known for their efforts to overthrow the old regimes.

# Assessment, Appraisal, and Selection

Assessments based on tests and judgments as well as appraisals of current performance can be used for leadership and management-development purposes. They can be used to modify current performance and predict future performance. The judgments and their combinations can forecast success and effectiveness as leaders. Such predictive data can be extracted from assessments of personal backgrounds, psychological tests of ability and motivation, and current performance in contrived and real-life settings. Forbes and Piercy (1991) examined the backgrounds and careers of 250 CEOs and emphasized the importance of early career success. In mid-career, alternate routes to the top were movement into general management or functional specialization. Background and experience influenced early promotion into middle and senior management. Credibility and visibility were enhanced by level of education, breadth of experience, entry from a prestigious university and its advanced management training programs, service on the staff of a senior executive, work in a powerful department, and functional understanding of the corporate organization's critical problems. It also could help to be a member of the family that controlled the corporation.

Business and industry were quick to adapt the intelligence tests developed for selection by the U.S. Army in 1917, in World War I, to assess 1.7 million draftees. (Portions of these tests can be found in the current, commercially available Wonderlic Personnel Test.) Development of personality inventories for assessment soon followed. The first modern standardized attitude surveys were completed by employees in the U.S. Department of Agriculture in the early 1930s (Likert, 1932).

## Purposes of Assessment

---

The uses of assessment are twofold. By whatever means it is done, assessment provides the basis for choosing from among candidates for leadership and management posts. It also provides useful information for the counseling and further development of incumbent leaders. The organization clearly benefits from using valid selection processes for its leaders rather than relying on haphazard processes, ranging from casual and ill-formed choices to those involving favoritism, prejudice, politics, nepotism, and bribery (Immegart, 1987). Organizational effectiveness is enhanced by the increased assignment of those best able to fill leadership posts. A valid assessment increases the tendency of the status of organization members to be correlated more highly with their ability and esteem. Also, it reduces potential conflicts caused by incongruities among status, esteem, and ability.<sup>1</sup> In the same way, counseling and development based on valid measurements rest on much firmer ground than do management counseling and development based exclusively on impressions and feelings. Thus Knight and Weiss (1980) demonstrated in an experiment that leaders perceived to have been chosen by a competent agent were judged by other group members to have greater expertise than those selected by a less competent agent. These leaders were also more influential.

## Varieties of Available Assessment Information

---

Personal traits related to leadership have included tests and judgments of capacity, achievement, and verbal and nonverbal communication styles; interests, attitudes, and values; sociability, initiative, confidence, and popularity; task and relations orientation; status, family, educational background, and work history. For example, Miner (1960a) and Nash (1966) reported patterns for forecasting managerial success that were consistent with the personal factors connected with leadership discussed in earlier chapters. These patterns involved energy, risk taking, verbal fluency, confidence, independence, and the desire to be persuasive. Mahoney, Jerdee, and Nash (1960, 1961) showed that the success of 468 managers in Minnesota-based companies was predicted by work-related, business-related, and higher-level occupational interests. These concerned interests in leadership, independence, moderate risk, and work that were not closely detailed. Also predictive were intelligence, solid education, activities in more organizations, and self-reported dominance. In the same way, Ghiselli (1971) predicted managers' progress based on a battery of tests of intelligence, supervisory ability, self-assurance, decisiveness, self-actualization, and motivation to achieve.

In addition to information generated from tests and simulations, the predictive data have been supplied by observers, interviewers, outsiders, superiors, peers, subordinates, and the assessees themselves. Assessment centers (discussed in detail below) have become a popular way of systematically gathering and pooling such multiple and diverse sources of information. The sources of information may be either subjective judgments about candidates for selection, development, and promotion or objective work samples, tests, and inventories. Often, both sources will be combined for a prediction. Naive observers may do just as good a job as trained process observers in identifying which individuals in a group are emerging as its leaders (Stein, 1977). The methods of combining the predictors for success as a leader are either statistical, judgmental, or both. Clinical judgment or mechanical pooling of the information in some objective systematic way may be used. To aid judgment, objective or subjective information or both may be displayed in profiles or printed in narrative reports. The mechanical combining may be based on unit or differential weighting of the information. The weighting can be a matter of judgment, or multiple regression analysis may be used to minimize error in the predictions (Sawyer, 1966).

## Importance of Effective Assessment and Appraisal

---

"We bet on people, not strategies," declared Larry Bossidy, CEO of Allied Signal. Many senior managers fail to have a "talent mind-set" that can maintain the quality of an organization. Only 23% of top executives agreed that their firm brought in highly talented people, and even fewer (16%) said they could identify the high and low performers. Only 11% agreed that they could retain almost all high performers; only 5% said they could remove low performers quickly (Michaels, 1998). Yet talent needs to be identified early in high flyers' careers in order to provide rapid promotion into leadership positions and avoid losing the high flyers to competing firms (Gratton, 1992). Early experiences in team sports and business and early identification are seen as important for the development of business leaders (Benton, 1990).

## Importance of Acceptability of Appraisals and Feedback for Development

---

Increasingly, performance appraisals, especially from multiple sources, are being used for development as well as placement and advancement. Their acceptability is important in determining how much they can change behavior (Taylor, Masterson, & Renard, 1988). This depends on the willingness of the rater to provide unbiased appraisals, and that of the ratee to accept and make use of the feedback (Waldman & Bowen, 1998). (The importance of feedback of appraisals to leaders' development and training, especially 360-degree feedback, was mentioned in earlier chapters.)

## CEO Performance Evaluation

---

Truskie (1995) presented the results of a survey of appraisal practices of more than 600 large firms, by the chief executives. Thirty-eight percent had formalized oral and written processes; 78% had preset performance objectives; 75% of the boards used the evaluations for compensation purposes. All CEOs were held accountable for the company's financial performance. Boards of directors were supposed to be able to justify CEOs' compensation. CEOs could use the evaluations for personal improvement and for building relations with the board. However, boards considered short-term, quarterly, and yearly goals as more important than long-term ones. Qualitative goals such as leadership might be considered, but only informally, and they were unlikely to be factored into compensation. In most cases, the evaluations were based on formal performance reviews.

## Judgmental Approaches

---

Pure judgments of the readiness of job incumbents for promotions into positions that require more leadership are commonly used. These judgments may be obtained from observers. More often, they are obtained from the supervisors of the incumbents or from higher management. Such judgments can be a part of standard performance appraisals, and, as was noted in [Chapter 30](#), such early appraisals of performance as a leader are likely to predict subsequent success as a leader. They also can be based on observations of leaders' performance in work samples and situational tests, as well as in the actual performance of a job. Simulations of management situations, paper-pencil simulations in the form of standardized managerial basket tests, initially leaderless group discussions (LGDs), and other small-group exercises can be used to generate the observations from which judgments are derived. Other ways of judging the potential for leadership are supervisors' opinions and performance appraisals, interviews, references, and recommendations. In addition to judgments of an assessee's overall leadership performance, discrete elements can be singled out for examination and decision. These elements can then be formed into scores for standardized processing.

### ***Judgments Based on Simulations***

*In-basket Tests.* These tests simulate the typical contents of a manager's in-basket. The items may include telephone messages, brief memos, detailed reports, letters, directives, complaints, and junk mail about a recently vacated management position. The examinee is instructed to imagine that he or she has just taken over the position and has limited time, such as one hour, to decide how to handle each item (Frederiksen, 1962b, 1966; Frederiksen, Saunders, & Ward, 1957). Realism can be added with telephone calls and visual

presentations (Lopez, 1966). An element that is deemed important in the test is ambiguity (Gill, 1979), although the common problems faced by all managers need to be sampled (Stewart & Stewart, 1976). Brass and Oldham (1976) argued that the more representative and appropriate the in-basket sample to the examinee's particular future management situation, the better the test results predict that performance.

As many as nine independent factors were uncovered in a Sears in-basket test (Bentz, 1967), but Gill (1979) concluded that most factor analyses of in-basket results, including Meyer's (1970a), emerge with just two factors: a relations dimension of supervision and an intellectual dimension of planning and administration. Highly reliable results can be obtained with standardized scoring procedures by adequately trained judges of the examinee's responses (Richards & Jaffee, 1972). Interviews with the examinees after they complete the in-basket test can augment the accuracy of the predictions obtained (Clutterbuck, 1974).

The results of the in-basket tests of IBM supervisors were found by Wollowick and McNamara (1969) to correlate .32 with increases in management responsibility during the three years following testing. Judgments of the examinees' organizing and planning ability and work standards, garnered from an in-basket test, correlated .27 and .44, respectively, with the managerial level they achieved at AT&T eight years later (Bray & Grant, 1966) and .19 and .24 with the level they achieved 20 years later (Howard & Bray, 1988). Similar findings were reported by Meyer (1963) for manufacturing supervisors at General Electric and by Lopez (1966) for managers at the Port Authority of New York and New Jersey. These investigators agreed that judgments and scores from in-basket tests add considerably to the accuracy of forecasting success as a manager that is not possible with ordinary paper-pencil tests of capacity and interests.

*Leaderless Group Discussion (LGD).* In the simplest form of small-group exercise, the initially leaderless discussion group (LGD) is assigned a problem to discuss to reach a group decision. Observers judge who emerges as a leader, initiatives displayed by each participant, and other aspects of interpersonal performance, such as motivation of others, persuasiveness in expression, and skills in dealing with others to handle the problems to be solved. Bass (1954a) reported correlations of these observers' judgments of LGDs of .44, .53, and .38 with rated merit among the 348 ROTC cadets as cadet officers obtained six months to a year later. A similar correlation of .47 was found in predicting subsequent nominations for positions of fraternity leadership from earlier performance in an LGD. Similarly, Arbous and Maree (1951) obtained a correlation among 168 South African administrative trainees of .50 between an LGD and the trainees' rated capacity a year later as administrators. Vernon (1950) found, among 123 personnel, a correlation of .33 between an LGD and their rated suitability for foreign service. The LGD was validated in the same way for shipyard supervisors (Mandell, 1950b), military officers (Weisloge, 1953), U.S. Army personnel (Gleason, 1957), and British supervisors who were followed up for four years (Handyside & Duncan, 1954). The LGD became a routine part of many assessment centers. Vernon (1950) found a correlation of .75 between judgments based on a one-hour LGD and judgments by assessors after three days of activities at an assessment center. Although the quantity of talk in an LGD reflects *attempts* to lead, its quality affects a person's *success* in leading (Bottger, 1984). Participants who are highly rated by observers see themselves as more assertive, competitive, self-confident, and willing to function autonomously. Those rated less effective view themselves as cooperative, disciplined, and tactful (Hills, 1985).

*Small-Group Simulations.* Complex simulations are specifically constructed exercises for small groups of candidates that can be observed by assessors whose judgments are shaped by what they see. Roskin and Margerison (1983) presented examples of simulations that involved organizing a team effort among managers whose problem required little special information or experience but could bring out differences in participants' leadership, managerial skills, and attitudes. These simulations were: (1) the production of a set of prototype greeting cards; (2) the building of a "monument" from material provided; (3) the solution of a case problem,

at both individual and corporate levels; (4) the construction and flying of paper airplanes; (5) the selection of an employee from a number of candidates. Assessors' judgments were based on observations of 39 elements in the assessee's behavior. The assessments were related to the compatibility of the behavior with the situation and how the assessments dealt with cognitive and perceptual complexity. Managers were detected who were most likely to be high achievers. Scores of leadership attitudes and opinions on paper-and-pencil tests alone failed to relate to the managers' performance.

Dunnette (1970) described two simulated business situations from which judgments of performance could be gleaned for predictions of leadership. Six participants were told they were managing an investment fund and had to buy and sell stocks to make profits for their investors. Stock quotations were changed every five minutes, and other information was presented at predetermined intervals. Organizing skillfully, working cooperatively with other people, handling a large amount of information, and other group process and cognitive variables were judged from each participant's behavior. In the second simulated business situation, the six participants were asked to play roles as managerial trainees. Each participant had to plan a project and make a 10-minute presentation justifying the project and its budget. After the six presentations, the participants engaged in an hour's discussion about the merits of the various projects. Skills in judgment, planning, and organizing, proficiency in oral communication, and effectiveness at working in competitive situations could be judged with some accuracy from the emergent behaviors.

*Cognitive Tests.* Organizational leadership is characterized as social problem solving in ill-defined, usually novel domains (Mumford, Zaccaro, Harding, et al., 2000). Cognitive and metacognitive abilities are needed to solve the problems of executive leadership. Cognitive abilities include intelligence, general reasoning skills, divergent thinking, and oral and written expression and comprehension (Connelly, Gilbert, Zaccaro, et al., 2000). Cognitive abilities are needed to get things done. Metacognitive abilities guide the problem-solving process and enhance choosing, planning, monitoring, and evaluating what to do. Such abilities include verbal fluency, information-processing skills, and inductive and deductive reasoning (Marshall-Mies, Fleishman, Martin, et al., 2000). Cognitive and metacognitive tests of executive leadership skills have been conducted by both conventional and computer methods. A battery of these complex problem-solving measures was administered at the National University, in San Diego, to senior military officers.

*Problem-Solving Scenarios.* Zaccaro, Mumford, Connelly, et al. (2000) administered a set of psychometric tests to tap the problem-solving capabilities of 1,807 U.S. Army officers ranging in rank from 597 second lieutenants to 37 colonels, most with experience serving in leadership roles from platoon to brigade commanders; 80% were men, and 20% were women. The first tests administered were either cued or uncued scenarios calling for creative problem-solving and processing of complex problems. (Half the samples underwent cued scenarios; the other half, uncued scenarios.) Next, military scenarios required the construction of solutions to assess attention to the constraints on and understanding of the context. Scenarios calling for social judgments tested the understanding of people. Knowledge of the roles of a leader in dealing with various tasks, writing skills (rewriting headlines), and divergent thinking about the consequences of unlikely events were also examined, using similarly brief 10-to 15-minute tests. Responses were constructed by the examinees rather than chosen by them. Cued and uncued complex problem-solving scenarios correlated with knowledge of leadership, .32, .33; understanding leadership as problem solving, .22, .41; divergent thinking, .49, .51; verbal reasoning, .18, .14; and creative writing, .30, .33. Cued problem solving correlated .55 with solution construction; uncued problem solving correlated .50 with social judgment.

### ***Judgments Based on Speeches and Essays***

Essays written by candidates, managers, and leaders and their speeches can provide the basis of judgments about their future performance. Winter (1987) demonstrated that the contents of the inaugural addresses of U.S. presidents could be judged and coded to obtain valid inferences of their leadership motivation patterns. Such patterns, in turn, were predictive of the success of their administrations. Speechwriters provided the specific words, but the leaders reviewed and modified the text. House, Woycke, and Fodor (1988) extended the work to Canadian prime ministers.<sup>2</sup>

### ***Judgments Based on Appraised Performance***

Superiors' appraisals, evaluations by peers, and self-reports of leaders about their own performance may all be employed as predictors of future leadership success. Generally, consistencies are likely to fall between superiors' and peers' ratings, although superiors are prone to emphasize getting work done and peers are more likely to emphasize cooperativeness. Self-reports tend to be inflated (although some managers may have better insight into themselves than others do). Self-reports may be unrelated to judgments obtained from peers or superiors. For example, Lawler (1967a) found a correlation of .52 between superiors' and peers' ratings of the job ability of 113 middle and top managers. Agreement on the rated quality of the managers' job performance was .38. On the other hand, correlations were close to zero between the managers' self-reports and the peers' or superiors' ratings of the managers' ability and performance. A meta-analysis by Harris and Schaubroeck (1988) of 11 to 36 reported correlations found a high correlation, on average, between peers' and superiors' ratings but much lower correlations between self-reports and superiors' ratings, or between self-reports and peers' ratings. Agreement between self-reports and others' ratings was lower for managers and professionals than for blue-collar and service employees. Whether the rating format was dimensional or global had little effect on the agreement.

### ***Judgments by Superiors***

Organizations commonly use supervisors' and superiors' judgments to decide whom to hire, transfer, and promote. The judgments are attempts to forecast future success as a leader and manager in the positions for which the candidates are to be chosen. Equally common are teachers' and trainers' appraisals of prospective future position holders while they are enrolled in training and education programs. When 493 to 631 U.S. Army soldiers were rated by their supervisors and peers, 13% of the variance in the supervisors' appraisals was accounted for by the soldiers' scores in ability, job knowledge, and proficiency. But only 7% could be accounted for by peers. When interpersonal factors were included, the percentages rose to 28% and 19% (Borman, White, & Dorsey, 1995). The cumulative military performance grades awarded by superiors at Annapolis correlated .25 with subsequent fitness reports of 186 U.S. Navy officers serving in the fleet as much as a decade later. They also predicted the tendency of subordinates to describe the officers as charismatic (Yammarino & Bass, 1989).

*Academic Performance Grades.* Cumulative academic performance grades at Annapolis were not

predictive (Yammarino & Bass, 1989) of success. This finding was consistent with the failure, more often than not, to find significant correlations between undergraduate college grades and success in business and industry (see, e.g., Schick & Kunnecke, 1982) or better ratings of job performance (Pallett & Hoyt, 1968). The record for postgraduate grades has been somewhat better (Weinstein & Srinivasan, 1974), although in general, postgraduate grades of any consequence emerged mainly in specific elective courses (Marshall, 1964). As the importance of technology increases, so may the importance of academic performance if grade inflation is not too severe. In special circumstances, academic performance may be predictive. In one study, academic performance predicted teachers' ratings of the leadership of high school students (Schneider, Paul, White, et al., 1999). The school was a magnet school focusing on leadership development, and these students spent most of two years of their class time together, confirming the data gathered about them. Grade point average (GPA) correlated .59 with task-goal teacher ratings of leadership and .48 with peers' nominations of leadership (Schneider, Ehrhart, & Ehrhart, 2002). Generally, results lagged over the two-year period. They showed more modest correlations among teachers' and peers' appraisals and the Myers-Briggs Type Indicator, the Campbell Interest and Skill Survey, and leadership in an initially leaderless group discussion.

From the research on the persistence of leadership in [Chapter 30](#), it can be inferred that superiors' performance appraisals of managers' behavior as leaders furnish a greater opportunity to observe the managers in action than when the managers are observed in diverse positions by different superiors, peers, and subordinates. At the same time, the predictive validity of superiors' judgments suffers to the extent that they overweight the candidates' technical proficiency and manipulative styles (Farrow, Valenzi, & Bass, 1981); the requirements of the new positions are also different from those of the old ones. Furthermore, successful performance in a lower-level position may not necessarily predict performance in a higher-level position that requires more cognitive complexity (Jacobs & Jaques, 1987).

Brush and Schoenfeldt (1980) proposed a procedure that would direct superiors' ratings toward a systematic evaluation of their current subordinates on dimensions of consequence to future positions the subordinates might hold. They argued that it is even possible to evaluate blue-collar workers, based on their observed behavior on the job, on dimensions relevant to supervisory positions to which they might aspire. Schippmann and Prien (1986) obtained such judgments of 47 candidates for first-level supervisory jobs in a steel company from 29 supervisors. The dimensions arranged for the supervisors' judgments included: (1) representational skills, (2) supervisory ability, (3) ability to analyze and evaluate information to define problems, (4) knowledge about and ability to work with mechanical devices, (5) ability to manage/orchestrate current activities effectively, (6) ability to decide and act, (7) ability to follow through to achieve closure on a task, (8) administrative ability. Satisfactory reliabilities were achieved, but self-assessed merits were much more lenient than the supervisors' ratings.

*Superiors' Intentions in Appraising Subordinates.* What stimulates superiors to appraise subordinates? In one study, 73 subordinates were rated by 32 supervisors. Some were rated by 25 of the supervisors, and none were rated by 16 supervisors. Supervisors who rated all the subordinates differed significantly from those who rated only some or none. According to the subordinates, the 32 supervisors were higher in initiating structure; they came from more formal departments; their work groups were more cohesive; their subordinates were better educated; and they had more confidence in the appraisals (Fried, Fried, Tiegs, & Bellamy, 1992).

Superiors may intend to try to rate subordinates' performance accurately or to inflate or deflate subordinates for political, social, or personal reasons. Davis (2000) queried the intentions of law enforcement superiors in appraising the performance of subordinates. A total of 266 superiors (captains, lieutenants, and sergeants in a county sheriff's department) completed the questionnaire. The superiors indicated their intention to be more accurate in their performance appraisals of their subordinates if they felt that the appraisals: (1) enabled

employees to participate in the process; (2) contributed to developmental purposes; (3) served to reward employees. Also, intentions to be accurate were greater if the supervisors had better relations with their subordinates and were more satisfied with the performance appraisal system.

*Peer Appraisals.* Consistent with other analyses of “buddy ratings,” peer ratings by cadets at West Point and at officer candidate schools (OCS) were found to be the best single predictor of subsequent success as a regular U.S. Army officer (Haggerty, Johnson, & King, 1954). A correlation of .51 was obtained between peers’ ratings at West Point and the rated success of infantry officers 18 months later. A correlation of .42 was obtained between peers’ ratings in OCS and officers’ combat performance in World War II (Baier, 1947). Similar results were reported for the U.S. Marine Corps (Wilkins, 1953; Williams & Leavitt, 1947b) and the U.S. Air Force (USAF 1952a, b). Ricciuti (1955) found fellow midshipmens’ ratings of aptitude for service more predictive of the subsequent performance of naval officers than ratings made at the U.S. Naval Academy by their navy officers. Hollander (1965) and Amir, Kovarsky, and Sharan (1970) applied peer ratings to accurately predict the success of junior officers. Downey, Medland, and Yates (1976) extended the findings to senior officers. They found that ratings by 1,656 colonels of each other forecast who would be promoted to general. The correlation was .47. Peer nominations among 133 women soldiers in the U.S. Army were found to generate two distinct factors, professional and social, but parallel ratings yielded only one general factor, suggesting the ratings were subject to halo bias (Schwartzwald, Koslowsky, & Mager-Bibi, 1999).

Judgments by peers are often in the form of nominations of one or several associates with whom the rater is acquainted (see [Chapter 10](#)). Nominations of the most and least valued have been employed. But to be predictive of subsequent success, the nominations must be positive. Kaufman and Johnson (1974) showed, in two studies of ROTC cadets, that being nominated as the most effective cadet officer during the school year correlated between .36 and .43 with independent criteria of performance as a platoon leader at summer camp. But being nominated for the least effective performance officer did not correlate as negatively as expected with such leadership at summer camp. For this, correlations were .03 and .16 in the two studies.

In business, Kraut (1975b) obtained peers’ ratings from 156 middle-level IBM managers and 83 higher-level executives attending a monthlong training program. Two factors emerged from 13 ratings: (1) impact; and (2) tactfulness. These factors correlated .35 and .37, respectively, with the performance appraisals of the higher-level executives, but close to zero with the performance appraisals of the middle managers once they were back on the job. However, the peers’ ratings of impact correlated with the subsequent number of promotions received by both the middle managers and the executives. These predictions from peer judgments were much more likely to be correlated with subsequent success than predictions obtained from the training staff of the monthlong program.

Are peer ratings biased by friendship? Mumford (1983) was impressed with the validity of peer ratings but found a need for a better theoretical understanding of the reasons for it. It would seem that peer ratings are valid because they are likely to be influenced by many of the persistent traits that contribute to success as a leader, such as competence and esteem not necessarily due to friendship.

*Subordinates’ Appraisals.* With the increase in participative management has come an increase in the acceptance of subordinates’ ratings of their bosses. Anecdotal evidence suggests that some managers learn from their subordinates that they talk too much or are not good listeners. Some receive better ratings than they expected. Reasons for discrepancies between ratings from the different sources can also be examined and action planning undertaken. Bob Myers, a vice president at the Limited, discovered that his colleagues wanted him to be more open to different views. Ellen Walton, at AT&T Network Systems, found out that she did not always listen. CEO Lawrence Bossidy of Allied Signal was not surprised to learn that his subordinates agreed with him that he was opinionated (Maynard, 1994). In 1992, the motorcycle manufacturer Harley-Davidson

began an upward feedback program to its executive committee members from their direct reports. Increasingly, in many firms such as General Electric and IBM, feedback programs for developing managers are surveying the managers' subordinates, as well as their peers and superiors (Gunn, 1992). Information from subordinates is also likely to be predictive of future success as a manager. However, the accuracy of the predictions derived from such information may suffer to the degree that the subordinates overweigh sentimentality, the superior's likability and the extent to which the future position's requirements differ from the current one. Nevertheless, Hater and Bass (1988) showed that among 56 Federal Express managers, those who were rated higher in transformational leadership and lower in laissez-faire leadership by their subordinates were significantly more likely to be judged by senior managers as having a greater potential for leadership. Similar results were found by Yammarino and Bass (1989) for junior naval officers.

Of course, it is one thing to use superiors', peers', and subordinates' ratings in research; it is another thing to use them in operations. The colleagues' and candidates' resistance and distortions are likely to increase when the ratings are to be employed by a higher authority to decide on a promotion for which the colleagues are also competing.

*Self-Ratings.* Objective personality tests and inventories may provide assessments for personal leadership development as well as selection of leaders. Most survey feedback asks managers to describe their own behavior. These results are then fed back to the managers relative to the average group results. The self-ratings are not likely to be as useful to the prediction of future success as the discrepancies between theirs and others' judgments. But the discrepancies are especially useful for developmental counseling and training. Most answers to questionnaires that ask managers to describe or evaluate their own behavior suffer from a variety of errors. Nevertheless, autobiographical material dealing with a person's early history of the challenge of important life decisions can be the basis of valid judgments by trained reviewers (Ezekiel, 1968). Assesseees may be asked to write about their high school and college experiences, their peak experiences, their jobs and organizations five years into the future, and their obituaries (what they expect and hope will be said about them and their performance). Anonymity is often important, using coded names for feedback and correlated research. Nonetheless, when it was optional for U.S. Army officers to sign their names to their answers to a personnel survey, most signed, wanting to indicate that they were cooperating.

Self-ratings tend to be inflated compared to other ratings sources. They may be accurate, especially when they are not being used for administrative purposes or when they are verifiable statements of intention. Again, some attributes that are self-rated, such as commitment, may be accurate rather than biased, as was found for 79 public service administrative staff (Goffin & Gellatly, 2001). Toegel and Conger (2003) argued that two kinds of 360-degree assessments are needed: one that provides more qualitative assessment and feedback for management development; the other, more quantitative assessment feedback for performance appraisal and performance outcomes.

## Multiple Rating Sources

---

The validity, accuracy, and relevance of ratings and other subjective judgments can be improved in a variety of ways. These include changes in format—by rater selection and training, by corrections for biases and expectations, and in particular by the use of multiple sources for ratings. The overall agreement among raters and the reliability and accuracy of the results are likely to increase with the number of independent raters judging the same ratee. To add validity to performance appraisals, ratings may be obtained from more than one source. Multi-source ratings may be any combination of ratings of leaders from superiors, peers,

subordinates, and self, as well as other sources such as clients, customers, and members of the same organization from different departments. A common multisource research plan is to obtain ratings of leaders from three or more subordinates and peers. As many as five observers may be employed by assessment centers and then compared with self-ratings. A plethora of studies has been completed on comparisons between self-rating and ratings by others.

*Self-Ratings versus Others' Ratings*

Oh, wad some power the giftie gie us

To see oursels as others see us,

It wad frae monie a blunder free us

An' foolish notion

(Burns, R., 1785/1974, pp. 43–44)

Poets, among others, have long been aware of the in-accuracy of self-appraisal. At the same time, many studies have shown that leaders are more accurate in their self-appraisals than are nonleaders; that is, leaders are in higher agreement with others' ratings of them (e.g., Gallo & McClintock, 1962). Baril, Ayman, & Palmiter (1994) examined the agreement between the self-ratings of 92 supervisors and their 853 subordinates. There was only minor agreement, but the agreement correlated with raters' situational control in Fiedler's (1967a) contingency model of leadership. Atwater and Yammarino (1992) looked at the self-other agreement of 92 midshipmen leaders with their subordinates and with the officers they reported to at the U.S. Naval Academy's summer camp. Using the Multifactor Leadership Questionnaire, subordinates and supervising officers rated the transformational leadership of each self-rating leader. As is usually found, mean self-ratings were higher than mean subordinates' ratings. Nevertheless, some leaders could be classified as overestimators or underestimators based on their deviations from the means. *Overestimators* were defined as more than half a standard deviation above the mean; *underestimators* were defined as more than half a standard deviation below the mean. For the remainder, self-ratings were defined as being in agreement with subordinates' or superiors' ratings. Approximately half of the 61 leaders were categorized in the same way by subordinates and superiors. Underestimators were seen more favorably by others. Self-ratings correlated .35 with superiors' ratings, but only .19 with subordinates' ratings. Bass and Yammarino (1991) obtained comparable data about 155 U.S. navy officers in the surface fleet. Again, mean self-ratings were inflated. The officers were classified in the same way as the midshipmen. Those officers who were less likely to be overestimators were more likely to obtain recommendations for promotion and better performance appraisals from their superiors. Self-ratings were unrelated to the superiors' performance appraisals and recommendations for promotion. Using differences between self-ratings and subordinates' ratings, of 2,056 managerial raters, the in-agreement raters and the underestimators were regarded by their superiors as more effective than overestimators. Yammarino and Atwater (1997) inferred that overestimators compared to under-estimators and individuals *in agreement* were more likely to misdiagnose their strengths and weaknesses, make less effective decisions, suffer from career derailment, be resentful and hostile, see no need for training and development, be absent and get into conflicts with colleagues more frequently, and quit. They lowered their self-evaluations and improved their performance when feedback from others was received and accepted. Underestimators are likely to be more successful but are lower in self-esteem, set low aspirations, underachieve, and avoid attempting leadership. Individuals in agreement and rated as good are likely to be the best performers; make effective decisions; develop favorable expectations and achievement; be most promotable; be successful, effective leaders; be low in absenteeism, turnover, and conflicts with others; and accept and use feedback from others constructively. Those who agreed they were poor performers were likely to be poor decision makers; lack competencies, self-esteem, motivation, and a positive outlook; and take few actions to improve their performance. When subordinate-peer agreement was used to predict superiors' ratings, overestimation, underestimation, or agreement of self and peers' ratings correlated with superiors' evaluations of the leadership effectiveness of 2,292 focal managers, but only if the

self-and peers' ratings were not in between favorable or unfavorable. Actually, it was mainly the peers' ratings that provided the best prediction. Peers' ratings correlated .40 with superiors' evaluations; self-ratings correlated only .17 with superiors' evaluations (Brutus, Fleenor, & Taylor, 1966).

According to a meta-analysis by Harris and Schaubroeck (1988), self-ratings were much less in agreement with peers' ( $r = .36$ ) and supervisors' ratings ( $r = .35$ ) than peers' and supervisors' ratings were with each other ( $r = .62$ ). Shipper and Davy (2002) compared five peers' and immediate subordinates' evaluations with self-evaluations. The questionnaire ratings dealt with the interactive and initiating skills of 1,125 middle managers in various facilities of a high-tech company. The peers' and immediate subordinates' ratings of interactive skills ( $r = .69$ ) and initiating skills ( $r = .33$ ) predicted the attitudes of the professional employees serving in the managers' units. In turn, the professional employees' attitudes significantly predicted the managers' performance. On the other hand, the self-evaluations of interactive skills were actually *negatively* related ( $r = .15$ ) to managerial performance.

Inflated self-evaluations can cause careers to derail. The discrepancy in what leaders think of themselves and what their colleagues think of them may be seen by colleagues and others as arrogance (McCall & Lombardo, 1983). The absence of such a discrepancy benefits manager-subordinate relationships (Wexley, Alexander, Greenwalt, et al., 1980).

*Adding Self-Ratings and Others, Ratings for Predicting Performance.* Atwater, Ostroff, Yammarino, et al. (1998) obtained self-and peers' Benchmarks ratings on 1,460 managers in leadership development programs as well as on-the-job performance appraisals from their direct supervisors. Correlations with the supervisors' ratings were .25 with self, .33 with subordinates, .37 with peers, and .50 between subordinates and peers. When subordinates' and peers' ratings were added in a linear regression equation, a multiple  $R$  of .40 was obtained. When curvilinearity was introduced by adding to the equation the squares and cross-products of self-and peers' ratings to predict supervisors' effectiveness ratings, the multiple correlation rose to only .41, but numerous other conclusions were able to be drawn about extreme underestimators and extreme overestimators from the three-dimensional equation.

*Moderators of Self-Other Agreement.* Becker, Ayman, & Korabik (2002) found complex effects when men and women, either high or low self-monitors, were compared as to their agreement with their subordinates in male-dominated industrial and educational organizations rather than in organizations balanced in the sexes. Atwater and Yammarino (1997) reviewed the literature and noted that students rated their scholastic ability higher than their peers' ability as they increased in age (Bailey & Bailey, 1974). Older and longer-tenured adults tended to inflate their own ratings (Ferris, Yates, Gilmore, et al., 1985). Intelligence, achievement, and internal locus of control correlate with more accurate self-evaluation (Mabe & West, 1982). Cognitively complex raters demonstrate more accurate self-assessments (Nydegger, 1975). Self-other ratings of MBTI types are higher in agreement for introverts than for extroverts, for feelers than for thinkers (Roush & Atwater, 1992), and for those higher in self-awareness (Van Velsor, Taylor, & Leslie, 1993). Accurate expectations increase the accuracy of self-assessments (Beyer, 1990) as do experiences with feedback of self-ratings (Kooker, 1974). Self-ratings will be inflated if they are to be used for personnel decisions or to manage impressions (Ferris & Judge, 1991). They also will be inflated by both subordinates and peers if they are used as recommendations for promotion rather than for developmental feedback (Gregura & Robie, 2001).

### **360-Degree Ratings**

When ratings for an executive or manager by subordinates, peers, superiors, and self are determined, there exists a 360-degree report that can be used for administrative purposes, promotion from within, succession planning, self-development, coaching, or training and development. Though anonymity usually is initially maintained for subordinates' ratings, when they are used for development, it is not uncommon for leaders to discuss their 360-degree report with subordinates as well as with peers and boss. Although the increase in 360-degree reporting paralleled the layering of organizations and the increase in participative management and teamwork, it is not new. The Center for Creative Leadership introduced the 360-degree format in 1974, and Personnel Decisions did the same in 1984 (Maynard, 1994). A 360-degree analysis for managers and leaders can be obtained from sources such as Personnel Decisions and the Center for Creative Leadership. A 360-degree report can be obtained for the Full Range of Leadership Development; from charismatic to laissez-faire; in Web or paper format (Avolio & Bass, 2004). (For a list of 10 commercially available 360-degree programs and their validity, languages, Web feedback availability, and other characteristics, see Morical, 1999.)

Alimo-Metcalfe and Metcalfe (1998) enumerated the advantages of 360-degree appraisals: (1) The data are more valid since they include observations by subordinates, who are in closer contact with the manager than is the manager's boss. (2) Subordinates see how the manager reacts in day-to-day situations as well as crises. (3) Subordinates are on the receiving end of managers' practices. Their ratings may provide greater validity than top-down ratings. (4) The subordinates, peers, and bosses observe and rate different aspects of the manager's behavior. (5) The reliability and fairness and the manager's acceptance of the data are greater. (6) With peer ratings, the organization shows its interest in horizontal relations.

The Metcalfes collected 360-degree data at a university management development program for British National Health Service middle managers (212 males, 263 females), their bosses, two to three peers each, and two to three subordinates each. The data included ratings of 41 competencies. Up to nine factors emerged in the different subsets of raters, but the factor performance management was usually the first and largest factor to emerge in the sets of women and men from the different sources analyzed. Other factors included presentation/communication skills, entrepreneurial innovation, and analytical ability. The variance in ratings accounted for by the six to nine factors per set ranged from 53% to 61%. There appeared to be more similarities than differences between the sexes and the sources of the appraisals.

Scullen, Mount, and Sytsma (1996) selected 2,297 managers from 22,431 in a personnel decisions data set from a variety of firms and industries. Along with self-ratings, each manager had been rated by two others at organizational levels above them, at the same level, and below them. The ratings were based on the Management Skills Profile (MSP) of 18 skills measured by 122 items. According to a Principles Components factor analysis, responses to the items formed three factors: (1) interpersonal skills (listening and human relations); (2) administrative skills (delegating, personal organization, and time management); (3) planning and general supervisory skills (occupational and technical knowledge, problem analysis, and financial and quantitative skills). As expected, mean self-ratings were higher than those of any other type of rater for interpersonal skills but not the other two factors. Reliabilities of the three factored scales ranged for superiors from .84 to .87; for peers, .82 to .86; and for subordinates, .76 to .82. Agreement between the pairs of superior raters ranged from .41 to .45; for pairs of peers, .31 to .35; and for pairs of subordinates, .31 to .36. Correlations were as follows among the types of raters: superiors-peers, .34; superiors-subordinates, .26; superiors-self, .17; subordinates-peers, .27; peers-self, .19; and subordinates-self, .34. These results indicated that there was modest agreement between and within the different levels of raters. Each rater was providing a somewhat different snapshot of the ratee. No rater level was redundant. A composite based on 360-degree ratings was needed to provide a fuller picture of the ratee's performance. Considerable training was needed to increase the correlations between raters at the same level. As was usually found across organizational levels, correlations were higher between peers and superiors and lower between self and others (Harris & Schaubroeck, 1988; Erisman & Reilly, 1996).

Conway and Huffcutt (1997) calculated for 319 managers from a Fortune 500 company how much unique variance would be found in the 360-degree ratings from different organizational levels and a customer assessment. They determined how much each source contributed to a multiple correlation when combined with the other sources. The results confirmed that each source was contributing mainly unique or nonredundant variance.

Multisource ratings are essential to provide a complete appraisal for developmental purposes, as each source of ratings comes from a different perspective of the same ratee. At the same time, although rating-point interpretations will differ among different groups of raters, the construct validity of most of the dimensions rated by different groups of raters holds up well on such 360-degree instruments as Benchmarks (Wise, 1998). An average predictive validity of .30 was obtained for the 360-degree ratings of 62 to 65 general managers of district retail stores. The ratings predicted their district discount retail stores' sales-to-goals ratio for four business quarters (Healey & Rose, 2003).

### ***Judgments Based on Organizational and Personnel Procedures***

Personnel procedures upon which judgments are based include interviews, projective testing, board meetings, and references and recommendations.

*Judgments Based on Interviews.* The standardized interview from which the interviewer forms judgments about the assessee ordinarily covers the candidate's family, education, and work history. Also often discussed are the candidate's expressed objectives, strong and weak points, hopes and fears, social values, interests, attitudes toward the organization, and attitudes toward interpersonal relationships. The accuracy of these self-descriptions is higher for the information that the candidate believes can be independently corroborated (Cascio, 1975).

The interviews vary widely in how they are organized in the time devoted to them, in the probing skills of the interviewer, in the extent to which the interviewer is trained to provide a similar stimulating situation for each candidate, and so on. A deliberate effort may be made to place stress on the candidate to observe his or her ability to cope. Admiral Hyman Rickover conducted more than 20,000 such stressful interviews in the process of choosing personnel for the nuclear surface ship and submarine program. However, there appeared to be little standardization in what he did. Furthermore, anecdotal evidence suggests that what he did do contributed little to his accuracy in predicting the subsequent performance of officers in the nuclear fleet (Polmar & Allen, 1981).

Early reviews of the validity of interviews for predicting performance were not supportive (Wagner, 1949). Upward of 80 studies led Mayfield (1964) to conclude that mainly intelligence could be satisfactorily predicted from an interview. However, subsequent improvements in the interview process, especially when combined with other personnel procedures, have revealed that interviews, properly designed, can be valid and useful. Wiesner and Cronshaw (1988) completed a meta-analysis of 150 reported efforts to validate the interview. *Structured interviews* produced validity coefficients twice as high, on average, as *unstructured interviews*. In the structured interview, the interview proceeded in an orderly manner and was programmed with specific areas to probe, and specific questions to be answered and recorded.

Huse (1962) compared the ratings made by interviewers of 107 managers in 37 firms and the ratings of the same managers by the managers' superiors. Consistent with Mayfield's findings, the interviewers' and superiors' ratings of the intellectual capacity of the managers correlated .26. But they also correlated on various other aspects as well: leadership, .38; creativeness, .27; and overall effectiveness, .16. When the interviewers'

leadership judgments were combined with the results of projective and objective tests, the multiple prediction of the superiors' ratings of the managers' leadership reached .44. Likewise, 20 experienced supervisors who were rated as highly effective by their superiors were matched by Glaser, Schwartz, and Flanagan (1958) with 20 less effective supervisors of similar experience, age, and scores on a paper-and-pencil test. The judgments combined with the test scores correlated .34 with discriminating between more effective and less effective supervisors. The results of the interview added to the accuracy of the discrimination. Similarly, Howard and Bray (1988) reported that interviews with assessment center candidates, assessed 20 years earlier, could detect a number of attributes of consequence to the managers' success at AT&T. They found a correlation of .30 between the interviewers' judgments of the interviewees' range of interests and the managerial level attained by the assesseees 20 years later. The interviewers' judgments of the assesseees' need for advancement correlated .44 with the level attained by the assesseees 20 years later.<sup>3</sup>

Careful attention to the job requirements of the position for which candidates are being considered and the use of multiple trained interviewers appear to make a difference in the validity of the interview. Russell (1978) arranged for five trained interviewers to assess 66 senior manager candidates in a Fortune 500 firm for positions as general managers. The candidates were assessed on nine dimensions generated by a focus group to describe the task and process responsibilities of the desired positions. Accomplishments, disappointments, and developmental activities were discussed in the interviews. The interviewers prepared a report on the candidates for discussion at a meeting to reach consensual decisions about the candidates' readiness for promotion to the positions and the candidates' developmental needs. The consensual judgments of understanding, analyzing, and setting direction for a business correlated .32 with the bonuses that were awarded, .26 with the quality of the candidates' relations with customers and other outsiders, and .23 with staffing performance. The pooled interview judgments of organizational acumen (understanding of the corporate environment to achieve both individual and unit objectives) also correlated .36 with superiors' appraisals of the candidates' nonfiscal performance. In another vein, Herriot and Rothwell (1983) found that the judgments of recruiters, based on their interviews with graduating students, added to the accuracy of predictions of the applicants' suitability above what was obtained from the applicants' résumés alone.

Other studies pointed to what was important in the interviews. For instance, Rasmussen (1984) observed that credentials listed on résumés and verbal behavior had more influence than nonverbal behavior on judgments of qualifications. Singer and Bruhns (1991) found, in an experiment comparing job selection interview scenarios, that students' decisions gave more weight to academic qualifications, while managers emphasized work experience in their choices. Still other studies pointed to ways of improving the assessment of judgments from interviews. For example, Dipboye, Fontenelle, and Garner (1984) found that reading the candidate's application before the interview increased the amount of correct information collected during the interview. Huffcutt, Weekley, J. A. Weisner, et al. (2001) showed that responses to interview questions about the actual past behavior of interviewees were more predictive of subsequent job performance than questions about how the candidate would respond to a hypothetical job situation. Having the interviewee describe his or her past behavior generated more information about the interviewee. Long-term memory, needed to select alternatives to a hypothetical problem, was less informative.

*Virtual Interviews.* Straus, Miles, and Levesque (2001) arranged for 59 MBA students to serve as simulated job applicants for interviews by video, by telephone, and face-to-face (FTF) with interviewers. Interviewers assessed "applicants" more favorably by telephone than FTF, particularly if the applicants were less physically attractive. Interviewers had more difficulty regulating and understanding discussions by video than FTF, and applicants were less favorable to video interviewing.

*Career Path Appreciation Interviews.* Zaccaro (1996) summarized research studies about these two-

hour sessions to assess an interviewee's conceptual capacity. The scores predicted insight, self-confidence, creativity, intuitive thinking, innovative-adaptive thinking, breadth of perspective, skill in strategic thinking, ability to handle ambiguity, ability to work simultaneously on several projects, military officer potential, and attained level of management.

*Objective Tests.* We have described aptitude, attitude, personality tests, and behavioral inventories of individual differences that have been found predictive of current and future leadership performance combined. With good judgment, these criteria can be used for assessment in the context of normative standards. Many objective tests use special keys to forecast leadership potential. Some generate scores that can be combined to optimize predictions of performance for future leaders and managers. These methods will be discussed later.

*Projective Tests.* Responses to projective tests can also form the basis of valid judgments by trained clinicians. The relationship of Miner's sentence completion test to managerial performance was noted in [Chapter 6](#). Huse (1962), for example, found that the results of projective tests correlated with the ratings of 107 managers by their superiors as follows: persuasiveness, .33; leadership, .26; overall effectiveness, .21; social skills, .18; planning, .18; creativeness, .17; intellectual capacity, .13; and motivation and energy, .03.

*Judgments by Boards.* It is centuries-old military and naval practice to have candidates appear before boards of officers to present their credentials and be interviewed, after which the combined judgments of the board members are used to decide whether to accept or reject the candidates for selection or promotion. Such boards are also used to screen teachers and managers in civil service systems. Selection committees are the rule rather than the exception for selecting faculty and administrators in colleges and universities. However, some of the processes that affect the decisions of such boards and committees are just beginning to be known.<sup>4</sup> For purposes of simulation, Day and Sessa (2001) created videotapes of four candidates differing in "hard" and "soft" skills. Hard skills are the concrete task-oriented skills contributing to handling the core technology of the organization. Soft skills are relations-oriented skills, leadership, and teamwork, as judged by inference. The candidates were finalists for president of a division of a medium-sized glass company. The candidates varied in negative attributions around an average of 21.5%, for leadership styles, competencies, decisiveness, vision, and experience. The tapes were viewed individually by 819 senior executives, who the next day were formed into 145 selection committees to achieve a consensus ranking of the four candidates during a 45-minute discussion. The committees significantly underreported candidates' strengths and overreported weaknesses. They reported more hard strengths and more soft weaknesses. Among key words for explanations of support for candidates were: teamwork (70%), leadership (66%), international (65%), marketing (63%), visionary (56%), technological (44%), risk taking (32%), and interpersonal skills (23%). The more the respondents' explanations used these prototypical key words, the lower was the correlation with the average ranking of the candidates ( $r = .31$ ).

*Judgments from References, Recommendations, and Search Firms.* The judgments of former superiors, colleagues, and acquaintances are routinely and almost universally used. Yet little has been published on their validity as predictors of success as leaders and managers. Illustrative of what is possible, however, was G. W. McLaughlin's (1971) predictions of the first year of success of cadets at West Point based on ratings about them by their high school teachers and coaches. Ratings of charisma (personal magnetism, bearing, and appearance) and situational behavior (moral and ethical values, cooperation and teamwork, common sense and judgment) were the best predictors of the cadets' leadership and followership performance during their first year at the academy. Athletic coaches and mathematics teachers provided the most valid ratings. References and recommendations about candidates from outside an organization have become more suspect and invalid due to the threat of lawsuits as sources increasingly avoid making accurate negative appraisals; recommenders have

become legally responsible for their information.

Cox (1986) surveyed more than a thousand executives from 13 U.S. service, consumer, and business corporations. They appeared somewhat more favorable to executives nominated by a search firm than by their own corporation's personnel department.

*Online versus Paper-and-Pencil Questionnaires.* Traditional paper-and-pencil formats are being replaced by e-mail questionnaires sent via the Worldwide Web or via intranets, responses collected from raters in the same way. Large firms, with facilities at different locations, find the Web approach more efficient in a number of ways. In comparison to paper and pencil and regular mail, the Web reaches more respondents quickly, and response rates are increased, while costs, missing data, and turnaround time are reduced (Yost & Homer, 1998; Frame & Beatty, 2000). Of 12,111 PepsiCo managers in 40 countries who rated 4,063 managers, 69.4% chose to complete the survey online; 30.6% chose mailing back paper *op-scan* recommendations. The 87% choosing the Web actually completed the survey while 40% choosing paper did not. There was little difference in the overall outcomes, although the Web users skipped more items and paper users marked "Don't know" more frequently. Online users provided more comments on developmental needs than did paper users (Church, 2002). Richmond, Keisler, Weisband, et al. (1999) completed a meta-analysis that showed hardly any difference between Web and paper in the effect of social desirability. After controlling for rater and ratee characteristics, Smither and Walker (2002) obtained no difference in results from paper and intranet arrangements.

Donovan, Drasgow, and Probst (2000) found that computerization did not affect item or test functioning. Stanton (1998) reported similar results for several tests of fairness. The Web is an obvious facilitator of 360-degree ratings, multiple raters, and feedback for development. Yet despite the advantages of using the Web for development, it also has problems. Everyone involved needs to have access to a computer. Addresses may be wrong. Poor page design and format can frustrate raters. Security must be provided so that only the correct raters are able to enter the system and ensure that the correct ratees are included. And results need to be transmitted to those with a need to know, for development or personnel decision purposes (Summers & Fleenor, 1998).

*Measurement Equivalence.* Measurements are equivalent among multiple raters rating the same ratees if they produce the same confirmatory factor patterns and factor loadings (Cheung, 1999). Web and paper measures have equal scale reliabilities and equal construct validities (King & Miles, 1995). Equivalence was found for Web and paper surveys across four of five countries (Spera & Moye, 2001). Smither and Walker (2003) found at first that the upward ratings of 789 employees who used an intranet rather than paper and pencil were more favorable, but equivalence between raters appeared when the results were controlled for rater and ratee characteristics.

Lack of equivalence between sources of ratings may occur for many reasons: (1) differences in raters biases (Harris & Schaubroack, 1988); (2) self-serving and felt need for self-enhancement (Fahr & Dobbins, 1989a); (3) opportunities to observe different behavior (Landy & Farr, 1980; Murphy & Cleveland, 1995); (4) differences in concerns and social comparison information at different organizational levels (Fahr & Dobbins, 1989b); (5) differences in understanding the scale items; (6) ratees' different behavior around different raters; (7) different experiences or training with the scales or format (Diefendorff & Silverman, 2001); (8) different models of effectiveness (Fecteau & Smith, 2000); (9) the importance attributed to some roles rather than to others (Tsui & Ohlott, 1988); (10) the inclusion, importance, and weighting of some dimensions rather than others (Campbell & Lee, 1988; Fecteau & Smith, 2000); (11) the manager's need to meet the expectations of different ratees (Tsui, 1984).

*Repertory Grid.* This method of appraisal was developed by an American clinical psychologist, George Kelly, in 1955. Since 1980, in Britain, it has become a general approach to appraising team members by comparing them on elements designated by the rater, along with a paired member judged to be most opposite to the first. A grid can be formed showing the pattern for each ratee on each element. There are many variations of the method that can be used to appraise individuals, groups, and systems (Easterby-Smith, Thorpe, & Holman (1996).

*Classification and Narrative Description.* Here the information obtained mechanically from tests and measures is combined into a display, summarized into a categorical type by its pattern, or reported in a narrative. From these displays, categorizations or narratives—judgments about the potential or performance of leaders—can be made. For instance, the results of the Myers-Briggs test are arranged to sort examinees into various combinations of sensors, feelers, thinkers, and judges; then the different types are related to the managers' and leaders' performance (McCaulley, 1989).

The individual examinee's capacity, interest, and personality scores are typically categorized, profiled, or converted into narratives. The scores are shown in contrast to norms for the individual's class, organization, occupation, and so on. Then judgments are made based on the profiles. For example, Dicken and Black (1965) administered a test battery to candidates for promotion. The battery included the Otis Quick Scoring Mental Ability Test, the Strong Vocational Interest Blank, the Minnesota Multiphasic Personality Inventory, and other measures of aptitude and knowledge. Narrative reports of about 500 words were written for each candidate based on the results. After reading the reports, four psychologists rated each candidate on effective intelligence, personal soundness, drive and ambition, leadership and dominance, likableness, responsibility and conscientiousness, ability to cooperate, and overall potential. Three to seven years later, officials from the two firms in which the examinees worked rated them on the same variables. The median correlations between the psychologists' and the officials' follow-up ratings were .38 and .33 in the two firms.

In similar fashion, Albrecht, Glaser, and Marks (1964) had three psychologists rank the potential of 31 prospective district marketing managers in budgeting effectiveness, sales performance, interpersonal relationships, and overall. Their rankings were clinical judgments based on combining objective and projective test results, as well as results from an interview and a personal history form. Although the test scores alone correlated .20, on average, with subsequent success as a manager, the psychologists' predictions, based on the combined results of tests, interviews, and personal history, correlated between .43 and .58 with the managers' subsequent job performance. When tests, interviews, and personal history are combined in this way with individual and small group exercises to make integrated judgments, the total illustrates what can be accomplished in an assessment center.

### ***Mechanical Methods of Combining Assessments***

Objective tests provide samples or signs of individual differences in cognition and behavior related to leadership that aim to predict leaders' subsequent performance. Responses to the test items are unit-weighted rather than differentially weighted when they are totaled to form a score, since identical results will be obtained when more than four or five items are to be summed (Gulliksen, 1950). Keys are developed to score those items that correlate with emergent, successful, or effective leadership.

*Special Keys.* It has often been possible to develop an especially cross-validated key for the Strong Campbell Vocational Interest Blank to discriminate among those who subsequently achieve more success as leaders in their organizations. The inventory is examined item by item (Laurent, 1968). This takes advantage of the extent to which values and interests are important to success as a leader. For example, Harrell and

Harrell (1975) developed such a key with the Strong Campbell for predicting high- and low-earning managers among MBAs from Stanford University five years after graduation. They also keyed responses to the Guilford-Zimmerman Personality Inventory and a survey of personal history in the same way. The total high earners key predicted earnings of the graduates at 5, 10, 15, and 20 years after graduation. The correlations were .52, .39, .33 and .44, respectively (Harrell & Harrell, 1984). For 443 Exxon managers, a key was developed from answers to the Guilford-Zimmerman Temperament Survey that correlated .31 with their success, as measured by their salaries adjusted for their age, education, seniority, and function. The key correlated .23 with their effectiveness as ranked by their superiors (Laurent, 1968).

Goodstein and Schrader (1963) developed a managerial potential key using the items of the California Psychological Inventory (CPI), a collection of personality items. The items included in the key that were found valid in differentiating managers from nonmanagers were consistent with much of what was said in earlier chapters about the personality requirements for successful leadership. The items were about masculinity, need for achievement, dominance, status, self-acceptance, and tolerance. In support, Rawls and Rawls (1968) compared 30 high-rated executives with 30 low-rated utilities executives using the CPI. High-rated executives scored higher than low-rated executives in dominance, status, sociability, and self-acceptance. Subsequently, the 206 items of the key were reduced to 34 by Gough (1984) in a study evaluating the items against measures of the success of military officers and bank managers. The reduced management potential key correlated .88 and .89 with Goodstein and Schrader's much longer version. The most positive items in the revised management potential scale were also consistent with the discussions in earlier chapters. They dealt with optimism about the future, ability to create a good impression, interpersonal effectiveness, self-confidence, relative freedom from instability and conflict, and realism in thinking and social behavior. Gough (1984) also reported considerable consistency between the keyed management potential scores and descriptions of the respondents by their fellow college students, by their spouses, and by assessment staffs.

*Scored Application and Biodata Blanks.* Responses to standardized operational questions on application blanks and biographical information blanks can be similarly keyed to forecast leadership and management performance. The blanks may focus on personal characteristics, events, and experiences at work, school, and home. Kirkpatrick (1960, 1966) constructed such a key from an 11-page biographical questionnaire. The key was constructed to sort out above-average, average, and below-average chamber of commerce executives. A five-year follow-up study demonstrated the ability of the key to discriminate 80 high-salary from 81 low-salary managers matched in age and the size of their employing organizations. Along with higher salaries, as evidence of greater success as an executive, it was observed that the higher-salaried executives were more likely to place a heavy emphasis on their careers, participate actively in community affairs, and enjoy excellent health. Again, the items that formed the key and discriminated more successful from less successful executives of the chamber of commerce were consistent with general findings about the antecedents and concomitants of successful leadership discussed earlier. According to the key, the more successful chamber of commerce executives: (1) came from a middle-class background; (2) had spent a happy childhood in a stable family; (3) had received a good education; (4) had engaged in many extracurricular activities in high school and college; (5) had held leadership positions in many of the organizations to which they belonged; (6) displayed communication skills in debating, dramatics, and editorial work.

A similar type of key, developed for scoring the biographical information blanks of 443 Exxon managers, correlated above .50 with their success and above .30 with their ranked effectiveness (Laurent, 1968). Drakeley and Herriot (1988) used data from 41 scorable items of a biographical inventory completed by 420 officers of the British Royal Navy and then cross-validated on a further sample of 282 officers. Three separate keys could be constructed to predict ratings for professional performance, leadership, and commitment. When cross-validated, the professional performance key correlated .50 with appraised professional performance; the

leadership key correlated .20 with appraised leadership; and the commitment key correlated .24 with remaining in the program. Russell and Domm (2007) found four factors for 748 cases in responses to biodata questions (1) problems and negative toning; example: "How often have you found yourself making assumptions about other people only to find out you were very wrong?"; (2) dealing with groups or information; example: "How often have you been part of a team or group that developed team spirit?"; (3) focused work efforts; example: "How often have you felt involved and constantly 'on the go' in your job?"; (4) rules and regulations; example: "Have you ever had to participate on a jury that actually deliberated some decision in a court of law?"

A promising biodata blank variant is one that emphasizes past accomplishments. The Accomplishment Record developed and validated by Hough (1984) correlated with subsequent job success (Hough, Keyes, & Dunnette, 1983). Biographical information—generated from retrospective life history essays primarily about past accomplishments and completed by first-year Annapolis midshipmen—was used to develop a biodata questionnaire of life history events. In constructing this questionnaire, Kuhnert and Russell (1990) were guided by Kegan's (1982) six stages of constructive development, from the reflexivity and impulsivity of immaturity to interpersonal maturity and interindividuality. They suggested that the answers to the questions could help to explain the meanings that leaders derive from their life experiences. A total of 917 midshipmen who were entering Annapolis completed a scored and keyed biodata questionnaire. The biodata scales predicted, in cross-validation, subsequent military performance, academic performance, and peer ratings of leadership at the U.S. Naval Academy (Russell, Mattson, Devlin, et al., 1986; Stricker, 1987). Russell (1990) assessed previous life experiences of 66 candidates for a position of division general manager in a Fortune 50 multinational firm and suggested that the assessments could contribute to senior managers' performance.

*Data from Small-Group Exercises.* Small-group exercises also generate objective leadership results that can be mechanically correlated with the future performance of leaders or managers. For example, in Bass, Burger, et al.'s (1979)<sup>5</sup> large-scale study of managers from 12 national clusters, Exercise Life Goals was administered to 3,082 managers who were above or below the median in their own rate of advancement. In this exercise, the managers had to rank the importance to themselves of 11 life goals. The *high flyers*, managers who had advanced more rapidly in their careers, attached more importance to leadership, expertise, prestige, and duty, whereas the slower-climbing managers favored self-realization, affection, security, and pleasure.

In a small-group budgeting exercise, the high flyers in all 12 nations studied were more cautious about allocating funds for safety, labor relations, management development, research and development, and controlling water pollution. Nevertheless, in another small-group exercise that asked for recommendations about salary increases, the high flyers granted larger increases than the slow-track managers. In Exercise Supervise, the high flyers gave more weight to the importance of generosity, honesty, and fair-mindedness.

In other small-group exercises, fast-track, compared with slow-track, managers rated themselves higher in self-understanding and preference for being more task-oriented. They also saw themselves as interpersonally competent. In addition, the high flyers revealed more objective signs of effective intelligence, objectivity, pro-activity, and long-term views. They were more accurate and slower in a two-way communication exercise. Many other objective signs obtained from the exercises differentiating fast-track from slow-track managers were country-specific.

*Rank and Salary Information.* To assess managers' success, Farrow, Valenzi, and Bass (1982) used salary information to compare 159 managers' predicted salary grade and actual salary grade, arguing that salaries reflected managerial merit. To predict expected salary grade, the multiple regression equation was as follows:  $.56 \times (\text{starting salary grade level}) + 1.24 \times (\text{years of service}) + .041 \times (\text{department size}) - .93 (\text{male}) + .472 \times$

(educational level). Overachievement was seen if a manager's actual salary grade was higher than predicted; underachievement, when actual salary grade was lower than predicted.

### ***Multiple Cutoffs, Unit Weighting, and Optimal Weighting***

When multiple cutoffs are employed, only applicants or candidates whose scores on selected tests are above a certain level are accepted; all other applicants are rejected. When scores are unit-weighted, they are merely added together in a combined prediction—the scores need to be standardized with means of 0 and standard deviations of 1 to give them equal weighting if they are added together to form a single prediction. Such standardized scores can be differentially weighted on the basis of a multiple regression equation or can be accepted or rejected for inclusion, as well as differentially weighted, by a stepwise regression process to optimize the prediction of effectiveness.

*Multiple Cutoffs.* Mahoney, Sorenson, Jerdee, and Nash (1963) administered the Wonderlic Intelligence Test, an empathy test, the Strong Vocational Interest Blank, the CPI, and a personal history questionnaire to 468 managers from 13 Minnesota-based firms. Panels of executives ranked the examinees on global, or overall, effectiveness in carrying out their functions as managers. For half the sample, the ability of each of the 98 measures from the test battery was analyzed to discriminate between the top and bottom thirds of the managers in ranked effectiveness. These managers were grouped into six discriminating clusters. One cluster that separated effective from ineffective managers rated them on whether, or not they had the interests of a sales manager, a purchasing agent, and the president of a manufacturing firm. The second cluster dealt with their lack of interest in dentistry, printing, and farming. A high score on the intelligence test and self-rated dominance on the CPI formed the bases of the third and fourth clusters. One's educational level and one's spouse's educational level and type of work were in the fifth cluster. Engagement in many sports and hobbies, offices held, and high school memberships were the sixth cluster. An optimum cutoff was determined for deciding whether a manager "passed" or "failed" each cluster. To be predicted "acceptable," a manager had to score above the cutoff point for five of the six clusters. For example, an acceptable manager was one scoring above the cutoffs in the interests of a sales manager, intelligence, dominance, education, and extracurricular activities.

The other half of the sample was held out for cross-validation. The same multiple cutoffs were used; 45.5% of the managers in the cross-validation sample were accepted and 54.5% were rejected. Of those who were accepted, 62% had been ranked high in effectiveness on the job and 29% had been ranked low. But of those who were rejected, only 38% had been ranked high in effectiveness while 71% had been ranked low.

*Unit Weighting.* Campbell, Dunnette, Lawler, et al. (1970) reviewed studies of the value of various measures that are usually included in test batteries—such as intelligence, interests, personality, and biographical information—for predicting leadership and management potential in designated locations. Salaries of supervisors and executives, adjusted for length of service and age, were predicted with correlations above .20 at Minneapolis Gas on scale scores of 15 to 18 (Jurgensen, 1966). The promotability of managers at Jewel Tea (Meyer, 1963) and sales managers at the American Oil Company (Albright, 1966) could similarly be predicted. But mixed results were reported by Tenopir and Ruch (1965) for various technical managers at North American Aviation.

Selover (1982) combined into a single advancement potential score five measures obtained from newly hired personnel at Prudential Insurance that had been found to predict the rate of advancement four to five

years later. Correlations ranging from .35 to .40 were found between the advancement potential scores, similarly derived, and the rate of advancement in three additional samples of newly hired employees. Ghiselli (1971) identified 13 traits of managerial talent and developed a questionnaire, the Self Description Inventory, to measure them. He then related the scores on the 13 traits to supervisors' ratings of effectiveness. Ten of the 13 scores related significantly to the criteria. These predictive scores dealt with supervisory ability, the need for occupational status, intelligence, self-actualization, self-assurance, decisiveness, and lack of the need for security. These scores could then be combined into a single score.

Basically negative conclusions about the value of tests and biographical information for predicting general success as a manager were reached by Brenner (1963) at Lockheed Aircraft. But with managers in the same company, Flanagan and Krug (1964) showed that it was necessary to differentiate between whether one was trying to predict success and effectiveness in supervision, creativity, organization, research, engineering, or sales. For each, a differently weighted optimization was required.

**Multiple Regression: Optimal Weighting of Predictions**

An illustration of the use of optimal weighting was created by Atwater and Yammarino (1997), who obtained a stepwise multiple regression coefficient of .53 when predicting the perceived transformational leadership of squad leaders of USNA plebes in summer camp from eight personal measures. The highest standardized beta weights were for engagement in varsity sports, .31; MBTI thinking/feeling, 2.21; and intelligence, .22. The use of stepwise multiple regression for predicting performance has become a common practice, as research is directed not only at optimal weighting of the predictors but also optimizing the number of predictors.

*Sears Program.* The Sears program for predicting managerial performance extended over a period of 35 years. The test battery that evolved tapped intellectual abilities, personality, values, and interests. Its results predicted the promotability of executives and the satisfaction of subordinates with operating efficiency, relationships, and their own personal satisfactions. Multiple regression was used to weight the test scores optimally to minimize the errors of the predictions. Illustrative are the results for 48 store managers and 42 higher-level managers, shown in [Table 35.1](#).

The Sears battery of psychological tests for predicting executives' performance included measures to tap flexible intellectual functioning by using the Sears adaptation of the California F Scale of authoritarianism. The battery included a number of tests constructed to measure creative ingenuity and ability to initiate change, tests for preference for complexity, a scored biographical history form, an adjective checklist, a verbal fluency test, and a self-rating of role definition.

To assess administrative skill and decision making, Sears devised a special in-basket test, along with two leaderless group problem-solving situations. In addition, three problem-solving simulations were designed. The Guilford Martin Personality Inventory was specially modified to measure emotional stability and competitive drive. The multiple correlation of the combination of predictor measures with various criteria, such as superiors' ratings, ranged from .49 to above .80.

The Thurstone Test of Mental Ability, the Guilford Martin Personality Inventory, the Allport Vernon Study of Values, and the Kuder Interest Inventory were used to

Table 35.1 Multiple Correlations between Scores for the Morale of Sears Employees and Scores on the Test Battery for Executives Who Were Responsible for Supervising the Employees

<i>Areas of Employee Morale</i>	<i>Multiple Correlations with Exective Test Battery Scores<sup>a</sup></i>
---------------------------------	----------------------------------------------------------------------------

	48 Store Managers	42 Executives
I. Operating Efficiency		
a. Effectiveness of administration	.77	.51
b. Technical competence of supervision	.74	.43
c. Adequacy of communication	.59	.61
II. Personal Relations		
a. Supervisor employee relations	.68	.54
b. Confidence in management	.59	.52
III. Individual Satisfaction		
a. Status and recognition	.69	.62
b. Identification with the company	.51	.52
IV. Job and Conditions of Work		
a. Working conditons	.36	.40
b. Overall morale score	.47	.54

<sup>a</sup> All correlations are significant at the 1 or 5 percent level of confidence.

SOURCE: Adapted from Bentz (1968, p. 71).

predict success as a Sears purchasing manager. Multiple correlations ranging from .32 to .57 were obtained against various criteria of job performance and management potential. A similar battery for predicting the long-term performance of managers of Sears stores yielded measures that correlated from .37 to .61 when optimally combined (Bentz, 1983, 1987, 1992).

*EIMP.* Exxon's Early Identification of Management Potential (EIMP) is another prominent effort to use multiple regression to optimize the prediction of managers' success from a battery of predictors. The combination of tests includes the Miller Analogies Test, the Strong Vocational Interest Inventory, the Guilford-Zimmerman Temperament Inventory, and a specially keyed and scored biographical information blank (Laurent, 1968). In the United States, the multiple predictions correlated between .33 and .64 with managers' success (salary adjusted for age, seniority, and function). In Norway, Denmark, and the Netherlands, the comparable multiple correlations ranged from .27 to .65 (Laurent, 1970). A multiple correlation of .70 was obtained in predicting performance appraisals from the EIMP battery.

Similar correlations were obtained in predicting examinees' subsequent overall managerial effectiveness, according to their rankings by higher-level executives. For predicting managerial effectiveness, the multiple correlations ranged from .37 for managers in oil exploration and production to .66 for managers in traffic and purchasing. The multiple correlations predicted success as a manager (suitably adjusted for education, seniority, and function), from .67 for marketing managers to .82 for employee relations managers. The predictive validity of the EIMP battery appeared to increase steadily with the years between testing and the measurement of the criteria during 3-to 12-year follow-ups. Sparks (1989, 1992) attributed the increase to improvements in the criteria of managerial effectiveness. He inferred that the EIMP measures of reasoning, judgment, and temperament contribute more to predicting performance at higher levels of management.

A derivative of the EIMP battery is the Manager Profile Record (MPR), based on the biographical data, the keyed Guilford Zimmerman Temperament Inventory, and other tested judgmental elements. The MPR makes use of computer scanning, scoring, and output of results. Its measures include: (1) academic and extracurricular achievements, self-worthiness, and social and work orientation; and (2) judging typical

management situations either needing solutions or calling for value judgments about staff communication, employee motivation and development, and decision-making style. Different scoring was provided for younger inexperienced candidates and for older, more experienced candidates. The profile indicated the similarity of the candidate to highly successful managers. It could be used to validate predictions specific to an organization. It excluded traditional intelligence and reasoning-ability tests of concern to civil rights agencies. New item analyses and new validations were completed for the MPR against criteria for the level of responsibility attained by more than 15,000 managers in a variety of industries. Rated potential job level attainable correlated .52 with the MPR total scores. The same correlations ranged from .50 for 86 administrative staff to .70 for 90 manufacturing personnel. In subsequent validation studies, rank and/or salary already achieved were correlated similarly with the MPR total scores of 446 managers and supervisors in a steelworks, 310 in a coal company, 2,205 in a baked goods firm, 361 in an urban utility firm, 592 in a national insurance company, 221 in an office equipment manufacturer, 478 in two chemical-processing firms, 416 in a hotel chain, and 4,856 managers and professionals in 14 southwestern banks. The work was repeated for first-level supervisors across a variety of situations, from utilities plants to data-processing offices. Validations for 8,765 first-level supervisors yielded correlations ranging from .25 to .37 between the derived Supervisory Profile Record and supervisors' appraisal on job performance as meeting or exceeding the requirements of the job<sup>6</sup> (Richardson, Bellows, Henry, & Company, undated).

A set of multiple regression predictions was developed by Saville (1984) for the Occupational Personality Questionnaire (OPQ) to measure the potential for a variety of different team roles and leader/subordinate types of roles. The output was standardized against a norm group of 527 British managers and professionals. Meaningful correlations were found between supervisors' appraisals of the performance of 440 British managers and OPQ predictive scores. For instance, a score on persuasiveness, extracted from optimally weighted scoring of the OPQ results, as predicted, correlated .27 with being appraised as having a commercial flair and .28 with being appraised as a good negotiator.

*Benchmarks.* A product of the Center for Creative Leadership, Benchmarks is a 360-degree appraisal whose multiple scales in combination can predict managers' performance. Managers are rated 360 degrees to form 16 positive scores about resourcefulness, being a quick study, doing whatever it takes, and leading subordinates. Additionally, six negative scores are included, such as difficulty molding a staff, difficulty making strategic transitions, and lack of follow-through. For 336 managers, an optimally weighted multiple regression accounted for 46% of the variance in bosses' ratings of the managers (McCaulley & Lombardo, 1990).

*Specifications Equations.* If we have the multiple regressions for predicting a criterion of leadership performance from a set of factored ratings or test scores, and for predicting the same criterion from scores based on situational variables, we can develop a specification equation for predicting the leadership criterion from the beta weights of predictors X, Y, Z. The specification equation is given by the sum of the products of every situational beta weight with the standardized rating or test score (means of zero and standard deviations of 1). For each individual case, the specification provides the best possible prediction of the criterion of leadership performance. Cattell (1980) provided specification equations for the Sixteen Personality Factor Questionnaire (16 PF) of 16 traits and various situations and Saville (1984) for occupational profiles.

## Moderators of Judgments and Their Predictive Validity

---

Moderators are analogous to Einstein's theory that gravity is a phenomenon due to the warping of space around stars, planets, and moons. Newton's laws have to be moderated to predict more accurately the force of

gravitational attraction between them.

Some of the moderating conditions are primarily associated with the rater, some with the ratee, and some with both. Some methods are moderators. Waldman, Yammarino, and Avolio (1990) completed a WABA analysis of 140 managers in a large mining company paired with their immediate bosses. They were imbedded in 39 work groups. Individual differences were common in the various types of performance and skill ratings received by the managers. Their bosses varied in the average ratings they assigned to the managers. The dyadic matches were also of consequence.

### ***Personal Moderating Conditions***

*Rater's Training and Competence.* The effects of rater training to produce more reliability and validity of the ratings and greater agreement among raters are well known. A rater of leaders needs perceptive skills, cognitive ability, and reflective thinking to make good judgments. This can be helped by the quality of the cues provided by the rating method and the research that has been completed to develop the procedure. Global assessments that are based on broad aspects of performance and can be used to make explicit comparisons between ratees provide the greatest differential accuracy, but more priming of the rater may be needed to provide for useful diagnostic feedback (Blake & Goffin, 2001).

*Biases in Perceptions and Ratings.* Both predictions and criteria of success are often subjective managerial ratings and assessments. Expectations bias ratings. When rating others, people tend to confirm rather than disconfirm their expectations (Copeland, 1993). In addition, ratings are biased by the effects of leniency, response set, halo effects, and implicit theories of leadership (Bass & Avolio, 1989). Starbuck and Mezias (1996) reviewed other distortions in management perceptions. For instance, correlations were close to zero between managers' perceptions of the uncertainties in their business environments and the objective volatility of the environment as measured by financial reports and industry statistics (Tosi, Aldeg, & Story, 1973; Downey, Hellriegel, & Slocum, 1975). Payne and Pugh (1976) found little agreement among managers describing their own organizations. Subsequent studies led Starbuck and Mezias to conclude that average senior managers' judgments about their firms' performance could be accurate, but their individual judgments varied greatly (Sutcliffe, 1994). Salam, Cox, and Sims (1997) found that leaders who were rated as challenging the status quo and encouraging their subordinates to act independently were rated lower by their superiors and higher by their subordinates. The fairness seen by ratees of the performance appraisal and feedback system was greater when the ratees felt they could voice their opinions about it (Cawley, Keeping, & Levy, 1998; Folger & Cropanzano, 1988). When 208 employees responded in a survey about the voice they had in an appraisal system ("I felt I could have influenced the review discussion"), those impressions correlated .59 with perceived accuracy, .43 with perceived utility, .52 with procedural justice, and .59 with satisfaction with the system (Keeping, Brown, Scott, et al., 2003).

Feedback to leaders and managers of subordinates' average judgments about performance can be misleading because they mask large differences among the subordinates' judgments. The subordinates may not be, for example, able to discriminate between a manager's personal idiosyncrasies and the requirements of the manager's role (Herold, Fields, & Hyatt, 1993).

*Raters' Age.* Benchmarks were completed by superiors, peers, subordinates, and self for more than 2,000 focal managers. While favorable superiors' and self-ratings by the managers increased with age, subordinates' and peers' ratings did not. Brutus, McCaully, and Fleenor (1996) offered several explanations, but the most plausible one was that managers behave differently toward their superiors than toward others and have a better

rapport with them. Also, managers may engage in more impression management with their superiors than with peers and subordinates.

*Raters' Choose Raters.* When leaders select those who are to rate them, the results are likely to be inflated. For instance, the norms for the Multifactor Leadership Questionnaire ratings when raters are selected by ratees are likely to be one point higher on a five-point scale of the transformational and contingent reward factor scores (Avolio & Bass, 2004). At the same time, O'Leary, Harkom, et al. (2003) reported that moderate positive correlations of .30 to .53 were found between ratee-selected and nonselected raters of the performance of 96 professional education students.

*Confidence in the Ratings.* Harper, Maurer, and Tross (1988) examined the 360-degree ratings of 1,852 aggregations of raters evaluating the teamwork, character, learning, vision, and leadership skills of 463 leaders. Raters also indicated their confidence in the accuracy of their ratings. More confident supervisors and more confident self-raters were slightly more likely to connect team-work and character with leadership skills. More confident peers added vision to the prediction of leadership. Gabris and Ihrke (2001) showed that the job satisfaction of 134 professional county government employees was related to the perceived fairness and validity of the performance appraisals they received.

### ***Moderating Conditions***

*Ratees' Early Career Experience.* Berlew and Hall (1966) showed that the degree of first-year challenge sensed by managers added to the prediction of their subsequent success. Within an Exxon U.S. subsidiary, Vicino and Bass (1978) showed that the accuracy of the predictions could be substantially enhanced by adding attending information about what happened subsequently to 140 newly hired managers. Six years after employment, the managers were more successful and effective than predicted by the EIMP battery if they (1) had initially been assigned to a supervisor with influence "upstairs"; (2) had a personality different from that of their first supervisor; (3) were more satisfied with the challenges of their first task; (4) were under less stress in the two years before their measured success and effectiveness.

*Ratees' Motivation and Needs.* Ghiselli (1968a) reported results demonstrating that motivational factors interacted with personality traits that were predictive of managers' job success. The need for job security was the strongest and the need for power was the weakest moderator in producing interactions between traits and success. Thus, whether managers had a low or a high need for security affected the extent to which their assertiveness correlated with their success as managers. In the same way, whether a score showing a high need or power forecast success as a leader depended on whether it was coupled with a strong sense of responsibility (Winter, 1989).

*Ratees' Seniority.* Although Moore (1981) found that it did not matter whether librarians came to their assignments as a first or second career choice, the librarians' patterns of personality and leadership were closer to norms for the general population than they had been 20 years earlier. Similarly, when Harrell and Harrell (1984) applied stepwise regression equations to ability and personality predictions of the success of MBAs from Stanford University in achieving high salaries 5, 10, 15, and 20 years after graduation, different predictors emerged. For example, high earnings at the end of five years were predicted by orientation to high earnings, but after 20 years, the best combination of predictors of high earnings from the measures obtained 20 years earlier were youth, interest in sales management, a projective measure of the need for power, and a scored

background survey that was favorable.

*Age.* Baltes and Staudinger (1993) noted that aging into older adult years modifies the relations between intelligence and leadership effectiveness. On the one hand, there is a decline in mental fluid mechanics. Leadership tasks depending on speed of reaction, processes of sensory information input, visual and motor memory, and processes of discrimination, categorization, and coordination decline with aging. On the other hand, older age increases wisdom, good judgment, and advice on uncertain but important aspects of life, based on expert knowledge. Such expert knowledge includes factual knowledge about the fundamental pragmatics of life, the contexts and uncertainties of life and societal change, and the competing relativism of values, life goals, and moral absolutes. While much of the decline in fluid mechanics is heavily influenced by biology, expert wisdom is more a matter of cultural inheritance, cultural innovation, and facilitative experiences. The wise person is open to new facilitative experiences. Nevertheless, Irwin (1998) reported that when 915 members (30% women) of teams in a variety of U.S. firms rated each other on 31 behaviors, and sex, education, ethnicity and job level were controlled, older members were rated as less effective by their peers. They were also rated less effective as managers. However, those of high status in their own organizations were rated more positively, as were women, especially black women. Peers also rated others as more effective if they had known them longer. According to Ferris, Yates, Gilmore, et al. (1985), age also influenced performance ratings of subordinates.

*Sex and Race.* The effects of sex and race of assessment center examinees may be of limited consequence in moderating predictive accuracy. Women do about as well as men when undergoing assessment, according to an analysis by Ritchie and Moses (1983) of the overall scores obtained by 1,097 female managers at AT&T. The assessment center's predictions for the progress of their careers at the end of seven years were as valid as those for male managers. Similar results for women and for men were reported by Moses and Boehm (1975) and for black women compared to white women (Huck & Bray, 1975). But, subsequently, a meta-analysis (to be discussed later) found that the predictive validity of assessment programs was higher when the percentage of women assesseees was higher. A validity of .38 based on multiple correlations of the Exxon EIMP battery and managerial success was found for 67 black males; of .31, for 80 white females; and .53 for 685 white males (Sparks, 1989).

*Coaching of Ratees.* In a meta-analysis of 131 controlled studies of feedback, by DeNisi and Kluger (2000), coaching to accompany feedback to those working at tasks was beneficial to more favorable appraisals of ratees' subsequent performance. In a different circumstance, 213 candidates for promotion in city fire and police departments were coached prior to being interviewed. The coached and better-prepared candidates gave more organized responses to the interviewers, who judged them as being better in performance in the interview (Maurer, Solomon, Andrews, et al., 2001).

*Personality of Ratees.* McCarthy & Garavan (2003) found that among 520 managers in a large Irish firm who received 360-degree feedback, belief in procedural justice and lack of cynicism accounted for 51.3% of the variance in the extent to which they accepted the feedback.

### ***Situational Moderating Conditions***

*Organization.* A modifier of regression predictions is organizational purpose. Szilagyi and Schweiger (1984) pointed to the need to keep an organization's strategies in mind when trying to forecast the patterns of ability, personality, and experience that will best match candidates with the requirements of a job. Hambrick

and Mason (1984) argued that an organization's character and performance and the particular personal attributes and experience of its senior managers will be correlated. The differential weights in multiple regression predictions of success in a rapidly growing organization are likely to be different from those in a mature or declining organization. The weights of predictors of success as a combat officer are likely to be different from the weights for optimizing the prediction of success as a garrison officer.

*Feedback Environment.* Feedback ratings may be moderated by an organization's business and human resource strategy. Firms with *prospector* strategies may place more of a premium on involved, innovative leadership; firms with *defender* strategies may focus more attention on inducements (Sivasubrahmanium & Kroeck, 1995). Employees who see a favorable feedback environment are more likely to use feedback from 360-degree ratings (Steelman & Levy, 2001).

DeNisi and Kluger (2000) concluded from a meta-analytic analysis of 131 evaluated controlled studies of feedback from 3,000 reports that 38% was harmful to performance rather than likely to improve it. The investigators assumed that attention was limited to gaps from feedback to standards. Little attention was paid where gaps were not present. Subsequent behavior was affected by this attention. They found that attention focused on task performance and resulted in improvement only if sufficient details for improvement were provided. Otherwise, the focus remained on the details of the feedback, not on improving performance. If multisource messages were in disagreement, more attention was focused on self-rating. If the feedback, particularly negative feedback, focused on the self and the self-concept rather than the task, performance suffered. Whether a ratee wants to work on a task or had to work on the task affected whether performance improved or declined with feedback. A goal-setting plan needed to be provided with feedback if subsequent performance was to improve. As much as possible, information provided with feedback should be about improving performance and not about the relative performance of others, as the latter can increase anxiety and a decline in performance. Feedback may be more harmful than beneficial to people working on complex tasks.

*Culture.* Given the cultural specificity of some leadership phenomena, as seen in [Chapter 33](#), as one moves from one culture and country to another, it is not surprising that culture moderates the relationship between performance appraisal procedures and effectiveness. When ratees in work units in countries with *individualistic* cultural norms are similar in personality to their peers, the peers' ratings predict the promotion of the ratees in work units, but in work units in countries with *collectivistic* norms, the supervisor's ratings predict the promotion (Schaubroeck & Lam, 2002).

Milliman, Nason, Lowe, et al. (1995) asked 237 South Koreans, 241 Taiwanese, 223 Japanese, and 144 Americans what purposes were served by performance appraisals. Most were managers, engineers, and professionals. Questionnaire items were about performance appraisal practices, performance appraisal effectiveness, organizational effectiveness, job satisfaction, and five possible purposes: pay, promotion, development, enabling subordinates to express themselves, and documentation of performance. LISREL analyses revealed, as expected, significant cultural differences in the relationships among the variables. In South Korea, only the purposes of documentation, promotion, and development were seen as contributing to appraisal effectiveness, which, in turn, contributed to organizational effectiveness and job satisfaction. In Japan, all five purposes contributed to appraisal effectiveness, which in turn related to organizational effectiveness and job satisfaction. In Taiwan, only documentation, pay, and development were seen to directly affect appraisal effectiveness and, indirectly, organizational effectiveness and job satisfaction. Finally, among Americans, a considerably different path model emerged. Documentation, promotion, and enabling subordinate expression were the chosen purposes. Appraisal effectiveness was positively related to job satisfaction but negatively related to organizational effectiveness.

## ***Methods as Moderators***

*Criteria of Success.* Obviously, how success is measured affects the differential weightings that optimize a multiple regression prediction of success. A majority of studies have depended on subjective evaluations of success as a leader provided by superiors and a higher authority. These evaluations may suffer from various sources of bias by raters, such as the halo effect and leniency. They may be subject to the quirks of memory and different raters' values.

Objective approaches to measuring success have also varied and, as a consequence, have led to different prediction results. At one extreme, as was noted in Chapter 4, many investigations before 1948 defined success as occupying a position of leadership, that is, holding an office or some position of responsibility. The level reached by a manager in an organization was often seen as an appropriate measure of success. This definition was improved by adjustments. Blake and Mouton (1964) used a managerial achievement quotient to evaluate the progress of managers' careers in a single organization; the level of the positions was corrected by the managers' chronological age: younger managers at higher organizational levels were seen as more successful than older managers at lower levels. Hall and Donnell (1979) modified the formula slightly. They continued to assume that regardless of the actual organization, managers worked in organizations of eight levels. To generate a realistic index number, they further assumed that all managers' careers are in eight-level organizations. Bass, Burger, et al. (1979) adjusted the quotient by dividing a manager's current level by the actual number of levels in the organization, then multiplying by the size of the organization. They argued that managers of larger organizations who are at the same place on their respective organizational ladders as managers of smaller organizations are more successful.

Another criterion of managers' success was the amount of salary or compensation earned (Harrell & Harrell, 1975). But the compensation had to be adjusted for age, function, experience, seniority, inflation, and other moderators when used to forecast managerial success (Farrow, Bass & Valenzi, 1977; Sparks, 1966). When performance quality was the main criterion of success, Deming (1986) argued, performance appraisal programs were detrimental to the quality of the performance because: (1) They held the ratee responsible for mistakes that could be due to faults in the system; (2) When their rewards were contingent on appraisals, the employees were directed toward short-term targets and quotas; (3) Ratees who fell at the lower end of the distribution of the appraisals were discouraged from trying to excel. Ghorpede and Chen (1995) suggested that the performance appraisal system would contribute to performance quality if: (1) The primary purpose of performance appraisal was the improvement of the ratee; (2) Everyone affected by the appraisal system was involved in improving it; (3) Opportunities for improvement and reduction of systematic errors were examined; (4) The focus of the performance appraisal was on behavior using input and output for diagnosis and development of the ratee; (5) For each dimension of performance, both task accomplishment and task improvement were considered; (6) Absolute rather than relative standards of performance were used.

*Single-Source Errors.* Single-source bias arises when data are collected from one source or method about two or more variables, such as self-report survey questionnaires (D. T. Campbell & Fiske, 1959). The same leader provides a self-report of influence, X, and a rating of job satisfaction, Y. The correlation of X and Y will be inflated by single-source variance. Sometimes it cannot be helped, but a correction is needed. The correlation may reflect a generalized response set and form a general factor in a factor analysis whose effect can be subtracted. But new errors are then introduced (Kemery & Dunlap, 1996). Within-and-Between Analysis (WABA) may be used to determine and correct same-source variance and error in self-reports (Avolio, Bass, & Yammarino, 1988). Performance appraisal becomes overshadowed in the case of CEOs rated by biased

compensation committees, which may award extremely high annual CEO compensation for continuously failing performance.

## Assessment Centers

---

In the European tradition, the identification of potential leaders tended to make use of inferences based on observations, personality tests, and interviews. The assessment center fit readily with the European approach. As early as 1923, following experience in World War I, boards of psychologists and officers formed judgments of candidates for leadership positions in the German army from observing the candidates in a roundtable discussion and from other tests and methods (Simoneit, 1944). Comparable developments took place in Great Britain (Garforth, 1945). By the 1940s, the British had organized country house retreats for civil service and industrial candidates to meet with assessors. The candidates were then observed by psychologists and a management assessor in formal exercises and in informal interactions. The results provided valid assessments for choosing candidates (Vernon, 1948, 1950).

During World War II, the Office of Strategic Services (1948), the forerunner of the Central Intelligence Agency (CIA), created a similar assessment program for candidates for assignments as special agents and spies, based on the psychological theories of Henry Murray (1938). In addition to the usual testing, the candidates were systematically subjected to cognitive and physical group exercises, along with stress interviews. Decisions were made on the basis of the assessors' ratings, which were formed from their observations of the candidates' performance in the various exercises (Murray & MacKinnon, 1946). The interest in assessment programs generated the establishment, in 1949, of a civilian assessment center at the University of California, Berkeley (MacKinnon, 1960); at Standard Oil of Ohio (SOHIO) in 1953 (Finkle & Jones, 1970); at IBM (Kraut, 1972); at General Electric (Meyer, 1972); and at Sears (Bentz, 1971). The modern assessment center approach spread rapidly around the world (Thornton & Byham, 1982). But most prominent was the assessment center program launched in 1956 at AT&T as a long-term research study of the development of the managers' careers (Bray, Campbell, & Grant, 1974).

As MacKinnon (1975) noted, "assessment center" may refer to a physical facility, such as Berkeley's Institute of Personality Assessment Research; a standardized assessment program, such as SOHIO's Formal Assessment of Corporate Talent; or the bringing together of a group of candidates for assessment. By the end of the 1970s, several thousand centers and programs were in operation.

### **Methods**

Ideally, the procedures and variables to be assessed in a particular assessment center should stem from an analysis of the requirements of the jobs for which the candidates are being considered. Assessment procedures to tap the identified dimensions that match these requirements should then follow (Thornton & Byham, 1982). Worbois (1975) selected 12 assessment variables in this way and predicted supervisory ratings of the subsequent performance of candidates with a correlation of .39. As noted in the preceding meta-analyses, specific dimensions of a candidate's current performance are harder to predict than the candidate's overall future performance or potential as a manager.

All the individual and group testing activities discussed so far in this chapter have been used in assessment centers and take from a half day to five days. These activities may include paper-and-pencil and projective tests

of values, interests, and personality; tests of cognitive abilities and reading and writing skills; and observers' judgments of performance on in-basket tests, interviews, role-playing exercises, organizational simulations, work samples, and leaderless group discussions requiring cooperation or competition. What is special about the assessment center is its use of the pooled judgments of staff psychologists and managers from the organization who have been assigned as observers. The judgments are based on their observations of the candidates in action and the inferences they draw from the test results to reach consensual decisions about the leadership potential of each candidate. The observers also use consensus to predict each candidate's likely performance as a manager and other aspects of the candidate's future performance. From 10 to 52 variables, assumed to be related to managerial performance, may be judged and pooled by the team of observers in this way (Howard, 1974). According to a survey of assessment centers by Bender (1973), the typical center uses six assessors, including psychologists and managers at several levels above the candidates. Usually, candidates are processed in multiples of six, which is seen as an optimal number for interactions and observations. For example, 12 candidates at a time were processed by Macy's in interviews, group discussions, and in-basket tests. Six executives from top and middle management formed the assessment team (Anonymous, 1975). Unless the information is withheld to avoid contaminating follow-up research, feedback of the consensual judgments is given to candidates in most centers to contribute to the candidates' developmental efforts. Assessment centers have demonstrated moderate validities for predicting job performance and leadership potential.

### ***Virtual Assessment Centers***

The spread of firms nationally as well as globally has sparked the need for assessment of managers for development and promotion at a distance from each other, to enhance a firm's quality of management. The Internet makes it possible to administer simulations and batteries of individual and group tests to managers in different locations. Virtuality eliminates extensive travel time, costs, and absence from work. It realistically simulates real business challenges (Smith, Rogg, & Collins, 2001). The investigators described a virtual assessment center for 78 senior managers in a global organization, 39% based in the United States and 61% in Britain, France, Germany, and the Netherlands. The AON virtual assessment center simulated a work environment in which the candidate had to analyze problems, make decisions, take appropriate actions, and move issues forward with e-mails, voice mails, timed interruptions, and role plays. Also included in the assessments were a work accomplishment record, structured interviews, a 360-degree survey, and the 16 PF Questionnaire. Higher convergent validities were obtained from assessment constructs that were alike than from divergent validities obtained for constructs that were unlike.

### ***Variables***

Because of the prominence of the AT&T Management Progress Study and the availability of materials from Development Dimensions International (DDI) derived from it, the 25 variables deemed important for success at AT&T have been incorporated, as a whole or in part, into many assessment programs elsewhere. These variables are: general mental ability, oral and written communication skills, human relations skills, personal impact, perception of threshold social cues, creativity, self-objectivity, social objectivity, behavioral flexibility, need for the approval of superiors, need for the approval of peers, inner work standards, need for advancement, need for security, goal flexibility, primacy of work, value orientation, realism of expectations, tolerance of

uncertainty, ability to delay gratification, resistance to stress, range of interests, energy, organization and planning, and decision making (Bray, Campbell, & Grant, 1974, pp. 19–20).

The 25 AT&T assessment variables were logically grouped into seven categories, as follows: (1) administrative skills—a good manager has the ability to organize work effectively and to make high-quality decisions; (2) interpersonal skills—a forceful personality makes a favorable impression on others with good oral skills; (3) intellectual ability—a good manager learns quickly and has a wide range of interests; (4) stability of performance—a good manager is consistent in his or her performance, even under stressful conditions or in an uncertain environment; (5) motivation to work—a good manager will find positive areas of satisfaction in life; he or she is concerned with doing a good job for its own sake; (6) career orientation—a good manager wants to advance quickly in the organization but is not as concerned about a secure job; the manager does not want to delay rewards for too long a time; (7) lack of dependence on others—a good manager is not as concerned about getting approval from superiors or peers and is unwilling to change his other life goals.

Administrative skills were found to be assessed best by a manager's performance on the in-basket test. An evaluation of interpersonal skills was procured from the observer teams' judgment of the manager's performance in group exercises. A measure of intellectual ability was reliably obtained from standardized general ability tests. A measure of stability of performance was acquired from the individual's performance in the simulations. A motivation work measure was obtained from projective tests and interviews, with some contribution from the simulations. Career orientation was seen in both interviews and projective tests and, to some extent, in the personality questionnaires. A measure of dependence was gained mostly from the projective tests (Bray, Campbell, & Grant, 1974).

Dunnette (1971) concluded, from a review of factor analyses of these variables not only for the AT&T assessment programs but for those at IBM, SOHIO, and elsewhere, that the underlying factors included overall activity and general effectiveness, organizing and planning, interpersonal competence, cognitive competence, motivation to work, personal control of feelings, and resistance to stress.<sup>7</sup> Empirical studies by Sackett and Hakel (1979) and Tziner (1984) also led to questioning whether more than just a few dimensions could account for all 25 variables or their factor clusters. Despite this questioning, the surplus of variables may be useful for diagnosis and counseling (Thornton & Byham, 1982).

Moreover, the correlations between the ratings of the dimensions on the same exercise are often much higher than the correlations for ratings of any one of the dimensions between exercises (Sackett & Dreher, 1982), which suggests that just a few global measures are involved. In 10 sessions, 149 government agency managers examined personal effects, effects of an exercise with nine behavioral dimensions, and assessors' effects on the assessments. Multiple assessors were used for four exercises: a competitive allocation exercise, an in-basket test, a written test, and a noncompetitive management problems exercise. Differences among the individual assesseees accounted for 60% of the assessments, whereas only 11% of assessments were accounted for by the differences between exercises and between assessors. From a study of 19 managers in three days of assessment and four months of follow-up training, Cunningham and Olshefski (1985) concluded that assessment centers, as ordinarily constituted, were better detectors of socioemotional leadership skills than of task leadership skills, but the two tended to be correlated. Bycio (1988) found little effect on ratings earned by participants at an assessment center due to one of 11 orders in which the participants completed assessment activities.

## ***Prescreening***

Much prescreening of candidates occurs for the expensive assessment center. For instance, in one year, 1974,

Macy's interviewed 2,000 prospective candidates for participation in an assessment center in New York City. Of these prospective candidates, only 500 were processed through the assessment center (Anonymous, 1975). Self-selection also served as prescreening. Ordinarily, participation from within an organization is voluntary after candidates (such as those at Michigan Bell) have learned that they have been nominated for participation in the assessment center by their supervisors, sometimes with higher-level approval. Self-nominations are also possible.

Psychometric testing can be used advantageously to prescreen candidates before involving them in the expense of the total assessment process. For example, for a sample of 80 AT&T prospects, the Gordon Personality Profile and Gordon Personality Inventory tests were administered before the prospective candidates could participate in an assessment center. Four of the scores on the tests correlated with the subsequent assessment based on the full three-day program, as follows: ascendancy, .46; sociability, .32; original thinking, .37; and vigor, .21. A specially scored biographical questionnaire alone correlated .48 with the results of the three days of assessments. If a composite score based on the biographical questionnaire and the measures of ascendancy and original thinking had been in effect, 84% of those scoring in the lowest or "D" category would have been detected as not acceptable to the assessors after three days, while only 16% would have been deemed acceptable. It was reckoned that more than \$2,000 per successful candidate was saved by the installation of such a screening program (Moses & Margolis, 1979). In the same way, Dulewicz and Fletcher (1982) found that scores on an intelligence test, but not previous specialized experience, contributed to candidates' performance and assessment based on the situational exercises of an assessment center. Thus, preassessment intelligence tests could be used to screen prospects for assessment. The possibilities of prescreening with a single LGD have been ignored, although, as mentioned earlier, a correlation of .75 was reported by Vernon (1950) between the results about candidates obtained in a one-hour LGD and the results of a full assessment at an assessment center.

### ***Reliability of Assessments***

Agreement among assessors in assessment centers has been subjected to numerous analyses to provide estimates of the reliability of the assessments. Fewer rate-rater estimates are available.

*Agreement among Assessors.* Observers' independent ratings of assessees correlated .74 in their ratings on average and .76 in the corresponding rankings of 12 participants in the various segments of a two-day IBM assessment program (Greenwood & McNamara, 1967). Comparable median correlations of .68 and .72 were reported for AT&T's program (Grant, 1964). For the SOHIO program, correlations of assessments between psychologists and managers who served as assessors ranged from .74 for the assessment of the drive of assessees to .93 for the judgment of the amount of assessees' participation.

Correlations among raters were increased most by the consensual discussions they held. Before such discussions, median correlations ranged from .50 (Tziner & Dolan, 1982) to .76 (Borman, 1982). After the discussions, the median correlations rose to .80 or above (Sack-ett & Dreher, 1982) and as high as .99 (Howard, 1974). Schmitt (1977) reported that when a team of four assessors evaluated 101 middle-management prospects over a four-month period, mean interrater correlations before the raters' discussion of the ratings ranged from .46 for the rating of assessees' inner work standards to .88 for the rating of assessees' oral communication skills. After the assessors discussed their first ratings, the intercorrelations rose to .74 and .91, respectively, but the opinion of no one assessor shifted more than that of any other (Schmitt, 1977), which suggested that mutual influence had occurred. However, in an analysis of the participation of 2,640

candidates in an assessment program to determine their suitability for training as U.S. Navy officers, Herriot, Chalmers, and Wingrove (1985) found that a discussion changed the opinions of the assessors if they: (1) were deviates from the majority opinion; (2) depended on their rank as officers for their influence; (3) were above or below the majority in the rating they had initially given a candidate. This increase may reflect more shared information, or it may be a matter of the raters' influence on one another. In an overall review, Howard (1984) concluded that correlations among assessors tended to be at least .60 in most cases, rising to as high as .99. This agreement was not affected by whether the assessors were psychologists or managers; but, as will be noted later, meta-analytic results from 47 assessment studies (Gaugler, Rosenthal, Thornton, & Bentson, 1987) showed that psychologists were more valid assessors than managers were.

Agreement among assessors depends on how much training they have received in making ratings in general and in making ratings about performance in specific exercises. For example, Richards and Jaffee (1972) obtained an increase in interrater agreement as a result of the assessors' training in rating the performance on in-basket tests. They found increases in interrater agreement from .46 to .78 on ratings of human relations skills and of .58 to .90 on ratings of administrative/technical skills. On the other hand, as noted in an examination of self-ratings and multiple raters, there was little correlation found by Clapham (1998) between the self-ratings of 167 assessment center participants and the ratings they received from five assessors. Randall, Ferguson, & Patterson (2000) noted that accurate self-assessments might add to the validity of psychometric tests in assessment center decisions.

*Rate-Rerate Reliability.* A rate-rerate retest reliability of .77 was reported for the AT&T assessment center's testing of men one month apart. The rate-rerate agreement obtained for women candidates was .70, .68 for black candidates of both sexes, and .73 for white candidates of both sexes (Moses & Boehm, 1979; Moses & Margolis, 1979).

### ***Predictive Validity***

Jansen and Stoop (2001) found that Dutch assessment center ratings, based on group discussion and presentation of analysis, predicted the average salary growth of 679 academic graduates over seven years. The correlation was .39 when corrected for starting salary and restriction in range. Reviews by Huck (1973) and Klimoski and Strickland (1977) concluded that assessment centers generated valid predictive information. This conclusion was corroborated in a meta-analysis by Hunter and Hunter (1984), which obtained median corrected correlations of .63 for predicting managerial potential from assessments and .43 for predicting on-the-job performance. But these findings appeared to be inflated according to a more extended meta-analysis by Gaugler, Rosenthal, Thornton, et al. (1987) based on 47 studies of assessment centers involving 12,235 participants. The 107 validity coefficients between the assessment centers' forecasts for candidates and criterion appraisals of candidates' managerial performance and advancement (corrected for sampling error, restrictions in range, and unreliability of the criteria) averaged .37. In the Management Program Study at AT&T, assessments were followed up for eight years to see if they predicted the promotion of assesseees into middle management. Assessment results were kept unknown to promotion decision makers. At AT&T and IBM, the assessment center's results for each candidate were not subsequently seen by their superiors, who were responsible for the on-the-job appraisals and promotions of the candidates; so the validity correlations could not be inflated by such contamination, as they might have been in other studies.<sup>8</sup>

*Consensual Discussions among Raters.* Correlations among raters were increased most by the

consensual discussions they held. Before such discussions, median correlations ranged from .50 (Tziner & Dolan, 1982) to .76 (Borman, 1982). After discussions, median correlations were likely to rise to .80 or above (Sackett & Dreher, 1982) and as high as .99 (Howard, 1974).

*Predictions of Career Advancement.* At AT&T, of those assesseees who were predicted to succeed, 42% did succeed, while only 7% of those predicted to fail actually attained middle-management positions (Bray, Campbell, & Grant, 1974). A correlation of .44 was found among 5,943 men designated as “more than acceptable,” “acceptable,” “less than acceptable,” or “not acceptable” by the consensus of the assessors’ judgments and information whether the men had subsequently earned two promotions in the eight years following the assessment. The overall managerial level the candidates achieved at the end of 20 years continued to be accurately forecast by the assessments obtained 20 years earlier. Intelligence scores and motivation and personality measures obtained from psychometric instruments, and the results of interviews and in-basket tests, all contributed positively to the accuracy of the predictions (Howard & Bray, 1988). The assessments collected 20 years previously also predicted satisfaction, self-confidence, and emotional adjustment.

At IBM, Wollowick and McNamara (1969) found a correlation of .37 between the assessment by the assessment center and increased responsibility assigned to candidates. In a follow-up, Hinrichs (1978a) obtained a correlation of .46 between the overall judgments of the assessment center and the level of management reached by candidates after eight years. At SOHIO, a correlation of .64 was achieved between the assessments and superiors’ appraisals of the candidates’ potential 6 to 27 months afterward. The correlation remained stable in forecasting appraisals up to 5 years later (Carleton, 1970).

Howard (1974) noted that the components of various assessment centers differed in the contributions they made to the accuracy of forecasts. For example, at AT&T, the overall assessment and situational tests had the highest predictive validities; at SOHIO, projective and psychometric tests were particularly important overall; at IBM, some elements in each of the procedures tended to contribute to the prediction of promotion. Arthur, Woehr, & Maldegen (2000) analyzed the convergent and divergent validities of an assessment center for two federal agencies. In 10 sessions, 149 government agency managers examined personal effects, effects of an exercise with nine behavioral dimensions, and assessors’ effects on the assessments. Multiple assessors were used for four exercises: a competitive allocation exercise, an in-basket test, a written test, and a noncompetitive management problems exercise. Differences among the individual assesseees accounted for 60% of the assessments, whereas only 11% of assessments were accounted for by the differences between exercises and between assessors.

### ***Moderating Effects on the Validities***

*Purposes Served.* The purpose of the validation effort makes a difference. According to the extended meta-analysis by Gaugler, Rosenthal, Thornton, and Bentson (1987), the validity of an assessment center’s forecast depends on the criterion of success predicted by the assessment. On average, according to the validities obtained (weighted by sample size and corrected for attenuation and the unreliability of the criterion), candidates’ potential for promotion, rated by supervisors and a higher authority, was better predicted (.53) than was their rated current performance (.36), rated performance in training (.35), or advancement in their careers (.36). The least valid predictions were for appraisals by supervisors of the same on-the-job dimensions rated at the assessment center (.33). The assessment center’s focus on candidates’ current job requirements appeared to be less useful than its concentration on the candidates’ possible future job assignments. An extreme case was illustrated by Turnage and Muchinsky (1984), who found no validity in a one-day program for predicting candidates’ currently appraised job performance, but did find valid predictions of the candidates’

potential after five years and their appraised career potential.

When the effort was for research purposes, the correlation between assessment predictions and subsequent appraisals of success was .48. However, the correlation was lower if the purpose of the effort was for administration of selection (.41), early identification of promise (.46), or promotion (.30). Overall judgments of candidates' participation in an assessment center's activities appeared to be better predictors of their advancement and salary increases than were the performance appraisals they received from their supervisors. In turn, the assessments appeared to be better predictors of the appraised on-the-job performance than objective measures of such performance (Turnage & Muchinsky, 1984). Nevertheless, it seems that the pooled ratings and consensual decisions of assessors may yield a less accurate prediction than one made by optimally weighing the independent assessors' ratings and using mechanical pooling of the assessors' ratings by means of multiple regression analysis (Tziner, 1987).

Some assessment centers have been aimed at development of leaders rather than selection. They provide feedback to participants for coaching and self-learning. For instance, an MBA program may conduct such a center for new entrants into the program. Engelbrecht and Fischer (1995) compared an experimental group with a control group of randomly selected first-line supervisors (56 white, 20 nonwhite; 38 men, 38 women) in a South African insurance firm. The 41 in the experimental group received assessment and feedback; the 35 in the control group did not. Three months afterward, the experimentals were significantly higher than the controls in action management, human resources management, information management, and problem resolution. Similarly, Fleenor (1988) found that, compared to results observed from a control sample, career development was significantly advanced by attendance at an assessment center for development.

*Individual Raters' Differences in Validity.* Borman, Eaton, Bryan, and Rosse (1983) could find no evidence of significant individual differences in the validity of raters' judgments. However, the aforementioned meta-analyses suggested that validities were higher if the assessors were psychologists rather than managers, if the percentage of female assesseees was greater, and if the percentage of minority assesseees was smaller. Some exercises generated ratings with higher predictive validities than others did (Sackett & Dreher, 1982). Validities were also higher when a broader array of exercises were employed and when peer ratings of one another were provided by the assesseees. On the other hand, the validity of assessment center predictions was little affected by other expected influences such as the ratio of assesseees to assessors, the number of days of observation, the number of days the assessors were trained, and number of hours the assessors spent in integrating information. Criterion contamination accruing from providing feedback to assesseees and their supervisors also had little of the expected effect on the validities.

*Transparency of Constructs.* Ninety-nine students were rated by assessors in a Dutch assessment center based on four types of simulated individual interviews. In one interview, they were assessed in their efforts to get a subordinate to work overtime. The experimental students were told in advance about the constructs being assessed (sensitivity, analytical skills, and persuasiveness); 50 control students were not so informed. Contrary to expectations, there were no differences in the validity of the outcomes. The study was replicated with the assessment of 297 job applicants (mostly for management) who were told about the constructs, and of 393 controls, who were not told. Group exercises were added. Predictive validity significantly improved with the transparency of the constructs to the 297 applicants, compared to the lack of information for 393 control applicants. At the same time, in both studies, no differences appeared in the mean ratings between the transparent and nontransparent methods (Kolk, Born, & van der Flier, 2003).

*Validity of Other Applications.* Specialized assessment centers have been created and found valid for predicting successful performance in various institutional settings. Centers were found to be valid and useful

for assessing military recruits (Borman, 1982), naval officers (Gardner & Williams, 1973), Canadian female military officers (Tziner & Dolan, 1982), managers of law enforcement agencies (McEvoy, 1988), and civil service and foreign service administrators (Anstey, 1966; Vernon, 1950; Wilson, 1948). Schmitt, Noe, Merrit, and Fitzgerald (1984) extended the use of assessment centers to forecast candidates' success as a school administrator. The specially developed assessment center featured activities and exercises relevant to schools, rather than business and industry. The assessments correlated between .20 and .35 with appraisals of the job performance of the administrators by teachers and administrative staff. However, the assessments failed to correlate with subsequent promotions or salary increases.

*Utility.* Because thousands of dollars may have to be spent per candidate, many essays on the cost-effectiveness of assessment centers have been produced (see, e.g., Byham & Thornton, 1970). Cascio and Sibley (1979) calculated the quantitative analysis of the hypothetical utility of assessment centers based on assumptions about the costs, validities, and gains to the organization as a consequence of improvements in the accuracy of prediction provided by the assessment center. The authors showed the numerous parameters that had to be considered and the optimal arrangements that were possible if the designated costs, validities, and benefits were involved.

Dunnette (1970) initially raised the question of whether the additional cost of assessment center procedures, in contrast to less expensive mechanical methods, added sufficiently to the validity of prediction. For instance, Glaser, Schwartz, and Flanagan (1958) had determined that assessments of 227 supervisors from individual interviews, an LCD session, a role-playing situation, and a simulated management-work situation, when combined with two paper-and-pencil tests, yielded multiple correlations of only .30 to .33. Yet the two paper-and-pencil tests alone correlated .23 and .25 with the appraised effectiveness of the supervisors on the job. On the other hand, the AT&T, SOHIO, and particularly the IBM studies showed considerable augmentation of the validity of predictions (up to multiple correlations of .62) when the results of an in-basket test, LGD, and biographical information inventory were added to information gained from a personality test (Wollowick & McNamara, 1969). But such augmentation did not occur in an assessment of 37 prospects for supervisory positions at Caterpillar Tractor (Bullard, 1969).

Cost estimates have ranged up to \$5,000 per assessment center examinee,<sup>2</sup> including space and materials as well as the assessors' and assessee's time and travel costs, without even considering staff salaries. Much less expensive alternatives use standardized machine-scored cognitive and personality psychometric tests. However, the validities of these tests are less likely to reach as high as what is possible when they are combined with the situational tests and other procedures of the assessment center. Another alternative is to rely on recommendations, individual interviews, committee reviews of credentials, and previous performance appraisals. Again, such approaches are unlikely to yield the same accuracies of prediction. Nor does actuarial prediction based on multiple regression yield more accurate predictions than assessors' ratings, according to an analysis based on 24 predictors of the growth of the salaries of 254 managers one, three, and five years after the managers were assessed (Howard, 1984).

Still, the benefits outweigh the costs. One mistake in the selection or promotion of a manager may cost an organization grievously. The validity of decisions about selection and promotion of managers may be raised from .25 to .50 or higher by using assessment centers instead of less thorough efforts. Hogan and Zenke (1986) showed that with a sample of 115 persons applying for seven school principalships, selected exercises at an assessment center yielded a large gain in performance (valued in dollars) over the traditional interview procedures. Nevertheless, Tziner (1987) suggested that it is still an open question whether much less expensive alternatives can achieve sufficiently accurate predictions of future managerial performance to justify using them instead of the procedures of full-blown assessment centers.

MacKinnon (1975) enumerated a number of other benefits that may be obtained from an assessment

center. The assessment center is an educational experience for the assesseees and even more so for the managers who serve as observers. Both assesseees and assessors may perform better after returning to their jobs (Campbell & Bray, 1967). Lorenzo (1984) demonstrated that experience as an assessor resulted in proficiency in interviewing others, as well as obtaining and presenting relevant information about candidates and their managerial qualifications. Assessors also increased their proficiency in preparing concise written reports about this information.

Intangible costs also need to be considered. The centers may promote organizational stagnation in that assesseees will be favored who are most similar in attitudes and values to current managers, hence stifling organizational change. Another possible negative effect is that the assessment center may establish “crown princes” whose future success becomes a self-fulfilling prophecy of the organization. Conversely, a candidate who receives a poor assessment may be denied opportunities to show what he or she can really do in an organization. In addition, the stressfulness of the assessment experience may invalidate it for some candidates. Finally, those who are not nominated for participation at an assessment center may feel abandoned in the advancement of their careers in an organization (Howard, 1974; MacKinnon, 1975).

## Summary and Conclusions

---

The traits that predict a person’s performance as a leader, which were discussed in previous chapters, can be assessed and combined in various ways to forecast success and effectiveness. Pure judgment and the expectations of supervisors and higher authority figures on the basis of current on-the-job performance are commonly used, often as part of performance appraisals; the judgments of peers and subordinates can also be considered, as can references from sources outside the organization. Clinical judgments based on psychological instruments and interviews with employees are another alternative. The reliability and validity of forecasting success with such pure judgments can be increased through standardization of judgmental requirements, the pooling of judgments, and the training of the judges.

Simulations make it possible to observe and judge employees’ performance in standardized problem settings. These simulations include managerial in-basket tests, small-group exercises, and LGDs. High-fidelity simulation and virtual assessment centers are now possible with computerization and the Internet. Complex data processing has been facilitated.

Valid scores from psychometric tests, application blanks, and biographical information blanks can be obtained, often through the use of specially constructed discriminating keys. The scores can be combined mechanically with or without the use of multiple regression. They also can be combined mechanically with judgments. Conversely, judgments can be formed from observations and information obtained from such tests and measurements. The procedures of assessment centers have become a popular means of combining scores on psychometric tests with observations of candidates in a variety of simulations that are relevant to current and future positions. The increased accuracy of predictions from the pooling of data gathering in assessment centers appears to justify the expense entailed. The centers usually provide more accurate predictions of the future potential of leaders and managers than do predictions of future performance of leadership candidates obtained by less expensive alternatives. The search for improvements and alternatives will be an issue for future research on leadership.

<sup>1</sup> See [Chapter 13](#).

[2](#) The results of work with this approach were discussed in Chapters 7 and 21.

<sup>3</sup> This research on the value of the interview for predicting managers' performance appeared in the context of its use in assessment centers. More will be said later about the validity of the interview for forecasting the subsequent performance of leaders when the validity and utility of assessment centers are examined.

[4](#) To be discussed later in the context of assessment centers.

5 Detailed in [Chapter 33](#).

<sup>6</sup> Drawn from the manuals and Technical Reports 1, 2, and 3 for the Manager Profile Record and the Supervisory Profile Record of Richardson, Bellows & Henry Company. Although by no means identical, similar results were obtained in different functional areas.

[Z](#) Note the similarity of these factors with much of what was presented in earlier chapters on personal factors associated with leadership.

[8](#) As will be noted later, even when it is possible, such contamination does not appear to occur.

## PART IX

---

# The Future

---

# Looking Ahead

Robert Crandall, as chairman and president of American Airlines, once opined, “I think the ideal leader in the 21st Century will ... create an environment that encourages everyone in the organization to stretch their capabilities and achieve a shared vision ... give people the confidence to run farther and faster ... and establish the conditions for people to be more productive, more innovative, and feel more in charge of their own lives” (McFarland, Senn, & Childress, 1993). The twenty-first century might well be called the Age of Peter Drucker. Because of him, organizational leaders scan their environments; revisit their missions; decide who are the customers and clients they serve; ban hierarchy; arrange flexible, fluid management systems; replace up-down vocabulary with team vocabulary; reject the status quo and policies that work for today and not for tomorrow; and communicate with clear, consistent mission-focused messages. Leadership is dispersed and highly involved, and responsibilities are shared. The moral compass of leaders works full-time by voice and example. Results are measured by objectives reached. The journey is celebrated (Hesselbein, November 4, 2000).

At the beginning of the second millennium, after reviewing what has happened in leadership research over the preceding 33 years, I looked forward 33 years and forecast that: in the year 2034, leaders will pay more attention to each follower than to the group they lead. Individualized consideration will have become routine. Leaders will be developed primarily online. Full second careers in management lasting 20 years will be commonplace. Women will dominate as MBA students and as educational, government, nonprofit, and service organization leaders. Empirically based ethical codes will have been established for management. Artificial intelligence will be a basis of management decision making. Biotechnology, such as genetic profiling and brain scanning, will be employed in assessing managers and leaders. There will be more concentration on leaders’ strengths than weaknesses. Mathematical operations will be used to optimize outcomes in negotiations. Leadership fads will be as strong as ever. Virtual teams and e-leadership will be the rule rather than the exception in large organizations (Bass, 2002).

The ideal twenty-first-century organizational leader will think locally and act globally, replace a bureaucratic hierarchy with a community of responsibility, communicate a strong sense of mission, and value the distribution of power, diversity, and inclusiveness (Leadership IS, 1994). Leadership research and its applications will continue to expand. Their effects will be seen in the ever-increasing attention to the “people” side of enterprise—in corporate mission statements, military doctrine, educational curricula, and nationwide community programs.

*Caveat.* It is impressive how wrong we can be about the future. In 1903, just before the Wright Brothers’ flight at Kitty Hawk, physicists were writing that heavier-than-air aircraft would never fly. Walter Lippmann commented in his column of April 27, 1948, in *The New York Times* that the Arab-Israeli conflict was “one of the simplest and most manageable.”

We can only speculate about how much the results of studies of leadership, popularized in college courses, best-selling books, and the mass media, contribute to the implicit theories of leadership espoused by college graduates—our future leaders. For the students believe that the productivity and morale of workers depend on leaders who express concern about the work to be done, are participatory, and offer praise and rewards for good performance (Graves, 1983). Would these same three clusters of leadership behavior have emerged

among college students in 1950? In 1950, whatever was produced profitably could be sold. The largest companies were manufacturers, such as General Motors. In 2007, the profitability of the largest firms—retailers like Wal-Mart—depended on satisfied customers and the ability to negotiate lower prices with suppliers. Would students today have the same prosocial attitudes and the same cynicism were it not for continuing scandals in business and government? The predictions about leadership and management in the year 2000 made in the mid-1960s and a few years later erred mainly in that the predicted developments came sooner than expected (Bass, 1967c; Bass & Ryterband, 1974). The predictions made today are likely to be equally conservative. Evaluation of past national growth rates by Franke, Hofstede, and Bond (1991) showed that individualistic, entrepreneurial, and innovative societies such as the United States tend to be disadvantaged in growth rate, compared with more collectivistic and bureaucratic societies such as Japan. However, since the 1990s it has been the latter type of society that has been disadvantaged compared to the former (Franke & Barrett, 2004).

## Expected Developments in Leadership Research

---

Paradigm shifts that took place between 1975 and 2005 are likely to settle into new concentrations of research effort. For instance, there is likely to be more research on transformational factors such as charismatic and inspirational leadership and on the cognitive processes involved in leader-subordinate relationships. In addition, there is likely to be much more sorting out of the personal and situational processes that influence leaders and followers, leading to the possibility of finding generalizations that apply to any leader and to any follower. Controlled survey and laboratory studies will increasingly extend to a wider array of methods. In the same way, issues will be broadened by the cross-fertilization of interests of the behavioral, social, and political sciences. Contributions to the field of both substance and methods from sources outside North America will increase. Concerns about the equitable distribution of power will be increasingly shared with concerns about the equitable distribution of information.

There is also likely to be increasing consolidation, as well as reanalysis, of earlier findings about leadership and the outcomes of leadership that questioned whether various contingencies were merely transient phenomena. The cultural, social, and economic changes that took place in the last half of the past century may require, as Tucker (1983) suggested, a reexamination of the instruments, structures, and relationships established earlier. Leadership researchers will need to consider whether their purpose is to make a contribution to theory or to application. If their intended audience is academia and their purpose is to make a rigorous addition to understanding, they may find there is less application of their work to human resources management, in contrast to possibly more messy broader empirical results (Weibler & Wald, 2004). Researchers will be paying more attention to the substance than the shadows (Bass, 1974). *Anything that can be meta-analyzed will be meta-analyzed.* Van de Vall and Bolas (1997) looked at the extent to which 120 Dutch policy research projects had an impact on organizational decisions. According to interviews, the impact of the findings had more effect on decisions if they were empirically grounded rather than based on theoretical constructs.

As new nations become complex industrialized societies, much will be learned about the leadership and management that emerge. These factors will need to fit with the cultural realities of the different nations. For instance, the new leadership styles emerging in China as a leading global market economy will be affected by the collectivism inherent in China's rich 3,000-year-old philosophical heritage (Liancang, 1987).

## Considerations in Looking Ahead

---

Six considerations guide our peek into the future of research on leadership and its applications: (1) extrapolation from the past, (2) societal changes, (3) new technologies, (4) organizational trends, (5) changes in organizations, (6) changes in personnel practices, (7) new paradigms.

### ***Extrapolation***

First, we look ahead by extrapolation from the past. For example, much of the course in the 2000s and beyond has been set by the trend that began in the 1950s and 1960s toward more longitudinal research rather than onetime, cross-sectional studies. Already confirmed in the 1950s and 1960s were the importance of the computer; the needs for challenging work and flexible organizations; faster communications; and more teamwork, diversity, temporary organizations, and simulation for decision making and training. Mass production and large inventories were beginning to be replaced by deliveries of just-in-time supplies and production for specific customer orders. Drucker (1994) noted that in the developed countries during the twentieth century, both qualitative and quantitative transformations occurred in the nature of work and in social, economic, and political systems. These transformations will continue through the twenty-first century. By 2010, Drucker (1998) foresaw, there will be no single dominant world economic power like the United States. To remain competitive, company leaders will need to have as good information about events and conditions outside their firms as internal reports and surveys provide about what is happening inside the firms. Retirement age will go up in developed countries, but the workforce will decrease in size as the productivity of knowledge and knowledge work continues to increase and provides the decisive competitive advantage.

### ***Societal Changes***

The substance of research on leadership is influenced considerably by what is happening in society as a whole. Leaders will have to adapt to the changing roles and relationships in society. Will government continue to enlarge despite the efforts to reduce it? (Beckhard, 1995). The majority of the American workforce has shifted from manufacturing to service and information work. Will manufacturing, services and information work continue to move offshore? More work is being done in smaller companies (Cascio, 1995). Organizational life in the public sector and health care have become of increasing interest. Opportunities to increase productivity, particularly its quality, have become more dependent on effective human relationships and the development of personnel. In the same way, when humans are replaced with robots and computers, more high-level personnel specialists, supervisors, and team development are likely to be required. Mandated in much of western Europe, industrial democracy remains voluntary in the United States, where it is increasingly becoming a fact of life through enlightened managements and employee ownership plans. At the same time, the percentage of the workforce in U.S. labor unions continues to decline, particularly in the private sector. Labor unions remain stronger in Europe, Australia, and the U.S. public sector. Nevertheless, despite unionization, affective organizational commitment to their firms by 635 Australian employees of Generation X, born between 1960 and 1975, when controlled for age, appears no different from that of 382 Australian baby boomers born between 1941 and 1959 (Hart, Schembri, Bell, et al., 2003). Low wages (paid in the United States to 25% of workers in 2004) remain acceptable to families because both spouses tend to be working. But the many

scandalous threats to the United States' civic infrastructure have resulted in a sharp reduction of public trust in government and business institutions (Gill, 1996).

Demographics are inexorably working their will. The current generation of U.S. employees is older and more diverse in sex, color, race, and foreign birth than the preceding one. Unlike in Europe, Japan, China, and parts of the Middle East, the United States' birth rate is not declining, and its population is continuing to increase very quickly due to continuing immigration. The trend continues toward more automation and self-service, and many immigrants are needed to fill lower-paying jobs in construction, manufacturing, agriculture, and service. Russian and other Eastern European professionals and skilled employees have migrated west in significant numbers. Illegal immigration of cheap labor from Mexico and elsewhere has reached crisis proportions. Flows of illegal immigrants from undeveloped Africa to developed Europe are occurring in the same way. Lower-paying jobs and the income gap between the rich and the poor continue to increase in the United States. The percentage of more relations-oriented personnel in the U.S. labor force has increased with the sharp rise in the employment of women. A plural society of varied ethnicity and race is replacing the ideal of a single melting pot.

The multinational firm, with its worldwide outlook, continues to expand. Multinational firms are just as likely to be headquartered in Japan, Britain, Germany, or elsewhere as in the United States. Dual careers and wage earners in the family are now the rule. Five of every six men over age 65 are moving into a new long-lived class of retirees. By 2010, Drucker (1998) expects, healthy people will stop working at 75. Foreign investment in the United States has risen sharply, particularly since 1985. A considerable percentage of U.S. personnel are now working for foreign-owned firms. There is an increasing need to remain competitive in the world marketplace with the Pacific Rim nations and with the rapidly growing European Union. The developed countries can remain competitive for a few more decades in the productivity of knowledge work (Drucker, 1998), although India and China are catching up fast.

Forms of government and economic systems from Chile to the Russian Federation changed in the 25 years from 1980 to 2005. Japan's industry is maturing; Britain's class structure is shifting. Ireland has gone from being one of the poorest to one of the wealthiest countries in Europe. The U.S. hegemony in 1945 in economic power is being challenged in 2008 by the European Union and East Asia. The expansion in international trade has been accompanied by rapid changes in exports and imports. In 2003, developing China exported \$30 billion in manufactured and high-tech goods to the developed United States; the developed United States exported \$3 billion in agricultural products to developing China. These economic and political changes are bringing new, continuing challenges for leaders at many levels in both countries in government, industry, and education. Continued social change is foreseen in the coming years.

The world climate continues to warm. The failure to control agricultural and industrial pollution continues, along with threats of pandemics of AIDS and avian influenza, a new strain of influenza resistant to medication available in 2008. Other threats include worldwide terrorism and the exploding populations in developing countries. Concern about corruption, business ethics, and the social responsibility of large corporations continues.

Leadership research and development reflect these societal developments. Mentoring will play an increasingly important role (Zey, 1988). Furthermore, a premium will be placed not only on junior managers' abilities to deal with the human factor but on attention to quality and costs. More statesmanship and an international outlook will increasingly be required of senior executives, who also will need to remain vigilant in the face of mergers and hostile corporate takeovers. Political leaders will increasingly need to learn how to negotiate and cooperate internationally in a competitive and sometimes hostile world.

*Work/Life Balance.* Households with both husband and wife working full-time as well as households with single parents have focused attention on balancing the needs of work with those of home and family.

Johnson & Johnson introduced its Balancing Work and Family program in 1988. It was seen as beneficial for recruiting and retention (Cole, 1998). In 1996, of 1,050 employers surveyed, 68% provided flexible scheduling; 86%, child care; 30%, elder care; and 23%, adoption benefits. Other firms were arranging job sharing and compressed work-weeks, help for spouses of relocated employees finding employment, and other benefits for help with home and family. Family friendliness was seen as a strategic objective (Vincola, 1998). Family-friendly corporations have been found to increase shareholder returns, according to an analysis by Cascio and Young (2005) of the 100 Best Companies for Working Mothers. Fathers are taking on more household and child care duties. A combined work and family life is an increasingly common experience for children that is shaping their attitudes (Riggio & Desrochers, 2005).

*National Security.* The increased importance of the highly equipped and trained individual soldier and small teams in the all-volunteer armed services will continue the need to promote stability and cohesiveness through effective leadership. In 2025, U.S. military thinking will need to make strong use of the political, economic, and social aspects of national security. Training and resources will need to be invested in peacekeeping as well as fighting war. More focus will be needed on small-scale interventions with greater mobility, agility, flexibility, and speed of strategy and decision making. Unless the major confrontation in the Middle East continues, overall, the active U.S. defense forces could be limited to three army divisions, three aircraft carrier battle groups, and four fighter wings. Much more may be invested in small, mobile special operations teams. A robust reserve force may be necessary, as might strong intelligence and understanding of foreign cultures and governments. What is predictable is less dependence on big force-on-force threats and conflicts and more dependence on special operations, airlifting, and close air support, together with diplomacy that integrates the use of U.S. and allied forces. These changes will make us well prepared to deal with the threats of terrorism and guerrilla warfare (Bass, 1998; D. Smith, Corbin, & Hellman, 2002).

Special operations teams in large numbers will replace the big military forces. Their missions are intensive, often secret, highly focused, and usually swift, stressful, and hazardous. Their members are cohesive “bands of brothers”—style heroes who are daring, imaginative, highly trained, and highly disciplined. They exploit short-term opportunities, surprise, weaknesses, and unpublicized vulnerabilities in the well-defended, much larger, and stronger-opposing forces. Whether army Rangers, navy Seals, British SAS (or guerrillas as in Spain or Russia in the past), the teams are led by extraordinary leaders who think “out of the box.” Their leaders need to learn more without postponing decisions, to adapt shrewdly without losing focus, to understand their opponents as well as themselves, and to command while maintaining authority and mutual loyalty. Both teams and leaders need to combine intellectual with physical courage, daring with patience, sacrifice with achievement, endurance with change, and attention to detail with openness to new approaches (Leebaert, 2006, pp. 7–11, 585–587).

International cooperation, multinational alliances, and astute diplomacy will be needed more than ever. Competitive market forces, population pressures, accelerating technological advances, and rapid societal changes further reduce the tolerance for laissez-faire leadership. But care has been taken to avoid a drift back to the promotion of autocratic behavior in the guise of active leadership. Presidents Ronald Reagan and George W. Bush both breached the constitutional limits on the powers of the president in the name of defending the nation against threats to national security. Paradoxically, they both sought to promote democracy abroad by upsetting the constitutional balance of the courts, Congress, and the executive branch at home.

## ***New Technologies***

A new managerial mindset is needed. The diffusion of new technologies makes innovation a competitive requirement. A premium has been placed on organizational learning. E-commerce, e-retailing, and online transactions with suppliers and customers increase revenues and reduce costs (Hitt, 2000). Networks of personal computers and interactive programming greatly increase the speed and opportunities for survey studies and the experimental manipulation of leader-follower variables. Advances in miniaturization and telemetry will no doubt be put to good use in the direct observation of neural reactions and nonverbal leader-follower interactions (Schyns & Mohr, 2004). As electronic mail crosses oceans and cultural boundaries instantly, leaders face new opportunities and challenges. Behavioral research on information systems is stimulated. Complexity theory suggests that the order, innovation, fitness, and decline of an organization depend on its networks inside and outside the organization, whether they are closer to or farther from the organization's technological core. Leaders should help to build and maintain these networks (Marion, 1999). Kahi, Sosik, and Avolio (2003) predicted that with the Internet, some organizational boundaries will disappear. Increasingly, consumers will communicate directly with peer suppliers through networks such as eBay. Hierarchical systems will be revolutionized by networking.

E-technology can bring both positive and negative consequences. It can foster e-leadership and virtual teamwork and promote close monitoring of employees. Spreitzer (2003) sees virtual teamwork continuing to replace face-to-face supervision with more remote management. Virtuality reduces the need to travel, increases round-the-clock operations in different time zones without the need for shift work, and minimizes diversity problems. But it may foster feelings of isolation, cross-cultural misunderstanding, and reduced identification.

*Computerization.* Fifty years ago, Leavitt and Whisler (1958) predicted that by the 1980s, computerization would change the role of management and leadership in organizations. Much of the routine decision making and reporting by middle management would be computerized. Information technology would replace much of the need for the traditional middle management role. Much of what was predicted came to pass. The world of computerized management information systems and the change in organizations came by the 1980s, as forecast. Middle management was squeezed out, as Leavitt and Whisler predicted, because senior management could be linked by computer directly to lower levels of supervision and to operations. Employee empowerment, collaboration, and teamwork also reduced the need for frequent managerial decision making and intervention (Kielson, 1996). Byrne and Zellner (1988) estimated that more than a million U.S. managers and staff professionals lost their jobs during the 1980s and that more than a third of middle-management positions were eliminated. The tenure of the average manager in a single firm, which was 12 years in 1970, had been reduced to seven years by 1990. By that year, much of the information processing formerly done by management and staff had been taken over by computers. Information technology departments were organized to maintain and modify what was needed.

*Leadership and the Information Revolution.* According to Cleveland (1985), the character of the leadership role is systematically changing under the shock of the information revolution. This revolution is evidenced by the rapidly changing distribution of the U.S. workforce. In 1920, 9% of the workforce was engaged in knowledge and educational services; in 1955, 29%; and in 1975, 50%. In 2000, it was estimated that 66% of the workforce was involved in such services. The generation, communication, storage, and retrieval of information have been increasing exponentially in speed and amount. Older approaches to getting work done may provide little guidance for the future.

Six interlinked characteristics of information have radically altered the leader-follower relationship. The agenda for research on leadership entails dealing with these properties of information: (1) Information is expandable. The more we have, the more we use and the more useful it can become. Information is not a scarce resource; only time and the capacity of people limit its growth. (Of course, it is possible to be

overloaded with information so that decisions based on it become delayed or less than optimum.) (2) Information is compressible. It can be concentrated, integrated, summarized, and miniaturized in its manipulation and storage. It requires little energy and the depletion of few physical resources. (3) Information can replace land, labor, and capital. Whole libraries can be packed into a computerized data bank. Automation replaces people. Organized data reduces localized inventory requirements. (4) Information is highly transportable. Telecommunications makes physical meeting sites unnecessary. People geographically distant from one another can work together in virtual teams. According to Kahai's (2000) surveys of senior executives, virtual teams are among the top five challenges for organizations to address in the future, along with the search for workers best suited to staff virtual projects. (5) Information is diffusive. It leaks. Despite efforts to maintain secrecy, the leakage may be wholesale and pervasive. (6) Information is shareable. An information-rich environment is "a sharing environment ... the standards, rules, conventions, and codes are ... different from those created to manage the zero-sum bargains of market economics" (Cleveland, 1985, p. 32).

The information technology revolution enables organizations to solve problems and share innovations with agility and speed by connecting the collective knowledge of their members. Ready access to marketing, production, employee, and customer information will be important for businesses to remain competitive. By 2025, it is estimated that 60% of work will use equipment and operations that did not exist in 2000. Future managers will attend more to operations, products, and outputs. They will coordinate their subordinates rather than telling them what to do. Again, they will coordinate rather than direct consultants, contract workers, and temporary employees outside the organization (Kahai, 2000). Networks of inside and outside organizational members will become more important to managers and leaders (Ronfeldt 1993). Before the information revolution, managers faced the possibility of too little information; now they are faced with information overload. In managing operations, information about objectives without clear boundaries as they affect decision-making processes can be treated as "fuzzy sets" of objectives instead of the less realistic single objective function. When involved with different sources of information, the multiscaling of categorizations can be applied. Computer mediation enhances the speed of communication and interaction between leaders and followers (Fischer & Manstead, 2004).

*Age-Status Imbalance.* Younger managers and junior officers are likely to have grown up with the rise of information technology. Older senior executives and senior officers are less likely to have developed "hands-on" experience with the personal computer, the Internet, and the Web. Older executives grew up with relative information scarcity. Now they have to deal with an overload of information. Computer-challenged managers and leaders who are not young enough to have grown up with computers are being helped with short courses, self-training, and coaching (Fleener, 2004). Computer literacy is becoming universal and is being instituted faster in the developed world, more slowly in the developing nations. Computer training is furnished in elementary, secondary, and higher education as well as virtually and at work-places.

## ***Changes in Organizations***

*The Future of the Hierarchical Organization.* Like many, Helgeson (2005) argued that top-down power is obsolete and will be replaced by networking. Nonetheless, in agreement with Leavitt (2005), some form of top-down hierarchy will remain in most organizations into the foreseeable future. As Leavitt noted, such hierarchies will persist even though we don't like them. They will continue to be further modified substantially by the humanist movement and strengthened substantially by the systems movement. We need to learn how to live with them as they are softened by the humanizing changes occurring; at the same time, the controls are being hardened in organizations by modern information technology. We need to reconcile

personal growth and fulfillment inside the hierarchy with the “roiling, multi-directional storms” of internal and external “storms of change” (Leavitt, 2005, p. 11). Hierarchy is unpopular in democratic societies because it generates dependence and mistreatment, blocks interpersonal relationships, and provides those at the top with power to become greedy and corrupt. Hierarchies may be slow, unresponsive, and inflexible. Those at the bottom may suffer from violation of democratic values, while those at the top may suffer from intrigues and conspiracies, cronyism, and personal and physical insecurities. Nevertheless, organizational hierarchies are here to stay. In contrast to the alternatives, they are efficient. Yet research continues to be needed on how they can be improved by further humanization and systemization.

*Organizational Change.* The very purpose of an organization is to provide reliability, predictability, and coordination to its constituent parts. Nevertheless, its environment continues to increase in turbulence, and continuing responsiveness, flexibility, and change are required. Attention to both stability and change in organizations will continue to be required, with efforts held together by good communications. Hierarchy has been changed with the participative management and the team approach of the *humanizers*, and with the rise of operations research, information technology, and analytical managing by the *systemizers*.

*The Case for Further Humanizing.* Although humanizing and systemizing are two opposing approaches to modifying organizations, both are needed for improvement. “Organizations used to be [discussed] as pieces of engineering, flawed pieces maybe but capable of perfection, of precision, of full efficiency designed, planned and managed ... [with] control backed by authority. ... The new language of organization is about networks and alliances, adhocracy and federalism, shared values ... and consensus ... options not plans, the possible rather than the perfect, involvement instead of compliance, political systems (rather than) engineering ... leadership rather than management” (Handy, 1994, p. 7).

Humanizers push for less hierarchy. As predicted by Bennis (1992, p. 3), traditional hierarchies are being modified by “networks, clusters, cross-functional teams, temporary systems, *ad hoc* task forces, lattices, modules, matrices.” Tall organizational structures are flattened. Combined with cost-cutting efforts, mergers, and acquisitions, the flatter structures have contributed to a decrease in the number of managers in the resulting new type of organization (Tomasko, 1987). The number of layers in management hierarchies continues to decrease, with larger spans of control for those who remain.

In an expanding economy, newly formed firms can absorb most of the managers made redundant in their former companies. But the decline of the percentage of managers in the U.S. workforce from its high of above 10% in 1980 is expected to continue well into the twenty-first century, exacerbated by the stock market bubble at the beginning of the millennium and the downturn in the economy in the three subsequent years. A career in a single firm from entry to retirement can no longer be counted on. Managers are redirecting their attention more toward personal goals and capabilities. The psychological contract of managers’ loyalty to the firm and the firm to the managers will continue to erode (R. Hirsch, 1987; Marks, 1988). The new contract provides managers with career-enhancing but impermanent opportunities. Managers need to take responsibility for their own careers. There is less status than before in working for a Fortune 500 company. Although 2,000 managers from many different corporations said that there was more than a 100% difference between the top performers and those below average in performance, the actual difference in pay between those at the same organizational level was 5% to 10%. Opportunities for promotion have decreased as layers of management have been reduced. To replace these motives for remaining with an organization, an organization needs to identify whom it wants to retain. Opportunities for involvement, recognition, and development need to be provided. For example, younger managers can be assigned to action learning projects. Organizations can be made more attractive through less bureaucracy, more flexible hours, and a greater sense of ownership (Mason, 1996). Among others, Clegg (1990) saw the need for organizations to move away from ratio-nalistic,

deterministic, and bureaucratic forms of organizing, toward more flexible, fluid, and values-driven forms. Decisions have to take into account individuals' values, emotions, and preferences as well as logic and empirical considerations. The individuals include suppliers and consumers outside the organization (Maas & Graf, 2004).

*The Case for Further Systemizing.* Systemizers support hierarchy, consistency, discipline, and order. Humans are just another resource amid these factors for the organization. Systemizers want to control, regulate, and reduce variability. They prefer to substitute machine performance for human performance and artificial intelligence for human thinking. They favor managing over leading. They are more supportive of hierarchies as the natural way to get things done than are humanizers. Both will contribute to effective organizational change into the foreseeable future. Boundaryless organizations illustrate a compromise between humanizing and systemizing. Such organizations contain fewer fixed structures and more temporary systems. Technology and systems are assembled as needed for specific projects (Davis, 1995). Boundaryless organizations are clusters of activities whose members and their goals are continually changing. Projects are more significant than positions (Kanter, Stein, & Jick, 1991). *Dejobbing*, or unbundling of work, illustrates another such compromise. Instead of a permanent position—a bundle of tasks—to be performed by one person, various necessary tasks are done by people inside and outside the organization. The individual member is assigned various tasks at different times (Bridges, 1995). Generally, changes in organization—following sociotechnical theory—encompass both systemizing and humanizing efforts to improve a system and employees' work satisfaction.

*Issue Management.* During changes in an organization, an underresearched area is leaders' role in building the momentum of key issues critical to the change process and reducing the attention to other issues by manipulating the dimensions of the issues. As a big change occurs, members are cognizant of a stream of issues flowing continually and competing with other issues for members' attention. These issues of organizational change often involve internal changes rather than changes in the external environment. For organizational change to occur, leaders need to move members to attend to the important issues inside the organization in order to solve the problems they present (Dutton, 1988). Leaders can do this by increasing the *salience* of an issue in an ongoing stream of issues by emphasizing and publicizing it; the *ambiguity* of an issue by clarifying it; the *immediacy* of an issue by setting deadlines; the *interdependence* of an issue by incorporating others' objectives; and the *scope* of an issue by broadening its range of activities (Hietapelto, 1994). In nonprofit organizations, Hesselbein (2004), as leader of the Girl Scouts for 13 years and leader of the Peter Drucker Foundation for the same time span, noted three particular challenging issues for nonprofit organizations. First, leaders of change must be developed with a moral compass that works full-time; they must be healers and unifiers who embody the mission, live the values, keep the faith, and remain fully responsible. Second, such leaders need to reflect and embrace diversity in the board, management, workforce, clients, and customers. Third, such leaders need to be open to collaboration, alliance, and partnerships. Nonprofits need to be in equal partnerships with government and private corporations. A more general question for nonprofit organizations is why there has been so little controlled leadership research about them. Many nonprofit foundations are dedicated to leadership development yet provide relatively little for formal leadership research in the nonprofit sector (Riggio & Orr, 2004).

### ***Changes in Personnel Practices***

Another consideration that may help predict likely future developments in substantive research on leadership and its applications is the discernment of dissatisfaction with the adequacy of current personnel practices. According to a survey in early 1988 (Anonymous, 1988b), the needs of human resource management that were not being handled well at that time and were seen as requiring emphasis were succession planning, human resource productivity, and organizational design. Less important practices that also needed improvement were team building, the measurement of morale, performance aids, job design, the stress of career development, and outplacement.

*Matching Practice with Theory and Doctrine.* The importance of a trusting relationship between leaders and their subordinates has been stressed as a principle for effective leadership in many previous chapters. It has been U.S. Army doctrine since 1775, but practice has often failed to match theory and doctrine. For instance, mentoring of junior officers by superiors is a well-established doctrine, but 85% of junior officers reported that they had received their support from such counseling less than a week before the Officer Evaluation Report was due (Bass, 1998).

*Practices Endorsed by Popular Books.* Academics are often asked what they think about a popular best-selling book on leadership and are likely to regard it with disdain, as anecdotal and not as rigorous as academic research published in peer review journals. But practicing leaders and managers are more likely to have read or heard about the popular book. Fortunately, Dickson, BeShears, Borys, et al. (2003) found that the gap between popular and academic literature on leadership was closing. They summarized the models of leadership themes they found in 30 best-selling books on leadership. At least 10 of the books were written by prominent academics. As seen in the preceding chapters, the themes in the popular press are readily found in the academic literature. They include the importance to leadership of goal orientation, self-awareness, visionary leadership, building of teamwork, development of others, assessment of the organization and environment, and management of organizational culture. Followers also read the popular literature and may expect their leaders to behave accordingly.

## ***New Paradigms***

A last consideration is the possibility of new paradigms that can affect both future methods and the content of leadership research. In looking to the future, we must not forget the past. Leadership is a mature field of study (Hunt & Dodge, 2001, p. 436). Concepts such as transformational leadership have evolved through stages (Reichers & Schneider, 1990): introduction and elaboration, evaluation and augmentation, and consolidation and accommodation. We have already seen the rapid impact on leadership theory and research of the cognitive revolution in psychology. Of the most prominent academic theories of leadership from 1900 into the twenty-first century, information processing became very active only in the 1990s; charismatic-transformational leadership (the “new leadership”) became very active only in the 1980s; and trait theories, which had been very active before 1920, reemerged as very active in the 1990s (Antonakis, Cianciolo, & Sternberg, 2004). Developments in the mathematics of dealing with irregularities, reversals in trends, and seemingly chaotic conditions may be applied to modeling the natural discontinuities in leader-follower relationships (Lord & Maher, 1991, p. 195). The physical sciences may suggest new ways of looking at short-lived phenomena—for example, the emergence of instant leadership in a crisis followed by its equally instant disappearance. The willingness to accept two distinct ways of dealing with the same phenomenon, as is common in wave and particle physics, may lead leadership theorists to simultaneously treat the leader’s and subordinates’ different

rationales for what is happening around them. Cause-and-effect analyses may be seen as the exception to mutual effects between the leader and the led. The 1980s saw an upsurge in interest in upward influence (see, for example, Kipnis & Schmidt, 1983), which has continued. It is likely that a greater number of future studies will be conducted of the reciprocity involved in the effects of upward and downward influence, as was done by Deluga (1988–1988a), who showed that subordinates' upward influence is depressed more by transactional than by transformational leaders. Generally, we are likely to see more work on how leaders influence *and are influenced* by the individuals and teams they have been elected or appointed to lead. Hollander (1958) focused importance on the follower in the emergence of the leader. But the follower needed to be active, not passive (Offerman, 1997). “We are content to follow when we lead the way” (Homer, c. 750 B.C.E.).

Societal, technological, and organizational changes call for new ways of thinking, the importance of creating new knowledge, and its diffusion and utilization in the organization. Many organizations consider their personnel as human capital assets accruing from their investment in human resources (Hitt, 2000). In contrast to regarding employees as assets to be developed and retained, another strategy is hiring temporary workers. A firm's workforce and costs can be expanded or contracted depending on its needs. Or whole functions such as payrolls can be contracted out. The workplace can be replaced by work at home, with subordinates linked to supervisors and colleagues by e-mail and telephone (Challenger, 1998). Faced with global competition, firms will put an emphasis on innovation, flexibility, and responsiveness. Leaders' attention will shift from tangible to intellectual resources (Dess & Picken, 2000). Attention will also continue to be paid to the company image, reputation, political connections, and strategic flexibility (Hitt, 2000). Methodological and substantive issues will broaden. Korukanda and Hunt (1991) see conflicting paradigms about leadership that may be combined. For instance, leadership research can be objective or subjective. The *objectivist* view assumes that leadership is a natural object—a concrete reality amenable to quantification. Understanding accrues from the discovery of facts about leadership and its processes and relationships. Inferences are drawn about the statistics of the average individual. The *subjectivist* view is that leader and leadership are convenient labels or fictions that facilitate sense making for the observer or for introspection. Results are usually qualitative. Self-awareness and self-improvement are of central importance to the information gathered. *Holistic* leadership demonstrates the subjectivist approach. The leaders of the Body Shop, for instance, focus on organizational processes with a systems view of interactions between people in their various roles and relationships. They keep the big picture in mind and practice empowerment. The senior managers refer to themselves as support staff. What the people in their franchised stores do is more important to the business than they are. Self-awareness and self-improvement are stressed. A new paradigm may combine the objectivist and subjectivist views to help understand the phenomenon better.

In the public sector, government agencies will ideally become more empowering and supportive rather than serving; competitive but not monopolizing of the delivery of services; mission-driven rather than rule-driven; results-oriented; meeting the needs of the client rather than the needs of the bureaucracy; likely to run surpluses rather than deficits; market-oriented, anticipatory, participative, and decentralized (Gore, 1993; Osborne & Gaebler, 1993). Change is also appropriate if it is creative and humane and there is a dedication to public service (Denhardt, 1993). Research, graduate education, and empirical studies in the United States have had strong influences on public administration in Britain, Belgium, the Netherlands, Germany, and Scandinavia but not in France, Spain, or Italy (Nelissen, 1998). It is proposed that by 2015 diplomacy between nations will not be limited to diplomats, but, thanks to the Internet, “diplomacy” will include governments and NGOs as well as individual citizens from the general public of the nations involved. Efforts to promote such virtual diplomacy have already been initiated (United States Institute of Peace, 2002).

*Changes in the Prominence of Leadership Theories.* From 1991 to 2000, of the 188 articles

published in *The Leadership Quarterly*, the most prominent were those dealing with charismatic and transformational leadership (34%), contingency theories (25%), and other, newer directions such as political leadership, strategic leadership, top-management teams, leader-Member exchange, and other multiple-level approaches. This was in contrast to fewer articles on trait theories and behavior theories of leadership. No doubt some of these will continue in prominence in the twenty-first century, while some will be replaced by newer entries stemming from new developments in genetics, technology, and European and Asian influences. In looking ahead from 1975 and 1995, Phillips (1995) suggested that, increasingly, theories and research about leadership schemas and cognition will modify trait, behavioral, and situational contingency theories.

## Methodological Issues

---

### ***Causal Relations***

In examining how leadership relates to outcomes, we continue to be faced with the question of what is cause and what effect. Thus, Kernberg (1984) stated that breakdowns in work effectiveness are erroneously attributed to failures of leadership. Yet often they are due to failures in systems and environmental, organizational, and group factors. Ineffective leadership is an effect rather than a cause. Supervisors may be supportive because they have productive subordinates, or subordinates may be productive because they have supportive supervisors (Bass, 1965c). Some investigations (see, for example, Greene, 1974) have shown that subordinates cause their leader's behavior. Other studies (see, for instance, Dawson, Mes-sick, & Phillips, 1972) have found that the leader's behavior is a cause of the subordinates' performance. Still others (such as Jacobs, 1970) have pointed to mutual causality in an exchange in which subordinates comply because of the leader's promise and the leader rewards subordinates for the compliance.

Although they still form a distinct minority, a sizable number of causal studies of leadership have appeared since 1970. Of 89 studies of leadership between 1970 and 1975 reviewed by Hunt, Osborn, and Schriesheim (1977), almost all the 17 laboratory studies but only 24% of the 72 field studies concentrated on causal relations. Despite the shortcomings of laboratory studies, they still make collecting causal data convenient—something that is much more difficult to accomplish in the field. However, it is edifying to see the increasing efforts to combine laboratory experiments with field studies and to search the field for corroboration of laboratory findings. But care is required, especially about the need for highly reliable measures. Regression strategies to determine cause and effect, such as path analysis, require highly reliable measures and strong enough relationships to permit the testing of alternative models.

### ***Laboratory versus Field Studies***

The five-year review by Hunt, Osborn, and Schriesheim (1977) of six major journals found that 72 field studies and 17 laboratory investigations focused mainly on supervisors' behavior and reactions to it. In the field, managers and their associates in a wide variety of organizations were the subjects of inquiry. In the laboratory, superior-subordinate relations were simulated by students. A fundamental question was whether the temporary nature of laboratory situations could faithfully represent the real-world relationship. Osborn and

Vicars (1976) noted a particular source of error in trying to generalize from laboratory studies of leader-follower relations: short-term laboratory situations tend to evoke the behavior of participants on the basis of available stereotypes. Extensive interpersonal contact in real life provides a more realistic basis for behavior.

Field studies, by their very nature, are fraught with internal and external threats to the validity of their data and measurements. Nonetheless, although laboratory experiments provide rigor and control, relying exclusively on laboratory studies should be avoided. As Meehl's (1967) paradox indicates, the more aseptic and controlled the laboratory study, the greater the precision of its outcome. In physics, greater precision increases confidence in the generality of the finding; in the social sciences, it does just the opposite. Ideally, laboratory studies should be planned in conjunction with fieldwork.

In controlled laboratory experiments, students are usually the subjects. When there is disagreement between the findings from such experiments and field studies of operating supervisors and employees, the greater rigor and control of the experiments often leads to greater confidence in their conclusions. They are preferred to field studies, although at times, field studies may obtain results that are closer to the truth. Thus, Fodor (1976) showed that the results of laboratory experiments, with practicing supervisors instead of students as participants, may be quite different from the results obtained in the field. In a rare laboratory study that utilized industrial supervisors as participants, Fodor found that, in comparison to control subjects, supervisors who were exposed to a group stress situation responded by giving significantly fewer pay raises and lower performance evaluations to compliant workers. However, field studies (such as Goodstadt & Kipnis, 1970) earlier found just the opposite; in those studies, compliant workers received significantly more pay increases under group stress than under control conditions. Nor were the laboratory results with supervisors consistent with the results that Fodor (1974) obtained with students. In all, we can expect to see an increase in efforts to examine and report laboratory experiences jointly with tests of the same hypotheses in the field.

### ***The Erroneous Law of Small Numbers***

The law of large numbers states that large random samples will be highly representative of the population from which they are drawn. The law of small numbers assumes erroneously that small samples will be similarly representative. If you have a sufficiently large sample, any difference is likely to be statistically significant. Testing the null hypothesis with a small sample of differences is a meaningless ritual (Cohen, 1994). Critics continue to voice their objections, but statistical significance testing of differences in results remains strong. Tversky and Kahneman (1971) demonstrated that the belief in the law of small numbers leads to highly inflated estimates of the amount of information contained in studies that use small samples. Schmidt and Hunter (1980) thought that much of the variation in the observed relationships in small samples could be considered random departures from a relatively simple overall generalization. The overall generalization does not need to be qualified by the particular situation involved. For example, in examining the relationship between individual competence and job performance, Schmidt, Hunter, and Urry (1976) showed that the samples were usually too small to produce acceptable levels of statistical power. Thus, if the true correlation between, say, scores on intelligence tests and the success of leaders is really about .35, any sample of 30 to 50 would yield a result that was statistically significant, from zero only 25% to 50% of the time. For a statistical power of .90, in order to reject statistically the zero relationship 90% of the time when the true correlation is .35, sample sizes of 200 or more are needed.

*Erroneous Interpretations of Small Differences.* In organizational research, we ordinarily measure the responses of individuals nested in their work groups. They are not random and are likely to be influenced by

their groups. In the same way, if the groups are nested in different organizations and influenced by their organizational membership, they are not random (Hanges & Shteynberg, 2004). They need to be treated by the variant approach (Dansereau, Alutto, & Yammarino, 1984), by hierarchical linear modeling (Hofmann, 1997), or by factor analysis (Muethen, 1994).

We may look at ten small-sample studies of scores on intelligence tests as they relate to leadership performance and find that half are statistically significant and half are not. Then we try to infer a reason for the different findings, when in fact the differences in the various samples are null and can be accounted for by the law of large numbers. The obvious implication is our need to be cautious in interpreting the meaning of situational variance when the data from the different situations are based on small samples. With contingent analyses using small samples, we will err considerably in rejecting the null hypothesis at the 5% level of confidence that no differences exist between different contingencies. Thus, Hunter and Schmidt (1978) noted that 28% of the time (at the 5% level of confidence) we could erroneously infer differential relationships between, say, intelligence and performance for 30 black leaders compared with 30 white leaders when no true difference exists.

The problem is far from academic. Hunt, Osborn, and Schriesheim's (1977) review of 89 reports found that 20% used samples as small as 30 or even fewer in analyses of data. The problem is compounded when we deal with leadership because ordinarily only small samples of leaders are available unless an organization is very large. Thus, we may need to reexamine carefully how much contingent results occur because of the low power of the sampling on which many are based.

Meta-analysis offers the opportunity to test how random are the various results obtained from the pool of small-sample studies of the same relationship and to arrive at a mean effect size for a given relationship. Here, however, we have to be cognizant of the inflation in the estimated effect size resulting from the adjustments for criterion unreliability and restriction in range. These adjustments may be highly unrealistic because they are based on assumptions about infinitely repeated measurements and samples with the full range of possibilities. Nevertheless, as has been noted, meta-analysis helps to tease out reliable contingent effects from those that are ephemeral, transient, or a consequence of random variation from a true mean relationship.

*Erroneous Conclusions from Small Effects.* Exacerbating the problem of small samples is the small size of many of the mean effects that emerge. It requires little in the way of systematic errors to distort or confound them. Systematic errors creep into the scene for a number of reasons (Webster & Starbuck, 1987). There are broad characteristics of people, such as intelligence, that appear to correlate with leadership and with outcomes when it is possible that there may be no direct relationship between the leadership and the outcomes. It may be that leaders tend to be more intelligent and that better outcomes require more intelligence, but there may be no direct link between the leadership and the outcomes. The failure to consider a contaminating third variable may result in the unwarranted blowing up of the importance of many small mean effects. Thus Woodward (1965) found that decision-making processes within an organization depended on the organization's technology and structure. Many subsequent studies elaborated on this finding. However, Gerwin (1981) showed that the modest results obtained tended to disappear when the size of the organization was held constant. Multiple-regression control variables are likely to become the rule, rather than the exception, in future research.

### ***Erroneous Conclusions from Convenience Sampling***

Convenience and feasibility have often dictated that a sample studied was actually a selected complete

subpopulation, rather than a random representation of a complete population. For example, all the supervisors in one Canadian department store are surveyed or interviewed, rather than a representative sample of all Canadian retail sales supervisors. Researchers still have to rely too much on convenience samples—samples that are most often obtained from larger rather than smaller organizations. The organizations must be cooperative and supportive or the data can be collected only on the outside or by an unobtrusive participant-observer. The combination of large organizations with accessible personnel systems, data banks, mailed surveys, and telephone interviewing will increase the possibilities of large-scale representative sampling.

*Single-Source Variance.* Convenience also leads to reliance on the same respondent for descriptions or evaluations of a leader's behavior and the outcomes of the leadership. Methods for correcting for the built-in correlation that is due to such Single-source variance have been developed. They include removing from the data the first general factor that is assumed to be due to the rater's propensities (Podsakoff & Organ, 1986), using one respondent to describe the leader and another to describe the outcome, and the variant approach of breaking the analysis of covariance into that among leaders and among between multiple respondents rating the same leader (Avolio, Bass, & Yammarino, 1988). However, so far, no one corrective action seems to be free of problems.

### ***Measurement Problems***

Lord Kelvin overreacted when he declared that in the pursuit of understanding, "if you can't measure it, you don't know what you are talking about." Handy (1994) retorted that when you cannot easily measure the phenomenon you wish to understand, it is wrong to disregard it if the phenomenon is difficult to measure or to argue that it is unimportant or that it doesn't exist.

*Need for Balanced Use of Standardized Measures.* A wide diversity of environmental, task, group, interpersonal, and personal variables have been employed in leadership research, each to a lesser extent, usually in multivariate fashion, as antecedent conditions, correlates, or moderators. Standardized scales for some variables, such as role clarity and role conflict, have been adopted, despite the many different but closely parallel conceptualizations of leadership style. Instruments such as Fiedler's Least Preferred Co-worker (LPC) scale and some form of the Leader Behavior Description Questionnaire (LBDQ) have dominated research on leadership in the past 40 years. This use of common standardized instruments has made possible a great deal of comparison across studies. It has already been noted how even small changes in instruments may lead to large differences in outcomes. But this concentration of leadership measures has kept the research establishment from looking at many other, possibly more important, aspects of leadership behavior. A balance is needed. On the one hand, researchers need to avoid inventing new measures of the same attributes when old ones with satisfactory reliability and validity are available. On the other hand, concentrated efforts with measures other than the most popular ones are needed, particularly if they can be joined in a nomothetic network with the well-used instruments.

*Limitations.* Elaborate theories may spin out tales of curvilinear complexity and multiplicative effects. Yet analyses over 50 years based on such efforts have usually added little beyond error to the prediction equation, even though the record is improving with more sophisticated measurements. Theory building should not go too far beyond what is empirically possible. Although contingency models are intuitively appealing (Yntema & Torgerson, 1961), contingency hypotheses (how X relates to Y depends on Z), Korman (1973) noted, should

be entertained in a theory only if they are empirically supported and necessary. Consistent with what has already been said about the erroneous interpretation of small differences, we may see a return to the positing of simpler relations based on larger samples.

Most observational studies use the single, mutually exclusive coding of the various categorizations of observed data. But such coding is no longer necessary. Statistical and computer programs are now available to analyze the multiple coding of multipurpose activities, multiple contacts, and simultaneous roles played (Martinko & Gardner, 1985).

*Cross-lagged* correlational analyses to demonstrate leader-subordinate relationships also have their limitations. For instance, Greene (1976a) noted that initial changes in leadership behavior between Time 1 and Time 2 may fail to be associated with parallel changes in subordinates during that same period, but they may show up between Time 2 and Time 3. Thus, three, not two, data collection points are needed. In addition, it is difficult, if not impossible, to rule out the possibilities of confounding uncontrolled changes in third variables on both the leader and the subordinate. Hence, the increased use of repeated measurements over many time periods, such as that reported by Howard and Bray (1988), is needed.

Yukl (1982) noted that factor-scaled questionnaires fail to include important items of leadership behavior that are correlated with two or more factors. Infrequent behaviors are also likely to be missed. Frequency is overemphasized while the leader's sequencing, timing, and style of execution are neglected. Often, the context in which the behavior appears is also missed. Richer information is also likely to be obtained from questionnaires if in addition to the items that purport to be objective behavioral descriptions, researchers use more items that tap the observers' gut feelings and estimates about the potential for future assignments of the leader being observed. We need to avoid, because of special interest in the leader-subordinate dyad, eliminating descriptions and evaluations of overall leader-group relations, for it is clear that both are important. Conversely, items about the interaction of the leader with the whole group fail to provide information about the leader's dyadic relationship with each individual member of the group (Yammarino & Bass, 1988).

*Simple versus Complex Hypothesis Testing.* We face a dilemma. On the one hand, "the chain of relationships between leader behavior and outcome is long and complex" (Lieberman, 1976a). Much of what needs to be understood is missed if we simply try to relate leadership behavior, particularly generalized leadership behavior, to final group outcomes. The relationship must be considered in terms of the group's norms, cohesiveness, and so on, as well as of the leader's characteristics. Members' expectations may be more important in determining group outcomes than anything the leader can do. Multivariate analyses, complex models, and contingent and moderator analyses need to be used. On the other hand, the limitations that have been noted in the measurements available, and the extent to which situational variations from one small sample to another, are likely to be random rather than true effects. At the same time, second-or higher-order interactions are likely to render inconsistent simple moderator effects from large sample to large sample. Thus, when faced with complex models, we need to be more open to experience and greater clinical understanding of data that demand less mathematical rigor (Bass, 1974; L. G. Cronbach, 1975). On the other hand, *structural equation models* (Gavin & Cheung, 2004) have become increasingly popular in dealing with both the direct and indirect paths between independent, intervening, and dependent variables. Each path or partial correlation corrects for the other paths and helps understand the network of relations.

Models may be built a priori on the basis of logic and prior information, and then tested to see if they fit the data obtained in the test. Or models can be built a posteriori to fit the obtained data. There are problems with each approach. Korman and Tanofsky (1975) pointed out that a priori models are hard to use because of the difficulties of accurately estimating the necessary parameters. Yet a posteriori empirical models may be fraught with psychometric error. They may be likely to exploit random effects. Both kinds of models may be more helpful in identifying the important elements for study rather than discerning the final true relationships.

Field studies can reflect the complexities of the real world, but laboratory studies and their controls do not provide the solution to dealing with complexity. For instance, in the study of the effects of sex differences on leadership, the short-term, artificial nature of leadership created in the laboratory results in participants' relying on stereotypes that influence their responses to the leader. This reliance on stereotypes is less likely to occur in field studies in which leader-subordinate relations are long-term. The laboratory engenders exaggerated sex-role demands, and thus the effects of sex differences in the laboratory are not replicated in the field setting (Osborn & Vicars, 1976).

*Need for Qualitative Methods.* These methods may be more suitable for providing confidence in the results when complex hypotheses are involved. Bryman (2004) was able to enumerate 65 acceptable published qualitative studies of leadership between Pettigew (1979) and Vangen and Huxham (2003), although the historical and management literatures are replete with many more qualitative comparisons. Additionally, Amabile, Schatzel, Moneta, et al. (2004) completed analyses of daily diary narratives written by leaders' subordinates.

Bryman, Bresnen, Beardsworth, and Keil (1988) examined the situational factors that construction project leaders take into account when deciding what style of leadership to adopt. Interviews revealed that site managers continually adjusted their leadership styles to suit varying circumstances, such as time pressure, their subordinates' personalities, and the degree of control they had. The authors suggested that qualitative research can uncover a wider array of contextual variables. Such variables are grounded in people's experiences and therefore are more accessible to leaders and researchers alike. The search for meaning and significance in the behaviors of leaders and their followers, as well as in related events, is aided by qualitative research (Van Maanen, 1979). People's actions can be explained in terms of the total context in which they occur instead of the isolated or manipulated elements within the situation (H. Smith, 1975).

Qualitative research is likely to begin with deductions from a theory or a set of general propositions (Orpen, 1987) and then to proceed as a detective might to track down patterns, searching for consistencies in the qualitative information. Qualitative research need not begin with precoded systems but can depend on analytic inductions (Strong, 1984). Creativity and controlled imagination are required to move from specific findings to general conclusions (Mintzberg, 1979). Thus, the movement is a circular process involving the search for and collection of specific data, development of crude hypotheses, and then the examination of the data (or new data) to see how well the inferred hypotheses fit the data (Brogdan & Taylor, 1975). More such qualitative research is needed and is likely to find its way into the study of leadership as the limitations of quantitative methods in dealing with organizational complexities become increasingly apparent (Orpen, 1987).

McCall and Lombardo (1978) advocated more leadership research using the ethnographic methods of non-statistical naturalists to detect the subtleties and nuances involved in the leadership process. Greater attention needs to be paid to unconscious motives that affect leaders' and followers' perspectives. Often, qualitative research can deal better with the art and craft of leadership than more objective qualitative analyses. That is, there is much art in leadership that is difficult or impossible to put into a test tube. Nevertheless, there is much regularity in this art that can be made understandable by detecting and describing the patterns that appear. Orpen (1987) regretted that, for the most part, qualitative and quantitative research are likely to parallel or remain independent of each other, rather than being integrated, even though they could do much to complement each other. This was demonstrated by Gibbons (1986), for example, who made use of both quantitative surveys and in-depth interviews of the same executives.

A risk in qualitative research is that we may learn more about the investigator than about the complex scene being investigated. Chafee (1987) noted the divergent conclusions reached by four investigators who looked at the same qualitative data about college presidents. The investigators' conclusions diverged, she argued, because the investigators came from different theoretical traditions: organizational theory, leadership theory, strategic

theory, and anthropological theory. The same key words had different meanings for them. That is, the researchers used the same terminology but drew different inferences from the same qualitative database. Ideally, studies need to *triangulate* qualitative with quantitative methods. They need to check the results of one against the other. Bryman (2003) was able to enumerate 11 such studies between Rosener (1990) and Voelek (2003). Rosener followed up a quantitative survey of woman managers to generate research questions that became the basis of a full qualitative study that followed. Voelek used qualitative data about university library managers to support and expand quantitative results about them.

Webster and Starbuck (1987) pointed to another handicapping bias in research on leadership. Within each research discipline—industrial/organizational psychology, social psychology, sociology, political science, educational administration, and so on—there are shared sets of beliefs, values, and techniques. The empiricists in each discipline prefer to measure certain sets of variables of consequence. Thus, the dimensions of leaders' and subordinates' behavior examined and the methods employed to do so continue to be narrow (Greene, 1976c). The narrowness depends on the disciplinary background of the investigator. There appears to be relatively little consensus on substantive issues of consequence (Campbell, 1982), especially across interdisciplinary boundaries. Despite this lack of consensus, we are likely to see, in this century, an increase in the use of common methods in the study of leadership, depending on whether the investigator is a behavioral, social, or political scientist or an historian, but one with a continuing wide range of substantive foci.<sup>1</sup>

### ***Dealing with Systematic Biases***

*Leniency.* The need will remain in future leadership practice and research to guard against leniency bias. Perlmutter (1954) found that the greater leaders' abilities to influence other group members, the greater the number of favorable traits applied to the leaders—and the more socially desirable the traits attributed to them. Schriesheim, Kinicki, and Schriesheim (1979) demonstrated the strong leniency effect in the LBDQ-XII consideration scale. A specific leader will earn higher LBDQ scores from respondents who give favorable ratings to leaders in general. Similar leniency is likely to be found in related measures of leaders' relations orientation, participation, and support. Leniency may account for much of the association between subordinates' descriptions of their leaders' consideration and the subordinates' satisfaction. Measures of the initiation of structure that are free of coercive items and measures of consideration that are free of leniency (if such is possible) will provide more precise measurements against which to pit situational and personal variables for study. The Multifactor Leadership Questionnaire's scales to measure transformational and transactional leadership appear to be relatively free of leniency effects (Bass & Avolio, 1989).

*Errors in Leaders' Self-Ratings.* Except for using it for personal development and expectations and exposing the gap between self-and others' ratings, future leadership research needs to avoid depending on self-ratings, as many studies still do. In earlier chapters, it was repeatedly pointed out that there is little or no relationship between leaders' self-descriptions and descriptions of them by their subordinates or superiors. Leaders' self-ratings and self-reports are suspect. Thus, in an intensive interview study and work flow analysis of 34 pairs of supervisors and subordinates, Webber (1980) found that the supervisors reported that they initiated almost twice as much verbal interaction with their subordinates as the subordinates perceived had occurred. At a considerably lower level, subordinates also overestimated the extent to which they initiated interactions with their superiors. Leaders' self-ratings have consistently been found to relate poorly or not at all to various dependent variables (Schriesheim & Kerr, 1977b). Most are probably contaminated by social desirability (Schriesheim & Kerr, 1974). They contain self-serving, self-vindicating biases and are likely to generate descriptions of what leaders think is expected of them in their organization and society, rather than an

accurate portrayal of their behavior relative to other leaders'. The manager who assures everyone that there is always full consultation on subordinates' problems since the manager's door is "always open" is not uncommon. Then there is the self-described "democratic" manager who announces that the organization is going to be democratic or else sanctions will be imposed.

No wonder so little correlation is found between subordinates' perceptions of what the leader does, what they think he will do, and what he should do, on the one hand, and the leader's self-reports on the same issues, on the other. Thus Rees and O'Karma (1980) observed that city department managers and their subordinates differed significantly in how the managers would behave in different situations described by the LEAD questionnaire. Holton (1984) reported similar discrepancies between leaders of a Cooperative Extension Service program and their staff subordinates. Nanko (1981) noted that although 1,800 elementary school teachers, using the LBDQ, judged that their supervisor was doing a poor job, each of the supervisors saw him- or herself as doing a good job. The correlations of responses from the two sources were close to zero. Burt (1984) found that 32 heads of hospital departments gave themselves better ratings on the LBDQ than their 379 employees gave them. In the same way, according to Dalessio (1983), working business students and their bosses disagreed about their bosses' leadership. As was noted earlier, supervisors see themselves as having bigger and more important jobs than their bosses say the supervisors have (Haas, Porat, & Vaughan, 1969). Leaders generally see themselves as more transformational than subordinates see them (Bass & Avolio, 1988). According to a survey using the Multifactor Leadership Questionnaire of a representative sample of 186 surface fleet officers in the U.S. Navy, the correlations of the self-versus subordinates' ratings of leadership were only .21 for charismatic leadership and .21 for individualized consideration (Bass & Yammarino, 1989). The self-subordinate correlations for the remaining five scales were close to zero.

In Birnbaum's (1986) survey of 252 college presidents about the effectiveness of the institutional leadership of the average presidents, their predecessors, and themselves, the presidents gave themselves a mean rating of 77.3; the average president, 65.6; and his or her predecessor, 52.0, on a scale of 0 to 100. A serious issue raised by these discrepant results is the reliance that so many studies of chief executive officers (CEOs) place on interviews with CEOs about themselves. Given the low or even zero correlations between what leaders do and their colleagues' descriptions of their behavior, we need to proceed with great care in drawing any inferences from leader-only data. In meeting with small informal groups of CEOs, I found that CEOs are likely to be highly and selectively biased in their self-descriptions. This is not to say that the leaders' self-descriptions are necessarily incorrect and the colleagues' descriptions of the leaders are necessarily correct. Rather, it is important for researchers to avoid depending solely on leaders' self-descriptions. Moreover, leaders obviously differ. Some are much more congruent than others in the extent to which their self-reports match those provided by their colleagues. Such congruence with their subordinates can increase the subordinates' morale (Browne & Neitzel, 1952), the quality of the leader-subordinate relationships (Graer & Schie-mann, 1978), satisfaction with communications (White, Crino, & Hatfield, 1985), and superiors' evaluations of the leaders (Bass & Yammarino, 1989).

*Increasing the Validity of Self-Ratings.* Various techniques help curb inflated self-ratings: (1) In forced-choice methods, a self-rater chooses from pairs of self-descriptions that appear equally favorable or socially desirable but in which only one of the pair is valid for prediction or assessment purposes. (2) Self-raters may be asked to complete a questionnaire as if they were applying for a job. Then they are asked to complete the same questionnaire as if it were to be used by a trusted adviser. (3) Self-raters are attached to a *bogus pipeline*, a physiological apparatus that purportedly is able to register their genuine responses. A meta-analysis of 31 studies demonstrated that, compared to a control group without the bogus pipeline, socially desirable self-ratings were lower (Roese & Jamieson, 1993).

Training and research efforts will, over time, make greater use of superiors', peers', and subordinates' ratings

and less of leaders' self-ratings of their purported behavior. But, as will be discussed later, leaders' own perceptions, attributions, cognitions, and opinions will continue to be of considerable research importance as a link to what leaders actually do.

*Other Systematic Errors.* Ratings of leaders and followers are built around memories of their behavior. What leaders or followers have actually done may register less in current evaluations of them than false memories of what they did. Past events may be remembered as far more important than they actually were. The "Rashomon effect" is illustrative: four people witness the same violent event; each later recalls a highly differing version of the same event. In future, we should expect further studies of the effects of false memories on ratings and evaluations.

Among all the biases in perceptions and ratings, a few are most salient in the study of leadership. One such tendency is for subordinates to see more good in their own relations with their leader than in the quality of leader-subordinate relations they observe elsewhere. Adams, Prince, Instone, and Rice (1984) found that when 400 freshman cadets at West Point described good leadership incidents, the incidents usually involved their interactions with their leaders, whereas the cadets perceived bad leadership as occurring mainly in other units. This perception may be part of the larger phenomenon of "we-they" bias, that is, seeing "our group" as better than "their group." In the future, the use of multiple sources of information with demonstrable convergent validity and suitable corrections of such self-other bias will be more routine.

Consistent with earlier work,<sup>2</sup> Larson (1982) and Larson, Lingle, and Scerbo (1984) demonstrated that raters' responses to LBDQ descriptions of leaders who were viewed in action on a videotape were affected by whether the respondents were cued before viewing the tape about whether the leader they were looking at was considered effective or ineffective. Such cuing before they observed the videotape of the leader in action moved them to selectively encode into memory different kinds of information. Given their implicit theories about the effects of initiation and consideration, the raters saw the supposedly effective leader as higher in both. Binning and Fernandez (1986) showed that another bias in the LBDQ descriptions was due to the differential availability to the rater's memory of the different items. The availability of items to the rater's memory is greater the more familiar, dramatic, specific, positively salient, retrievable, and imaginable the items of leadership behavior in the LBDQ are. An average correlation of .48 was found between the extent to which an item of leadership behavior was seen as descriptive of a leader and the availability of the item to memory. The correlation was higher if information about the leader was more limited. In the future, standardized corrections in the LBDQ and similar questionnaires are likely to be introduced to adjust for these availability biases.

An aspect of the bias in self-fulfilling prophecy was detected by Schoorman (1988), who verified that the supervisors of 354 subordinates who had originally participated in the decision to hire them tended to bias their subsequent performance appraisals in a favorable direction if they had supported the decision to hire. They tended to do the reverse if they had opposed the decision.

These consistencies among persons because of their individual predilections and the tendency to be influenced by personal memories reinforce the need to have multiple sources of data about leaders and outcomes attributed to the leaders. Or else, as was mentioned earlier, corrections need to be made to allow for single-source bias when only a single source of information is possible. An example is when a dyadic analysis of the leader with each subordinate calls for each subordinate to describe both the felt quality of relations with the leader and how much the subordinate is committed to the organization's goals.

Phillips and Lord (1986) noted that leadership questionnaires need to be designed according to the type of accuracy being sought, that is, whether it is behavioral or classificatory. Also, the theory (or lack of it) underlying the questionnaire needs to be taken into account when the questionnaire is employed, to assess interventions that attempt to change leadership behavior.

## *Dyadic versus Group Relations*

At times, the need to describe leaders' performance in terms of their one-on-one relationships with each of their subordinates is more conceptually pleasing than empirically fruitful. However, the dyadic approach can be applied with considerable utility to a variety of research questions. For example, sanctioning, punitive leadership behavior seems to be the result, rather than the cause, of the inadequate performance of specific subordinates. It follows that dyadic analysis should reveal strong differential dealings of supervisors with their subordinates on the basis of leaders' differential judgments about each of their subordinates.

Indeed, we are likely to find a variety of important consequences stemming from Hollander's (1978) observation that leaders have "A" lists and "B" lists of subordinates. The As are closer, and the Bs are more distant. Work-oriented leaders are likely to relegate the more incompetent of their subordinates to the B list and to treat them more punitively. But the As will be expected to be more loyal and obedient and will be required to maintain higher standards of performance. However, person-oriented leaders may exert extra effort with their black sheep and may even think that their most competent subordinates are sources of conflict because their performance exceeds the group's norms. The linkages to Least Preferred Co-worker need to be investigated.

Several different approaches have originated, to tease out individual, dyadic, and group effects. One approach is to hold leader-group effects constant to see what happens within each leader's group. Vecchio (1982) obtained data on attitudes and performance from in-group and out-group members of 48 four-man military groups. Within-group leader-Member differences predicted attitudes, but only after between-group leader differences were held constant. Performance outcomes appeared to be unaffected by dyadic or group leadership. Katerberg and Hom (1981) used a stepwise hierarchical regression analysis. They first determined the contribution of each of 31 U.S. Army National Guard units to LBDQ descriptions of the units' leaders, then the contribution of the individuals within the units. Although the effects of within-unit variations in LBDQ scores were stronger than between-unit variations, both significantly predicted the subordinates' reactions.

Still another approach uses an *adaptive process regression* technique that determines the artificially assembled groups of an original pool of subordinates that will result in the best possible predictions. The nature of these groups then gives the investigator an idea of which possible groupings may moderate the dyadic leader-subordinate relationship. Berkes and Rauch (1981) found such artificial clusters among 800 police officers. One moderating cluster of those officers operated under less specified procedures. Another cluster was younger, better educated, and more interdependent in their work. Less role clarifying and more participative leadership were required for satisfying the young, educated, interdependent officers.

The use of dyadic analyses of leaders' relations with individual peers, individual superiors, and relevant others will continue to increase owing to the continuing interest in leader-Member exchange theory (Graen, 1976) and its quantitative possibilities. However, allowance clearly has to be made for leaders not only to relate on some dimensions, at least, in the same way to every group member, but to the generation of effects that transcend the average member. For instance, an *assembly bonus effect* in productivity may be due to a leader's structuring the group as a whole, which goes beyond the contributions of the group's members.

*The Variant Approach.* As was noted in earlier chapters, the most ambitious, comprehensive, and possibly defensible effort, the variant<sup>3</sup> approach, was developed by Dansereau, Alutto, and Yammarino (1984), who used this method to reexamine the reports that originally supported the importance of the individual leader-Member exchange dyad over the leader-group relationship in how much negotiating latitude the leader

provides each member and the group as a whole. The analyses concluded that both individual member effects and group effects may be equally salient (Nachman, Dansereau, & Naughton, 1983).

The variant approach is a paradigm for formulating and testing theories that explicitly consider both the involved variables and entities—the individual, the group, and/or higher levels of analysis (Yammarino, 1988). The future will increasingly see its use to clarify: (1) the differences among leaders in their average leadership style (ALS); and (2) their vertical dyad linkages (VDL) or leader-member exchanges (LMX), as was done by Markham, Dansereau, Alutto, and Dumas (1983). More superior-subordinate communications will be profitably analyzed by the variant method (Dansereau & Markham, 1987). A higher level of effects may be examined, such as the effects of whole departments or organizations and their different policies on the leaders' relations with their group members as a whole, as well as with various individual members.

New nomological networks of variables will be clarified by WABA procedures. For example, a leadership behavior may be related or unrelated to two outcomes. Or the two outcome variables may be related, but the leadership behavior may be related to one outcome, not to the other. Another possibility is that the two outcome variables may be unrelated and leadership behavior may be related to one outcome, but not to the other. The leader's dyadic and group relations may affect the members' satisfaction but not the members' productivity, for instance. New moderator variables and contingency effects will be identified with WABA. One possibility is that variables are directly related; that leaders' behavior, for instance, directly affects outcomes. Another possibility is that a relationship between two variables (leadership behavior and an outcome, for example) is dependent or contingent on the values of a third variable, such as company regulations. This indirect contingency is a moderated effect. Here, leaders' behaviors could relate strongly to dyadic and group outcomes in departments with few regulations but not in departments with many regulations (Dansereau, Alutto, Markham, & Dumas, 1982).

## A Future of Variety

---

New approaches to the study of leadership will continue to proliferate. The method of choice for study and application depends on the way the leader-follower phenomenon is conceptualized. Among the most likely approaches are cognitive and information processing, phenomenology, motivation, psychodynamics, and behavioral observations and reports. At the one extreme are cognitive investigators who focus on perceptions, causal attributions, and expectations. At the other are behavioral investigators who concern themselves with stimulating conditions, behavioral repertoires, and reinforcements that are contingent on subordinates' performance. The vast array of possible variables to study must continually be pruned. For surveys and experiments to be manageable, researchers must single out for study different aspects of the total process of leader-follower interactions. But the models they construct that focus on one aspect or another are not necessarily inconsistent with each other. The potential exists for considerable integration of the models.

As noted in [Chapter 4](#), by the 1940s, a variety of methods was available to study leadership, including observation and time sampling, sociometry, position and office holding, analysis of biographies and case histories, and judged requirements for leadership. Measurements were being obtained from psychological tests, questionnaires, rating scales, and interviews. Dimensionalizing by factor analysis was possible (but time-consuming). Along with refinements in these procedures since the 1940s, promising new methods have emerged.

### ***Cognitive and Information-Processing Methods***

Applications of new methods (or new applications of old methods) have accompanied the emergence of interest in cognitive and information processes in lieu of descriptions of the behavior of leaders and followers. Since 1970, empirical examination has found a decline in behavioral and an increase in cognitive studies (Robins, Gosling, & Craik, 1999). In leadership reports, the focus is on leaders' and followers' schemas for actively organizing information and the scripts they employ to give specific meanings to situations. The making of meaning or sense making "is the process of arranging our understanding of experience so we can know what has happened ... what is happening, so we can predict what will happen" (Drath & Palus, 1994, p. 2). Prototypes help interpret the world of leadership. Information about specific situations is encoded, stored in memory, and retrieved in terms of category structures and inferential strategies (Pervin, 1985). Galbraith and De Noble (2004) presented a cognitive framework for historical leadership stories.

Cognitive-perceptual methods, first developed in the 1940s and 1950s to study learning and decision-making processes, the dynamics of personality, and counseling, were subsequently introduced into the study of leadership. These methods include protocol analysis, stimulated recall, and the repertory grid. In protocol analysis, individuals' thoughts, feelings, and emotions are recorded as they engage in the activity under investigation. With stimulated recall, an audio or video record of the activity or the protocol is played back, and the individuals describe more fully the thoughts, ideas, and feelings they had when the activity was in progress (Burgoyne & Hodgson, 1984). To construct a repertory grid, a respondent sorts colleagues, noting the categories used to differentiate them (Kelly, 1955). Coghill (1981) showed the profitability of studying the perceptual categories that managers naturally use to assess one another. He applied Kelly's repertory grid method with 90 managers to provide data to illustrate the importance of perceptual mediation, personal constructs, and implicit theories.

### ***Phenomenological and Perceptual Methods***

The methodology of another line of cognitive inquiry has been phenomenological. The inability to resolve the controversy surrounding Fiedler's (1967a) Contingency Theory after more than three decades of theorization and empirical research led Bar-Tal (1989) to argue that what may be most important in understanding leadership is to determine leaders' and followers' phenomenological fields rather than to continue to pursue a positivistic, mechanistic, or statistical explanation of their interaction. To expedite this methodology, the researcher may disclose as much about himself or herself to the focal leader as the leader does to the researcher. Basic emotional processes can then be explored, along with remote and accessible aspects of their respective lives. Barriers between the researcher and the leader to knowing and sharing are expected to be minimized in this way (Massarik, 1983).

If the focus is on perception or cognition rather than behavior, methods that exploit attribution phenomena can be applied with profit to the leader-follower relationship. As noted in earlier chapters, the behavior of leaders toward their subordinates appears to be strongly determined by the reasons (ability or motivation) the leaders give for their subordinates' performance—how much it is a matter of luck or of the situation or whether it is under the subordinates' control. In the same way, the subordinates' attributions of the reasons for the leaders' behavior will strongly relate to the subordinates' satisfaction. Leaders whom subordinates perceive to be incompetent but willing seem to be more forgivable than leaders whom subordinates perceive to be competent but unwilling.

As already noted, conscious perceptions can determine a leader's subsequent efforts. Thus Nebeker and Mitchell (1974) found that differences in leaders' behavior could be explained by the leaders' expectations that a certain style of leadership would be effective in a given situation. At the same time, subordinates' descriptions of their leaders' behavior may be distorted by their implicit theories about leadership, particularly when they lack real information about the situation and are therefore inclined to fall back on stereotypes (Schriesheim & deNisi, 1978). The use of cognitive, as opposed to exclusively behavioral, methods is likely to parallel the same continuing developments in psychology in general.

Still underutilized are sociometric designs, such as the "Work with" sociometry<sup>4</sup> of Stogdill and Haase (1957), which provides a measure of interaction structures that can be applied to a variety of research designs. Three-dimensional holographic sociometry (Bradley, 1987) is in its infancy. It is likely to have a promising future as it opens up the contributions of the sociometric structure of triadic relationships within an organization to the performance of leaders.

### ***Motivational and Psychodynamic Methods***

Documents, recordings, and protocols can be analyzed from particular theoretical perspectives and coding models based on motivational and psychoanalytical theories. Keyword coding of protocols provides a powerful tool. The projective inferential methodology, pioneered by Winter (1973) to analyze the needs and values of leaders from their speeches, documents, and biographical materials, was detailed in [Chapter 8](#). The approach is likely to provide important empirical support for and understanding of studies of charismatic and inspirational leadership. Less prominent is the inductive methodology that Demause (1982) derived from psychoanalysis. Demause argued that a group's fantasies, shared by the leader and his or her followers, which play a crucial role in charismatic leadership, can be detected from a psychoanalytic examination of the leader's and followers' speeches, documents, and body language. The group's fantasies can be teased out from the metaphors and similes that the leader and followers use, and body language, feeling tones, and emotional states can be significant. Thus the "killing" of bills and "dead" halts in negotiations are relevant to the psychohistorian, as are unusual or gratuitous word usages (in the 2004 presidential campaign, saying "the 'L word,'" for example, implied that "liberal" was a dirty word). Unusual repetition and phrasing in discussions, speeches, documents, and minutes of meetings imply potent messages for the psychoanalyst. Symbolism has obvious implications; even its absence during long periods without imagery may be symptomatic of the severe repression of the group's fantasy (Scheidlinger, 1980).

Increasingly, metaphors from science will be used for taxonomies, as, for example, Field (1989b) did in likening leaders to stars, pulsars, quasars, and black holes. (Stars communicate positive expectations to followers and induce positive performance. Pulsars communicate positive, but unsustainable and unrealistic, expectations. Quasars are pessimistic, but followers succeed despite them. Black holes' pessimism is a drag on followers.)

Zaleznik (1984) reviewed a number of promising schemes for looking at the "text" of leadership—the meanings, intentions, and motives that are subconscious as well as conscious in the spoken or written words employed. The deeper structure underlying the surface interactions of the leader and the followers can be discerned from thematic interpretation. Such interpretation requires grasping a multiplicity of complex conceptual structures in the text. These structures may be cultural or social forces or individual values, meanings, and intentions. They may be seen in the linguistic study of speech patterns or of the formation of symbols. Hidden meanings and unconscious ideas and fantasies are brought to light. Clues to what is hidden in the text may include: the percentage of positive, neutral, and negative words and phrases, emotional or

nonemotional; the percentage of references to the past, present, conditional, or future; the percentage of action verbs; the percentage of interruptions, hidden reversals, or recycling; and delayed responses and silences.

The formation of groups and movements can be organized around such shared fantasies and provide the basis for displacing personal inadequacies. For instance, Demause (1982) applied a psychoanalytical coding scheme to the Nixon tapes to complete a fantasy analysis of them. The analysis found that a leader's personal embarrassments can become substitutes for policy; goals can disappear, while actions become irresistible.

Psychohistory has been the psychoanalysts' exclusive turf. However, documentary analyses (House, 1988b) and survey methodology (Bass, Avolio, & Goodheim, 1987) are beginning to be applied to psychohistory. Indeed, if motivational analysis is to move off the psychoanalyst's couch, it will need to take individual, political, and social psychology, as well as relevant aspects of sociology and anthropology, into account to elucidate the performance of historical figures (Strozier & Offer, 1985). In the hands of psychoanalysts, psychohistory has been limited to an understanding of collective actions from an individualistic orientation. It has focused too much on neurotic mechanisms and the inner person, whose ideas and thoughts are interpreted by an analyst who is far distant in place and time from the leader (Gay, 1985).

Recourse to more objective methods that are also projective techniques is likely to move researchers toward establishing more confidence in the findings about the hidden and unconscious motives and the implicit theories of leadership that affect interactions. For example, Boal, Hunt, and Sorenson (1988) constructed a "Leadership Quotes" questionnaire. Respondents indicated whether each of 133 famous quotations (such as "People are more easily led than driven," "The world needs able men who can create and lead others," and "Happy the kings whose thrones are founded on their peoples' hearts" were related to leadership and whether the leadership was effective or ineffective. Multiple factors emerged that dealt with the direction of activities, influential interactions, legitimate power to lead, and initiation of structure.

In the future, we are likely to see more joining of motivational analyses of the biographies of world-class leaders, analyses of their speeches and writings, news accounts of their performances, and evaluations of them by historians and political scientists. Much of this joining is already to be seen, for example, in the work of House, Woycke, and Fodor (1988).

## ***Behavioral Methods***

Behavioral accounts are still the most popular. Purely behavioral explanations cannot be dismissed. One can look at leadership as a perceptual phenomenon under certain conditions or as a behavioral phenomenon under other conditions and accurately explain what is happening in both instances. Research on leadership has been heavily dependent on subordinates' reported perceptions of their leaders' behavior. Yet Gilmore, Beehr, and Richter (1979) demonstrated, in a laboratory setting, that participants failed to perceive that their leaders (who had been instructed to be high or low in initiation and consideration) actually differed in their behavior. Nevertheless, higher-quality work by the subordinates resulted if the leaders' behavior was actually high rather than low in initiation and consideration. The lowest-quality work occurred when the leader's initiation of structure was high but consideration was low. It is clear that studies that do not depend solely on perceptions are still needed.

Among the promising behaviorally-oriented methods is one that shifts attention away from the leader's *frequency* of behavior to the leader's *intensity* of behavior. Influenced by opponent process theory, Sheridan, Kerr, and Abelson (1982) examined the intensity, rather than the frequency, of a leader's actions. Seven dimensions of leadership behavior were scaled: task direction, participation, consideration, performance feedback, integrity, performance reward, and representation. Intensive task direction was illustrated by "taking

time to instruct subordinates in proper work techniques in their jobs.” The lack of intensive task direction was illustrated by “bringing new employees into the group without providing any direction or indication of their job responsibilities.”

### ***Multidimensional Scaling***

The use of multidimensional scaling in the study of leadership also has not been exploited as much as it could be. One example was provided by Misumi (1985), who described the use of the Quantification of Pattern Classification as a multidimensional scaling method for assigning quantitative values to categorizations of leadership and their effects. At the same time, not to be ignored are old methods that can be applied to new taxonomies of leadership behavior. For example, Van Fleet and Yukl (1986b) trained students to code more than 2,500 entries for each of 23 behavior categories as the students encountered them in biographies and autobiographies of military leaders. Clarifying work roles, setting goals, monitoring the environment, planning, and inspiration were the most frequent entries. Bass, Avolio, and Goodheim (1987) asked students to complete the Multifactor Leadership Survey questionnaire about the world-class leaders whose biographies they read. Inspirational leadership emerged as an important factor, along with other transformational factors.

### ***Observation of Behavior***

Davis and Luthans (1984) demonstrated the usefulness of idiosyncratic observational efforts. They observed over time what happens when a single leader, in this case a production manager, takes a specific action: the introduction of a new scheduling form with complete instructions and deadlines. The investigators found that the new form resulted in improvements in the quality and quantity of production that could be explained from the cause-effect linkages in what they were able to observe in detail. The Leadership Observation System (LOS) was developed by Luthans and Lockwood (1984) to be used by trained participants and observers to record independently the behavior of managers using time sampling. Twelve leadership behavior categories with numerous subcategories emerged from a Delphi process that began with 100 categories of possible managerial behaviors. A typical category was planning/coordinating. Within this category were subcategories, such as setting goals and objectives. In a study of 120 managers in a number of organizations, Lockwood (1981) found that LOS had greater convergent and discriminant validity than parallel descriptions of the same managers with the LBDQ-Form XII or the Managerial Behavior Scales. Different conclusions about managers' consideration and initiation of structure were reached when the different methods were applied.

At odds with Strong's atheoretical approach (1984) to ethnographic analysis has been the construction of new observational procedures based on explicit theories and models. Although observational studies of leadership are not new, among the most promising current approaches are those that use observations of leadership based on a formal model of interrelated measurements. Particularly notable has been the emergence of increasingly sophisticated methodologies to observe behaviors and their linkage to theory in their construction. SYMLOG (Bales, Cohen, & Williamson, 1979) uses teams of up to five observers, each of whom is on his or her own time schedule. The observers pick out salient acts of the members of academic self-study groups. Twenty-six general behaviors of a member, such as “active, dominant, talks a lot,” and 26 value descriptions, such as “making others feel happy,” can be recorded and profiled in terms of three dimensions: friendly versus unfriendly, dominant versus submissive, and instrumentally controlled versus emotionally

expressive. Members rate one another on these dimensions. Their images of one another reflect the polarization or unification of the group. The observed leadership behaviors and inferred values are examined for their decisive influence on the polarization or unification.

Even more closely tied to theory, Komaki, Zlotnick, and Jensen (1986) began with a theory-based taxonomy of supervisory behavior and then proceeded to develop appropriate observational measures. The taxonomy included three categories based on the theory of operant conditioning: antecedents, monitoring, and consequences of performance. Further classification broke down the observed supervisory behavior into own and solitary performance and work and nonwork-related behavior. Archival records could be consulted in addition to observed work samples and others' reports and self-reports about designated actions. Satisfactory interrelated reliabilities were obtained, along with differential patterns of effective and ineffective supervisory behavior (Komaki, 1986). The results were particularly promising because they can be linked to the voluminous psychological research that deals with operant conditioning.

Martinko and Gardner (1984a) designed and utilized a model involving field observation of leaders' external and work environments, competencies, needs, and causal attributions. Also included were categories of behavior (such as planning, organizing, directing, and rewarding) and outcomes. With the procedures and model, the time and event patterns of more effective and less effective school principals could be readily distinguished. For instance, in comparison to principals who were low performers, those who were high performers used more diverse media for communication and initiated more contacts with teachers and students. Metcalfe (1984) analyzed the behavior of leaders in taped appraisal interviews. A behavior that distinguished effective from ineffective interviewers was the greater frequency with which leaders invited participation from their followers.

### ***Simulation and Games***

Increasingly, along with the theory-based observations of behavior for research on leadership, simulations that feature interactive computer programs portraying problem situations likely will become common. Research on maximizing the utility of such programs and evaluating their impact on the performance of leaders will be likely in the decades ahead. Simulation offers the opportunity to examine perceptions, cognitions, motivations, and behaviors simultaneously. In a live field study, observers have no control over what they are observing. This fact places a premium on high-fidelity simulation as a method of inquiry. With high-fidelity simulation, the antecedent conditions and contingencies can be controlled, to a considerable degree, and time can be compressed to facilitate the observational processes and linkages to outcomes. The future is likely to see increasing reliance on simulations to provide opportunities for research on cognitive processes as well as on observed behavior.

Developed from earlier attempts with small-group exercises, in-basket tests, computerized business games, and larger organizational games, high-fidelity simulations have become a fine art that provides opportunities to manipulate variables experimentally in laboratory conditions that approach field studies. Subjects may be hired for a week to do, as far as they know, real clerical work in a seemingly real office. Computer simulations provide complete visual and auditory displays in which leader-subordinate relations can be examined. Complex business games that last for many months are conducted, in which many of the elements of real-world decisions must be dealt with satisfactorily and in which leaders may find themselves involved in labor negotiations and with real boards of directors. Complex military and political games played by real military and political leaders can both provide training and clarify the most probable effects on decisions for the real world. The future will bring increasing fidelity to the games.

As illustrated in [Chapter 35](#), the Looking Glass is a finely developed simulation and parallel-in-miniature to

managing Corning Glass. The Looking Glass re-creates for players the hierarchy of positions, necessary requirements, and interactions to running a sample organization. Salient variables can be manipulated in a collapsed time frame. Follow-up critiques of players in these simulations make it possible to gain insight into the processes and relationships perceived to be of consequence to the players (McCall & Lombardo, 1982). Videotaping can store the experience for later intensive analysis.

### ***Mathematical Modeling***

Mathematical modeling is another approach to simulation that has a great deal of unexploited potential for leadership research. Zahn and Wolf (1981) used the Markov model to chain events that related the current hypothetical task-oriented or relations-oriented performance of supervisors to future states of supervisory-subordinate relationships. The model could be manipulated to see designed hypothetical effects on outcomes. Long-term behavior was determined to be highly variable and versatile. Both the leader and the subordinates could influence the system.

### ***What If?***

What if? is a thought experiment or a mental simulation of possible events at turning points of history and its leaders. It is counterfactual. What if Lee Harvey Oswald's bullet had missed John F. Kennedy in 1963? Would Lyndon Johnson's reforms have been delayed? Would the United States still be entangled in Vietnam? What if the Germans had not arranged in 1917 for Lenin to go by train from his exile in Switzerland through Germany and German-occupied land, to emerge in St. Petersburg? Would the Bolsheviks have taken over from the Democratic Kerensky regime for the next 70 years following the October Revolution? Would the monarchy have been restored? Would fascism have taken over, so that Russia would have been allied with Germany, Italy, and Japan in World War II? How different would world history have been if the Supreme Court's 5-4 decision had not terminated the reexamination of the Florida balloting and given the 2000 presidential election to the less experienced, conservative Republican George W. Bush instead of to the more experienced Al Gore, a liberal Democrat who had won the popular vote but not the electoral college vote?

### ***The Need to Use Multiple Methods***

No one approach is fully adequate, by itself, to understand the leadership process. Yukl (1982) pointed out that cognitive processes, for instance, are unlikely to be reliably detected from observation alone. Yukl and Van Fleet (1982) found, when analyzing four studies to identify effective patterns of leadership behavior among military cadets and U.S. Air Force officers, that different results materialize when nonquestionnaire methods, such as the critical incidents technique, are employed than when questionnaires are used in the same situation. They noted that leadership consideration was important to effective leadership in the critical incidents analyses but not in the questionnaire surveys, whereas coordination was important to effective leadership in the questionnaire surveys but not in the critical incidents studies.

There will continue to be proponents of one method over another. For instance, there will continue to be

proponents of a *cognitive-perceptual* approach and advocates of a *behavioral* approach to understanding. Still others will emphasize social factors. Hooijberg, Hunt, and Dodge (1997) suggested that a full account of leader-outcome results would require the use of more complex approaches—cognitive, behavioral and social—for comprehensive explanations of leadership, followership, and their interaction.

## Substantive Issues

---

In a discipline, consensus about a new paradigm usually develops slowly. Nevertheless, a number of new substantive issues quickly aroused attention in the last quarter of the twentieth century and the twenty-first century. For example, charismatic and transformational leadership can be studied in small groups and in the histories of world-class leaders with the same theoretical framework. Historical studies of leaders in the past were stories about prominent figures who had influenced events (Luecke, 1994). Relatively recent and continuing cultural, behavioral, social, and/or political science explanations of institutions, followers, leaders, and events are in force. More than just narratives of the past, they are stories about elites and ordinary people, individual choices and collective experiences, unusual and normal events, and social, political, educational, and economic problems. Historians provide descriptive statistics and maps to buttress their propositions. In the future, some may analytically test the validity of hypotheses about qualitative and quantitative changes linked to the leaders (Fischer, 1989). Illustrative is the investigation of the constructiveness and destructiveness of charismatic leaders by psychologists (O'Connor, Mumford, Clifton, Gessner & Connelly, 1995). The centuries-old person-versus-situation controversy is likely to remain with us, with more attention in the future to genetics and hormonal effects. New co-twin studies are to be expected of the heritability of leadership behavior. Hormonal levels will also be considered. Thus Dabbs (2000) suggested that testosterone level is a biological aspect of temperament. Coupled with a proclivity for action, this factor has predicted firefighting and emergency medical performance. It may predict a leader's power, motivation, dominance, boldness, focused attention, frame of mind, and leadership style, along with the emergence of violent or conciliatory behavior. Hormonal levels may become increasingly important as women take more positions of leadership.

Jago (1982) believed that much more needed to be done to compare the validity of universal and contingent theories of leadership. Since then, mounting evidence has supported the point of view that both personal factors and contingencies are involved. How much of each is important is an empirical question for continuing research (Bass, 1997).

### ***Personal Factors Associated with Leadership***

There has been a renewal of interest in the personal factors of leadership. Although research designed solely to isolate the characteristics of leaders was thought to have reached the point of diminishing returns, it has been revived in a new form with the emergence of interest in the life-span development of leaders, particularly transformational leaders. The need to learn more about what contributes to the self-confidence, self-determination, and freedom from inner conflict of the charismatic leader is apparent. The quest for a greater understanding of personality and the personality dynamics that affect leaders' performance transcends situational considerations. Programmatic efforts to look at personality, as such, are also suggested by the developments of assessment centers, as well as long-term predictions of success as a manager. Increasingly, character is seen as of prime importance to leadership.

Paige (1977) proposed a hypothesis that still awaits empirical confirmation: leaders choose tasks and engage in them on the basis of personal considerations, such as their age. Thus, what could be a tempting challenge to a 40-year-old executive might be sidestepped by his or her 60-year-old counterpart. More often than not, even when there is a lack of supporting evidence, personality is seen as interacting with situational variables to account for leadership and group performance. It may be more important in some situations than others and with some people more than others. It may be dominant in cultural settings where, to be a leader, one must epitomize the authoritarianism rooted in the culture. Autocrats may behave the way they do because of their personalities; democrats may behave the way they do as a consequence of both their personalities and other immediate situational and personal considerations (Farrow & Bass, 1977).

Research that is designed to test the effects on the group of the interaction of the characteristics of the leader and the followers has generally been effective in producing valuable insights into leader-follower relations. Research in the 1950s and 1960s on different combinations of authoritarian leaders and followers continues to suggest designs that could be used to test the effects of other leader-follower characteristics. Although much has been done with reference to the need for achievement, the need for affiliation, internal and external locus of control, and so on, many other personality dimensions can be examined in the same way to test the interaction of the leader's personality, values, and behaviors with the followers' personalities, values, and behaviors and the effect of such interaction on the group. Interest is strong in examining how the leader's style of thinking, as measured by the Myers-Briggs Type Inventory, interacts with the followers' styles. To be kept in mind is the likelihood that extreme homogeneity in leader-follower characteristics may be dysfunctional to satisfactory problem solving by the group that requires flexibility and creativity. With increased interest in charismatic-transformational leadership, *time orientation* of leaders to the past, present, or future is an underresearched issue likely to be examined more frequently in the future (Daltrey & Langer, 1984).

### ***The Leader's and Manager's Role***

Suggestions continue to be made that research on leadership—in addition to its narrowness—has been concentrating on the wrong thing. The aim of science is to understand. Understanding is checked by prediction. Adequate prediction can produce control. Practitioners are anxious to provide such control when their understanding is far from perfect. Research on leadership is faulted when it fails to improve such control immediately. Basic research should be judged on whether it contributes to understanding.

The failure of adequate prediction to make the suitable control of behavior possible may also be partly a consequence of the unpredictable and uncontrollable elements in the real-world performance of leaders. Mintzberg (1973) and many others since have concluded that instead of a systematic, steady, orderly attack on one problem at a time, the practicing manager is more likely to be observed devoting short bursts of time to different problems. Frequently interrupted, the manager unsystematically responds to a diversity of demands from superiors, peers, clients, and subordinates. (This behavior helps explain the popularity of management training in time management.) Given the large array of diverse situations that are the daily regimen of the general manager, M. W. McCall (1977) suggested that much of the research to determine which type of leadership style is most effective in particular conditions may remain an impractical academic exercise because the demand characteristics of the manager's role result in the manager optimizing his or her performance by "proficient superficiality" (Mintzberg, 1973). Insufficient time is given to different problems to deal with each of them fully and adequately.

A promising approach looks at how the leader's identity, prototypicality, and representativeness of the team, the followers' social identification with the team, and team members' desires for closure to reduce uncertainty

contribute to various criteria of satisfaction and effectiveness. Pierro, Cicero, Bonaiuto, et al. (2005) surveyed 242 manager professionals and white-collar and blue-collar employee members of three Italian firms in petrochemicals, manufacturing, and electronics. Leader prototypicality correlated .41 with perceived leader effectiveness and .20 with job satisfaction. Intentions to quit were high when leader prototypicality was low, but only when members were also high in preference for closure. The members' self-rated performance was high when the leader's prototypicality was high, but only when members were high in preference for closure.

*Innovation and Creativity.* Mumford, Connelly, and Gaddis (2003) concluded from a set of experiments that for leaders to promote creativity and innovation, they must possess creative thinking skills. These may provide a critical perspective in evaluative operations in collaboration with followers. More needs to be learned about the leader's contribution to the followers' creativity. The leader's competence in this regard may depend on: (1) his or her awareness of temporal complexity in a "knowledge-rich," hypercompetitive technological environment (Halbesleben, Novicevic, Harvey, et al., 2003); (2) whether the leader accepts, challenges, or synthesizes different ways of doing things (Sternberg, Kaufman, & Pretz, 2003); (3) how transformational leadership contributes to innovation (Jung, Chow, & Wu, 2003); (4) how the transformational leader's unconventional behavior can add to the group's creativity (Jauss & Dionne, 2003); (5) how transformational leadership and members' anonymity can make a difference (Kahai, Sosik, & Avolio, 2003); (6) the leader's emotional intelligence (Zhou & George, 2003).

We need to learn more about why, when jobs are routine, extrinsic rewards contribute to the innovativeness of cognitively adaptive followers but, when jobs are complex, the results of extrinsic rewards may be negative (Baer, Oldham, and Cummings, 2003). Mumford and Licuan (2004) concluded that further research is needed on: (1) how leaders choose the performance strategies that influence the innovations they are willing to support; (2) how leaders establish a creative group identity; (3) how leaders need to understand the importance of emotions in the leadership of creativity in the groups they lead. Research is also needed that distinguishes: (1) leading idea generation and idea implementation; (2) leadership of routine groups and leadership of creative groups; (3) leadership of groups working on significant innovations being implemented. We need to learn the cognitive requirements that contribute to a follower's creativity (Reiter & Illies, 2004). Further evidence needs to be found about how a leader's consultation increases followers' creativity and how clarification of roles and objectives affects it (Amabile, Schatzel, Moneta, et al., 2004). Such clarity provides clear objectives, commitment to excellence, and support for innovation (West, Borrill, Dawson, et al., 2003). Research is needed on: (1) how to be participative and delegative leaders and yet be able to impart expert knowledge to promote subordinates' creativity (Krause, 2004); (2) about what contextual features in the leader-subordinate relationship promote followers' creativity (Shalley & Gilson, 2004); (3) how team members with different preferences in the creative process can be brought to think together innovatively (Basadur, 2004). Further studies are also required of the champions of innovation, how they informally influence idea generation in the organization and pursue a flexible role orientation. Cognitive mapping of their mental models is needed (Howell & Boies, 2004).

*Leader-Member Exchange.* In addition to seeing the leader's role as less orderly, Graen (1976) shifted attention away from the unilateral and consistent group-oriented behavior of the leader toward a focus on the mutual role relationships of the leader with each different member of the group. The quality of this reciprocal relationship contains considerable explanatory value, and researchers should continue to explore its antecedents and consequences with methods described earlier, to ascertain its importance relative to average leader-group effects. Nonetheless, Dienesch and Liden (1986) argued that to be more fully utilized, leader-Member exchange needs to be conceived of as a multidimensional variable involving perceived contributions, loyalty, and affect. Research is needed on the different ways in which the leader-Member relationship varies, and the

different outcomes that will occur as a consequence.

### ***Succession and Retention of the Leadership Position***

Various personal characteristics—rates of talking and interaction, capacity to interact, ability to perform a task, dominance, exclusive possession of information, initiation of spontaneity, provision of freedom to the group, and acceptance of group members—have been found to be associated with emergence as a leader. It has not been demonstrated, however, that these are the same variables that enable the leader to retain his or her role. There is a need for research that isolates the factors that facilitate retention of a position of leadership once it has been attained. There is an abundance of evidence about factors that contribute to the emergence of a leader; there is a dearth of research on factors that enable a leader to consolidate his or her position once it has been obtained. In the same way, the characteristics required to win election to political office may be quite different from those required for success and effectiveness as an officeholder. An important problem that has been ignored concerns the effects of training on the retention of the leadership role. What kind of training strengthens or weakens an individual's chances of retaining the leadership position?

*Issues of Succession.* Increasing empirical attention to the replacement and succession problem would seem to have great utility. There are many issues to be explored in this regard. Nathan (1989) concluded that whether a succession had a positive or negative effect or no effect on an organization depended on the study's method, the criterion of effectiveness, and the level of analysis. Continuing good organizational performance will slow successions; continuing poor organizational performance will speed up successions. Several questions needing future research include: What are the optimum rates of succession for different types of groups, organizations, or institutions? How is the succession used as a tool of strategic change? How do successors cope best with initial resistance? Do the dynamics of the succession process change over time? Is the cost of accelerating the recruitment and compensation of successor CEOs justified? (In 1965, the compensation of CEOs of major U.S. corporations averaged 24 times that of their average worker. The ratio was 38 times in 1978, 71 times in 1989, and 262 times in 2005—\$10.9 million for the average CEO compared to \$41,861 for the average worker.)

Many other questions about the succession process can also be posed: Does a successor executive ignore the former occupant's performance in an executive position, see it competitively, or attempt to build on it? Should the former occupant be involved in the choice of the successor? Does the former occupant help or hinder the succession process? When occupants are "lame ducks" and must give up office in a designated amount of time, how does the time limit shape their objectives, planning, and power? How does the loss of institutional knowledge affect legislatures whose members cannot run for reelection after two or three terms?

*Types of Successors.* Sonnenfeld (1988) was able to interview 50 CEOs and their senior management about the CEOs' retirement experience and succession plans—interviews that were difficult to obtain. Four types of CEOs were identified: (1) *Monarchs* did not leave office willingly but were overthrown. (2) *Generals* left office reluctantly but instituted campaigns to return to office. (3) *Ambassadors* remained active in the firm after leaving office and supported their successors; (4) *Governors* left the firm cleanly and cut all formal contact with it. Each type had advantages and disadvantages. The *monarch* had brilliant visions, assumed personal responsibility for problems, created order in the face of environmental disturbances, and was completely dedicated. The firm grew in assets, sales, employees, and shareholder support. At the same time, the monarch stubbornly defended old strategies and was reluctant to develop the next generation of leadership.

The *general* was capable of building strong leaders but was cautious about leadership transitions and was ready to return to office if needed. But the general fueled internal rivalries, encouraged resistance to successors, and even undermined them. The *ambassador* provided long service, continuity of command, and wisdom as an elder statesman. As a member of many outside boards, with wide contacts and community interests, the ambassador remained available for assignment as an external representative of the firm and was familiar with other approaches to management. But his continued presence became awkward, he supported inappropriate fads, and he needed to defend his record. He wanted to remain available to give advice that was unwanted. The *governor* was in office for only a short time. His organization was a large, stable, and formal bureaucracy. He had a wide range of outside business interests, which may have distracted him from his responsibilities of office. The firm's performance lagged. He gave his successor little help except for the freedom to revamp his strategy. When he retired, he completely cut connections with his organization. Many of Sonnenfeld's qualitative conclusions and typology can form the basis of future quantitative studies of executive retirement and succession.

### ***Leadership and Power***

Those who tend to conceive leadership as nothing but a form of social power obscure important relationships between leadership and power and restrict the range of research on the problem. More research is needed on the interaction of power with leadership behavior and personality. Questions remain: (1) Will followers respond positively to a leader with power who exhibits task-oriented rather than relations-oriented behavior? (2) How will the personality of the followers and the urgency to complete the task affect their response? (3) Are there patterns of a leader's personality that may mitigate the adverse effects of coercive power? (4) Can a sense of humor exert a strong moderating effect? (5) Will coercive power and strong control be more readily accepted when the leader's and followers' values are highly similar than when they are not? (6) What factors tend to legitimate different forms of power among members of a group? (7) What factors tend to legitimate different forms of power in the eyes of observers who are not members of the group? (8) What contributes to a leader's continuing to be held in high regard despite his making one mistake after another? (9) How do presidents and television evangelists maintain their power and charisma regardless of the quality of their performance? (10) What are the limits to the possibilities of "damage control"? (11) When does reward power become adverse in its effects?

*Power Equalization.* Research on the equalization of power has been attended by serious difficulties. Appropriate control organizations are seldom available for comparative purposes when some form of power equalization is introduced into an organization. External forces are almost impossible to control. The effects of social, political, and economic factors may be stronger than any variations that can be introduced. Simulated organizations may provide a better setting for the study of the equalization of power in the large organization.

*Conflict of Roles and Ideas.* Research on role conflict, conducted primarily in formal organizations, is deficient in experimental controls. Here again, it would be advantageous to study role conflict in simulated organizations in which conflict-inducing demands can be varied and controlled. Research is needed to determine the extent to which various styles of the personality and behavior of leaders are subject to role conflict. We need to know more about how controversy—conflicts of ideas—can result in creative outcomes. Tjosvold (1985d) pointed to the importance of goal interdependence, confirmation, and collaborative influence in this regard. These factors would be relevant to strategic decision making, policy setting, and

participative leadership. A small number of competently executed studies are available on the legitimization of the leadership role. More studies are needed. Little is yet known about what makes a leader legitimate and why and what the effects of such legitimacy are. The importance of the subject merits a much higher rate of activity in this area. In future research, it would be desirable to determine the effect of variations in the followers' characteristics, as well as variations in a leader's characteristics. One would like to know, for example, for what types of follower a given characteristic or pattern of behavior tends to legitimate the leadership role. In addition, it would be useful to know under what conditions a given pattern of leadership behavior is regarded as legitimate or illegitimate and by what type of follower. From a practical point of view, the problem of the legitimization of leaders is one that should be given high priority in future research. With the expected continued increase in knowledge work, the formal leader of a knowledge work group needs to share leadership. Leadership in knowledge work done in teams should rotate to the worker with the knowledge, skills, and abilities for the work at hand. Leadership will rotate when knowledge tasks are highly complex and interdependent and when much creativity is required (Pearce, 2004). Much is still to be learned about how *superleaders* (see [Chapter 20](#)) share their power by converting and legitimizing others to lead themselves (Goel, Manz, Neck, et al., 1995). They convert leaders into self-leaders. The suppressive effects of power on followers suggest the need for more subtle approaches to data collection than direct questioning. We should also be seeing more multiple methods examining the same power and leadership issues. Authority and responsibility, linked to power but conceptually different, could be examined more fully in their distribution as sources of organizational pathology.

*Conflict Management.* What should be done for managers who want to be participative but have poor skills in conflict management? Are there high costs for such managers who bring their subordinates together to resolve conflicts among them? (Crouch & Yetton, 1987). Burgess, Salas, Cannon-Bowers, et al. (1992) prepared training guidelines for teams under stress. To correct errors leaders needed to learn transactional practices such as contingent rewarding and management by exception (MBE). MBE included troubleshooting and double-checking of team members' performance focused on the immediate task. Transformational leadership was suggested for handling future crises, understanding the mission, aligning individual and team goals, providing support, and establishing trust and cooperation.

Empirical studies are needed of the mathematical approach that Brams (1993) developed for resolving conflicts. Opportunities should be expanded for learning more about crisis management based on the increased willingness of decision makers to air their mistakes. The disclosure by U.S. and Soviet decision makers in 1989, 27 years after the Cuban missile crisis in 1962, of how each side misread the other's intentions and almost jointly precipitated World War III is illustrative (Keller, 1989). Likewise, Whyte's (1989) addition to the factors that underlie "groupthink" may further elucidate events when leadership fails during a crisis. Whyte noted the tendency for a group to polarize around the point of view initially dominant in the group. This tendency usually frames the leader's and group's decision as a choice between two or more unattractive options. Threats are not seen as possible opportunities. Risk seeking occurs as a way of gambling for a reasonable chance to avoid the certain losses. Much still has to be learned about the U.S. leadership's initiating a preemptive war against Iraq, a secular state, when it was fundamentalist religious Muslims in Saudi Arabia who were mainly responsible for the 2001 terrorist attacks on the United States. How much was due to the groupthink of the neoconservative advisers in the Bush administration? How much was due to the false intelligence that the Iraqis had weapons of mass destruction? How much did Saddam Hussain's game-playing behavior about inspections contribute to the sense of threat from Iraq? How much was due to failures, secrecy, and poor communications among the 15 U.S. security agencies? How much did the excessive layers of bureaucracy affect decision making? How much did the destruction of the World Trade Center on September 11, 2001, and the desire for retaliation contribute (*The 9/11 Commission Report*, 2004)? The mishandling of the Hurricane Katrina

disaster in 2005 and its flooding of New Orleans and the Gulf Coast will be the subject of studies for years to come.

In the business world we need to learn more about the human costs and benefits of acquisitions and mergers. A great many fail to achieve the expected benefits from the combining of firms. Failures are estimated to be as high as 80% due to choice of partners, lack of clarity of strategy, incompatibility of organizational cultures, and inadequate preparation of their organizations' members for the event (Marks & Mirvis, 2000).

## ***Leadership Styles***

To some degree, all research on leadership styles prior to Burns's (1978) introduction of the concepts of transformational versus transactional leadership could be conceived of as being about democratic, autocratic, or laissez-faire leadership, which takes us back to where it all began, in 1938 with Lewin and Lippitt's seminal experiment. Each of these three styles is described by either the amount of overall activity of the leaders or the extent to which the leaders are oriented toward being completely work-oriented or completely person-oriented.

Ordinarily, leaders' performance will be better if they are more active than inactive. But activity does not guarantee effective, satisfied, and cohesive groups. A number of hypotheses need to be tested further. For instance, it has been suggested that leaders tend to be more autocratic and directive when it is easier and more comfortable for them to be so because of their own personalities and because goals are clear and structure is given. But it has also been proposed that leaders really need to be directive and structuring when goals are not clear and structure is not given. Another suggestion is that leaders tend to be more democratic, participative, relations-oriented, and considerate when they are concerned about the need for input and reactions from subordinates. Again, how different personalities and situational demands play their parts can be tested in designated organizational settings to determine the importance of selection in contrast to training of leaders.

*Dimensions.* Many dimensions of autocratic and democratic leadership have been proposed to describe leaders' different styles. The relationships among some of the dimensions have been clarified and altered. Borrowing from work motivation theory, researchers have purged the initiation-of-structure scales of their coercive components and have relabeled them instrumental (to the success of the task). Similarly, consideration is now seen as supportive leadership, and its focus is now on leaders' attention to the different needs of individual subordinates rather than to the use of group methods.

The situational leadership approach, as in the Hersey-Blanchard model, and an approach to the best way of integrating task and relations orientation, as advocated by Blake and Mouton, need to be compared with a variety of methods and measurement instruments. Studies ought to be conducted that make the comparisons in simulated organizations and in controlled laboratory settings, as well as in content analyses of documents and time-sampling observations in the field.

It should be clear that factor analyses can establish only how leaders are distributed empirically in the eyes of observers of their performance on given dimensions, such as *directive*, *negotiative*, *consultative*, *participative*, and *delegative*.<sup>5</sup> However, leaders in real-life positions tend to reveal performance on all the dimensions but in different amounts, although the dimensions are conceptually distinct but not empirically uncorrelated.

One can stress the utility of consultation (the manager's most frequent style) as a useful style in general. But, as Vroom (1976b) noted, concrete situations may demand otherwise. And leaders do change their styles in response to situational conditions (Hill & Hughes, 1974).

The differential effects of task-related and person-related clusters of leadership styles suggest that two central needs are: a response allocation analysis, to sort out the different styles from one another conceptually; and

more factorial analyses to determine the empirical communalities among the styles. Researchers need to take into account the well-established negative impact on the group of the inactivity of a laissez-faire leader with the possibly but not necessarily positive impact of various types of active intervention by the leader.

Theory and research are needed about the various kinds of considerate behavior. Consideration, as measured by the LBDQ, tends to be noncontingent, unlike the contingent rewarding of the MLQ. For instance, LBDQ items about how much the leader helps and does favors for the group do not refer to the group's performance. Nor does LBDQ consideration correlate highly with the individualized consideration factor score of the MLQ (Seltzer & Bass, 1990), which tends to concentrate on how much the leader is concerned about followers' differential development needs.

### ***Transformational and Transactional Leadership***

Before the 1980s, behavioral research on leadership concentrated on the transactional exchange between the leader and the led. The leader clarified what needed to be done and the benefits of compliance to the self-interests of the followers. In the new paradigm, the transformational leader moves followers to transcend their own interests for the good of the group, organization, or society (Burns, 1978; Bass, 1985a). Paraphrasing Zaleznik (1977), transformational leaders, like charismatics, attract strong feelings of identification from their subordinates.

The 1980s were a decade in which empirical research was initiated with this new paradigm in mind. As noted in [Chapter 25](#), a number of survey questionnaires, such as the Multifactor Leadership Questionnaire (MLQ), were used extensively in a variety of organizations and countries (Bass, 1997). In the twenty-first century, the work has expanded into new areas, such as the empirical connection of transformational leadership with corporate social responsibility (Waldman, Siegel, & Javidan, 2004).<sup>6</sup> Much more still needs to be done, especially in teasing out the dynamics involved. Some empirical support has been obtained of followers' strong beliefs in the leader as a person. Do these beliefs go beyond the leader's actual competence? Followers have faith that the leader will make it possible for the group to succeed. Are they justified in their faith? Do the followers willingly give the leader too much power to act in crises? Do such leaders transform followers into leaders? Podsakoff, MacKenzie, Moorman, and Fetter (1990) have shown the importance of *trust* as a variable intervening between transformational leadership and outcomes in performance and satisfaction.

Generally, transformational leadership augments transactional leadership (Waldman, Bass, & Yammarino, 1988). But under what conditions do they conflict? How can one add the fostering of the pursuit of group and organizational goals (in transformational leadership) to the promotion of self-interest (in transactional leadership)? Much more research lies ahead about the components of transformational and transactional leadership: charisma and inspiration, intellectual stimulation, individualized consideration, contingent rewarding, and active management by exception (which includes contingent but not noncontingent punishment).

Transformational leadership theory has now gone from being novel and interesting to initial acceptance; to critiques of what is missing ... a much deeper investigation [is needed] of what constitutes the constructs of transformational leadership and how it can be measured, developed, and projected through technology in virtual teams and organizations. (Avolio & Yammarino, 2002, p. 388)

*Charisma and Inspirational Leadership.* Leaders of political, social, and labor and student movements as well as managers, ministers, battalion commanders, teachers, coaches, and directors can be found who fit the description of persons to whom followers form deep emotional attachments and who, in turn, inspire their

followers to go beyond their own interests for superordinate goals, higher goals than the followers previously recognized. Even in hardened bureaucracies, there are leaders with knowledge of the system, good connections, and the ability to mobilize and husband resources. Such leaders keep their eyes on the bigger issues and take the risks required for “creative administration,” which gives them the large amount of *idiosyncrasy credit* necessary to arouse in subordinates complete faith and trust in them and a willingness to strive for the higher goals they set forth as challenges for the group.

To understand the high expectations of success generated by the charismatic leader, we can look at Field and Van Seters’ (1989) proposal to combine the self-altering prophecies of the Pygmalion and Galatea effects to generate an energized group, organization, or society of high expectations in which members act with positive expectations about one another. This group is labeled the “Metharme effect” by Field (1989), after the daughter of Pygmalion and Galatea (Field & Van Seters, 1989). House and Shamir (1993) and Shamir, House, and Arthur (1993) began a theoretical explanation of the effects of transactional and transformational leadership. Transactional leaders focus on pragmatic paths and goals that can be reached by followers. Transformational leaders produce in their followers a greater sense of: (1) collective identity in their self-concepts; (2) consistency between their self-concepts and their actions for the leader; (3) self-worth and self-esteem; (4) similarity between their self-concept and perception of the leader; (5) collective efficacy; (6) meaning in their work and lives. Charismatic/transformational leaders arouse in followers unconscious motives of achievement, power, and affiliation.

*Idealized Influence.* Handy (1994) noted that Maslow’s (1954) hierarchy of needs from safety and security to self-realization failed to include a need for *idealization*, a higher need than self-realization, not as self-centered as the rest of the hierarchy. Bass and Avolio (1989–2003) began to substitute *idealized influence* for charismatic leadership because of charisma’s popular association with flamboyance and malevolent dictators. Idealized influence was thought, like inspirational leadership, to correlate highly with charismatic leadership. For Handy (1994, p. 275), Maslow’s hierarchy was all self-centered. At a higher level was idealization, “the pursuit of an ideal or a cause that is more than oneself.” Handy’s concept may relate better to Howell and House’s (1992) concept of *socialized* charisma than to *personalized* charisma. Is this also true for idealized influence?

*Collective Motivation.* An interesting research issue is raised by the question of how collective motivation is promoted in organizations. Collective motivation on the part of employees was seen by Lawler (1982) to be a matter of outcomes that they valued occurring from the performance of the organization and their own contributions to that performance. But Staw (1984) argued that collective motivation depends on employees’ identification with the organization and their contributions to the organization’s performance. Transformational leadership theory would go further and imply that collective motivation is generated by the employees’ identification with their leader and the employees’ and their leader’s identification with the organization and its goals and values. This requires fuller testing empirically.

*The Importance of Identification.* House, Howell, & Shamir (2002) use the identification of followers with a transformational/charismatic leader to explain why the followers are willing to forgo their own self-interests for the collective mission. The theory they present raises many questions for the future, including the evolutionary processes that have made social identification such a strong force. In what ways is identification with a charismatic leader and his or her organization important to members’ decision making, sense making, satisfaction, and commitment? Why do strong emotions accompany identification with the charismatic leader and mission? How and when does identification cause conformity, groupthink, blind obedience, and abandonment of rationality?

The themes of neo-Weberian charismatic leadership research that are likely to continue are: (1) charisma in everyday life of work, care, friendship, and leisure; (2) focus on the relationships between the leaders and the led, with special emphasis on emotional interactions; (3) a determination of the extent to which the charismatic leader or the charismatic mission drives followers; (4) an explanation of the charismatic mission is institutionalized, routinized, and maintained in the succession (Jermier, 1993). Additionally, research is needed on: (5) how the charismatic leader influences followers' self-concept, self-efficacy, and social identification (Yukl, 1994); (6) how much motivational impetus and routinization in the mission is lost in a succession when the charismatic is replaced, departs, or dies; (7) how much the routinization of the charismatic mission impedes needed organizational change to facilitate adaptation to the changed environment; (8) how much is lost in the succession without the driving force of the departed charismatic leader (Bryman, 1993).

*Intellectual Stimulation.* As noted earlier, innovation and creativity often depend on leadership (Mumford & Licuan, 2004). Mueller (1980) described the "leading-edge" leader who deals with "fuzzy futures." This type of leader is able to simplify problems and to get to the crux of complex matters while the rest of the crowd is still trying to identify the problem.<sup>7</sup> Research is needed on this "rapid reification" and how to integrate and relate intellectual stimulation with the logical and intuitive attributes of leadership. With the continuing importance of technological innovation in the twenty-first century, we will see more research on the subject, such as that by Berson, Dionne, and Jaussi (2002) connecting task, technology, people, and innovative processes both quantitatively and qualitatively.

*Individualized Consideration.* Future questions to be answered are: How do leaders maintain their recognition for fairness when they treat each of their followers individually? How much do the effects of individualized consideration using the MLQ correlate with the effects of consideration using the LBDQ? When is an individually considerate leader seen by followers as weak? How different is individualized consideration from relations-oriented leadership? Can participation proceed without individualized consideration?

*Management by Exception: Contingent Reward and Punishment.* Podsakoff and Schriesheim (1985) enumerated a number of unanswered questions about a leader's use of contingent reinforcement for which research is needed. What is the best sequencing of contingent and noncontingent rewards and punishments (when necessary)? How do they interact? Can contingent punishment for poor performance work if it is offset by promises of rewards for appropriate performance? What rewards make promises more or less effective? How important are specificity and focus on the subordinate's performance or products to the efficacy of contingent praise for good performance (as Kanouse, Gumpert, and Canavan-Gumpert [1984] suggested)? How does contingent reinforcement of the individual affect the group? How does contingent reinforcement of the group affect the individual? Further exploration is needed about the conditions when active management by exception is successful and/or effective and when it is not. Is there evidence of its changing in practice when followers are novices versus when they are experts?

*The Hierarchy of Effectiveness.* A hierarchy of leader-outcome relationships based on survey questionnaire methods and routines has been established in a number of industrial, educational, and military settings. Transformational leadership, particularly charismatic leadership, correlates above .70 with subordinates' satisfaction with the leader and the leader's perceived effectiveness. The transactional contingent reward correlates closer to .40 with these same outcomes in satisfaction, as can the transformational aspect of contingent rewarding of psychological benefits (Antonakis, 2000). Transactional passive management by exception correlates closer to zero with these outcomes (Yammarino & Bass, 1989). Studies of the more conceptually differentiated personal communication style of the transformational leader, along with his or her

mastery of impression management and authenticity, will be important. Will Handy's (1994) *idealization*, the pursuit of ideals, help or hinder effectiveness? Researchers need to examine the conditions that promote the emergence of a transformational leader and how to facilitate this emergence. They need to determine the consequences of moving from an emphasis on social exchange, which characterizes the transactional leader, to leadership that mobilizes and directs members toward higher objectives. They need to study the costs and obvious dangers, as well as the benefits, of transformational leadership. A step in this direction will be to examine further the communication differences between self-oriented and prosocial leaders.

*Handling Stress and Conflict.* Investigators should be searching for how a transformational or transactional leader moves followers toward acceptance of super-ordinate goals. How can followers be aroused to self-transcendence? How can a leader move a group from complacency, hasty responses, inertia, or defensiveness in the face of threats to complete and adequate vigilance? If a group is focused primarily on its lower-level needs for safety and security, how can a leader move it toward concern for recognition and achievement? If a group is under stress that is too high for coping with the complexity of the situation, how can the leader steady and calm the group?

*Micro-Macro Linkage.* Hollander (1985) remained dissatisfied with the overconcentration of research on the microleadership of small groups. More macroleadership studies are needed of how leaders affect the strategic functions of institutions and organizations. For instance, Khan (2002) reported on the transformational and transactional leadership of the executives in 157 sponsoring high-tech Japanese-U.S. alliances, finding that, as predicted, transformational leadership by both the Japanese and American executives resulted in lower innovative effectiveness in the alliance.

The transformational-transactional distinction offers an avenue for tying together research on microleadership and macroleadership. Gordon and Yukl (2004) see the need to link microleadership with strategic leadership. As noted in [Chapter 12](#), transformational leadership—charismatic, intellectually stimulating, inspirational leadership—can be manipulated in the laboratory, reliably observed in small groups playing business games, rated reliably in large organizations at all levels, and used to differentiate among world-class leaders. At the same time, the paradigm lends itself to investigations across the disciplines of political science, organizational science, anthropology, sociology, and psychology.

*Selection and Training.* We need to be able to train the average supervisor in the sensitivities and interpersonal competencies that are required of a transformational leader. We need to be able to select potential transformational leaders who may not show up well on many currently available predictors of transactional leadership. It may be less difficult to enable leaders to learn how and when to be constructive with contingent rewards or corrective with management by exception. Self-reports, incidents, and 360-degree ratings from 200 executives and 500 leaders in one community were collected during and after their participation in Full Range Leadership Development programs, indicating modest improvements by the trainees in transformational leadership and reduced management by exception. Similar results were found for U.S. Army platoon sergeants and lieutenants from 72 platoons rated by their more than 3,000 subordinates, peers, and superiors (Avolio & Bass, 1996).

*Contraindications.* Theory and research are needed on the costs and dangers of transformational leaders. Thus Bennis (1989) pointed to the destructive consequences of considering only such successful transformational leaders as Steve Jobs and Lee Iacocca as heroes. Lippman-Blumen (2005, p. 220) warned against heroes with noble visions who are actually toxic for us. We need to “escape the magnetic pull of subtle toxic leaders ... heroes [who] ... attract us with challenges and visions that entrap us before we perceive their negative potential, ... their dark call to battle, genocide, and unjust war.” The *toxic leader* is

pseudotransformational. Toxic leaders consciously feed followers with illusions that enhance the leaders' power and impair followers' capacity to act independently. They play to followers' basic fears and needs. They mislead followers through deliberate untruths. They treat their own followers well but persuade them to hate others. They are amoral and lack integrity. Their egos and arrogance blind them to their own faults that limit the possibilities of their self-improvement (Lipman-Blumen, 2005, pp. 20–21). Much needs to be learned about the moral development of the toxic pseudotransformational leader when the charismatic leader is a false messiah.

Bass (1985a) speculated on organizational and societal circumstances that might militate against the success and effectiveness of transformational leaders. Spangler and Braiotta (1990) located such an example. Chairmen of audit committees of boards of directors need to be more concerned about good monitoring, auditing, and controlling. For them, transactional leadership may be as effective as transformational leadership. Contingent reward and active management by exception correlated .43 and .39, respectively, with effectiveness judged by colleagues in accounting and auditing inside and outside the firm. Parallel correlations with effectiveness of individualized consideration, intellectual stimulation, and inspirational leadership were .40, .30, and .25 respectively.

### ***Laissez-Faire Leadership***

Questions for the future: What makes laissez-faire leadership ineffective and empowerment effective? When is laissez-faire leadership appropriate and effective?

### ***Political Leadership***

Political leadership needs to be seen in a positive light as well as a Machiavellian one. Although the evidence (possibly as a consequence of social desirability) points to a general rejection of Machiavellian approaches (with-holding information, bluffing, agreeing but delaying, and maintaining social distance), organizational and social decisions can often be understood as a consequence of coalition formation, negotiations, and other beneficial political processes. Decisions are based on the relative power of those involved rather than the merits of the issue.<sup>8</sup> Ammeter, Douglass, Gardner, et al. (2004) agreed that since organizations are an arena for politics (Mintzberg, 1983), they can be beneficial as well as harmful. They can be altruistic as well as self-serving. Ammeter et al. (2002) theorized that the effects of political leadership in organizations were to be studied, not deprecated. Like Cyert & March (1963), they took a neutral stance on organizational politics. Their model proposed that the antecedents and outcomes of political influence depend on many intervening variables, such as the combinations of tactics used, the need to justify decisions, the facilitators of political effectiveness, and the leader's motivation, reputation, and interpersonal style. Also important were the status of the leaders and followers and the question of whether the political behavior was directed toward individuals on a one-to-one basis, in coalitions, or in networks.

Culbert and McDonough (1980) considered effective brokering inside and outside their own groups as a challenge for leaders. Inside the group, the leader should try to negotiate arrangements with the members that make for the best possible mix of members' serving their own interests and meeting the needs of the group. Externally, the leader as a representative can often do much to increase the group's resources and opportunities

through effective negotiations with higher authority, with constituencies, and with opposition. Whereas, within organizations such negotiating behavior with individual subordinates may be a counterproductive leadership style,<sup>9</sup> the leader's successful playing of the role of broker is worthy of further exploration.

The effective political use of authority and power is still a highly underresearched area. Particularly important and underresearched is how the would-be organizational politician can be converted into an organizational statesman. It is possible to be an "honest broker," for whom the marshaling of evidence becomes as significant as the relative interests of the parties in a negotiation. In this regard, the similarities and differences between legislative leadership and executive leadership need to be examined more fully. We are likely to see a continuing interest in the specifics of the influence tactics employed by leaders and managers to obtain desired outcomes from their superiors, their subordinates, their organization, and outsiders (Kipnis, Schmidt, Swaffin-Smith, & Wilkinson, 1984), as well as the use of increasingly refined instruments to do so (Schriesheim & Hinken, 1986). Hermann, Snyder, and Cunningham (1980) posed a number of questions about the way the organizational politician uses staffs, advisers, and confidants: How are they chosen? To what extent do they insulate the leader from the rest of the organization? To what extent do they amplify, distance, or reduce incoming and outgoing communications by the leader?

Drake and Moberg (1986) called for research on how leaders modify their language to create consistent forms of calibration and impression. Contingencies in the phrasing of requests need to be examined. Tactics need to be related to desired outcomes. The effective use of disclaimers needs to be better understood, along with other ways in which the forms of language can foster interaction.

It is not feasible for even the most active leader of a complex business to have a hand on every lever ... not practical to juggle with a fast-moving present ... and the imponderable forces of the future. ... The direct order [needs to be] replaced by a framework—a set of values to guide the independent actions [of others]. Devising that framework needs sympathetic thought, specific to the objective. ... The well-tempered leader ... will combine tactical skill, judgment, and the ability to coalesce the intentions [of others].... [He will be] an *impresario* skilled in generating enthusiasm and ... the aspirations of [people with talent]. (Benton, 1990, p. 349)

## ***Ethics***

Ciulla (2004) suggested that the writings of classical philosophers such as Plato and Confucius contained many principles of ethics worthy of modern empirical research. These classics contain themes and values that offer well-grounded ideas about who we are, what we should be like, and how we should live. In reviewing the ethics of leadership, Bennis (2004) concluded that particularly significant for further study will be the continuing examination of leadership from a cross-cultural perspective. We need to understand each other's symbols, values, and mind-sets. For instance, Westerners need to develop a better understanding of leadership in the Islamic world, especially its tribalism, a handicap to globalization. Bennis also suggested that future efforts need to focus on leadership that continues to involve rhetoric, artifice, and perceived authenticity. The public figure is mainly a virtual leader, depending on the media to carry his or her message to the public. Impressions from the media create the perceived character of the political leader. We need to do more research about how the media affect the reputation and behavior of public leaders. *Spin* begins where reality ends. Trust in leaders falls as belief in the media's manipulation of reality increases. Instant polling allows leaders to change their positions in midspeech. More must be learned about how modern leadership is affected by the Internet as it grows in size and importance as an informal channel of information, rumor, and gossip (Bennis, 2004, pp. 340–341). Much of this has equal relevance to political leadership in the private sector, about which

little is known (House, 1999)

Both legislative and the organizational politicians may adopt influence tactics that border on the unethical. Flagrant lying, cheating, and stealing are clearly unethical managerial practices. But the extent to which telling white lies, cutting corners on standards, and making unauthorized use of company or government property are clearly unethical varies with the circumstances and individual differences in the concepts of right and wrong. Despite the importance that it should have, this is a severely underresearched area of empirical research on managerial and leadership behavior. A 1988 Louis Harris poll of 1,031 office workers and 150 senior executives reported that while 89% of the employees thought that it was very important for managers to be honest, upright, and ethical in their dealings with employees and the community, only 41% said this was actually true of their current employers (Anonymous, 1988a).

Weber (1989) found in interviews with 37 managers that they reasoned morally in order to conform to majority opinion and their organization's rules rather than due to any universal principles of morality. For Burns (1978), the fostering of moral virtue was fundamental to being a transformational leader. The self-seeking charismatic, by definition, could not truly be a transformational leader. But Howell (1988) and Bass (1989) suggested that many charismatic leaders have two faces. They can show their prosocial one, which is transforming, and keep their self-aggrandizing face from interfering with the process.

For Kuhnert and Lewis (1987), the transformational leader develops from having a concern for personal goals and agendas to having more mature, higher levels of values and obligations. At the highest level of development are to be found the endorsement of universal ethical principles of justice, the equality of human rights, and respect for human dignity. There is a belief in and a commitment to these principles as valid and as an end in themselves. Thus, the values of life and liberty led Paige (1977) to argue that the pursuit of nonviolent means for dealing with problem solving has to be a central focus in the education of political leaders. Somewhat less idealistic is the extent to which values are relative to the group and circumstance; sometimes they may conflict with one another. But the organization and society are maintained by the decision to do what is right. At the other extreme, if the ethical sense is absent, one obeys the rules to avoid being punished (Kohlberg, 1969).<sup>10</sup>

Chapter 11 reviewed the few studies that could be found that dealt with managers' attitudes toward corrupt practices. Revealing to a competitor one's own company's bid for a payoff was almost universally condemned, but taking petty payoffs from outside contractors for awarding them contracts was much less frowned upon. Insider trading is seen as more a matter of illegality<sup>11</sup> than immorality (Pitt, 1985). The Enron scandal of 2001 showed how widespread and devastating corruption could be, as it involved fraudulent behavior by the CEO, vice presidents, leading financial officers, accountants, and outside auditing agencies. It resulted in the bankruptcy of the firm, the destruction of the auditing agency, the loss of employment by thousands of employees, and the employees' loss of pensions and savings. Thousands of shareholders were left with worthless shares (*St. Petersburg Times*, 2006).

An experimental program was launched in 1986 to apply Misumi's (1985) PM leadership in seven Chinese factories, hospitals, and agencies. An idiographic character function of leadership was added to the survey feedback process with emphasis on the moral character of the leader. Along with elements of effective human relations familiar to the West was included in moral character "the commitment to remain within the law and resist temptations for personal gain" (Peterson, 1989, p. 33). Also included was willingness to follow the Communist Party line even when one's personal views conflicted with it.

In the West, professional organizations, such as those in the health professions or in public accounting, tend to monitor violations of their rules on a case-by-case basis. But beyond this monitoring, critical-incidents survey methods used by the American Psychological Association (1953) are available for gathering both clear-cut and borderline incidents of immoral behavior by managers and the various alternative ways in which

managers and leaders could have acted that would have been morally acceptable in terms of informed consensual opinion or universal standards. We are still waiting to see such an effort in the fields of organizational management, led by the accounting profession. But we are more often likely to see questions of commitment to ethical behavior added to survey feedback.

*A Model for Ethical Analysis.* For Socrates, ethics was the search for the good life in which one's actions are in accord with the truth. According to Steidlmeier (1987), ethics is creative—the search for human fulfillment and the choosing of it as good and beautiful. Ethics is practical in purpose. It seeks the full flowering of the human person and excellence in the actualization of the human capacity. Moral virtues are life-giving patterns of behavior; moral vices are destructive ones.

Most discussions of professional ethics focus on the destructive vices. They are negative and guilt-ridden. The focus is on what should not be, rather than on what should be. Discussions are defensive and dogmatic. Steidlmeier accented the positive. He suggested that we need to clarify our worldview and our principles, which should be integrated into our educational and developmental processes. Unfortunately, principles of self-regulation and codes of conduct often conflict with the avoidance of costs and the maintenance of one's competitive edge. There is a need to recognize the costs and to share them with public officials, stockholders, management, employees, and the public to gain societywide benefits. Weber (1989) pointed to the need to examine how the organization impinges on the manager's maturity of moral reasoning. Beyond this, there is a need to determine the connection between moral reasoning and moral behavior and how each depends on the issue involved.

What's needed is a model that can fit both the hortatory literature on business and political leaders' ethics and social responsibility and the survey evidence of current leaders' and managers' beliefs and practices. Forrest, Cochran, Ray, and Robin (1989) made such an attempt but were unable to account for the ethical opinions of 315 surveyed managers and 577 surveyed teachers. The investigators extracted four bipolarities from the prescriptive literature: (1) economic versus social purpose, (2) company policy versus individual managers' discretion, (3) recurring versus one-time problems, (4) utilitarian versus ideological decision-making rules.

*Organizational Citizenship.* Conceptualizing organizations as a collection of constituencies (March & Simon, 1958) remains a powerful source for understanding the individual organizational leader's performance. Much of the success of leaders with their subordinates may depend on how well they negotiate arrangements with other units. By now, the need to focus more attention on the manager's horizontal interactions with peers in other units and with clients (Dubin, 1962b) has become a platitude. However, these leader-leader interactions could be studied with considerable profitability (Hermann, Snyder, & Cunningham, 1980).

*Whistle-blowers.* In opposition to the political balancing of self-interest, a new concept is taking shape that transcends the formal horizontal or vertical relationship. It is that of the good organizational citizen who goes beyond his or her immediate self-interest to promote the well-being of the organization, its members, and society as a whole. "Whistle-blowers" are illustrative. There is a need in both the public and private sectors to provide more support for valid whistle-blowers and less for their corrupt superiors. More often than not, the whistle-blower is likely to suffer more punishment than the corrupt superior. Nonetheless, big rewards are being paid to whistle-blowers based on how much money was earned and how much in fines was assessed in the fraud or other crimes. What may follow the "me-too" generations of the past 40 years is more good organizational citizenship. Or there may be a reversion to the "my-group" generation of the 1950s (like the East Asians of today), which was concerned primarily with peer pressure. What happens will have considerable implications for leadership.

Ethical resolve continues to remain more important than philanthropical concerns to senior management,

according to surveys of several hundred CEOs in 1988 and 1989; but ethics are less important to them than legal or economic considerations. Nor does ethical resolve appear to relate one way or another to a corporation's financial performance (Aupperle & Simmons, 1989). Nevertheless, research on the morality of business leaders and the citizenry is likely to increase substantially in the twenty-first century if the continuing political lobbying scandals and the power of money to win elections are any indication. The increase in the consideration of the effects of spirituality and religious orientation on transformational leadership also may have ethical implications (Twigg, 2004).

### ***Criteria of Effective Leadership***

In a review of 89 studies published between 1970 and 1975, Hunt, Osborn, and Schriesheim (1977) reported that 61% used only a single criterion of effective leadership and 43% of that group emphasized performance. However, a greater use of multiple criteria was noted in field studies. Most field studies (81%) used criteria obtained from a different informational source than the predictors.

Studies have been conducted on followers' beliefs, satisfaction, and behavior, as well as productivity, drive, and cohesiveness. However, certain variables, such as group productivity and followers' satisfaction, have been overemphasized at the expense of other variables. For instance, the mean true correlation was .30 between job performance and job satisfaction for 54,417 individuals in 312 samples, according to a meta-analysis by Judge, Thoresen, Bono, et al. (2001). Followers' efforts, which presumably should be affected by leadership, have been neglected as an outcome due to leadership.

*Use of a Supermeasure.* Morgan and Rao (2002) advocated using one single criterion of effectiveness in service organizations that align their strategy with operating systems serving well-defined markets. One supermeasure focuses the attention of these service firms on their customers' needs better than a complex set of criterion measures does. For instance, Continental Airlines found that on-time performance of its flights encompassed an effective incentive system that was simple to implement, communicate, and build a strategy around—one that provided a feeling of success when Continental's on-time arrivals ranked highest among airlines. Nordstrom, a department store, identified customer satisfaction as its supermeasure, Marriott supported careful, selective hiring of staff for its economy service. Fairfield Inns selected its supermeasure of cleanliness, friendliness, and efficiency.

*Consecutive Criteria.* Anderson, Lievens, van Damm, et al. (2004) noted that flexible forms of work teams and rapidly changing organizations mean that the criteria for a single leadership job are less relevant to predicting performance than are the criteria for a role involving a multiplicity of assignments (Howard, 1995). Instead of predicting person-job fit, the effort has to be in two stages. First, there is a need to determine the composition of a changeable job role; then there is a need to predict the person-role fit. Person-role fit may entail considering, along with aptitude predictors of adaptability, flexibility, innovativeness, openness to change, and skills needed for the future (Herriot & Anderson, 2004).

*Evaluations Are Relative and Subject to Change.* Evaluations of leaders are subject to revision. Shartle (1956) observed that ten years too late, a firm might discover it had fired its most effective manager. Often vilified while he was in office, President Harry S. Truman's performance was upgraded considerably in the years that followed. Seen as being more interested in playing golf than in taking decisive actions, President D. Eisenhower was later found to have played an active role in substituting clandestine forces in Iran, Central

America, and elsewhere for open displays of U.S. military power actions. These actions had delayed and devastating effects on those countries and on subsequent U.S. relations with them. Donald Burr, at first evaluated as a hero who devised a radical new approach to managing airlines, became the villain who failed to consult with others and overexpanded PEOPLExpress to the point where it was thrust into bankruptcy.

Evaluations are relative. Well known are the stories about executives who introduce belt-tightening measures into a department, ride roughshod over subordinates to reduce costs, maximize immediate productivity, and are then promoted to repeat the process higher up. They leave behind a shambles of dissatisfaction and conflict to be blamed on their successors. Peters and Waterman's (1982) popular assessment of exemplary firms that represented excellence in management was based on a highly subjective evaluation of excellent management. When a fuller analysis of the firms' financial performance was compared with those of 1,000 firms evaluated by *Forbes*, the performance of the first group of firms was seen as not particularly better (Aupperle, Acar, & Booth, 1986).

What scholars view as effective leadership and how followers view the same performance may be quite different. In contrast to presidents from Woodrow Wilson through Richard M. Nixon, who fulfilled nearly 75% of their campaign pledges, Jimmy Carter did almost as well but was seen as a failure by the public because he did not fulfill the major campaign promises that were important to voters: reducing unemployment and inflation (Krukones, 1985). Despite many mistakes made in his first administration, George W. Bush won reelection in 2004. But his popularity fell from 90% to 30% as his administration's mistakes continued; and by 2006 he could not figure out how to withdraw from the war in Iraq he had started in 2003. The discrepancies between scholarly appraisals and the public's evaluation of a leader's performance are particularly apparent in the case of demagogues.

There is a need to distinguish between the successful influence of a leader and his or her long-term effectiveness, as determined by the contribution that the "influence" makes to attaining the long-term goals and well-being of the organization or nation. For instance, researchers need to broaden the criteria of consequence and to attach the appropriate longer-term value of leadership to the development of followers, the organization, and the nation (McCall, 1977). Human resources accounting is an effort in this direction. As managerial accountants increasingly become interested in the behavioral side of a firm's assets and liabilities, there should be increasing opportunities to measure such effects (Caplan & Landekich, 1974). Utility analysis is a promising tool (Cascio & Ramos, 1986). But considerable care will be required to weed out the cause-effect relationships. First Lady Nancy Reagan was effective in the short run in the nation with her campaign "Just say no to drugs," which was largely forgotten once her husband left office, but Eleanor Roosevelt had lasting effects on the world with her influence as an advocate for human rights and the United Nations (Wills, 1994).

Additional questions about the evaluations of the effectiveness of leaders were posed by Hermann, Snyder, and Cunningham (1980). Who determines the criteria for effective leadership, and what difference does it make? (Shareholders will emphasize stock prices; employees, job satisfaction.) Are output measures, such as the size of profits, votes obtained, or church membership, sufficient measures of the effectiveness of leaders, or are leadership-process variables more important? How do researchers avoid having leaders directly influence the raters to render favorable judgments about their effectiveness, a phenomenon examined by Dubin (1979)?

### ***Linkages, Moderators, and Substitutes***

Why does a leader's behavior affect the group's outcomes? Why do the group's outcomes affect a leader's behavior? The leadership roles serve the necessary functions of maintaining role structure, role freedom, goal

direction, and cohesive group action in the performance of a task. These roles do not necessarily specify the patterns of behavior required but, rather, the purposes they serve. These purposes include dealing with goal direction, individual members' goals, and relations within the group; maintaining the group's role structure, constraints and freedom; and promoting individual and group motivation, individual satisfaction and group cohesion, and the group's norms and requirements.

In the emergent situation, leadership is created by the group in response to its own necessities even though an impatient member may impose himself or herself upon the group before the group expresses a demand for such services. In formal organizations, the necessity is acknowledged by the appointment or election of leaders. The effective performance of a task is usually dependent on the appointed or emergent leader's enactment of the leadership roles to carry out the necessary functions. How are the role enactments affected by changes in membership, task, and organization? Are there satisfactory substitutes for leadership, such as overtraining of followers, computerization and automation, or policies and regulations? How far can self-management be taken with such substitutes?

Computers can be substituted for a supervisor for monitoring of and feedback (to both employees and a higher authority) about an individual employee's productivity, wasting of time, frequency of errors, and presence at or absence from the workstation. Computers can trouble-shoot and inform employees about corrections they should make and how to make them. Are such monitoring and feedback likely to be favorably accepted by the employee, in contrast to less close human monitoring? Are some aspects more coercive than others? What if this type of monitoring and feedback represents a diminution of the job for the employee, with the associated effects of increased boredom, dissatisfaction, and loss of self-esteem?

### *A Systems Approach*

Katz and Kahn (1966) pointed the way. A systems approach looks at the leader as someone imbedded in a system with multiple inputs from the environment, the organization, the immediate work group supervised, the task and the leader's behavior. Other factors include his or her relationships with subordinates and outputs in terms of effective performance and satisfactions (Bass, 1976). Hunt, Osborn, and Schriesheim (1977) thought this kind of systems view of contingent variables was particularly important for future research. For instance, studies of military leadership confirmed that combat and noncombat conditions require different patterns of effective leadership behavior. Such differences are likely to vary by the officers' level. Upward and lateral influence in the system can be as important as downward influence to the accomplishment of missions (Van Fleet & Yukl, 1986). Gal (1989) argued that military leadership in the future will be derived from the commitment of subordinates to rise to the challenge of complex, risky, uncertain, and dangerous situations.

According to Demming (1986), managers need to know whether the system in which they are involved is stable and predictable. Are the system's goals and norms stable? Inefficiencies that show up repeatedly call for managers' efforts to improve the situation. Any one positive outcome by itself, such as the satisfaction of customers or meeting the competition, may mean little to the overall health of the system. Zero-defects programs or new equipment alone may also be of little consequence to the system. Management needs to focus proactively on the constant improvement of the design and processes of the system that lie within its capabilities.

Much needs to be learned about how leaders manage the boundary between what is inside and outside their mission in the larger organization and how to protect it. How do they create the necessary environment for productivity within their boundaries? To what must they attend, and what can they ignore? How do they help others to make sense of arrangements and situations (Gilmore, 1982)?

Adams and Yoder (1985) advocated that particular attention be paid to the need to consider leader-subordinate relations in the broader setting in which actions take place—the wider organization and external environment—as was done in [Chapter 25](#). Hermann, Snyder, and Cunningham (1980) noted the absence of research about how a leader's behavior is affected by a variety of specific contextual issues. Will a number of groups need to be coordinated, or can one group handle the problems? Is the organizational problem a crisis, or is it routine? Is the problem familiar or unfamiliar to the organization? Is the leadership operating with immediate subordinates or at a distance? Similarly, Behling and Schriesheim (1976) and Schriesheim and Neider (1988a) saw the need for more future research about the externally oriented activities of managers with higher authority, other department heads, clients, and the community. In all, a more complex set of roles will be seen as part of managerial leadership.

The application of a systems approach to leadership was reflected in the principles set forth for senior executives by the Center for Creative Leadership. Executive leaders need to get in touch with “what is really going on” at different levels in the organization. They need to articulate a vision with clear goals, standards, and priorities, along with a plan for developing a climate that will support the effort. Key leaders at various levels of the organization will need to set examples of such support. Periodic measurements of the effort and its success are required. Risk taking and trust building need to be encouraged. Competitiveness that reduces information sharing needs to be discouraged. Suitable appraisal and reward systems for outstanding individual and team accomplishments should follow, with continuing attention to effective personnel staffing, development, and succession to fit the programmatic effort.

In contrast to *microlevel* research on the leader in relation to his or her subordinates and immediate superiors and to *macrolevel* research on the aggregated data that relate to the total organization and its environment, *mesolevel* research involves the individual leader, on the one hand, and the total organization and environment surrounding the leader, on the other. More such mesolevel research is needed (House, 1988a).

*The Learning Organization.* Senge (1990) introduced the concept of the *learning organization*. It adapts to the changes in its environment. Its leaders learn how to move its members to adjust to needed changes. The leaders and members learn to be more flexible. New perspectives are adopted when the organization moves from national to global markets. Leaders and members adapt to the needs to diversify the workforce and customers. In the learning organization, the permanent bundle of specific tasks that form a job is replaced with a temporary combination of tasks. Some tasks may be shifted to others in the organization or outsourced. Needed also in the learning organization is consultative leadership that articulates what needs to change, careful listening, the giving and accepting of feedback, coaching, mentoring, calculated risk taking, and careful experimentation (Bass, 2000).

### ***Discretionary Possibilities and Nondiscretionary Requirements***

A few efforts have been made to identify the discretionary opportunities that shape a leader's behavior. Much more study is needed to determine what is and is not under a leader's control. Such knowledge should reduce subordinates' unrealistic expectations about the leader, as well as the leader's own experiences of violated expectations. In selection and placement testing, researchers should be able to generate higher validity coefficients between personality attributes and the portion of a leader's behavior that is discretionary.

### ***Delegation***

Delegation remains a relatively unexplored management option despite the evidence of its important contribution to the leader's and the organization's effectiveness. Miller and Toulouse (1986) showed that the extent to which delegation of authority was practiced in 97 small businesses in Quebec correlated .31 with profitability and .34 with sales growth of the business relative to others in the same industry. The effects of delegation were stronger than any others examined, such as the business strategies employed, how they were devised, and the CEO's personal characteristics.

Studies of the delegative process are likely to be important in future research on leadership, with more finetuning of delegation as a style of leadership. Delegation is clearly not participation. Although Vroom and Yelton (1973); Bass, Valenzi, Farrow, and Solomon (1975); and Leana (1986, 1987), among others, contributed to some understanding of delegation, it still remains the least researched style.

As a step forward in the research effort, Schriesheim and Neider (1988) conceived of three forms of delegation instead of one. Research is needed to learn whether each of the forms is likely to interact differently with the motivation, commitment, satisfaction, and performance of the leaders and subordinates: (1) *advisory* delegation, in which the subordinate makes a decision after first getting a recommendation from the leader; (2) *informed* delegation, in which the subordinate makes the decision after first getting needed information from the leader; (3) *nonsuggestive* delegation, in which the subordinate makes the decision without any input from the leader. Of the three forms, advisory delegation is likely to coincide with a strong commitment from the subordinates.

Delegation has been regarded as the style at the other end of the continuum of styles from autocratic directive leadership. Yet an autocrat may delegate because of lack of interest or time to handle the problem directly. A transactional leader may delegate in exchange for subordinate support. A transformational leader will use delegation to develop his or her subordinates. A consultative leader may delegate after being convinced of the subordinate's competence and motivations to handle the problem. Delegation may be the choice of a participant consensus. A laissez-faire leader may delegate to avoid taking the blame for a possible failure.

There is a need to conceptualize delegation as a process and to research what makes it effective or ineffective.

## ***Contingent Models***

Personal traits that are associated with the emergence of a leader appear to transcend situational demands. It is still axiomatic that some of the variance in the emergence and effectiveness of leadership is due to personal traits, and some is due to situational and interactive factors. Nevertheless, a meta-analysis by Lord, DeVader, and Alliger (1986) of data from Mann (1959) and additional data suggested that both Stogdill (1948) and Mann seriously underestimated the importance of personal traits relative to situational effects. The meta-analysis showed that the theoretical mean correlations predicting emergence as a leader between such traits as intelligence, extroversion, and assertiveness, and actual emergence as a leader were much higher than had been realized. These high correlations occurred even when suitable adjustments were made for restrictions in the range of the subjects of the studies and for the unreliability of the measures employed. Also taken into account in the meta-analysis was the likelihood of random variation from one study to the next, which explained much of the situational variance and argued against the need for contingent explanations. Assertiveness, for example, is necessary for leaders, regardless of the situation.

Contingent models are still required to explain how the styles required for effective leadership vary with the

demands of a situation. For example, Barbieri (1983) used path analyses to show that much of the 39% of the variance in revenues from the sales of mature products generated by marketing managers and their sales representatives could be accounted for by the managers' extroversion, relations orientation, and intuitive thinking. But revenues from the sales of innovative products were accounted for by the managers' task orientation and the sales representatives' experience, practical orientation, and intelligence. At the same time, the branch managers' unwillingness to delegate was not a contingent effect; it contributed positively to the sales of both kinds of products.

In sum, despite meta-analytic support for generalizing across situations about personal traits associated with the emergence of leadership, such as intelligence, assertiveness, and extroversion, applications of contingent models of leadership are likely to remain prolific sources of further examination and validation. This occurs particularly with reference to the styles of leadership that are most effective in designated circumstances. More causal, longer-term, larger-scale contingent studies of styles of leadership and their effectiveness are likely to appear during the coming decades.

## ***Assessment***

Research on the various assessment methods employed and their integration into decisions about assesseees need to be studied further. The phrasing of more than 100 such research questions emerged from a brainstorming session on the subject (Jeswald, 1971), and most of them still remain unanswered or partly unanswered almost four decades later. For example, much more remains to be learned about the kinds of biodata and biometric data that can be profitably used for assessment.

The development and evaluation of more sophisticated theory-based, in contrast to empirically-originated, biodata forms of greater validity are needed. These forms can be developed and evaluated by asking questions that generate responses more likely to relate to the personal styles that are of consequence to subsequent performance as a leader. Thus researchers can ask questions about how the applicant coped with "the most important challenge you faced" or "your most disappointing experience." Appropriate scoring, consistent with theoretical expectations, can be developed (Kuhnert & Russell, 1989). A list of such dynamic items for application blanks was suggested by Bass and Barrett (1972)—for example, "May we consult your present employer?"

In this endeavor, as well as in the development of new psychological tests and measurements, experimental findings about personality and social psychology can be put to better use. More complex simulations that duplicate critical aspects of on-the-job performance should be employed. The subtleties of the deep structures involved can be introduced into such simulations. More should be done to assess creative, flexible intelligence, as well as less socially desirable aspects of personality, such as dogmatism and authoritarianism, that may influence leadership behavior. More research is needed on newer personality dimensions that are of consequence, such as the tolerance for ambiguity. A lot more needs to be known about the abilities needed to cope with higher-level managerial responsibilities, including the ability to translate ideas into actions. More sophisticated assessments of leaders' performance in decision-making processes are desirable. Justification of the greater expense of assessment centers over ordinary selection methods calls for more utility analyses such as the one presented by Cascio and Ramos (1986). The contextual conditions surrounding the assessment process also need to be taken into account more fully (Bentz, 1987). For example, Kleinmann, Kuptsch, and Köller (1996) showed that for 119 students in a German assessment center, construct validity was higher if the dimensions on which they were being assessed were transparent, that is, if the students were informed in advance about the assessment dimensions and the behavior that was required of them. In the same way,

McClelland (1998) noted that for good competency assessment in interviews, the competencies assessed and how they may be improved should be made public instead of kept secret as in the case of traditional testing of traits.

*Expected Developments in Assessment.* FernándezBallester (1995) suggested that in the coming decades, new evaluations of mental processes will appear that examine human cognitive functioning, the dynamic assessment of intelligence, and applications of Item Response Theory to computerized and adaptive intelligence tests and personality inventories. Also, new ways of reducing biases in self-reports will emerge. New biophysical measurements of emotion and new ways of assessing person-situation interactions will appear. Many uses for assessment will accrue from the availability of virtual reality. Further studies will be needed in the utility of cognitive, social, and emotional assessment by individual tests in comparison to group situational tests. Assessment technology will have spread to many more countries in many more languages. Further developments can be expected in controlling response set, faking, and desirability of responses.

### ***Leadership Development, Training, Persistence, and Succession***

On one hand, researchers can point with pride to the large array of positive evidence about the efforts to train and educate leaders and the success that has been experienced.<sup>12</sup> On the other, it is still possible to decry the many continuing inadequacies of leadership training and education. Kerr (2004) summarized the results of a symposium of book authors on the subject of how organizations can best prepare leaders to lead and manage. All four authors agreed, and argued convincingly, that developing leader-managers early in their careers is important. But this effort has to be limited, for their turnover is much greater than those of long-term employees and so much less is known about them. This places a premium on careful selection and appraisal. Secondly, work assignments have to be seen as a developmental tool. An assignment should provide a learning opportunity. But more often, an already experienced employee is given an assignment to ensure its successful completion.

Leadership development is a continuing process. Researchers need to learn a lot more about how experience with subordinates, peers, and superiors, as well as with family and friends, shapes one's subsequent performance as a leader. Research on the persistence and transfer of leadership has produced a convincing body of evidence indicating that one's past success as a leader contributes to one's future success as a leader.

What experiences are necessary to make an effective leader? Does one need to be trained in business to be an effective industrial leader? Does one need to be trained in theology to make an effective pope? Does one need to be a lawyer to be an effective legislative leader? Does one need legislative experience to be an effective state governor or president?

Innovative and creative approaches for teaching leadership using films, classics, and fiction are provided by Pillai and Stites-Doe (2003). For instance, some of the subjects covered in college courses include: (1) What is leadership, and is it learned or innate? (2) What are the qualities and behaviors of a great leader, and are they the same for all cultures? (3) Are political leaders history's slaves? (4) Are there unique challenges for women leaders? (5) How do great leaders handle mistakes and failures? (Nathan, 2003).

Based on a review of 20 studies, Atwater, Brett, and Waldman (2003) see both benefits and risks in multirater feedback. Improvement based on feedback was not uniformly found. Negative feedback was likely to result in reduced performance and commitment, anger, questioning of the validity of the feedback process, and discouragement. To be useful, rating systems need to be ongoing and integrated with a means of training and development. Conger and Toegel (2003) foresee a systematic set of action projects being assigned to an

employee so that learning from them can build and be integrated. Qualitative data needs to be included. (In the future, we will see more analyses of qualitative data for feedback.) For Uhl-Bien (2003), relationship skills are the social capital that organizations need. Awareness of the other person's needs, mutual obligation, trust, and respect are present in high-quality relationships. Without them, teamwork suffers. Leadership development requires more attention in the future to training in relations skills.

Kuhnert and Lewis (1987) raised a number of unanswered substantive questions about the development of transformational leadership. Are there observable changes in transformational leaders' behavior as a function of the leaders' personalities? Is transactional leadership a less mature developmental phase than transformational leadership? Are leaders' developmental phases invariant? Does one have to be a transactional leader before he or she can become transformational? What happens when leaders and followers operate at different developmental levels?

*The Genetic Factor.* The nature-nurture controversy is by no means settled. Advances in genetics and biology need to be incorporated into leadership models. Large-scale studies of heredity suggest that genes contribute to energy levels, intelligence, long life, interests, assertiveness, a sense of well-being, the ability to take risks, and even job satisfaction. The genetic factor needs to be taken into account in any complete examination of leadership. There are remarkable correlations in these kinds of traits and outcomes among identical twins reared apart, in contrast to people who are genetically unrelated.

*Purposes of Leadership Education and Training.* Stogdill (1974) faulted research on training for focusing too much on the extent to which training produces attitudinal and behavioral changes in trainees. He demanded more evidence on the impact of the training of leaders on followers. Yet researchers still need to link particular training efforts with particular behavioral changes. For instance, training may understandably increase a trainee's sensitivity; nevertheless, increased sensitivity may be counterproductive on the job. Sensitivity training may incapacitate the leader for coping with strong opposition, threats, and challenges to the legitimacy of his or her status. What is at fault here is not the training as such, but an inadequate analysis of the situational demands on the leader. We are beginning to see much greater precision in such analyses. Over time, it is expected that the application of sophisticated analyses of managers', administrators', and leaders' roles to training will be much more intensive.

For Rost and Barker (2000), leadership education, such as that furnished by secondary and higher education, needs to be distinguished from organizational leadership training. Leadership education should produce citizens for a democratic society who understand the dynamics of the change process and the politics of distributing scarce resources to facilitate change. Participants need to learn how: to get into the decision-making process; collect, interpret, and disseminate information about the issues involved; develop a reputation; think critically in public discourse; and confront opposition. Cherrey and Isgar (1998) propose as goals for teaching students leadership in the twenty-first century: (1) understanding the complexity of an interrelated system such as a multinational NGO with many alliances and diverse units; (2) continually reflecting and learning with a commitment to the greater good; (3) valuing diversity and embracing inclusiveness; (4) practicing collective leadership; (5) focusing on the leadership process, not on the leader; (6) linking academic and extracurricular activities that provide opportunities to learn about leadership. For Ayman, Adams, Fisher, et al. (2003), who evaluated the leadership development programs at 63 U.S. universities, fewer than 10% appear to offer the complete program envisaged: (1) Long-term involvement, (2) the facts about what works, (3) insights gained from reading and case discussions, (4) opportunities for reflection, (5) opportunities to lead, (6) increased self-awareness as a result of personal feedback. The attention to the importance of individual merit, competitiveness, and the "bottom line" needs to be leavened with the importance of cooperation, corporate social responsibility, and ethics (Berry, 1997). Aupperle and Simmons (1989) compared the forced-choice

tested attitudes of 245 CEOs in 1981 and 1988 and found there was no change in how much emphasis they placed on their corporate social responsibility. In order of importance, from most to least important, were economic, legal, ethical, and philanthropic responsibilities. The U.S. Army, Navy, and Air Force military academies come closer to meeting Ayman, Adams, and Fisher et al.'s (2003) requirements for leadership education. Also closer to the requirements are colleges such as Jepson, which offer a four-year curriculum in leadership. In 1998, there were almost 700 leadership development programs in U.S. academic institutions (Honan, 1998). With increasing recognition of the importance of leadership, we can expect more to appear in the future, as well as full four-year programs in leadership.

*Increased Reliance on Intuition.* While new and better techniques for analytical decision making will be developed in the coming years, we will also learn and be trained in how to make better use of intuition—apprehending something without completely understanding it. Intuition is based on experiences and reflective thinking about the experiences. It uses metaphors and imagery. There will be less reluctance to depend on intuition if reflection connects the known information, perspectives, and feelings about the issue. It can add to what analysis can provide for making a decision in the absence of complete information (Cartwright, 2004).

*Improvements in Evaluation.* Evidence of the utility of focusing on specific behavioral training and its specific effects is to be found in the attention now being paid to behavioral objectives, behavioral modeling, and applications of social learning theory. But in many evaluative studies of leadership training, it is impossible to determine the method or combination of methods employed. Evaluative reports need to describe in detail both the method of training and the content taught. In addition, more attention needs to be paid to the threats to the validity of training designs and their evaluations (Kane, 1976). For example, for the purposes of unbiased evaluations, if possible, superiors should not know who has received training and who has not after trainees return to their jobs. Likewise, trainees should not be told whether they are serving as experimental subjects or controls (as in holdout designs).

*Multinationalism and Diversity.* The globalization of industry will mean increasing attention to international managers, as such, with the probable submergence of surface differences in national styles and performance, but with needed increases in attention to underlying differences in institutions, cultures, and governments. At the same time, with the rise in power and influence and the further economic development of countries whose cultures are alien to the West, attitudes, values, interests, and beliefs that are different from those in the West and that affect leader-follower relations will emerge. They are likely to emphasize tradition and collectivism more heavily. Globalization has been accompanied by the emergence of a global civil society whose problems challenge the international community. Learning from the experiences of corporations and institutions can be helpful in satisfying the “need for leadership to promote peace, democracy, and development within (nations) and between (nations) ... the national leader's (has a) responsibility to serve his people ... and global civil society's efforts to promote peace and development worldwide ... without losing sight of the larger picture linking leadership to human development” (Safty, 2000).

In the United States, studies of black, Hispanic, Asian-American, and women leaders will continue to increase, reflecting their movement into higher levels of leadership and management in industry, government, and education. A greater openness to line management by Jewish Americans, Asian Americans, and other minorities is likely to increase with the increasing technological requirements for remaining competitive. As more women move into the higher reaches of management, we may see more of an emphasis on androgyny than on masculinity as being favorable to effective management (Adams & Yoder, 1985). Extensive commentaries will be replaced by more empirical studies. More empirical studies will also be needed, considering how quickly outdated conclusions from them can become.

Because of the emotional content involved, care needs to be taken not to accept at face value leaders' and subordinates' cross-race and cross-sex opinions and descriptions. At the same time, more attention has to be paid to the underlying feelings of rejection, contempt, guilt, and threat in mainstreamers and outsiders that do not surface because of superficial socialization, socially desirable responses, or mistrust of the investigators. This is another reason why empirical monitoring of such dimensions as the self-confidence of blacks, women, Hispanics, and particularly Asian Americans is essential. It should be recognized that an effective, polite, mutual acceptance can be maintained at one level while underneath, a wall of misunderstanding still exists.

Little is known about Anglo-Hispanic leader-subordinate relations. Yet Latinos are now the largest U.S. minority. Research here will be made particularly difficult by the wide differences among Mexican Americans, Puerto Ricans, Cuban Americans, and the large immigrant groups from the central Caribbean and elsewhere in Latin America.

So far, the preponderance of evidence endorses the need for minority members serving as leaders in majority environments to emulate the original white male manager. However, more and timely research will be needed on the accommodations made by minority members to the duality of their roles as both managers and members of a minority group. Leadership is also a completely different matter for minority community leaders, who ordinarily need to identify more with their own subculture than do their followers.

*Work/Family Balance.* There will be more focus on family-friendly policies. More will need to be learned about the policies needed for the different types of child care by single mothers and single fathers, divorcées, homosexual couples, and grandparents. More research is needed on the full range of working family forms and incomes for policies across socioeconomic levels. Beyond this can lie a future where families engage in educational experiences for mutual benefit, from learning computer programs to learning foreign languages. Increasingly, we are likely to see government policies toward families becoming friendlier, with more flexible work weeks, longer part-time hours and more sharing of the costs of child care as well as greater portability of pension benefits, care for parents, and solutions to the problems of overscheduled lives. Globalization may bring the United States closer to many European nations in family friendliness (Murphy & Halpern, 2005).

### ***Criminal Leadership***

One of the areas of leadership among many that I have neglected is leadership of organized criminal gangs such as the Mafia, Colombian drug lords, and the Japanese Yakuza. The gangs pursue a variety of illegal activities and also invest in legal businesses. Their leadership tends to be autocratic and coercive, supported by disciplinary rules and codes of honor. Informants and undercover agents unveil the secrets of their operations. Fictional portrayals are common in literature and TV and, like *The Sopranos*, can be used to propose principles of leadership, but can serve only as illustrations (Yammarino, 1996).

## **Summary and Conclusions**

---

Many important issues remain relatively unexplored. Others have been overworked. Much original, creative leadership research has appeared since the early twentieth century and especially since the 1940s. But it has also been accompanied by a wasteful repetition of tests of shopworn hypotheses. The atheoretical research published before 1965 was too unfocused, but much of the research that followed was based on naive,

uncritical theorizing and retarded the process of new discoveries. Nevertheless, much has been accomplished. Based on his 32 years as a military leader and 10 years directing the Center of Creative Leadership, Ulmer (1997) found that much had been accomplished in leadership research by then, although there had been diversions. Yukl (1998, p. 508) concluded that the field “has witnessed an increase in the richness of research questions and the variety of approaches used to study them, and ... appears to be undergoing an accelerating pace of discovery.”

## ***Accomplishments***

Critics complain that leadership is fundamentally anti-democratic and antithetical to nonleaders' rights of expression and power sharing. Other critics complain that despite all the research, nothing is known about leadership! Still others declare that leadership is a figment of the imagination or that leadership as a research subject is moribund and has reached a “dead end.” Nonetheless, this and the preceding chapters attest to the health and well-being of the subject. A wide range of new and challenging substantive issues have been created: implicit leadership, substitutes for leadership, prototypicality effects, neocharismatic and transformational leadership, strategic leadership, virtual leadership, leader-Member exchange, impression management, self-management, and upward influence. Among the methodologies introduced have been analysis by WABA, meta-analysis, and triangulation of quantitative and qualitative findings. More replicated studies have made possible many more meta-analyses to increase confidence in results. Both personal traits *and* situations have been shown to be important to leadership.

Considerable advances have occurred in the development and use of theories. Linkages have been forged to general theories, for example, between contingent reinforcement leadership and the general theory of reinforcement. Testable theories have been constructed and tested. No longer does one have to wait for the demise of the theorist before a theory of leadership is abandoned or modified because of its failure to be supported empirically.

The ability to predict future leadership performance accurately has increased substantially during the past half century. Many studies have taken advantage of the miniaturization of wireless physiological recording and the personal computer. More will be doing so in the future. The same is true for electronic mail, videoconferencing, and other forms of telecommunication, which will also increase in importance in linking leaders and subordinates who are distant from each other.

New complex and effective research designs are now available. These designs would be equally useful for testing other relationships that have not been explored. The production of critically needed information could be greatly accelerated by feeding new combinations of variables into research designs that have been demonstrated to be effective. Efforts are increasing to bring together active leaders, organizational consultants, and research investigators to discern common problems and interests and to increase the focus of this research on realities and the application of research results (see, e.g., Clark & Clark, 1989).

In the social sciences, old theories used to wither away with the retirement of the originators and their disciples. However, although some theories of leadership have gone or are going this route, other theories of leadership, such as path-goal theory, the contingency theories, and charismatic/transformational leadership have by no means withered. Rather, they have been systematically tested and reshaped as a consequence of the results of tests. And new models have been fashioned on top of them.

The preceding suggestions for future research indicate that the possibilities are far from exhausted. Leadership presents a lively, challenging field for research and innovative applications.

*Optimism or Pessimism?* The optimist sees the wine bottle as half full; the pessimist sees it as half empty (and sour to boot). It is easier to be destructive than constructive, particularly when one lacks information. “Know-nothings” argue that the past years have essentially been a waste and it is now necessary to start afresh. Miner (1975) proposed that the concept of leadership be abandoned altogether. Since then, he has changed his mind. M. W. McCall (1977) thought that leadership would remain an enigmatic subject because of its many definitions, but in [Chapter 1](#), I noted that the definitions were evolving in a systematic fashion and that, at any rate, the diverse definitions do not seem to detract from model and theory building. The many models and theories that have sprung forth in the past five decades are not as divergent and conflicting as one might expect from the diverse definitions of leadership on which they may be built. Ways are needed to juxtapose one model with another to test which one yields more plausible explanations. Fiedler and associates tested Fiedler’s contingency theory; Vroom and associates tested their deductive model; Likert and his associates produced massive amounts of support for System 4. Points of theoretical disagreement can be found and critical experiments developed, as was done by Locke, Latham, and Erez (1987) and Blake and Mouton (1985) to determine which model best fits the data.

To some extent, the problem may be that each theoretical point of view is supported by a different array of measurements and situational circumstances. Part of the problem may also be that situational factors determine some kinds of leadership behavior but not others. Autocratic leaders—rigid, inflexible, and self-assured—may try to lead in any situation in which they are placed. Democratic leaders may attempt to lead only if they feel competent and supported in the particular situation. The nondiscretionary behavior of leaders will be determined by organizational and environmental matters that are not within their control. But leaders’ discretionary performance will be much more a matter of their personal predilections than of situational differences alone.

It is one thing to say that researchers know nothing because they do not obtain consistent results. The lack of consistency may be attributed to a lack of knowledge. Yet it may be that to achieve consistent results requires accounting for a complexity of variables and that, as researchers do so, they increase their understanding of what is happening. What is needed are better measurements; a broader appreciation of which situational variables are more important and which are less so (Korman, 1974); and, as was noted earlier, larger samples. Calas (1986) and Calas and Smircich (1987) joined the “cry and dismay” about the narrow substantive themes and methodological means of the past in what has been published about leadership by its establishment of scientific investigators. Nevertheless, the researchers believe that the field has the potential to become: much more open to broader approaches in the search for understanding; accepting of expanded horizons; reflective of more adequate connections with salient substantive issues of the real world outside the community of researchers; and populated with researchers learning from experience, observation, and narrative interpretations of meaning about what they write, as well as from continued dependence on field surveys and controlled experiments. Historians, anthropologists, and political scientists have much to say about leadership in their narrative reports. Illustrative is Schrujjer’s (1997) historical essay on the early-medieval Christian bishops’ management of meaning between the fourth and eighth centuries. They carefully substituted and imitated pagan practices and beliefs to satisfy people’s need for miracles in a dangerous world. And because they tolerated and encouraged magical practices, they succeeded in redirecting loyalty and commitment from pagan gods to Christian saints.

The choice of topics needs to be broadened to reflect more of the long-lasting issues that leaders, as well as the leadership research establishment, confront. However, one side of the establishment has continued to complain about the substantive and methodological narrowness of research in the field. The other side has been equally vociferous about the need for more rigor and discipline. Both types of investigators make contributions, particularly when they can join forces or pursue the expansion of horizons from a disciplinary or interdisciplinary basis. New lines of investigation should be expected and welcomed. For instance, Morgeson

(2005) demonstrated the utility of examining the impact of novel and disruptive events on self-managing teams. This was followed shortly by Morgeson and DeRue (2006) demonstrating the impact of criticality, urgency, and duration on the disruption of teams, and influence on the intervention by the team leader. The future should see more efforts to develop understanding of how leadership is affected by events. The future should also see more research on developing, in both leaders and followers, positive psychological capacities such as hope, optimism, confidence, and resiliency (Anonymous, 2006).

Some collectively disparage the thousands of research studies of leadership.<sup>13</sup> But T. R. Mitchell (1979) concluded that theory and research were continuing to develop and that much of what had been done was being used in practice: "There was reason for controlled optimism. Yet the challenges are still there for the years ahead." His words are even truer a quarter of a century later. At the end of the twentieth century, House (1999) concluded that, "there is a substantial amount of available knowledge concerning the exercise and effectiveness of leadership, and there are sufficient number of remaining issues and questions to occupy the time of social scientists for a considerable, and indefinite duration."

This book should provide an antidote for the arguments of those continuing to bemoan the supposedly unknowable, elusive, mysterious nature of leadership. I expect and hope that I have been able to show that a considerable body of theory, method, evidence, and understanding is available about how, why, and under what conditions leadership, in all its rich variations—implied, observed, described, and/or evaluated—energizes and exerts its influence—sometimes for the worse, more often for the better.

### ***Past and Future Developments***

In 1967, I looked ahead to the year 2000 and forecast accurately that organizations would be more flexible, that providing challenging work would be a more common practice, and that online computers would greatly facilitate management. Sensitivity training would be more proficient; and knowledge would be more important to management. There would be increased attention to the behavioral and social sciences and a decline in middle management (Bass, 1967, Wilcox & Bush, 2003). In 1998, I speculated about the U.S. Army in 2025 (Bass, 1998). In 2002, I looked ahead to 2034 and suggested what future leadership research and applications might be like. Many of these predictions are noted next (Bass, 2002).

*Methodological Trends.* More studies will combine data from individual, team, and organizational levels for within and between analyses (WABA). Old fads will decline, but new ones may take their place, thanks to newspaper and magazine articles, journals and books on the subject. The fads are well known by managers. As noted earlier, academic researchers are now often the source of the information, so that we can expect an increasing coalescence of the fads and scientific literature (Gibson & Tesone, 2001; Gill, 1992). With the increase in more reliable and valid measurements, mathematical operations and model testing will increase in application. Organizational charts will describe networks of leadership, communications, responsibility, and accountability. We will have seriously underestimated developments in information technology, nanotechnology, biotechnology, and electronic brain and body scanning applicable to understanding leaders' and followers' cognitions, behavior, and perceptions. Genetic profiling and hormone levels will have been introduced into the study of leadership. Artificial intelligence will assist managerial decision making. More longitudinal studies contrasting and combining economic, social, and behavioral studies will have been completed.

*Substantive Trends.* Coaching, mentoring, and individualized consideration will have become routinized,

much of it available for delivery online. Most training will be delivered from Web sites, the Internet, and intranets. The “not invented here” syndrome will disappear in a global economy. Most industries and businesses will be dominated by a few gigantic multinational corporations. Purely transactional bureaucratic organizations will have given way to more transformational ones. In the developed world, women will be in the majority in legislatures, government, and business management and ownership. They will foster more networking, relationships, and concerns for social justice, equity, and fairness. In the United States, more Hispanics, Blacks, Asian Americans, and American Indians, as well as those of southern and eastern European ancestry, will have increased proportionately in senior management. Second careers for leaders after retirement will be commonplace. Working to the age of 85 will not be unusual.

Ethical codes will be constructed empirically, based on experience with borderline cases and judgments about them by managers, ethicists, and workers. Changes in the environment will be mirrored in changes in the organization. At all levels, adaptability will be essential. Leaders will be prized for their innovativeness, responsiveness, and flexibility and their greater frequency of transformational leadership. Improvements in health and medical care will make diseases such as cancer, Alzheimer’s, stroke, and heart disease less likely to disrupt careers acting as Robert Crowley’s “wild cards in history.”

As Aelfric, a schoolteacher and abbot (c. 955–1020), said, “We dare not lengthen this book much more, lest it ... stir up men’s antipathy because of its size” (Lacy & Danziger, 1999).

<sup>1</sup> *The Leadership Quarterly* has as one of its purposes to provide a single forum for research on leadership from the different disciplines.

[2](#) See Binning and Lord (1980).

[3](#) *Varient* is not a misspelling of *variant*; it stands for *vari(able) ent(ities)*.

4 Sociograms plot the choices by organizational members of those with whom they would most prefer to work.

5 As detailed in Chapters 18 and 19, *direction* (italicized) refers only to giving orders with or without explanation. Direction (romanized) includes ordering, persuading, and manipulating. *Participation* (italicized) refers only to sharing in the decision process. Participation (romanized) includes consulting, sharing, and delegating.

6 See [Chapter 14](#).

[Z](#) This type of leadership is discussed in [Chapter 14](#) as intellectual stimulation, one of the factors in transformational leadership.

[8 Chapter 7](#), in particular, looked at individual differences in this regard.

[2](#) Chapters 10 and 11 discussed the more general issues involved.

[10](#) Illustrative of people at this level are those who faulted President Richard M. Nixon not for trying to subvert the law but for getting caught.

[11](#) In some countries, such as Japan, it is not even illegal.

<sup>12</sup> See [Chapter 34](#).

[13](#) About 7,500 have been cited here.

# Glossary

This glossary has been prepared because some readers may be unfamiliar with particular specialized terms in statistics, management, and the behavioral, social, and political sciences that were mentioned in the text but not defined or fully discussed. The glossary may also be helpful to readers from outside the United States who are less familiar with some American colloquialisms that appear in the text. The terms that are discussed more fully in the text are likely to be found in the subject index rather than in this glossary.

## A

**Accountability** Members of an organization who are given responsibility and authority are held answerable for the results.

**Achievement motive (nAch)** Motivation to seek high performance and success.

**Acquiescent response set** Agreement with statements, regardless of their content.

**Action research** Research whose objective includes the implemented solution of the research problem using the diagnosis of the problem, the collection of data, and the analysis and feedback of data.

**Adaptation level** An individual's expectations and experience set a standard against which events or objects are perceived.

**Ad hoc group** A temporary group established to deal with a problem or problems (also *Task force*).

**Affect (noun)** Feeling; emotional reaction.

**Affiliation motive (nAff)** The motivation to belong and to be with other people.

**Affirmative action** Positive programs to increase opportunities for the employment and promotion of members of disadvantaged groups.

**Algorithm** A procedure used to solve a set of problems by an explicit formula.

**Alienation** A generalized sense of meaninglessness, helplessness, and social isolation that contributes to the disinhibition of personal controls against engaging in deviant behavior.

**Altruism** Helping others with no obvious benefit to oneself and with few expectations for personal gain.

**Analog** A physical, mechanical, or electrical model of an object or concept about which measurements and calculations can be made.

**Androgynous** Combining attitudes and behavior of both males and females.

**Anglos** Mainstreamers in the southwest region of the United States.

**Anomie** The reduced social control against deviant behavior that is due to a disregard of norms and standards.

**Anxiety** Generalized, diffuse apprehension.

**A posteriori** Explanations are offered after the facts are known.

**Application blank** A personnel form to elicit information about an individual's personal characteristics, background, and experience.

**A priori** Hypotheses are formulated before the facts are known.

**Arbitration** A situation in which a third party renders a decision for two parties who are in conflict.

**Artifact** The results of an arbitrary method, rather than the true state of affairs.

**Artificial intelligence** The emulation of the problem-solving, linguistic, and other capabilities of human beings by means of a computer.

**Assumed similarity** We assume that we are like other people in values, interests, beliefs, and personality

(see *Projection*).

Attenuation Reduction from a theoretically true correlation because of the unreliability of one or both measures correlated.

Attitude An affective, evaluative, relatively enduring reaction, positive or negative, toward an object or proposition.

Attribution theory A theory of the way people impute intentions to other persons or situations.

Auditing Verification of the validity of data, statements, and records.

Autokinetic effect A stationary light that, when viewed in a dark room, appears to move.

Autonomy The degree of freedom in carrying out an assignment.

Aversive reinforcement Reinforcing conditions that inhibit the reinforced behavior; also *Negative reinforcement*.

## B

Batch production The production of quantities of similar items, rather than mixes of items.

Behavior modification Changing behavior by changing the consequences of that behavior. Desired new behavior is rewarded (*positively reinforced*); undesired old behavior is punished or positive consequences are removed (*negatively reinforced*).

Behavior shaping *Behavior modification* in which small increments of behavior are reinforced in the direction of the desired behavior until a final desired result is achieved.

Biased sample A sample that is unrepresentative because of one or more sources of systematic error.

Binary Involving two digits or states.

Biographical information blank See *Application blank*.

Boundary-spanning roles Liaison roles that connect departments or organizations with each other and with the environment.

Bounded rationality Managers make the best decisions they can within the constraints of limited information about possible alternatives and the consequences of the alternatives.

Brainstorming The generation of ideas without evaluating them; a maximum number of ideas can be generated in a limited time.

Buffering Actions or events to seal off processes from external variations.

Bureaucracy An organization that is operated on the basis of rules, regulations, and orderliness and that focuses on legitimacy, the duties of jobs, and the rights of office. It is characterized by standardization, hierarchical control, specified authority, and responsibilities.

Bureaucratic personality The preference for rules, regulations, and order in running organizations.

Burnout Emotional, mental, and physical exhaustion resulting from continuing exposure to stress.

Business game A simulation of a business operated by two or more players competing with other businesses in a common market.

## C

Career plateau A prolonged halt in promotion up the corporate ladder.

Centralization The degree of concentration of authority in a central location at the top of the organization.

Chain of command The hierarchy of authority in an organization from top to bottom. Members are supposed to know to whom they should report and who reports to them.

Change agent An individual who guides the process of group or organizational change.

Channel The communication path along which information flows.

Chicano American of Mexican descent.

Classical organization theory Early efforts to identify the principles of effective management.

Code A system for representing information and rules.

Coefficient alpha The internal consistency or reliability of a test or measure based on the average intercorrelation among its items.

Cognition A mental event in which perceptions, memories, beliefs, and thoughts are processed; the sensing of many narrow segmented categories in behavior or events, rather than a few broad classifications.

Cognitive dissonance The holding of incompatible beliefs and cognitions.

Cognitive dissonance theory The theory that it is unpleasant to maintain strongly held beliefs that clash with facts, and that people are motivated to resolve the incompatibility by maintaining the beliefs and denying the facts.

Cognitive framework The categories and their connections into which individuals place events, behaviors, objects, attributes, and concepts.

Cohesiveness The forces that hold a group together; the attractiveness of a group for its members and the members for one another.

Collective bargaining The negotiation and administration of agreements between labor and management about wages, working conditions, benefits, and other labor-management issues.

Commitment Strong, positive involvement; continuing concern.

Common factor The statistical representation of a factor underlying two or more variables.

Communality The sum of squares of *factor loadings* for a designated variable; the total variance that is due to the factors that this variable shares with all other variables in an intercorrelated set.

Communication overload The receipt of excessive amounts of information such that the information cannot be processed satisfactorily.

Complexity leadership Leaders go beyond ordinary management to coordinate the complexities of the organization.

Compliance Acting that is consistent with rules, norms, or influence by others.

Compression of salaries Because of changes in labor market conditions, newly hired employees may begin employment at salaries that are near to or the same as those with seniority, more experience, but similar other credentials.

Compulsory arbitration A negotiation in which the arbiter's decision is binding on the parties in conflict.

Computer-assisted instruction (CAI) Instruction by computers that substitutes for human instruction.

Computer program A set of instructions, arranged in proper sequence, to cause a computer to perform a desired set of operations.

Concept A mental image formed from a set of observations; a definition that labels and provides meaning to the observed reality.

Conflict management Intervening as needed to avoid, reduce, or resolve conflicts.

Confrontation A situation in which parties in conflict directly face, oppose, and resist each other on the issues.

Connective leadership Achieving styles (behavioral strategies) to deal with a changing environment.

Consensus An emotionally and intellectually acceptable group decision.

Construct See *Concept*.

Content analysis An objective, systematic, and usually quantitative description of communications as observed, recorded, or documented.

Contingency table A display of the frequency of individuals or cases, classified according to two or more

attributes.

**Continuous processing** Inputs of energy and materials are transformed into products in a flow for a period of time, such as occurs in a petrochemical refinery.

**Controlling** The process of monitoring and correcting organizational activities to see that they conform to plans.

**Co-optation** A situation in which authorities choose their successors, colleagues, and assistants.

**Coordination** Integration of the activities of the separate parts of a group or organization.

**Correlation coefficient** The relationship between two variables obtained from the same set of cases. It can range from -1.00 through 0.00 to +1.00. It is the ratio of how much one (standardized) variable's changes coincide with the changes in the other (standardized) variable.

**Counterculture** A culture that is radically divergent from the mainstream culture of the society of which it is a part.

**Coup** Illegitimate, sudden seizure of power; also, a sudden, surprising victory.

**Covariance** The mean of the products of the deviations of each of two variables from its own mean.

**Criterion** A standard of performance; the measure against which other measures are calibrated.

**Critical incidents method** A performance appraisal in which the supervisor keeps a record over a period of time of the behaviors of each subordinate that are critical to the performance of the job. Also, a survey method for collecting desired and undesired critical behaviors from a sample of employees.

**Cross-lag** The correlation of earlier data on one variable with later data from another variable and vice versa.

**Cross-lagged correlational analysis** Correlations between variables X and Y are obtained at time 1 and time 2. The correlations between X<sub>1</sub> and Y<sub>2</sub> and X<sub>2</sub> and Y<sub>1</sub> are contrasted with the correlations between X<sub>1</sub> and Y<sub>1</sub> and X<sub>2</sub> and Y<sub>2</sub>.

**Cross-validation** Scoring keys developed using a first sample are validated using a second sample.

## D

**Damage control** Explanations to offset the effects of a leader's failures and mistakes.

**Decentralization** The delegation of power and authority from a central, higher authority to lower levels of the organization, which often results in smaller, self-contained organizational units.

**Decision making** Identifying and selecting a course of action to solve a problem.

**Decode** To convert coded data into readable and meaningful information.

**Deep change** The process of radical alteration or transformation that occurs infrequently and with profound effects on the individual or group.

**Deindividuation** A state of being in which an individual in a collection of people does not feel personally identifiable by others.

**Dejobbing** An individual worker is assigned to complete a variety of tasks at different times rather than a bundle of the same tasks.

**Delphi method** A method by which expert opinion is surveyed and compiled, and then each expert evaluates the compilation.

**Demand characteristics** Explicit and implicit perceptual cues of what behavior is expected in a situation.

**Departmentalization** The grouping into departments of similar, logically connected work activities.

**Dependent variable** A variable whose changes are the consequences of changes in other variables.

**Dialectical inquiry method** A method in which decision makers first examine their assumptions, then negate their assumptions, and then create countersolutions that are based on the negated assumptions.

**Differentiation** Separating and focusing on the differences between individuals, groups, and the activities in an organization.

**Discriminant function** An optimal weighting of a set of variables to show the maximum statistical discrimination between two groups.

**Discrimination (social)** The acceptance or rejection of people solely on the basis of their age, sex, race, ethnicity, or membership in a particular group or organization.

**Division of labor** The breakdown of a complex task into components so that different individuals are responsible for a limited set of more closely connected or similar activities, instead of the task as a whole.

**Dogmatism** A close-minded rigid style with beliefs that are authoritarian in content.

**Double-loop learning** Errors are corrected, resulting in a change of values about what is important to change; actions are then taken accordingly. In single-loop learning, values remain unchanged and no actions are taken.

**Downsizing** Making smaller.

**Dramaturgy** Managing impressions by controlling information or cues to be imparted to others.

**Dual-career family** A family in which both the husband and wife hold jobs or otherwise pursue careers.

**Dyad** A two-person group.

**Dynamic correlation** A correlation of a predictor with successive criteria that change as the criteria change in time.

**Dyzygotic** Fraternal twins from two eggs. Less common inheritance than identical twins but more than ordinary siblings.

## E

**Efficiency** The use of minimum costs and resources in achieving organizational objectives.

**Ego** The part of one's personality that is oriented toward acting reasonably and realistically (see *Id* and *Superego*).

**Ego ideal** A partly conscious image of oneself at one's future best.

**Empathy** The internalization of the feelings of another person.

**Empirically-oriented leadership** Relies on data and information.

**Encoding** The translation of information into a series of symbols for communication.

**Equity** The fairness of rewards and punishments; a situation in which the ratio of outcomes to inputs for a person is equal to the same ratio for comparison persons.

**Ethicality** Implied standards of morally acceptable conduct with emphasis on moral principles.

**Ethnocentrism** The rejection of foreigners, aliens, and outgroups; the extreme favoring of one's own group. Also belief that the home country is superior to other countries and that methods that work at home can be exported elsewhere (see *Geocentrism* and *Polycentrism*).

**Expectancy** An estimate or judgment of the likelihood that some outcome or event will occur.

**Expectancy theory** The theory that an effort to achieve high performance is a function of the perceived likelihood that high performance can be achieved and will be rewarded if achieved and that the reward will be worth the effort that is expended.

**Experiment** The manipulation of one or more independent variables and the control of other related variables to observe one or more dependent variables.

**Experimental control** The elimination or holding of some variables constant, to examine the effects of other variables that are allowed to vary.

**External environment** The environment outside the organization or the independent group.

**External validity** The conclusiveness with which findings can be generalized to other populations and settings.

**Extrinsic rewards** Pay, promotion, and fringe benefits, apart from the satisfaction that is derived from the

work itself.

## F

*F* test A test that determines whether the greater variance in the means among groups compared to the variance within the groups cannot be accounted for by chance.

Factor analysis A statistical technique to extract the smallest number of underlying factors accounting for a larger set of variables.

Factor loading The correlation of any particular variable with an extracted factor.

Factor matrix A matrix whose entries are the *factor loadings* obtained from a factor analysis.

Factor validation The validity of scores derived from a *factor analysis*.

Fear of success The fear that envy and dislike by others will accompany one's success.

Feedback The receiver's expression of her or his reaction to the sender's message or actions. Also, information about the results of one's behavior, efforts, or performance that can result in correction and control.

Field experiment The use of the controlled laboratory method in a real-life setting.

Field study The examination of the relations and interactions among variables in real-life settings, without the manipulation of variables as in a field experiment.

Field theory The theory that social behavior is a function of one's environment, as well as of one's attitudes and personality.

First impression One's impression of others that is formed early in a relationship, that often has a lasting impact.

First-line managers Managers who are at the lowest level in the management hierarchy and who are responsible only for the work of operating employees, not for the work of other managers.

First-order factors Factors that are extracted from an original set of variables.

Flexible organization An organization in which the policies, structure, relationships, and jobs are loosely defined and open to alteration.

Forecasting The prediction of outcomes and future trends.

Formal authority Legitimate or position power; the right to exert influence because of one's hierarchical position in the organization.

Formal group A group that is created by a *formal authority* and is directed toward achieving specific objectives.

Formalization A situation in which rules, policies, and procedures in organizations are written and institutionalized (see *Bureaucracy*).

Functional organization An organization that is departmentalized so that those engaged in the same functional activity, such as marketing, are grouped into one department.

## G

Game theory The explanation of the behavior of rational people in competitive and conflict situations.

Gender Grammatical categories, male, female, and neuter, such as he, she, and it. Commonly misapplied to the two biologically distinct sexes, male and female.

General factor The factor present in every variable of the set.

General manager An individual who is responsible for all departments within a larger division, such as a manufacturing plant.

Geocentrism A world view of management, operations, and opportunities rather than one limited to a

single nation or nationality (*Ethnocentrism*) or an independent collection of countries (*Polycentrism*).

Grapevine The paths through which informal communications are passed in an organization.

Group decision support system (GDSS) A computerized information system in a group meeting to make better use of information for group decisions.

Groupthink Faulty processes resulting in group decisions that are poorer than those of the individual members working alone.

## H

Habituated followers Blindly trusting followers of the charismatic or pseudotransformational leader.

Halo effect The influence of overall impressions on the rating of a specific characteristic.

Hawthorne effect The performance of employees who receive special attention will be better simply because the employees received that attention.

Hedonism Motivation that is attained by gaining pleasure and avoiding pain.

Heuristics “Rule of thumb” solutions to problems that are based on past experience rather than explicit formulas.

Hierarchical factor analysis The systematic organization of a factor solution from the simplest two-factor solution to a complex of many factors.

Hierarchical organization In a hierarchical organization, except for the member at the top, each member has a superior; and except for those at the bottom, each member has one or more subordinates.

Higher-order factors Factors that are extracted from a set of first-order factors (also called *second-order factors*).

Higher-order interactions The analysis of the interacting effects of three or more independent variables.

Hollistic hunch Intuition.

Human resource information system A computerized collection, storage, maintenance, and retrieval system for an organization’s information about its personnel.

Hygiene factors Benefits that cause dissatisfaction with the job if they are not present but that do not add to satisfaction if they are present.

Hypothesis A conditional prediction about the relationship among concepts or among variables, often generated from a theory, that is subjected to empirical verification.

## I

Id The part of the personality that is the repository of basic drives and unsocialized impulses, including sex and aggression.

Idealistic leadership Relies on intuition and a minimum of data and information.

Ideologue A convinced advocate of a specific set of doctrines, attitudes, and beliefs.

Ideology A strongly held set of values, attitudes, and beliefs that explain the world.

Implicit theories The tendencies of individuals to weave characteristics of others or characteristics of events into explanatory patterns.

In-basket test A test in which an examinee is given a booklet that contains a sample of memos, bulletins, notes, letters, and reports representing a manager’s in-basket; the test is scored on the way the individual prepares to deal with various issues contained in the material.

Incremental adjustments Problem solving in which each successive action represents a small change.

Independent variable A variable that is manipulated in an experiment whose changes are considered to be the cause of changes in other variables (the dependent variables); variables selected in a survey for the same

purpose.

**Inflection point** Major change in technology, business, or performance evidenced in a changing trend in a graph.

**Informal communication** Communication that is not officially sanctioned (see *Grapevine*).

**Informal group** A group that voluntarily arises from the needs of individuals and the attraction of people to one another because of common values and interests; an unofficial group that is created without the sanction of a higher organizational authority.

**Informal organization** The relationships between members of an organization that are based on friendship, propinquity, and personal and social needs.

**Ingratiation** An attempt to influence other persons by flattering them.

**Insider trading** Trading of stocks and bonds on knowledge from inside the firm that is not available to the public.

**Integration** The joining of elements to work together in a unified way.

**Internal environment** Workers, managers, technology, working conditions, and the culture in the organization.

**Internalized** Behavior, compliance, and conformity are consistent with one's beliefs and values.

**Internal locus of control** The belief that the rewards one receives result from one's own efforts, rather than because of chance or the effects of others.

**Internal validity** The conclusiveness with which the effects of the experimental treatments are established in an experiment.

**Interpretive strategy** Attention placed on perceptions, feelings, values, symbols, and nuances rather than simple realities.

**Intrapsychic tension** Conflicts within an individual.

**Intrinsic rewards** Satisfaction from doing the work itself apart from the pay, promotion, and benefits; feelings of growth, esteem, and achievement from doing a job well.

**Introjection** The unconscious or subconscious attribution of others' motives to oneself.

**Ipsative scores** A set of scores generated for the same person, rather than a single score per person generated for a set of persons.

## J, K

**Job** A collection of tasks grouped together similarly in a number of similar positions in a given organization.

**Job enlargement** The combining of various operations at a similar level into one job to provide more variety for workers.

**Job enrichment** Providing a job with more challenge, meaning, *autonomy*, and responsibility.

**Job satisfaction** Attitudes and feelings about one's job.

**Job scope** The number of separate operations a particular job requires before a cycle is repeated.

**Job specialization** The division of work into standardized, simplified tasks.

## L

**Laboratory study** Research in which the effects of extraneous factors that are irrelevant to the problem are minimized by isolating the research in an artificial setting; elements thought to be important in real life are reproduced and manipulated under controlled conditions.

**Lame duck** A leader whose power has declined because his or her tenure in the leadership position is near its end.

**Lateral (or horizontal) communication** Communication between departments of an organization that generally follows the work flow, thus providing a direct channel for coordination and problem solving.

**Lateral (or horizontal) relationship** Direct contact between members of different departments at the same hierarchical level that bypasses the chain of command in their own department.

**Leader-member exchange (LMX)** Interaction of a leader with an individual member of the group or the average member of the group in contrast to the interaction of a leader with the group of members.

**Learned helplessness** A condition in which persons become passive, depressed, and unable to learn to cope with the situation.

**Leniency bias** The tendency to be more favorable and positive than is justified by evidence.

**Libido** Psychic energy that is expended in satisfying different needs.

**Likert scale** A scale in which respondents are asked to indicate how much they agree or disagree with an attitudinal statement.

**Linear programming** A method for the optimal allocation of limited resources to attain a goal.

**Line personnel** Those managers and workers who are directly responsible for achieving organizational goals (in contrast to staff personnel, who provide support services for the line personnel).

**Linguistics** The scientific study of language.

**LMX** See *Leader-member exchange*.

**Locus of control** The degree to which individuals are controlled by their internal motives, habits, and values, rather than by external forces.

**Logic** Principles and criteria of validity in thought and demonstration; the application of truth tables, the relations of propositions, and the consistency of deductions and assumptions.

**Long-linked technology** Serial interdependence between work activities; one task can be performed only after another task has been completed.

## M

**Management by objectives (MBO)** A formal set of procedures to review the progress toward common goals of organizational superiors and their immediate subordinates.

**Management information system (MIS)** A formal, usually computerized, system to provide management with information.

**Management science** See *Operations research*.

**Manipulation** An attempt to influence others in which the manipulator tries to conceal the effort from the target of the influence.

**Marginality** The position of people at the boundary between two societies, who are often uncertain about their identity and status.

**Markov model** The mathematical transformation of one set of states and events into another.

**Mathematical model** A facsimile of reality in mathematical terms; a description of a process and parameters and their relationships to one another and to environments.

**Matriarchal** A female-dominated family or society in which the woman (wife or mother) is most influential.

**Matrix organization** An organization in which each subordinate reports to both a functional (or divisional) manager and to a project (or group) manager.

**MBA** Master of Business Administration.

**Mechanistic organization** An organization in which the operations are rule based.

**Mediating variable** Its correlation with the criterion in a multiple regression serves to add to the multiple effect by its linkage to the other predictor variables.

**Mediation** A situation in which a third party assists two parties in conflict to reach agreement.

**Mentors** Individuals who pass on the benefits of their knowledge and experience to younger and less experienced individuals.

**Message** Encoded information sent by a sender to a receiver.

**Mestizo** Of mixed Indian-Native American and European descent.

**Meta-analysis** Statistical method for estimating the true correlation between two variables from the distribution of sample correlations corrected for the different size of samples, restrictions in range, and its limits from the results obtained from several individual samples or studies.

**Middle managers** Managers at the middle levels of the organizational hierarchy, who are responsible for the direction of the lower level supervisors reporting to them.

**Mission** The stated purposes of the organization.

**Model** A facsimile that captures the important essentials of reality; may be conceptual, mathematical, or physical.

**Modeling** Learning by imitation; behaving in the same way as observed in another person to make a certain response.

**Moderated regression analysis** An optimal prediction equation that includes the effects of *moderator variables*.

**Moderator variable** Unrelated by itself to the criterion variable in a multiple regression, its correlation with predictor variables adds to the multiple prediction of the criterion.

**Monotonic** Numbers arranged so that each is larger (or smaller) than the one preceding it in the sequence.

**Monozygotic** Identical twins from one egg. The closest in heritability of the same traits.

**Moral identity** Awareness of one's own moral beliefs and ethical behavior, and of their importance to oneself.

**Morality** Set of social beliefs and values of right conduct.

**Multinational corporation (MNC)** A corporation with operations and divisions in numerous countries, but that is controlled by headquarters in one country.

**Multinational firm** An organization that locates, trades, or produces products or offers services in several countries.

**Multiple regression** The optimal weighting of a set of predictor variables to minimize the error of prediction of a criterion.

**Myth** A dramatic narrative of imagined events and fantasies, usually to explain origins and developments.

## N

**Negative reinforcement** See *Aversive reinforcement*.

**Network** A pattern of interconnections among individuals, groups, or organizations.

**Nominal group technique** The pooling of the ideas of individuals without their meeting to generate or accumulate the pool of ideas.

**Nomological network** The web of logical connections among constructs.

**Nomothetical network** See *Nomological network*.

**Nonprogrammed decisions** Specific solutions that emerge from unstructured processes to deal with nonroutine problems.

**Normative model** A model that prescribes a solution to a problem.

**Normative scores** Raw scores scaled in relation to those of the rest of the population, for example percentiles and standard scores.

**Norms** Shared group expectations about behavior; socially defined and enforced standards about how the

world should be interpreted and how one should behave in it.  
NROTC Naval Research Officers Training Corps, for the U.S. Navy.

## O

**Objectives** The targeted goals of individuals, groups, or organizations toward which resources and efforts are channeled.

**Oblique dimensions** Dimensions inclined toward each other at some angle other than 90°, representing their correlation; not orthogonal.

**Occupation** A collection of similar jobs existing in different firms.

**One-way communication** Any communication from the sender without a reply from the receiver.

**Open system** A system that transforms inputs from its environment to outputs to its environment; its general principles may explain organizational behavior.

**Operant conditioning** A behavioral modification technique in which cued responses are strengthened (more likely to be repeated) as a result of reinforcements (consequences of the behavior).

**Operational definition** A specification of the procedures or operations by which a concept is sensed and measured.

**Operations research** Mathematical techniques for modeling, analysis, and solution of management problems.

**Organic organization** An organization in which operations are subject to modification through learning from *feedback*.

**Organizational climate** Employees' attitudes toward the organization and their satisfaction with it.

**Organizational conflict** Disagreement between organizational members and groups over the allocation of scarce resources, or how to engage in interdependent work activities; disagreements arising from different assumptions, goals, identifications, or statuses.

**Organizational culture** The norms, values, attitudes, and beliefs, evidenced in myths, stories, jargon, and rituals that are shared by organizational members.

**Organizational design** The creation of the organizational structure that is most appropriate for the strategy, people, technology, and tasks of the organization.

**Organizational development** A long-range effort to improve an organization's problem solving and renewal process.

**Organizational goals** An organization's purpose, mission, and objectives that form the bases of its strategy.

**Organizational structure** The arrangement and interrelationship of the various components and positions in an organization.

**Organization chart** A diagram displaying the functions, departments, and positions in an organization.

**Orthogonal dimensions** Dimensions that are at right angles to each other; uncorrelated, independent dimensions.

**Overload** The lack of capacity to meet performance expectations.

## P

**Parsimonious** The simple but accurate explanation of a phenomenon that avoids more complicated explanations because the simplified one is adequate.

**Partial reinforcement** A schedule of reinforcement in which rewards are given intermittently.

**Path-goal analysis** The means and ways that describe what objectives can be reached.

**Patriarchal** A male-dominated family or society in which the men are much more in power and control than are the women.

**Perception** An immediately sensed experience of other persons or objects, modified and organized by the perceiver's personal characteristics and by social influences.

**Perceptual defense** A selective perception in which a person substitutes innocuous perceptions for unpleasant stimuli.

**Performance appraisal** The evaluation of an individual's performance by comparing it to standards or objectives.

**Peripheral routing** Persuading people unable or unmotivated to accept the idea.

**Personal construct** A concept that is used by a particular individual to categorize events and other persons' behaviors.

**Personality** The dynamic organization of the abilities, attitudes, beliefs, and motives of a particular individual that contribute to the individual's reaction to his or her environment.

**Phenomenological** Of or related to comprehending the environment above and beyond the objective environment.

**Placebo** A substance or a condition used as an experimental control, which should have no effects relevant to the experiment.

**Policy** General guidelines for decision making.

**Policy capturing** A multiple regression procedure in which the regression weights underlying the policies that influenced the decision makers are determined.

**Polycentrism** The view that because countries are different, local control is best for organizing operations.

**Population** The total collection of people or cases from which a sample is drawn.

**Position power** Power that is inherent in the formal position occupied by the incumbent.

**Positive reinforcer** The consequence of behavior that is desirable, pleasant, or needed. When linked to the behavior, the positive reinforcer increases the probability that the behavior will be repeated in the same or similar situations.

**Post hoc analysis** A statistical analysis that is chosen after the experimental data have been collected, not as a part of the original design of the experiment.

**Power structure** A set of relationships among different members or units of an organization that is based on the differences in power among them.

**Prejudice** A negative evaluation of a person because of the person's sex, age, race, ethnicity, or membership in another group or organization.

**Primary effect** The predominant effect of the first information received about persons, objects, or issues upon learning, retention, judgment, or opinion about them.

**Principled moral reasoning** Application of general rules to decide on a just solution.

**Prisoner's dilemma** The choice when a better outcome for one player is incompatible with the choice resulting in a better outcome for a competing player. This dilemma leads to both players making choices that have unfavorable results for both of them.

**Probability estimate** Probability of success.

**Probability sample** A sample chosen in such a way that every member of the population has a known, usually equal, probability of being included.

**Process consultation** Consultation in which members of an organization are helped to understand and change the ways in which they work together.

**Productivity** Performance relative to resources; output divided by input; quantity and quality of output in a given period.

**Programmed decisions** Solutions to routine problems determined by rules, procedures, or habits.

**Projection** The attribution of one's own motives to others, usually unconsciously or subconsciously (see *Assumed similarity*).

**Propinquity** Physical proximity.

**Prototype** An idealized image or the first of its kind on which copies are based.

**Prospectors** Strategists who search for new opportunities.

**Pseudotransformational leadership** A false messiah who appears to act like a transformational leader but is actually inauthentic and self-interested and leads the group, organization, or society astray.

**Psychological contract** Mutual expectations between an individual and an organization or between subordinates and superiors of how work is to be performed and how they will relate to each other; the rights, privileges, and obligations of each to each other.

**Psychosocial** Psychological elements combine with social aspects to affect relationships.

**Purpose** The primary role of an organization in society in producing goods or services.

**p value** The probability of a given outcome or event, on a scale from 0.00 (not possible) to 1.00 (certain).

## Q

**Q-technique** A technique in which a set of paired scores is correlated across different variables for two persons or cases.

**Quality circles** Periodic meetings of employees and management personnel to solve quality, production, and related problems.

**Quality control** The process that ensures that goods and services meet predetermined standards.

**Quality of work life** The value of work that takes into account the well-being of the employee as well as that of the organization.

## R

**R & D** Research and development.

**Random sample** A probability sample in which members are drawn in a random manner from a list of prospects that enumerates the population.

**Rational approach** An approach in which conclusions are arrived at by reasoning.

**Rational-economic man** A theory that fully informed people are motivated primarily by money and self-interest.

**Rationally-oriented leadership** Relies on logical and methodical reasoning.

**Real-time operation** An operation in which an event is controlled by information generated by the event.

**Recency effect** The predominant effect of the most recent information received on learning, retention, judgment, or opinion about persons, objects, or issues.

**Reference group** A group with whom a person identifies and compares him or herself.

**Reflect** The sign of a variable is changed so the variable is now opposite in meaning.

**Refreezing** A process in which new behavior becomes the norm through support and *reinforcement*.

**Reinforcement** The consequence of behavior that influences whether the behavior will be evoked again under the same or similar stimulus conditions.

**Reinforcement schedule** The pattern of *reinforcement* that can affect how quickly behavior is modified, shaped, and learned, and how resistant it is to change or extinction.

**Relative deprivation** The tendency to be dissatisfied with one's own status and compensation relative to that of those with whom one compares oneself, to expectations, and to comparable conditions.

**Reliability** The consistency of measurement, as seen in the stability of scores over time or in the equivalence

of scores on two forms of a test of the same attributes (see *Coefficient alpha*).

**Representative sample** A sample that is composed of different members proportionate to their types in the population.

**Reputational capital** Intangible corporate value enhanced by executive leadership, quality of products, publicized awards, and rankings.

**Resilience** Ability to deal with adversity.

**Response sets** A systematic way of answering a question that is not directly related to the content of the question but to the form of the question and the alternative answers.

**Risk ratio** Maximum risk compared with probability of success.

**Risky shift** The tendency for groups to make a decision that is less conservative than one that would be made alone by each of its individual members.

**Rite** An elaborate, dramatic, ceremonial activity that consolidates cultural expressions into a social event.

**Rites of passage** Rites in which a person passes from an organizational outsider to an organizational insider. They convey the organization's norms and values symbolically. In society, they include confirmation, graduation, and marriage.

**Ritual** A fixed way of enacting a set of rites within an *organizational culture*.

**Role** A socially defined pattern of behavior that is expected of an individual in a designated function in a particular position within a group, organization, or society.

**Role ambiguity** A condition of uncertainty about what is expected and what role behavior will be accepted and rewarded.

**Role boundaries** Limits of the role behavior that are expected.

**Role conflict** A situation in which persons are faced with meeting conflicting demands. Conflict can arise between values within a role, between competing roles, or from the demands of others.

**Role overload** A situation in which role requirements exceed the limits of time, resources, and capabilities.

**Role perception** What an individual sees are the behaviors needed to enact a role.

**Rotation** Moving factor axes and their hyper-planes around the 0,0 coordinate to allow more points representing *factor loadings* to fall in these hyper-planes.

**ROTC** Reserve Officers Training Corps for the U.S. Army or U.S. Air Force.

**R-technique** A technique in which the paired scores on two variables are correlated for a number of persons or cases.

## S

**Sample** A portion of a population that is selected for study in lieu of the complete population.

**Sampling error** Deviation of any sample statistic from the population value.

**Satisfice** The choice of a suboptimal alternative that meets some minimal criteria of acceptance, when making a decision.

**Scapegoating** The displacement of hostility toward a weaker available target when the source of frustration is too powerful or not available for attack.

**Scientific method** The systematic use of deduction, induction, and verification of predictions by the collection of relevant data.

**Selective perception** Sensing some aspects.

**Self-actualization** Using one's capacities fully in meaningful, personally satisfying endeavors.

**Self-concept** The way people perceive and evaluate themselves.

**Self-fulfilling prophecy** The expectation of a reality influences the fulfillment of that reality.

**Self-serving bias** Bias to judge oneself favorably, crediting oneself for successes but blaming others and

external factors for failures.

Semantic differential rating Graphic scale with defined extremes, such as a term at one end and its antonym at the other, but undefined anchors in between.

Sense making Attributing meaning to experience.

Significance See *Statistical significance*.

Simple structure A structure in which a *rotation* solution is achieved so that each variable is maximally correlated with as few factors as possible; the variance of the *factor loadings* is maximized in the *VARIMAX* solution.

Simulation The representation of the necessary elements of some object, phenomenon, system, or environment to facilitate control and study. The representation mirrors or maps the effects of various changes in the original, enabling the researcher or trainee to study, analyze, and understand the original by means of the behavior of the model.

Single-loop learning See *Double-loop learning*.

Single-source bias An inflated value that occurs when the same rater supplies the information for the pairs of variables to be correlated.

Smallest-space analysis and mapping The mathematical procedure to locate and display optimally in two dimensions, a sample of individuals or cases according to their respective distances in measurements from each other.

Social desirability A response set to answer questions about oneself in the socially approved manner.

Social determinism The view that the course of history emerges only as an expression, instrument, or consequence of historical laws.

Social distance The acceptable degree of closeness (physical, social, or psychological) between leaders and subordinates and between members of particular ethnic groups.

Socialization Learning the norms of one's group, organization, or society and acquiring its distinctive values, beliefs, and characteristics.

Social loafing A condition in which workers reduce or withhold effort on a group task.

Socioemotional Interpersonal; dealing with the social and emotional aspects of the relations between people.

Sociometric measure A measure based on the nominations of peers; who chooses whom can provide a display of the informal structure of relations in a group.

Specialization The performance of only some specific part of a whole collection of tasks by an individual worker.

Specification equation An equation that indicates a designated individual's performance on a test in terms of factor sub-scores weighted by *factor loadings*.

Specific factor The statistical representation of some variable based on only one variable in contrast to common factors which are based on two or more variables.

Staff Individuals or groups who provide line personnel with advice and services.

Staff personnel See *Line personnel*.

Stakeholders Individuals and groups who gain from the organization's successes and lose from its failures.

Standard deviation A measure of how much variability is present in a set of scores. It is the square root of the variance.

Statistical prediction Objective judgments about people based on data combined by means of formulas or mechanical methods.

Statistical significance The probability that a given mean statistic could not have occurred by chance alone.

Statistical test A mathematical procedure for determining the probability that obtained results are due to

chance.

**Stepwise multiple regression analyses** Analyses in which one predictor variable at a time is added to the regression equation. The process is halted when the next step adds more error than predictive value to the optimal combination of predictors.

**Stereotype** A standard image applied to all members of the same group that ignores the variations among them.

**Strategic planning** The formulation of an organization's objectives and how to achieve them.

**Stratified random sample** A probability sample whose members are selected by dividing the population into several categories, then selecting respondents randomly from each category (see *Representative sample*).

**Structure** A pattern of prescribed or observed consistencies in relations among members of a group or organization.

**Sunk costs** Money spent or resources already used.

**Superego** The part of the personality that is oriented toward doing what is regarded as morally right and proper: one's conscience, *ego ideal*, and ideal self-image.

**Superordinate goals** Goals around which divergent parties can rally to collaborate to achieve the goals.

**Switch hitter** Ambidextrous; one who can respond in alternative ways.

**Symbols** Emblems, tokens, and signs representing ideas, terms, and objects.

**Synergy** Cooperative efforts among people or units that generate more motivation than would the isolated operation of the units or people.

**System boundary** The boundary between the system and its environment. It is rigid in a closed system (not interactive with its environment) and flexible in an *open system* (interactive with its environment).

## T

**Task force** A temporary group established to address a specific problem (also *Ad hoc group*).

**Tautology** Circular reasoning; for example, arguing that A caused B because B caused A.

**Team building** Improving relationships among members and the accomplishment of the task by diagnosing problems in team processes affecting the team's performance.

**Territoriality** An innate drive in many species of animals to defend their own habitat.

**Theory** A system of concepts, rules about the interconnections of the concepts, and ways of linking the concepts to observed facts.

**Theory X** A theory that assumes that the average worker dislikes work, is lazy, has little ambition, and must be directed or threatened with punishment to perform adequately.

**Theory Y** A theory that assumes the average worker can enjoy work and be committed, involved, and responsible.

**Transformational leadership** The leader elevates the follower morally about what is important, valued, and goes beyond the simpler transactional relationship of providing reward or avoidance of punishment for compliance.

**Triad** A three-person group.

**t-test** A test that determines whether the average statistics for two samples of subjects cannot be accounted for by chance.

## U

**Unfreezing** Making old ways unacceptable so that changes are readily accepted and can occur.

**Unobtrusive measures** Measures obtained without the knowledge of the persons studied.

## V

**Valence** The values or motivating strength of a reward to an individual.

**Validity** The accuracy or correctness of a method or measurement according to expert opinion, its predictive ability, or its correlation with a construct representing its true meaning.

**Values** What people consider right, good, and important.

**Variable** Any quantity that may take on several points on a dimension.

**Variance** The mean of the sum of squares of the deviations of each of a set of scores from its mean; the square of the standard deviation.

**Varimax** A solution in factor analysis in which the rotation achieves a maximum variation among the *factor loadings* so that variables correlate as highly as possible with as few factors as possible and as low as possible with as many other factors as possible.

**Verification** The collection of facts to support or refute hypotheses.

**Vertical communication** Communication up or down the chain of command.

**Visionary Leadership** Planning and forming policy that is farsighted and future-oriented, and provides direction for future actions.

## W, X, Y

**Walk-around management** Top managers visit with employees at their workplace.

**Whistle blower** Employee who voluntarily reports infractions of the rules, violations of ethics, or illegal actions by other members of the organization.

## Z

**Zero loading** A loading in a *factor analysis*, a correlation between a variable and a factor so small that it can be attributed to a chance difference from zero.
