More constraining are likely to be the rules on shareholder consent, which are in general imposed more widely in European corporate systems than in Delaware.¹²³ These are likely to make the adoption of a German rights plan difficult without shareholder consent, but that may do no more than push the German management in the direction of other defensive measures, such as the conditional sale of assets whose acquisition is important to the acquirer.¹²⁴ Furthermore, the German system has not developed the two adaptive devices (p. 564) which have proved important in Delaware. High-powered share-based remuneration systems have not taken hold in Germany and, after the financial crisis, legislative reforms have pushed in the opposite direction.¹²⁵ "Golden parachutes" are far from excluded but the equity interest of German management board members in their company is likely to be substantially less than in a comparable Delaware company. In addition, German rulemakers have been lukewarm about requirements for independent directors on supervisory boards, probably because of the presence of employee representatives on the supervisory boards of large companies.¹²⁶ The German corporate governance code goes no further than to state that "The Supervisory Board shall include what it considers an adequate number of independent members."¹²⁷ So there may be few independent directors pushing for consideration of the acquirer's case, whilst the employee representatives on the supervisory are likely to tilt the board against takeovers, at least where adverse short-term consequences for the employees are likely to follow.

It is thus reasonable to conclude that German management boards are not under the same incentives as directors of Delaware companies to use their defensive powers in the interests of target shareholders.¹²⁸ However, traditionally this has been an unimportant question in (p. 565) Germany, given the shareholding structure of German companies. In the past that structure has been highly concentrated. In the 1990s the average size of the largest shareholding in a German public company was 57%.¹²⁹ The historically very small number of hostile takeovers in Germany needs no other explanation: a hostile bid is pointless if management is likely to have been pursuing the policies preferred by the controlling shareholder and if the management are not likely to be willing to take defensive steps which the controlling shareholder opposes.

Control Shifts via Share Acquisition Contracts with Shareholders (Takeovers)

A precondition for the issue of defensive measures to move center-stage in Germany is some deconcentration of the shareholding structure of German companies. Mannesman, unusually, had such a structure, which facilitated its takeover by the UK company Vodafone in 2000. This event alerted the German government and management and employee interest groups to the salience of the issue. It led the German government to oppose, successfully, the adoption of a mandatory “no frustration” rule at EU level and to enact the domestic legislation putting into the hands of the supervisory board the approval of defensive measures. Ringe has provided recent evidence of a more general de-concentration of shareholdings in German companies.¹³⁰ Issues relating to the scope of management board freedom to block hostile bids, to their incentives to do so, and to the incentives of the supervisory board to sanction such measures are thus likely to become more important in the future.

However, it would be wrong to read in a straight line from deconcentration to the acceptance of a higher level of hostile takeovers. Employee representatives on the board might still play an important role in discouraging takeovers. More importantly, if it is the case that the German system of coordination lowers the cost of labor contracting more than it raises the cost of equity finance,¹³¹ it would not be in the societal interest routinely to promote hostile bids, even if shareholders were willing to accept the offers made.

4.4 Japan

In relation to takeovers Japan has many similarities to Germany, that is, the issue of the hostile takeover (and thus of defensive measures) has not been a live one until recently, because other elements of the corporate governance system had made takeovers unfeasible and perhaps unnecessary. However, changes in the surrounding governance environment appear to have gone further than in Germany and to have opened up a lively debate about the appropriate role for takeovers in general, and hostile bids in particular. That debate, in which courts, government, and the Tokyo stock exchange have all participated, has not produced a clear resolution of the issues and the rules, still inchoate, chart an uncertain course between the contractual and corporate models. Japan, like Germany, can be viewed as a coordinated market economy, so that the question of whether facilitating hostile bids would increase the productive efficiency of Japanese companies raises a wide range of difficult questions.

(p. 566) Although the US occupying power after the Second World War sought to impose a highly deconcentrated shareholding structure in place of the family control which had prevailed pre-war, what resulted by the mid-1960s was not retail ownership of large Japanese companies but ownership by other corporations, insurance companies, and banks, in an elaborate pattern of cross-holdings with a “main bank” at the center. This made hostile takeovers difficult or even impossible to mount so long as the system of cross-holdings remained solid—though it is doubtful whether takeover protection was the primary driver of this development.¹³² In fact, not only takeovers but external governance mechanisms in general were weak at this time. What developed instead was a system of internal governance, dominated by the interests of the employees. For core employees as

Control Shifts via Share Acquisition Contracts with Shareholders (Takeovers)

a whole this development was symbolized by the emergence of lifetime employment contracts. For management, the system rewarded long and loyal service in an additional way. Top management was invariably appointed from the managers who had worked their way up through the company, and the chances of moving from a management position in one company to another in mid-career were limited. The board was an executive, not a monitoring, board. Having reached the top, the leading executives secured the loyalty of subordinate management by maximizing their opportunities for promotion within the company. This system has been called the “company community.”¹³³

The incentives generated by this arrangement were to increase steadily the size of Japanese public companies, but not necessarily their profitability. During the good times, which lasted until the 1990s, this tension was not normally apparent, for the success of Japanese public companies in global markets normally provided a satisfactory return to external investors, despite their limited governance powers. In those cases where there were idiosyncratic failings which internal management did not address, the main bank would intervene as a matter of last resort. From the 1990s onwards, three factors put this setup under pressure. The Japanese economy ground to a halt in the “lost decade”; given the opportunities provided by globalization Japanese banks became less willing to tie up capital in patient cross-holdings when that capital could be more profitably used in support of investment banking; and with the removal of restrictions on capital flows, foreign investors appeared on the Tokyo market in substantial quantities and with different expectations of external governance rights.¹³⁴

Given these changes, attempts to revive and expand external governance mechanisms appeared in practice and moved center-stage in policy discussions. As for hostile takeovers, in the absence of a Japanese Takeover Code and Panel, disputes were handled by the ordinary courts on the basis of general corporate law, notably a “proper purpose” doctrine not dissimilar to the UK concept. As befits a coordinated market economy, however, an important role was also played by government guidelines, issue by the Ministry of Economy, Trade and Industry (METI), to which the courts paid attention, whilst the Tokyo Stock Exchange (p. 567) sought to hold a balance between investors and issuers. As suggested, these only partially coordinated developments have not (yet) crystallized into a coherent set of rules.

The leading court decisions are consistent with a contractual approach. In the Livedoor case¹³⁵ the High Court disallowed defensive measures the shareholders had not approved, applying the proper purposes standard.¹³⁶ In Bulldog Sauce¹³⁷ the Supreme Court allowed discriminatory defensive measures which had been approved by the shareholders.¹³⁸ However, it would be wrong to interpret the Japanese rules as a simple “shareholders decide” approach. The METI guidelines of 2005 suggested that the maintenance of “corporate value” is the appropriate object of takeover defenses and “corporate value” is a concept not to be equated with shareholder value—although those guidelines suggested that the “reasonable will” of the shareholders was also an important element. The court decisions recognize that the proper purposes doctrine allows defensive measures without shareholder approval against “abusive” takeovers (undefined). The

Control Shifts via Share Acquisition Contracts with Shareholders (Takeovers)

Supreme Court in Bulldog Sauce seemed to attach less importance to shareholder approval of the measures than to its characterization of the takeover as abusive, apparently on the grounds that the bidder, a US activist hedge fund, had no clear plans for increasing the target's corporate value. To underline this point the study group, whose report had lain behind the METI guidelines, issued another report in 2008 pointing out that shareholder approval was not the sole criterion for legitimacy (whilst also saying that defensive measures should not be used to entrench incumbent management).¹³⁹ The TSE has played a moderating role, largely in the interests of investors. Whilst the METI guidelines state that rights plans are potentially legitimate, they also suggest that these should not normally discriminate among shareholders of the same class and should be subject to removal by shareholder vote. The TSE, however, used its power over listing conditions to encourage the adoption instead of what is in effect a board procedure for assessing the implications for corporate value of an acquirer of, for example, 20% of the voting rights, on the basis of which assessment rights might be issued.¹⁴⁰

How these competing perspectives will be resolved will depend, it is suggested, on the more general evolution of corporate governance in Japan. The recent developments noted above indicate a greater role for external governance in Japan than in the latter part of the twentieth century. However, the role of the hostile takeover in that context is far from obvious. The hostile takeover carries potentially high costs in terms of undermining the internal governance system which constitutes a major "path dependency" in that country. In other words, policy makers would have to be convinced, before they introduced a strong (p. 568) system of external governance, that the switching costs from a predominantly internal to predominantly external form of governance would be less than the benefits to be obtained. They would also need to overcome the likely opposition from incumbents who would lose out from the switch (essentially the management of public companies). Thoughtful analysis by Japanese scholars tends toward the view that greater engagement (Japanese-style) between newly significant institutional shareholders and corporate management is the most likely development. In that context, hostile takeovers might come to play only a modest role.¹⁴¹

5 Conclusions

From the 1960s onwards takeovers have served up to interested spectators a never-ending, if somewhat episodic, spectacle combining drama and technical innovation of the highest order by clever lawyers and bankers, at least in the United States and United Kingdom. Consequently, there has been a tendency to analyze takeovers as an isolated phenomenon, which the contractual structure of the takeover offer somewhat encourages. However, the complex policy issues underlying the setting of the detailed rules on takeovers can be resolved only in the context of an analysis of the central features of the broader corporate governance arrangements in a particular jurisdiction. One obviously relevant feature is the level of shareholder concentration in a particular jurisdiction or

Control Shifts via Share Acquisition Contracts with Shareholders (Takeovers)

company, though, as we noted in section 2.2, this does not mean that takeovers are relevant only in jurisdictions with highly dispersed patterns of shareholding.

More important, and more difficult to handle, is the relationship between takeover regulation and features of the governance system which are less easy to quantify. One can look at this relationship relatively narrowly, that is, as concerning only the interaction of the board/top management and the shareholders. It is trite to remark that in all jurisdictions board rules set both board authority and board accountability and that jurisdictions vary in the balance which is struck between these two desirable characteristics.

Takeovers are a potentially powerful tool for encouraging accountability and so their facilitation sits more naturally in jurisdictions where accountability is highly regarded and the standard governance mechanisms for providing accountability may not function at low cost. The UK, with its dispersed shareholdings, is the exemplar here. In jurisdictions where the balance between authority and accountability has been struck traditionally more in favor of authority, some skepticism about the complete exclusion of management from the takeover decision is likely to be found, as in Delaware law. Delaware law also shows, however, the ability of the market (albeit at some cost) to “contract around” the initial allocation of decision-making power to (p. 569) the board by adapting other features of the governance system (in this case, remuneration and board composition practices) so as to shape management’s exercise of that power.

More broadly, takeovers can be looked at in the context of the governance system for providers of other inputs into the company, especially the employees. Systems that use mechanisms of corporate governance to regulate the process whereby a company contracts for labor as well as for equity capital are likely to find the unfettered takeover disruptive of those arrangements. This may lead, as in Germany, to an attempt to insert management firmly into the decision-making process on the takeover or, as in Japan, to uncertainty as to how takeovers should be regulated.

Finally, analysis should not be static. In all systems some movement toward alternative approaches is usually within contemplation, awaiting only the right set of events to trigger change. Japan shows this dynamic most openly. However, share deconcentration in Germany, the emphasis on engagement by shareholders in the UK, and the growing power of institutional shareholders in the US may have an impact on takeover regulation in those countries in the future. It is not inconceivable that UK institutions might want to be able to opt out of the “no frustration” rule in order to “engage” with shareholders, that US institutions might become powerful enough to block the routine adoption of plans, or that German institutions might want greater input into takeover defenses. Even with the growth of “activist” hedge funds,¹⁴² which have stolen some of the governance thunder of hostile takeovers, takeover regulation looks likely to continue to be in a state of “becoming” rather than of having “arrived” at some final destination point.

Control Shifts via Share Acquisition Contracts with Shareholders (Takeovers)

Notes:

(¹) Senior Research Fellow, Harris Manchester College and Allen & Overy Professor of Corporate Law Emeritus, Oxford University, and ECGI.

(²) The UK term also suggests that, in contractual terminology, the acquirer's communication to the shareholders is an offer to contract rather than an invitation to treat, which may or may not be the case. In this chapter the acquirer's communication to the target shareholders will be referred to as an "offer" even if contractually it is the target shareholders who offer their shares for purchase by the acquirer.

(³) The term takeover is often used in a wider sense, i.e. whenever the shareholders of one company end up with a dominant interest in the combined entity, even if the combination is brought about, not by an offer to acquire shares (a "takeover" in my terminology), but via a statutory merger procedure.

(⁴) In close companies there may be restrictions imposed via the company's internal rules on the free transfer of shares, but such restrictions are rare for public companies and generally prohibited by stock exchange rules if the shares are publicly traded.

(⁵) These percentages may be expressed as percentages of the total voting rights in the company (thus including voting rights held by the acquirer before the offer is launched) or as percentages of the voting rights offered for.

(⁶) See generally L.A. Bebchuk, "Toward Undistorted Choice and Equal Treatment in Corporate Takeovers", 98 Harv. L. Rev. 1695 (1985).

(⁷) Typically a freestanding squeeze out right, tied to the takeover is made available, as in the European Union (Directive 2004/25/EC, Art. 15 - hereinafter "Takeover Directive"). In jurisdictions without comprehensive takeover codes, the merger rules may be adapted to this end. For example, Delaware dispenses with the need for target shareholder approval of the merger if the acquiring company already holds 90% of each outstanding class of stock (Delaware General Corporation Law (DGCL) § 253).

(⁸) The UK Listing Rules (5.2.11A) permit de-listing of the target (normally a potent threat in the light of the loss of liquidity) following a takeover bid by a previously non-controlling acquirer provided the acquirer ends up with at least 75% of the voting rights of the class to be de-listed and the de-listing proposal was part of the offer. Similarly DGCL § 251(h) dispenses with the need for target shareholder approval (see previous note) if the normally required level of approval has been acquired in a tender offer - but this relaxation is not available after a hostile takeover.

(⁹) Sanford Grossman & Oliver Hart, "Takeover Bids, the Free Rider Problem and the Theory of the Corporation", 11 Bell J. Econ. 42 (1980).

(¹⁰) Indeed, where the acquisition is supported by target management, the question of whether transfer of control takes place via a takeover or a statutory merger procedure

Control Shifts via Share Acquisition Contracts with Shareholders (Takeovers)

becomes a second-order question, which revolves around questions such as, which is more tax efficient, which is more likely to give the acquirer the level of control it seeks, which offers the fewest opportunities for a competing acquirer to emerge? See J. Payne, *The Use of Schemes of Arrangement to Effect Takeovers: A Comparative Analysis*, Oxford Legal Studies Research Paper No. 51/2014.

(¹¹) Reinier Kraakman et al., *Anatomy of Corporate Law* ch. 7 (3rd ed. 2017).

(¹²) “Hostile,” that is, to the incumbent management, not to the target shareholders. See note 15 on the difficulty of classifying bids as “friendly” or “hostile.”

(¹³) This will be true even of “independent” directors.

(¹⁴) A substantial number of takeovers are initiated by the target company.

(¹⁵) The available commercial data on hostile bids is notoriously difficult to interpret in relation to the issues discussed in this chapter. Typically, a bid is classified as hostile only if it remained opposed by management throughout the offer period. Along one dimension this approach can be supported: a bid that is initially opposed but later accepted by management may indicate management negotiating with the bidder on behalf of shareholders rather than management acting in a self-interested way. But a bid that is always “friendly” (or becomes so) may simply reflect a regulatory structure that makes managerial opposition fruitless, so that the hostile bid data underestimate the impact of the takeover rules. With some exaggeration, one might say that, where regulation outlaws defensive measures by management, hostile bids will not show up because management will not oppose the acquirer on grounds of futility, whilst, where regulation permits defensive measures, hostile bids will not show up because acquirers will not launch them!

(¹⁶) Pepper C. Culpepper, *Quiet Politics and Business Power* 34–35 (2011).

(¹⁷) The argument in this paragraph is not that hostile bids will inevitably emerge at some particular level of dispersal of shareholding. Clearly, existing controlling shareholders or the state may block the development of takeover regulation that facilitates hostile bids. The argument is rather that the question of how takeover regulation is structured becomes a salient question long before a high level of dispersal is achieved. For an analysis of the factors that might affect the evolution of takeover laws in developing countries see John Armour, Jack B. Jacobs, & Curtis J. Milhaupt, “The Evolution of Hostile Takeover Regimes in Developed and Emerging Markets: An Analytical Framework”, 52 *Harv. Int’l. L. J.* 219, Part IV (2011).

(¹⁸) The non-controlling shareholders may have some leverage if the acquirer needs to obtain a very high level of acceptances, for example, in order to squeeze out the non-accepting shareholders to obtain 100% control of the company. This is a common objective of private equity bidders.

Control Shifts via Share Acquisition Contracts with Shareholders (Takeovers)

⁽¹⁹⁾ However, the sale would not normally require the consent of the minority shareholders (except possibly in a related party transaction). By analogy, takeover regulation does not contemplate making the control shift conditional on the consent of the non-controlling shareholders.

⁽²⁰⁾ Anatomy, *supra* note 11, ch 1.5.

⁽²¹⁾ M. Jensen & R. Ruback, "The Market for Corporate Control: the Scientific Evidence", 11 J. Fin. Econ. 5 (1983)—gains of about 30% at the time of the announcement of the takeover.

⁽²²⁾ B. Espen Eckbo, "Takeovers and Economic Efficiency", 6 Annual Review of Financial Economics 51 (2014).

⁽²³⁾ A point of importance to shareholders who have holdings in both acquirer and target, a position many institutional shareholders will find themselves in. However, the more pessimistic evidence does raise the question of why acquirers launch takeovers, a question we address below.

⁽²⁴⁾ Roberta Romano, "A Guide to Takeovers: Theory, Evidence and Regulation", 9 Yale J. Reg. 119 (1992).

⁽²⁵⁾ As we noted in section 2, concentrated shareholders are well placed to change underperforming management through the exercise of their governance rights.

⁽²⁶⁾ Julian Franks & Colin Mayer, "Hostile Takeovers and the Correction of Managerial Failure", 40 J. Fin. Econ. 163 (1996), but cf. Randall Morck, Andrei Shleifer, & Robert Vishny, Characteristics of Targets of Hostile and Friendly Takeovers, in Corporate Takeovers: Causes and Consequences (A. Auerbach ed., 1988).

⁽²⁷⁾ Eckbo, *supra* note 22, § 2.1.

⁽²⁸⁾ Franks & Mayer (*supra* note 26) found that 90% of the directors of the targets they studied were no longer with the company two years after the acquisition. (In interpreting this statistic it should be remembered that a UK board (at least then) would typically have a higher percentage of executives on it, at least half, than a US board. So top managers departed, not just independent directors.)

⁽²⁹⁾ On activist investors see Ronald Gilson & Jeffrey Gordon, "The Agency Costs of Agency Capitalism: Activist Investors and the Revaluation of Governance Rights", 113 Colum. L. Rev. 863 (2013) and Mike Burkart & Samuel Lee, "Signaling to Dispersed Shareholders and Corporate Control", 82 Rev. Econ. Stud. 922 (2015). In a cash bid the target shareholders are being offered the discounted present cash value of the alternative strategy (or some proportion of that value); in a share-exchange offer there is the opportunity to benefit from the implementation of that strategy.

Control Shifts via Share Acquisition Contracts with Shareholders (Takeovers)

⁽³⁰⁾ Where the pbc arise out of actual management of the company, the controller may be unwilling to relinquish that managerial role, even if she is making a poor job of it. Consequently, the availability of a hostile takeover may be an important disciplinary tool in such cases. However, as performance declines, the controller will suffer financially, and this is likely to generate a change of mind on the value of a management renewal, especially if there is a controlling group (e.g., a family) only some of whom are involved in the management of the company.

⁽³¹⁾ Art. 5. The definition of control is left to the Member States. Most have adopted a “bright-line” rule, i.e. a fixed percentage of the voting rights and fixed that percentage around 30%. This is arguably too high to catch all cases of de facto control: L. Enriques & M. Gatti, “Creeping Acquisitions in Europe: Enabling Companies to be Better Safe than Sorry”, 15 J. Corp. L. Stud. 55 (2015).

⁽³²⁾ If the bidder is able to acquire a block of shares just below the threshold which triggers the mandatory bid and to do so in secret (perhaps through equity swaps), it might then wait out the reference period (6 to 12 months) before making a public offer at significantly below the highest price paid for the block. Or it might make a “low ball” offer, enough to get it over the threshold, but not much more. Going over the threshold in a voluntary offer does not trigger a mandatory bid. See Klaus J. Hopt, “European Takeover Reform of 2012/2013 – Time to Re-Examine the Mandatory Bid”, 15 Eur. Bus. Org. L. Rev. 143 at 3.2.3.

⁽³³⁾ We leave on one side the situation where the gains are partly from operating efficiencies and partly from a wealth transfer.

⁽³⁷⁾ Takeover Directive, Arts. 6.1, 8.2 and 8.5.

⁽³⁸⁾ Some sort of works council is now mandatory in the EU in all but the smallest enterprises or establishments where the employees wish to establish one. See Directive 2002/14/EC. The composition of the works council varies from country to country, but essentially it is a body representative of all the employees in the workplace whose powers are defined by statute. It thus contrasts with firm-level collective bargaining where, formally at least, only union members are represented in the bargaining and the scope of the bargaining is more influenced by agreement between employer and union. The powers of the works council also vary: they are noticeably strong in Germany and the Netherlands, but weak in, for example, the UK, where the firm-level representation space has been oc-

Control Shifts via Share Acquisition Contracts with Shareholders (Takeovers)

cupied by trade unions. France is an intermediate case where union and works-council-based systems to some degree compete at workplace level.

(³⁹) Pietrancosta, *supra* note 34, 45–46.

(⁴⁰) The Takeover Code (UK), rule 19.1, n.3. The acquirer is committed to statements of intention made during a bid for 12 months post-bid or for the period mentioned in the statement “unless there has been a material change of circumstances.” Enforcement is by the Panel, though it is unclear what steps it might be prepared to take. Rule 24.2 requires the acquirer to state what implications, if any, the acquisition has for employment or the employees’ pension scheme. The commitment rules arose out of the acquisition of Cadbury plc. by Kraft Inc., in the course of which the bidder unwisely committed itself to keeping open a plant the incumbent management had decided to close, only to discover upon acquisition that the previous management had good reasons for its decision.

(⁴¹) See for asset transfers Directive 2001/23/EC; for dismissals on economic grounds generally Directive 98/59/EC; and for changes proposed by incumbent management which are likely to lead to “substantial changes in work organisation or in contractual relations” Directive 2002/14/EC.

(⁴²) For example, if the government is responsive to the interests of organized labor and has the formal power to make life difficult for the acquirer—perhaps because the proposed acquisition is by a foreign company in a sensitive part of the economy—the employees’ views may weigh heavily with the acquirer when deciding whether to bid and how to formulate its plans for the target.

(⁴³) A litigation challenge to the directors’ decision will be more difficult to mount if the statute requires the directors to consider the interests of multiple groups but leaves the balance to be struck to the incumbent board than if their obligation is to consider the interests of only a single group.

(⁴⁴) See *supra* note 38.

Control Shifts via Share Acquisition Contracts with Shareholders (Takeovers)

⁽⁵¹⁾ In Germany, half the seats on the supervisory board in companies with 2,000 plus employees are allocated to worker representatives and one-third in companies below this number (except in the coal and iron and steel industries where specially strong arrangements apply).

⁽⁵²⁾ P.A. Hall and D.W. Gingerich, "Varieties of Capitalism and Institutional Complementarities in the Political Economy: An Empirical Analysis", 39 *British Journal of Political Science* 449 (2009).

⁽⁵³⁾ Paul Davies, *supra* note 50.

⁽⁵⁴⁾ This is clear if the acquisition is wholly for cash; but even where it is wholly for shares, the target shareholders gain a disproportionately large share of the combined enterprise.

⁽⁵⁵⁾ Michael Jensen, "A Free Cash Flow Theory of Takeovers", 76 *Am. Econ. Rev.* 323 (1986).

⁽⁵⁶⁾ Here approval by the shareholders as a class is not likely to be effective and "majority of the minority" approval is difficult to justify since there will normally be a plausible commercial explanation for the acquisition.

⁽⁵⁷⁾ As in the UK. See Financial Conduct Authority, Listing Rules, § 10. This requirement was one of the factors that led to the failure of Barclays plc. to put forward a takeover proposal for Lehman Brothers over the weekend of September 12-15, 2008: the size of the financial guarantees of Lehman Brothers' obligations, which the US authorities insisted Barclays should provide, made shareholder approval necessary. See Financial Services Authority, Statement, 20 January 2010 (available at fsa.gov.uk/pubs/other/lehman.pdf).

⁽⁵⁸⁾ See J.C. Coates, IV, "M&A Break Fees: U.S. Litigation vs. U.K. Regulation", in *Regulation versus Litigation* ch 9 (Daniel P. Kessler ed., 2011). The UK Rules are now tighter than when this article was written, since break fees (previously limited to 1% of the deal value) are now entirely prohibited except in limited cases; for example, with a competing bidder where the initial offer was not recommended (Takeover Code UK, rule 21.2). Coates found that bids in the UK were twice as likely to face a competitor than bids in the US, which also affected completion rates, because, in both countries, bids without competition were completed in 90% of instances but, with competition, in only 60% of instances (§ III.B).

⁽⁵⁹⁾ "Toe-hold" bidding is associated with lower winning premiums and a higher probability of winning: S. Betton and B. Eckbo, "Toeholds, Bid Jumps, and Expected Payoff in Takeovers", 13 *Rev. Fin. Stud.* 841 (2000).

⁽⁶⁰⁾ The latest version of the EU rules on insider trading is, however, ambiguous on this matter. See Art. 9.4 of Regulation (EU) No 596/2014. This contains an exemption for inside information obtained in the course of a public takeover where that information is

Control Shifts via Share Acquisition Contracts with Shareholders (Takeovers)

used to effect the acquisition but it is also stated that “This paragraph shall not apply to stake-building.”

⁽⁶¹⁾ The UK has a low disclosure threshold (3% of the voting rights in the company), disclosure within two trading days (not including the day of acquisition), with economic interests under equity swaps counting toward the threshold: Financial Conduct Authority, Disclosure and Transparency Rules § 5. In addition, there is a company-initiated interrogation scheme (Companies Act 2006, Part 22), which can lead to the disenfranchisement of shares whose beneficial ownership is not disclosed to the company.

⁽⁶²⁾ What is clear is that the UK regulation opts for maximizing shareholder wealth conditional on a bid rather than maximizing the number of bids. The ban on break fees, strict disclosure rules, the presence of a mandatory bid rule and the associated restriction on partial bids, other strict equal treatment rules, and the minimum time periods for bids to be open are all conducive to the emergence of a competing bid.

⁽⁶³⁾ This is the approach to the problem favored by US law, which in general applies a “market rule” to sales of control, i.e. the seller is entitled to whatever she can get for the controlling shares, but not in the case of looting and analogous situations (R.C. Clark, *Corporate Law* 478–498 (1986).) Neither federal law nor most US states have an MBR, but in Delaware an acquirer who wishes to move, by means of a merger, to 100% ownership after obtaining a controlling stake in the target will find that fiduciary duty law applies particularly strongly to ensure that the non-controlling shareholders receive a fair price. See *Kahn v. M & F Worldwide Corp* (88 A.3d 635 (Del. 2014)).

⁽⁶⁴⁾ Assume there are 100 shares outstanding, of which existing controller holds half, and the company pre-bid is worth 110, of which the controller extracts 10 by way of pbc, so that the shares are each worth 1. Existing controller’s reservation price for the control block is 60 (50 + 10). New controller proposes to extract pbc of 40 and to run the company so that its overall value falls to 90. Post-bid shares will be worth 0.5 each. New controller can afford to pay 60 for control block (i.e., 1.2 per share) because that block will be worth 65 to it (25 + 40). To pay that price for all the shares, however, means paying 120 for a company worth 90. L. Bebchuk, “Efficient and Inefficient Sales of Corporate Control”, 109 Q. J. Econ. 957 (1994); E.-P. Schuster, “The Mandatory Bid Rule: Efficient, After All?”, 76 Mod. L. Rev. 529 (2013), arguing that MBR is an efficient rule because it places bidders competing to acquire a controlling stake in a company in the same position.

⁽⁶⁵⁾ For an early discussion see Paul Marsh, *Short-Termism on Trial* (1990); for early skepticism see Robert Shiller, *Fashions, Fads and Bubbles in Financial Markets*, in *Knights, Raiders and Targets* ch. 3 (J. Coffee, L. Lowenstein, & S. Rose-Ackerman eds., 1988); for a discussion of market prices in the financial crisis and their implications for corporate governance, see E. Fox, M. Fox, & R. Gilson, “Economic Crisis and Share Price Unpredictability: Reasons and Implications”, ECGI Working Paper in Law, 243/2014; and for the status of the Efficient Capital Market Hypothesis after the crisis, see R. Kraakman and R. Gilson, “Market Efficiency after the Financial Crisis: It’s Still a Matter of Information Costs”, 100

Control Shifts via Share Acquisition Contracts with Shareholders (Takeovers)

Va. L. Rev. 313 (2014). The empirical evidence does not support the view that acquirers routinely failed to engage in innovation or R&D expenditures: Eckbo, *supra* note 22, § 3.

⁽⁶⁶⁾ The Kay Review of UK Equity Markets and Long-Term Decision Making, Final Report (2012, URN 12/917), stressing the absence of trust; along the same lines Colin Mayer, *Firm Commitment* (2013).

⁽⁶⁷⁾ M. Lipton, “Takeover Bids in the Target’s Boardroom”, 35 Bus. L. 101 (1979–1980) and “Twenty-Five Years After ‘Takeover Bids in the Target’s Boardroom’: Old Battles, New Attacks and the Continuing War”, 60 Bus. L. 1369 (2005). Lipton, famously, invented the “poison pill” discussed below in § 3.

⁽⁶⁸⁾ L. Bebchuk, “The Myth that Insulating Boards Serves Long-Term Value”, 113 Colum. L. Rev. 1637 (2013).

⁽⁶⁹⁾ With the risk for the target that no offer may in fact emerge, leading the market to downgrade the former target’s share price, on the assumption that the potential bidder discovered some adverse facts the market does not yet know.

⁽⁷⁰⁾ R. Gilson, “Globalizing Corporate Governance: Convergence of Form or Function”, 49 Am. J. Comp. Law 329 (2001).

⁽⁷¹⁾ That is, the notion that a feature of a country’s corporate governance system is more efficient because of its coexistence with another feature of that system than it would be on its own. Indeed, on its own that feature might be a second-best choice, but its functioning together with the other feature makes it first best.

⁽⁷²⁾ Under Part 28 of the Companies Act 2006. The Takeover Code is still made and enforced by practitioner-panels operating in real time (www.thetakeoverpanel.org.uk).

⁽⁷³⁾ Rule 21.

⁽⁷⁴⁾ Rule 20.2.

⁽⁷⁵⁾ Rule 21.2. See *supra* note 58.

⁽⁷⁶⁾ P. Davies, *The Nature of Equality in European Takeover Regulation*, in *Takeovers in English and German Law* ch. 2 (J. Payne ed., 2002).

⁽⁷⁷⁾ See Bebchuk, *supra* note 6.

⁽⁷⁸⁾ On similar grounds partial bids are not normally permitted (rule 36) and offers which result in the acquirer holding less than 50% of the voting rights are ineffective, i.e. bidder does not acquire the shares assented to the offer (rule 10).

⁽⁷⁹⁾ Enriques & Gatti, *supra* note 31.

⁽⁸⁰⁾ Coates, *supra* note 58 at Table 1: the mean was about 30% in both countries.

Control Shifts via Share Acquisition Contracts with Shareholders (Takeovers)

⁽⁸¹⁾ Although it is no longer the case that the Panel is a self-regulatory body (see above) its rules and working practices still strongly reflect this origin.

⁽⁸²⁾ See J. Armour & D. Skeel, “Who Writes the Rules for Hostile Takeovers, and Why? The Peculiar Divergence of US and UK Takeover Regulation”, 95 Geo. L. J. 1727 (2007).

⁽⁸³⁾ Most recently in the takeover of Cadbury plc. by Kraft Foods Inc. in 2010. The Panel engaged in a preemptive review of the Code, which, however, left the “no frustration” rule intact. See Panel Consultation Paper 2010/2.

⁽⁸⁴⁾ On these grounds Arlen and Talley argue against a no frustration rule: “Unregulable Defenses and the Perils of Shareholder Choice”, 152 U. Pa. L. Rev. 577 (2003).

⁽⁸⁵⁾ See Paul L. Davies, “Shareholder Power in the United Kingdom”, in Research Handbook on Shareholder Power 355 (Randall Thomas and Jennifer Hill eds., 2015). An interesting question for the future is whether foreign institutions, now the dominant players in the market, will take a similar line.

⁽⁸⁶⁾ Of course, management has greater freedom pre-bid to take commercially plausible action which makes the company a less attractive target, e.g. entering into a joint-venture arrangement, because an effects-based pre-bid rule would constrain centralized management too tightly, even from the shareholders’ point of view. As a matter of law pre-bid defensive measures are controlled by fiduciary duties, where the test is whether the “dominant” purpose of the directors is to entrench themselves or to promote the company’s commercial interests. But such action is also scrutinized by institutional shareholders, albeit not by reference to the bright-line standard which is applied to non-voting shares.

⁽⁸⁷⁾ Davies, *supra* note 85.

⁽⁸⁸⁾ This is recounted in Armour and Skeel, *supra* note 82, § II.B.

⁽⁸⁹⁾ David Kershaw, “The Illusion of Importance: Reconsidering the UK’s Takeover Defence Prohibition”, 56 Int’l. & Comp. L. Q. 267 (2007).

⁽⁹⁰⁾ [1967] Ch 254.

⁽⁹¹⁾ On the differences between courts and other forms of rulemaking from a “lobbying” point of view, see Armour & Skeel, *supra* note 82.

⁽⁹²⁾ Amending the Securities Exchange Act 1934, §§ 13 and 14. 1968 was also the year in which the first version of the UK Takeover Code was adopted.

⁽⁹³⁾ Above § 2.B.ii.

⁽⁹⁴⁾ Some of the more extreme statutes were struck down as unconstitutional on the grounds that the Williams Act had preempted the area in which the states sought to legislate. However, state regulation outside the area of proxy solicitation was upheld. For

Control Shifts via Share Acquisition Contracts with Shareholders (Takeovers)

more detail see J. Seligman, T. Paredes, & L. Loss, *Fundamentals of Securities Regulation* 868–81 (6th ed. 2014).

(⁹⁵) E. Catan & M. Kahan, “The Law and Finance of Anti-Takeover Statutes”, 68 *Stan. L. Rev.* 629 (2016) pointing out the insignificance of other defensive devices and the relevance of this fact for empirical research.

(⁹⁶) Early versions of the pill gave target shareholders rights to shares in the acquiring company (“flip over”) but doubts about the effectiveness of such plans led to their replacement by “flip-in” plans: W. Allen, R. Kraakman, & G. Subramanian, *Commentaries and Cases on the Law of Business Organization* § 12.3 (4th ed. 2012).

(⁹⁷) The plan might be tailored so as to produce the required level of dilution even at a high threshold level.

(⁹⁸) In this case the exclusion of the acquirer from the warrants is probably unnecessary. The increase in the number of shares bid for is in itself enough to destroy the acquirer’s offer, even if the acquirer’s pre-bid holding is also pro-rata increased. Formulating the plan in this way, as is done in the French version of the plan (Commercial Code (France) Art. L233–32, as amended by Loi n° 2014–384 of 29 March 2014) avoids the legal risk arising from unequal treatment of shareholders, which is a substantial one in some European jurisdictions. Under the French version, the warrants may be issued by the board of the target when a bid is launched; if this happens, the acquirer is permitted to withdraw its offer; and the board can then withdraw the warrants. P. Davies, E. Schuster, & E. van de Walle de Ghelcke, *The Takeover Directive as a Protectionist Tool?* in *Company Law and Economic Protectionism—New Challenges to Economic Integration* 105 (Ulf Bernitz and Wolf-Georg Ringe eds., 2010) § V(b). However, it should be noted that pre-bid shareholder approval is needed to confer this power on the board, and the French poison pill leaves the target unprotected from an actual acquisition of de facto control through the market or private treaty.

(⁹⁹) As interpreted in *Moran v. Household International Inc* 500 A 2d 1346 (1985).

(¹⁰⁰) By contrast, in the EU the issuance of shares, including warrants granting entitlements to subscribe for shares, requires shareholder approval, though that approval can be given in advance (for periods up to five years) (Directive 2012/30/EU, originally enacted in 1977).

(¹⁰¹) Hence, given the disclosure rules relating to shareholdings, it matters little to the ability of the board to defend against a bid whether it actually has a plan in place or not (M. Klausner, “Fact and Fiction in Corporate Law and Governance”, 65 *Stan. L. Rev.* 1325 (2013)).

(¹⁰²) See note 99—an issue which would clearly be debatable under the English or Japanese improper purposes doctrine, since the plan’s only purpose is to give the target board that power.

Control Shifts via Share Acquisition Contracts with Shareholders (Takeovers)

(¹⁰³) *Unocal Corp v. Mesa Petroleum Co* 493 A 2d 946 (1985).

(¹⁰⁴) It was whether the board had reasonable grounds for believing that the acquisition presented a threat to the corporation's interests and whether the board's response was proportionate in relation to the threat. See previous note.

(¹⁰⁵) R. Gilson, "Unocal Fifteen Years Later (and What We Can Do About it)", 26 Del. J. Corp. L. 491 (2001).

(¹⁰⁶) *Paramount Communications Inc v. Time Inc* 571 A 2d 1140 (1989). But the board must have an objective which plausibly promotes shareholder value: *eBay Domestic Holdings Inc v. Newmark* 16 A 3d 1 (2010)—defense of "corporate culture" by itself not enough.

(¹⁰⁷) *Air Products and Chemicals Inc v. Airgas Inc*, 16 A.3d 48 (2011).

(¹⁰⁸) *Revlon Inc v. MacAndrews and Forbes Holdings Inc* 506 A 2d 173 (1986). On the significance of *Revlon*, see L. Johnson & R. Ricca, "The Dwindling of Revlon", 71 Wash. & Lee L. Rev. 167 (2013).

(¹⁰⁹) *Supra* note 82, 1739.

(¹¹⁰) *Supra* note 82, 1741. Coates, *supra* note 58, § III.C found that the UK bid rate was only 80% of the US rate (after controlling for the relative size of the economies). See also S. Rossi & P. Volpin, "Cross-Country Determinants of Mergers and Acquisitions", 74 J. Fin. Econ. 277 (2004).

(¹¹¹) Of course, it could be that the US takeover rate would be even higher but for the plan.

(¹¹²) See *supra* note 94, at 812 for the advantages of the takeover as against a proxy fight, even in the absence of a staggered board. Indeed, the takeover emerged initially as a response to the costs of a proxy fight.

(¹¹³) L. Bebchuk, J. Coates, & G. Subramanian, "The Powerful Antitakeover Force of Staggered Boards: Theory, Evidence, and Policy", 54 Stan. L. Rev. 887 (2002). Classification of the board under § 141(d) DGCL rests on either such a provision being in the company's initial certificate of incorporation or by-laws or be adopted by shareholder vote through a subsequent by-law amendment. Today, however, staggered boards are less common than they were and their impact on corporate performance is much disputed.

(¹¹⁴) M. Kahan & E. Rock, "How I Learned to Stop Worrying and Love the Pill: Adaptive Responses to Takeover Law", 69 U. Chi. L. Rev. 879 (2002). At the same time staggered boards were becoming less prevalent, as institutional shareholder power grew, so that staggered boards became more difficult to obtain or to maintain (M. Kahan & E. Rock, "Embattled CEOs", 88 Tex. L. Rev. 987 (2009-2010)). Consequently, the defensive power of the plan became less, though by no means negligible.

Control Shifts via Share Acquisition Contracts with Shareholders (Takeovers)

⁽¹¹⁵⁾ If they do not, the financial gains from the control shift are likely to mean that they do not persist in their opposition.

⁽¹¹⁶⁾ Fox, Fox, & Gilson, *supra* note 65.

⁽¹¹⁷⁾ Of course, to the extent that US institutional shareholders become able and willing to exercise their general governance rights, for example to remove staggered boards or directors of whom they disapprove, incumbent management may become less incentivized to back its own judgment against a potential acquirer. Kahan & Rock, *supra* note 114 (Embattled CEOs).

⁽¹¹⁸⁾ L. Enriques, R.J. Gilson, & A.M. Paces, “The Case for an Unbiased Takeover Law (with an Application to the European Union)”, 4 Harv. Bus. L. Rev. 85 (2014). They make the same argument in relation to the MBR.

⁽¹¹⁹⁾ There is some evidence from the US that takeover defenses among companies going public are common in firms that have substantial contractual commitments to business partners—customers, suppliers, or strategic partners (W. Johnson et al., “The Bonding Hypothesis of Takeover Defenses: Evidence from IPO Firms”, 117 J. Fin. Econ. 307 (2015). But see the comments of Klausner, *supra* note 101, at 1325.

⁽¹²⁰⁾ M. Kahan & E. Rock, “Corporate Constitutionalism: Antitakeover Charter Provisions as Pre-Commitment”, 152 U. Pa. L. Rev. 473 (2003).

⁽¹²¹⁾ The EU Takeover Directive requires Member States which do not make a “no-frustration” rule mandatory to permit companies incorporated in their jurisdiction to opt into that rule, by shareholder supermajority vote (as needed to alter the company’s articles). No company is known ever to have opted in. European Commission, External Study on the application of the Directive on Takeover Bids, 190 (available at http://ec.europa.eu/internal_market/company/docs/takeoverbids/study/study_en.pdf).

⁽¹²²⁾ Wertpapiererwerbs- und Übernahmegesetz (WpÜG), § 33(1). Germany has a mandatory two-tier board system (except for European Companies incorporated in Germany). Management is normally in the hands of the management board; the supervisory board may not be allocated management powers but can make certain management board decisions subject to its approval; and shareholders have only limited decision-making rights. However, in the case of defensive measures, shareholder approval, which can be given in advance for periods of up to 18 months, can replace supervisory board approval, but apparently is rarely sought, perhaps because a 75% majority of the shareholders is required and minority shareholders are likely to be less accepting of defenses than the supervisory board.

⁽¹²³⁾ See *supra* note 11.

⁽¹²⁴⁾ Carsten Gerner-Beuerle, David Kershaw, & Matteo Solinas, “Is The Board Neutrality Rule Trivial? Amnesia About Corporate Law In European Takeover Regulation”, 22 Eur. Bus. Org. Rev. 559 (2011) come close to the view that other provisions of German law will

Control Shifts via Share Acquisition Contracts with Shareholders (Takeovers)

always require shareholder consent for defensive actions, so that the WpÜG provisions are irrelevant. Two responses: general corporate law usually requires shareholder consent in advance (up to five years in advance often being permitted) rather than post bid, as under the “no frustration” rule. It is thus not possible to equate voting outcomes in general meetings in advance with outcomes in takeover offers. See § I.B above. Second, in relation to asset sales the authors have to rely on what might be argued to be an overextended interpretation of the *Holzmüller* doctrine for the proposition that crown jewel sales would require shareholder approval. *Holzmüller* ((1982) BGHZ 83, 122) was a surprising decision of the Federal High Court (Bundesgerichtshof) which increased the decision-making powers of the shareholders beyond the apparently closed list of matters on which shareholders can decide, as laid down in § 119 of the German Companies Act (AktG). The extension was to large-asset transactions which impacted adversely on the exercise of shareholder rights. This decision has been reined in significantly by the subsequent *Gelatine* decision ((2004) Doc. No. II ZR 154/02). Both *Holzmüller* and *Gelatine* concerned intra-group restructurings, not takeovers. It is suggested that it is unlikely that the German courts would use *Holzmüller* to impose the contractual model of defensive measures on German companies when the legislative history of the WpÜG shows the legislature had wished to adopt the corporate model. For English translations of these decisions see A. Cahn and D. Donald, *Comparative Company Law* 695–721 (2010).

(¹²⁵) § 87(1) of the AktG provides: “The supervisory board shall, in determining the aggregate remuneration of any member of the management board (salary, profit participation, reimbursement of expenses, insurance premiums, commissions, incentive-based compensation promises such as subscription rights and additional benefits of any kind), ensure that such aggregate remuneration bears a reasonable relationship to the duties and performance of such member as well as the condition of the company and that it does not exceed standard remuneration without any particular reasons. The remuneration system of listed companies shall be aimed at the company’s sustainable development. The calculation basis of variable remuneration components should therefore be several years long; in case of extraordinary developments, the supervisory board shall agree on a possibility of remuneration limitation.” The German Corporate Governance Code (4.2.3), enforceable on a “comply or explain” basis adds: “Benefit commitments made in connection with the early termination of a Management Board member’s activity due to a change of control shall not exceed 150% of the severance cap.” That cap is set at two years’ total compensation.

(¹²⁶) P. Davies and K. Hopt, “Corporate Boards in Europe-Accountability and Convergence”, 61 *Am. J. Comp. L.* 301, § II.B (2013). If half the seats are taken by employee representatives and half the shareholder seats were allocated to independent directors (who must not have links to important shareholders), large shareholders might feel that they could not rely on the board to protect their interests.

(¹²⁷) German Corporate Governance Code, § 5.4.2 (available at <http://www.dcgk.de/en/home.html>).

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

John C. Coates IV

The Oxford Handbook of Corporate Law and Governance

Edited by Jeffrey N. Gordon and Wolf-Georg Ringe

Print Publication Date: May 2018 Subject: Law, Company and Commercial Law

Online Publication Date: Jul 2015 DOI: 10.1093/oxfordhb/9780198743682.013.29

Abstract and Keywords

This chapter examines how mergers, acquisitions, and restructuring are regulated, both within the formal body of corporate law and as that law interacts with other bodies of law such as securities (including listing standards), antitrust, industry-specific regulation, and regulations of cross-border transactions. It begins with an overview of relevant terminology and scope of M&A and restructuring and how they differ from other corporate transactions or activities. It then considers major types of M&A transactions, the core goals of corporate law or governance, and other bodies of law (antitrust, industry-based regulation, regulation of foreign ownership of business, and tax) that give special treatment to M&A and restructuring, and sometimes interact with corporate law and governance. It also looks at laws that constrain M&A transactions and those that facilitate them. It concludes by summarizing empirical research and discussing what variations in types and modes of regulation governing M&A and restructuring transactions imply.

Keywords: mergers, acquisitions, restructuring, corporate law, securities, antitrust, regulations, cross-border transactions, corporate governance

1 Introduction

¹THE core goal of corporate law and governance is to improve outcomes for participants in businesses organized as corporations, and for society, relative to what could be achieved through contract, property, and other less “regulatory” bodies of law. One way that corporate law and governance achieves that goal is to regulate significant transactions—particularly mergers, acquisitions, and restructuring, with an eye toward the two core values served by fiduciary duty doctrines: to ensure care and loyalty on the part of corporate decision makers. This chapter considers ways in which M&A—which will be the chapter’s shorthand for the general class of significant corporate transactions, including restructuring—is specially regulated, both within the formal body of corporate law and as that law interacts with other bodies of law, particularly securities (including listing stan-

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

dards), antitrust, industry-specific regulation, and regulations of cross-border transactions.

The chapter proceeds as follows. First, the concepts of “M&A” and “restructuring” are defined, and they are distinguished from other corporate transactions or activities. Second, major types of M&A transactions are briefly reviewed, using recent examples to illustrate the choices M&A participants have for effecting an M&A transaction. Third, the core goals of regulation are sketched²:

(p. 571)

1. To clarify authority and control over M&A by corporate decision makers;
2. To reduce transaction costs and overcome collective action problems;
3. To constrain and improve outcomes of conflict-of-interest transactions;
4. To protect dispersed owners of public companies;
5. To deter or mitigate looting, asset-stripping and excessive M&A-related leverage; and
6. To cope with the side effects of other regulations.

In addition to these corporate law or governance related goals, M&A transactions face special treatment under other bodies of law (antitrust, industry-based regulation, regulation of foreign ownership of business, and tax) that sometimes interact with corporate law and governance, and the goals of these laws as applied to M&A are also briefly reviewed. Fourth, the modes of regulation are summarized, dividing laws or regulations into those that constrain M&A transactions and those that facilitate them. Fifth and finally, empirical research is summarized to present the different types of transactions that are actually chosen and (where available) what effects the laws that apply to them have in the world’s two largest M&A markets (the US and the UK) and (as a contrasting example, and more selectively, given data limitations) in a developing nation (India), which now accounts for ~4% of global M&A. Throughout, the chapter notes similarities and differences of the choices and modes of regulation across transaction types and countries.

The chapter concludes with more general observations about what these variations in types and modes imply. Some differences, for example, seem to reflect longstanding differences in deep structural features of the markets (such as ownership structure). But other differences seem to reflect the way that (as in chaotic systems) seemingly small differences in starting conditions can ramify and persist in the face of otherwise generally similar conditions and strong market pressures. Minor variations in similar laws with similar goals in similar legal systems, in other words, can have real effects on the amount and nature of economic activity.

2 Terminology and Scope: What Are M&A and Restructuring Transactions?

The concepts “mergers and acquisitions” (M&A) and “restructuring” are primarily used as business terms, not as legal terms of art. They are not sharply defined, instead referring to fuzzy sets of similar transactions. As commonly understood by practitioners and used in this chapter, the core of M&A is a deliberate transfer of control and ownership of a business (p. 572) organized in one or more corporations.³ “Restructuring” is a deliberate, significant and unusual alteration in the organization and operations of a business, commonly in times of financial or operational distress, typically accompanied by changes in ownership or finance, as when a company merges two divisions, or sells off a business unit.

M&A and restructuring commonly occur together, and can bleed into one another, as well as other, unusual but less dramatic business decisions: bulk sales of inventory, organic growth through advertising campaigns, office closures, layoffs, and so on. M&A differs from those events, and from restructuring, in that M&A typically refers to the transfer of control of a business as an entirety, even if the buyer may consequently choose to restructure the target or itself. Restructuring differs from ordinary business events in that it is more significant, disruptive of prior operations and strategy, and not part of ongoing or routine business activity. M&A and restructuring are commonly accompanied by changes or transactions in capital (borrowing, buybacks, stock sales, etc.), either as part of the transactions or in parallel, but differ in that they change fundamental business operations and not purely finance.

M&A and restructuring are the most important transactions an incorporated business can undertake, rivaled only by initial organization or liquidation. The combination of change on multiple dimensions with deliberation and importance gives these transactions their characteristic drama and complexity. Their importance and complexity also makes them challenging for corporate law and governance.

Characteristically, M&A transactions involve a purchaser or buyer and a seller. The business being transferred is commonly called the “target,” which may be separately incorporated, or may consist of an operating unit or division—a collection of assets, employees, relationships, etc.—owned along with other businesses by a single entity. In some M&A transactions, however, there is no clear purchaser or seller—two companies combine their assets in what is commonly called a merger of equals.⁴

3 What Are the Major Types of M&A Transactions?

M&A transactions fall into a variety of types. A standard typology focuses on the legal nature of the transaction, dividing M&A into asset purchases, stock purchases, and mergers (or schemes of arrangement). The most primitive M&A transaction consists simply of the

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

purchase of all of the assets used in (and so control over) a business. Where the target sells all of its assets, it typically then liquidates or otherwise distributes the price paid to its owners. (Something must also be done about the target's liabilities, of course; the buyer may assume them, or they may be paid in the target's liquidation, or they may be maintained in force if the target retains the price paid for its assets, or some combination.) In May 2007, for example, (p. 573) iStar Financial purchased Freemont Investment's commercial real estate mortgage lending business, and the parties structured their deal as a purchase of assets for \$1.9 billion in cash, with liabilities of the target divided between the buyer and seller.⁵

Where target assets are extensive, complex, or hard to specify, or their transfer is subject to regulatory requirements, or contract consents—think of the purchase of the individual assets of a company such as Barclays or Citigroup—asset purchases can be cumbersome, time-consuming, and lengthy. The corporate form creates a simple, and often vastly simpler, alternative: a buyer can purchase all of the stock (and thus control) of the corporation that owns a business, rather than its assets. AT&T's attempted acquisition of T-Mobile from Deutsche Telekom in 2011 was structured as a stock purchase.⁶

In India, stock purchases represent the dominant type of M&A transaction, followed by asset purchases, because ownership is typically concentrated in the hands of a single or small number of related shareholders, even when a target company is listed. In the five-year period ending 2008, for example, the average stake transferred in a domestic Indian M&A deal was only 53%, and in cross-border deals, involving a foreign bidder, only 16% of deals involved a 100% acquisition—a feature of the Indian M&A market partly explained by India's extensive regulation of foreign ownership of Indian companies, discussed more below. Examples of partial in-bound acquisitions include Vodafone's acquisition of 67% of Hutchison and Vedanta's acquisition of 59% of Cairn India.

When a target corporation has more than a small number of shareholders and the goal of the buyer is to obtain 100% ownership, stock purchases begin to increase transaction costs, making a simpler method of purchasing ownership more attractive. In the US, this is accomplished through the use of statutorily authorized mergers. Other statutory mechanisms exist in the US—consolidations, mandatory share exchanges, etc.—but mergers are the most straightforward and by operation of law result in the transfer of assets of one corporation to another, without the need to specify or purchase individual assets, and through which all owners have their stock converted into an agreed-upon form of “currency” or deal consideration (cash, stock of the buyer, etc.).

Commonly, it is desirable for purchasers to create new subsidiary corporations to carry out an acquisition. If done by merger, the resulting “triangle” of companies (parent/buyer, acquisition subsidiary, and target company) is described as having engaged in a “triangular” merger (target into subsidiary being called “forward” and the reverse being called “reverse”). AT&T's May 2014 agreement to buy DirecTV is structured as a forward triangular merger⁷; Comcast's February 2014 agreement to buy Time Warner Cable is structured as a reverse triangular merger.⁸

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

In the UK and India, a similar result can be obtained through what is termed a scheme of arrangement. Vodafone's April 2012 offer for Cable & Wireless was effected as a scheme of arrangement⁹; an example from India is the combination of Centurion Bank with HDFC Bank in 2008.¹⁰ More commonly in the UK (and to a lesser extent in the US), a purchaser can achieve a similar result by making a public bid (or tender offer) for the target's stock—that is, to use the tools of mass communication to offer to buy stock of multiple shares (p. 574) simultaneously, at a set price with a specified currency. This enables the stock purchase to occur more cheaply than could be done through individual shareholder-by-shareholder purchases. Kraft's January 2010 acquisition for Cadbury was structured as a bid.¹¹

In a bid or tender offer, some shareholders may not tender, either because they (sincerely or strategically) choose to “hold out” for a higher price, or because they may not be aware of the offer (despite the bidder's best efforts at publicity) or even that they own the relevant stock (suppose the shareholder has a diversified portfolio and is traveling or busy and has failed to delegate authority over her stock dealings to a responsible agent). In that case, some statutorily authorized transaction—a freezeout or squeezeout, as they are often called—amounting economically to the equivalent of a call option on the stock may be necessary to convey 100% ownership of the target (and its businesses). The transaction thus consists of two formal steps—bid plus squeezeout—that produce the same result as a reverse triangular merger or scheme of arrangement.¹² Another step that might precede or fall between those steps is an initial stock purchase by the buyer from the target, or from selling shareholders of the target. Freezeouts also sometimes occur outside the context of an arm's-length acquisition, as when a controlling shareholder or parent company freezes out a minority stake in a controlled public subsidiary, generally pursuant to a single-step merger.¹³ The freezeout of public investors in Levi-Strauss in 1996 by the Haas family is an example.¹⁴

In addition to these basic types of M&A transactions, there are other types, less common but not uncommon. In a spin-off, ownership interests in one business are distributed to shareholders of a company that retains other businesses, resulting in a transfer of effective control to a newly constituted board and management of the “spinco,” and transfer of ownership to the shareholders of the spinning corporation—followed typically by a divergence over time in the ownership of the two companies. Alternatively, a company can place one business in a corporation and sell its stock to the public for cash. Or these can be combined, with an initial carve-out followed by a spin-off. More complexity is possible and not uncommon. A new company can be created, along with two subsidiaries, and each of two separate companies can merge with each subsidiary (a top-hat or double dummy structure).¹⁵ It is possible to combine three separate businesses at once in a new single enterprise, through a combination of the above simple legal types, or to transfer control and ownership of one company followed immediately by a further resale, spin-off, or carve-out (or both) of one of that company's businesses.

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

(p. 575) Larger businesses are not typically organized as single companies, but as holding companies with multiple subsidiaries in multiple layers. (Morgan Stanley has ~2,800 subsidiaries, for example, and is not the most complex financial institution in the world.¹⁶) As a result, it is common for the buyer in an M&A transaction to want—after the initial “main” transaction—to move pieces of the target’s business (often in multiple subsidiaries) into multiple subsidiaries of the purchaser, so as to achieve economies, avoid or reduce the costs of regulation, or for other reasons. As a result, the overall M&A transaction may take many steps. In Bank of America’s acquisition of Countrywide, it used an initial forward triangular merger, followed by at least three sets of major stock or asset purchases at the subsidiary level, taking place over more than a year.¹⁷

M&A transactions also use a variety of types of currencies or forms of consideration. Cash is common, as is stock of the buyer. Buyers can also “pay” the target’s owners with their own debt, i.e., promise to pay cash later—something commonly referred to as “seller financing,” or by exchanging assets for assets, or by assuming debt of the target or the seller. Forms of currency can be mixed, as in a one-step fixed blend (e.g., 50% cash, 50% stock), or by using all cash in one step, followed by all stock in a second step, or by offering target shareholders a choice, perhaps constrained by specified limits.¹⁸ If non-cash is used and the transaction involves delay between the moment the parties agree upon a price and the completion of the transaction, the value of the non-cash currency can fluctuate or can be fixed by contract. Deal currency is a separate choice from the legal form of the transaction—so asset purchases can be for cash or stock, as can stock purchases, mergers, and bids.

A final way to break down M&A transactions by type is by the nature of the parties or financing for the deal. Targets and buyers alike can have a single or small set of shareholders—private companies—or dispersed owners with stock listed on an exchange—public companies.¹⁹ Buyers can have existing businesses—strategic buyers—or may be newly formed solely to carry out the transaction, typically raising the price of the deal by issuing equity to a sponsor (such as a private equity fund) and debt to banks or investors in the leveraged loan market, sometimes combined with sales of bonds or preferred stock—financial buyers. Acquisitions by financial buyers are commonly called “buyouts,” and where newly issued debt is used to generate the currency used in the deal, the buyouts are called leveraged buyouts or LBOs. Where the seller is also a private equity fund, the deal is commonly referred to as a secondary buyout; where the seller is a company with other businesses, a buyout of one its divisions or subsidiaries is commonly referred to as a divisional buyout.

(p. 576) A final observation about deal types: many economically identical (or highly similar) M&A transactions can be accomplished through more than one combination of legal components. One-step mergers are similar to tender offers followed by freezeouts. A cash bid can achieve much the same effect as a stock-for-stock merger coupled with a buyback of shares. A leveraged buyout is similar to a buyout funded with cash on hand, followed by new borrowings to replace the cash. A purchase of all assets plus target liquidation can produce economically equivalent results as a merger. And so on. This fact can make it

hard to regulate M&A transaction effectively through simple, clear rules. Coupled with differences in legal treatment of different forms of M&A transaction, the economic similarity of different transaction forms can also make it hard for conventional doctrinal analysis to rationalize fully, or even to identify adequately the goals served by, every feature of M&A law and regulation.

4 What Roles Exist for Regulation of M&A Transactions?

Let us turn to the goals of regulation of M&A transactions. Within the traditional scope of corporate law, three major regulatory goals pertaining to M&A exist: (1) to enhance and clarify authority and control over a corporation as applied to M&A, setting baseline entitlements to participate in related decision making; (2) to facilitate M&A by overcoming collective action problems and transaction costs; (3) to constrain and improve the outcomes associated with conflicts of interest; and (4) to deter or mitigate looting, asset-stripping, and excessive M&A-related leverage. If the owners of a party are dispersed, an additional goal of M&A law is (5) to protect those owners, a goal that sometimes overlaps or extends into the domain of securities regulation and listing standards. As discussed below, a major “mode” or method of regulation of M&A is to impose approval and disclosure requirements—and where owners are dispersed, these requirements have important side effects on M&A process and outcomes, so that another goal of M&A regulatory design is (6) to cope with those side effects. Finally, other bodies of law apply specially to M&A, and while not within the scope of corporate law and governance as generally understood today, those bodies of law interact with corporate law and governance sufficiently that they must be taken into account as well.

The material in this section is not meant to present a comprehensive list of all possible justifications for regulation of M&A, nor is it meant to justify regulation overall or in any given instance. Rather, the justifications that are commonly offered for (or common rationalizations of) major types of actual regulation (discussed more below) are presented, with only passing reference to costs or unintended consequences of regulation. This choice of presentation reflects not a naïve embrace of the nirvana fallacy. Many efforts to regulate M&A fail for the reason already noted above (i.e., that M&A can sometimes be structured in many different ways, sometimes so as to successfully evade a given law or regulation), and all regulatory efforts impose at least some costs. Instead, the material simply reflects standard arguments for entrenched modes of regulation, which all those who are interested in M&A contend with, whether in designing deals, complying with law, or proposing reforms to M&A regulation.

(p. 577) 4.1 Enhancing and Clarifying Authority, Control, and Baseline Entitlements

An important function of corporate law is to establish “default” or baseline entitlements to control over a corporation. Even if no one set of entitlements is best in all settings, a clear baseline economizes on contracting costs. Because M&A transactions are so fundamental and significant, and have potentially dramatic effects on the value of a company (and therefore on common stock), it is natural to set a baseline right for common shareholders to participate in the decision whether to engage in an M&A transaction. This is particularly likely when an M&A transaction involves either (1) a sale or liquidation of a company (as when all of a target’s assets are purchased for cash) or (2) an acquisition in which the buyer issues a significant amount of equity. (If an M&A transaction is structured as a stock purchase, a role for shareholders emerges from contract and property; but if the transaction is structured in other ways, or if statutes provide overrides (as in a merger or squeezeout), it does not.)

However, because M&A is not a clearly defined category—as discussed above—and bleeds into routine transactions, it is hard to map shareholder participation onto all M&A transactions, without sweeping in many transactions for which shareholder governance would not be efficient as a baseline. (Shareholders can obtain or broaden such governance rights by contract, such as a voting or shareholders agreement.) Dividing M&A into subsets where shareholder governance is usefully required and where it is not, then, is one role for corporate law.

In addition, M&A creates opportunities and incentives for corporate decision makers (boards, officers, employees) to conflict with one another (and with shareholders) over whether, when, and how to engage in such transactions, and for some to pursue transactions without actual authority. Even if each agent or decision maker is free of a personal conflict of interest, the dramatic nature of a change in control and ownership, or of a significant and abnormal shock to normal operations, may lead agents to deviate from normal corporate practices. For example, one officer may in good faith pursue a transaction and agree to negotiate exclusively with one potential counterparty, only to have other officers, or the board, disagree with this method of pursuing a transaction and try to stop the deal. An M&A transaction can involve contracts that commit a company to take on operations (perhaps at a subsidiary of a target) that are not subject to adequate controls, and can thus undermine the control authorized corporate decision makers customarily have over a company or its assets.

Corporate law clarifies who decides, and how, and who will have control and responsibility over the combined company after the deal. Because of M&A’s significance, and because corporate actors and third parties alike often have a greater need to rely on the fact of appropriate authorization in an M&A context, corporate law typically imposes explicit or implicit requirements on M&A that differ from those applicable to more ordinary business decisions. For example, when does a corporate officer need to notify or obtain explicit authority from the board to sell a business, or enter into a contract to buy one, or

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

sell a potentially controlling block of stock?²⁰ If shareholder approval is required, what vote is required, and through what mechanism? If not, are disclosures to shareholders required, and if so, (p. 578) when? These aspects of M&A-related laws can be understood as (efficiently) communicating to all concerned a clear set of default procedures for authorization of M&A transactions.

4.2 To Facilitate M&A by Overcoming Collective Action Problems and Transaction Costs

A second goal of M&A law is to facilitate M&A transactions. As noted above, asset purchases can generate extensive transaction costs under background conditions of property and contract law, which can prevent the transfer of control and ownership of business and so reduce social welfare. If a large bank had to obtain consent from each borrower to transfer each of its loans to a buyer, the costs might overwhelm the benefits from the sale, even if the buyer could efficiently combine the target's operations with its own. The structure of corporate law—which permits control and ownership of a collection of assets to be transferred via purchase of stock—facilitates M&A. However, even stock purchases can generate non-trivial transaction costs if ownership is dispersed. While technology (mass communication) has overcome some of these costs, collective action problems may impede M&A under certain circumstances. If an M&A transaction requires individual consents from dispersed shareholders, each shareholder may have an economic incentive to hold out in an attempt to remain an equity owner of a business whose value will be enhanced by the bidder after the transaction; if each shareholder has that incentive, then none may sell, preventing value-increasing transactions from occurring.²¹ Law can overcome those incentives by providing mechanisms to force target shareholders to accept a proposed M&A transaction under specified circumstances, as in a merger, scheme of arrangement, or squeezeout.

4.3 To Constrain Conflicts of Interest

A more controversial set of legal constraints on M&A is designed to constrain or improve the outcomes of conflicts of interest that arise in the M&A context. Such conflicts can take a variety of forms, some obvious, some less so. In a management buyout or MBO, officer-fiduciaries of the target participate as owners of the buyer, and so face a clear conflict.²² In a freezeout of minority investors by a controlling shareholder or parent company, again, the conflict is clear.²³ A controlling shareholder may cause two controlled subsidiaries to merge, or one to acquire the other, and if one of the subsidiaries is wholly owned while the other is not, the transaction's terms may be designed to favor the wholly owned over the partly owned subsidiary.²⁴ Absent legal protections, management or the control shareholder would (p. 579) be tempted to offer an unfairly low price; investors, anticipating this, would refuse to invest, or would impose a severe discount on the value they would place on the shares. Since investors would not know in advance when such a conflict transaction might occur, the cost of capital would be higher for all firms. In a hypothetical bargain designed to maximize the joint gain to both the conflicted party and in-

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

vestors, the parties would agree to some degree of legal protection, and corporate law can economize on bargaining costs by imposing such protections as a default.²⁵

Other conflicts are less direct but clear and significant. Fiduciaries may propose a spin-off in which they are given the right to buy a controlling stake.²⁶ A fiduciary may sell a public company to an arm's-length buyer but simultaneously engage in negotiations to buy back part of the public company from the buyer.²⁷ A control shareholder who also serves as a fiduciary may divert an opportunity to sell the company as a whole by offering to sell a control block in lieu of the whole-company transaction.²⁸

Still other conflicts are real but may not be as stark. Fiduciaries may favor one bidder over another, not in return for an explicit quid pro quo (e.g., in the form of a payment) but to curry goodwill in the hope of obtaining post-deal employment, or perhaps out of malice toward a bidder or gratitude for some past favor. Fiduciaries may prefer one set of transaction-related agents (investment bankers, lawyers, lenders) for the same kinds of reasons. Those agents may have incentives distorted if they own equity in a party with interests opposed to their client.²⁹ Fiduciaries may seek to sell their company "too early" or "too cheaply" to trigger "golden parachutes" or vesting under option plans or retirement plans, or in return for benefits from the buyer.³⁰ Fiduciaries of a target may have business or social ties to a buyer.³¹

Conflicts can exist at the shareholder level (between control and minority shareholders), between shareholders and the board, among board members, between the board and officers, and between officers and the company. The range of potential conflicts created by an M&A transaction is enormous—and the opportunity to hide payoffs or benefits from the transactions is generally larger than is true in the ordinary course of corporate decision (p. 580) making. In all of these circumstances, corporate law and governance may be able to improve on outcomes for shareholders by constraining the process or nature of the transaction.

4.4 To Protect Dispersed Owners

Corporate law (and closely related securities regulations) can also protect the interests of dispersed owners in the M&A context. Where an M&A transaction requires shareholder approval or consent, law can usefully specify what information and process needs to be followed to obtain that approval (particularly how long shareholders must be given to consider whether to approve). The information required and process to be followed may differ if the shareholders are dispersed, and so likely to be less informed, to be able to protect their own interests, or to act quickly than a small number of owners. Because bids can be structured to have a coercive effect on dispersed shareholders—the reverse of the collective action problem discussed above—dispersed shareholders may need protection even when they are informed, active, and sophisticated.³² Even where a transaction does not require (as a baseline entitlement) shareholder approval, dispersed shareholders may still need information to decide whether they should use other legal rights (e.g., through normal voting rights to elect directors, or the right to sue in response to conflicts of inter-

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

est). Without specific approval rights, moreover, shareholders may suffer the effects of M&A before they can mobilize to protect their interests with normal voting rights or other governance mechanisms. This risk seems more acute for bidders, whose value may be destroyed by poorly conceived acquisitions, than for targets, which generally attract bids at prices over market prices.

4.5 To Deter or Mitigate Looting, Asset-Stripping, and Excessive M&A-Related Leverage

Particular risks toward which M&A law may be directed include the risk of looting, asset-stripping, or excessive leverage from debt-financed M&A. Looting here means theft or clear violation of fiduciary duties or other legal obligations (arising under contract, tort, property, or other bodies of law) resulting in a transfer of value from a company to a person in control of the company. Looting harms not just shareholders, but also creditors, employees, and others who depend on the continued functioning of the business. Looting is by definition already made illegal by non-M&A law. But because M&A results in a change of control, it can increase the risk of looting, and M&A-related duties may enhance the effectiveness of such laws, such as the imposition of a duty of care on decision makers who are selling not to sell to a person with a reputation as a looter.

A similar potential result of M&A is asset stripping. Asset stripping is the transfer out of a business (often via M&A) of value (as in a transaction at an unfair price), or of revenue or earnings-generating assets of a company. Even if those transfers are at a fair price, they may insure that certain creditors will not be paid, while others (and perhaps shareholders, (p. 581) too) obtain value from the transaction or the company, in violation of normal payment priorities.³³ The result is that the company is left insolvent (immediately or over time, as contingent liabilities are realized), and with non-operating assets that are incapable of generating growth or future revenues or earnings. Asset stripping includes conduct that verges on or in fact may constitute fraud in contexts where complexities associated with valuation and proof of intent³⁴ may make fraud claims grounded in tort or other doctrines difficult or impossible. Asset stripping can also result in what would (in an insolvency or bankruptcy proceeding) be treated as preferential payments, and sometimes also involves transactions implicating conflicts of interest (where for example insiders or control persons are the recipients or beneficiaries of the transfers).

Where a target has only one shareholder after an M&A transaction, as when a private company is the buyer, the result of asset stripping is to harm creditors. Where a target continues to have dispersed owners after control has passed, it may also harm shareholders. Where value is itself taken, the harm of asset stripping is clear. Where revenue or earnings-generating potential is taken (but value is not clearly reduced), the harm is not direct, but flows from the reduction (or, in the limit, elimination) of the possibility that a target business nearing insolvency may recover, by virtue of having an uncertain future expected value reduced to a certain or near-certain insolvency or by virtue of having

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

residual assets distributed in a non-pro rata fashion (the anticipation of which can reduce the value of all firms potentially subject to this technique).

As with looting, other laws of general application—rules about dividends (actual or constructive), fraudulent conveyance, theft, fiduciary duties, fraud, or preferential payments—may constrain asset stripping. However, it is a common risk for corporate claimants in the M&A context, and can be amplified by M&A, due to the transfer of control and the ability of an M&A participant to camouflage asset stripping with the pretext of ordinary post-deal consolidation or restructuring. The difficulties of proof and enforcement may justify tighter legal constraints in the M&A context, absent which M&A may be induced by the possibility of successful asset stripping.

A final if less extreme example—and therefore one that generates more public policy debate over whether it should be regulated—is the incurrence of excessive debt as a result of an M&A transaction. Even if assets are not removed, M&A that is funded by new debt, or for which debt is part of the deal currency, the target (or bidder) may be left with more debt than it can repay. This is most likely to be true if the surviving company already had significant debt in place prior to the M&A transaction, such that the related creditors were not (at the time of the transaction) able to price the risk of insolvency arising from the increased debt.

Contract creditors can (in theory³⁵) demand covenants to prevent, or a price that reflects, the risk of M&A-related increases in debt, as well as asset stripping. Tort creditors cannot do (p. 582) so, however, nor (due to transaction costs) can employees, many kinds of contract counter-parties (e.g., with warranty claims), or other third parties that may be affected by a resulting insolvency. Laws aimed at preventing sudden and excessive M&A-related increases in debt may protect these parties. Even contract creditors (such as banks) may lack appropriate incentives to prevent excessive risk, due to moral hazard or internal agency problems, and tax laws may induce levels of debt that are excessive relative to what would otherwise be socially optimal. Transaction costs may also be reduced if law sets baseline restrictions on excessive debt for the benefit of contract creditors (who then do not need to contract for those restrictions). Regulatory strategies aimed primarily to prevent systemic risk or tax-induced speculative excess may include restrictions on debt-financed M&A.

4.6 To Cope with the Effects of Other Regulations

All of the laws justified by the foregoing rules are likely to produce unintended and sometimes pernicious consequences, given the difficulties of enforcement and achieving precise, targeted goals through general laws. For example, a rule facilitating M&A by allowing shareholders to be forced to accept transaction via statutory merger or squeezeout mechanism may make inefficient transactions easier for a conflicted fiduciary to pursue. Disclosure obligations may chill bids. Constraints on conflicts of interest may make efficient transactions less likely. Shareholder approval requirements may create opportunities for third parties to compete for a target during the shareholder approval period. Pri-

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

vate actors may attempt to respond to these consequences in ways that either undermine the purpose of the laws or create additional problems. For example, private contract can mitigate the risk of post-announcement bid competition (e.g., through break fees), which thereby undermine the shareholder approval or consent requirement that creates the risk of competition. Fiduciary obligations to obtain the best reasonably available price may lead targets to insist upon “no-shop” or “go-shop” clauses in M&A contracts.³⁶

Another, second-order role for corporate law, then, is to mitigate unintended consequences and private responses to first-order corporate laws. Specialized courts, regulatory agencies, or other means to address evasions and enforce laws governing M&A can be understood in this way, as can a variety of laws and regulations focused on the process of approving an M&A transaction as well as a variety of exemptions from otherwise applicable M&A-related requirements. First-order structural laws are (almost by definition) important, so much so that they are taken for granted by practitioners. For instance, it would not occur to most M&A lawyers (or judges, for that matter) to ask whether shareholders should have any role in approving the liquidation of their investment in an M&A transaction. The nuances of second-order laws that mitigate the effects of first-order laws, by contrast, can be of first-order practical importance, as they are more likely to be modified by lawmakers (such as judges) and be affected by choices of transaction participants and their lawyers.

(p. 583) 4.7 Antitrust, Industry Regulation, Foreign Ownership, and Tax

Finally, M&A implicates a variety of third party or social interests. M&A is a fast way to achieve monopoly power, and is typically regulated separately under general antitrust laws to prevent or remediate such power.³⁷ Industry-based regulations (e.g., banking, airlines, telecommunications, utilities) are often aimed at preserving or stabilizing firms that produce public goods (systems of payment, communication, transportation, or energy production) that are vital to society and the economy. One means to prevent private interference with those systems often includes rules specifying who may obtain control over companies in those industries, and M&A is often regulated specially in those industries.³⁸ Foreign ownership of domestic business can raise political concerns that range from the cross-culturally intuitive to the less so—e.g., in the defense, yogurt, or tea industries—and so cross-border M&A is often regulated specially.³⁹ M&A can be a way for owners to liquidate or realize cash from profits built up in a business, and in most income tax regimes, tax is typically (p. 584) linked to such realizations, and more generally, tax systems are often linked to transactions, including M&A.⁴⁰

While M&A-related laws emerging from antitrust, industry regulation, foreign ownership, and tax are not formally part of corporate law, and a detailed review is beyond the scope of this chapter (and book), they have important implications for the ways corporate law regulates M&A. Such laws can create incentives for certain kinds of M&A transactions versus others; or impose delays or notice requirements that collaterally inform the public or relevant corporate decision makers or potential competing bidders; or constrain how ownership and control can be allocated after a transaction. For those reasons, M&A prac-

tioners tend to be highly aware of these related bodies of law, and corporate law is sometimes modified in response to their effects.

5 What Modes Exist for Regulation of M&A Transactions?

In this section, the analysis moves from potential purposes for law to actual law. The material is organized around mode of regulation, with some serving multiple purposes. The presentation is not meant to be exhaustive, but illustrative, with examples from the US, the UK, and India.

5.1 Facilitating M&A

5.1.1 Collective Action: Mergers and Schemes of Arrangement

One purpose of M&A law is to facilitate M&A. One way the law does this is to assist decision makers in overcoming collective action problems. One method of doing this is to permit an M&A transaction to be “forced” upon shareholders, even without their consent, provided certain procedural conditions are satisfied. One example—our first mode of M&A regulation—is the statutory merger, which effectively allows a share of common stock to be converted into some other thing (or even, in the limit, nothing⁴¹), in connection with the (p. 585) legal combination of the issuing corporation with some other corporation, provided the statutorily specified steps for a merger are completed. Every US state provides for a merger,⁴² and compulsory share exchanges, with much the same result, are also permitted by statute in a majority of US states.⁴³ Typically, a statute requires one corporation to be designated as the “surviving” or “continuing” corporation, which by operation of law succeeds to all assets and liabilities of the two combining companies. That choice is generally independent of whether one or both combining companies’ shareholders continue as shareholders.

As noted above, one company that is formally “combining” in a US merger may be a newly created shell corporation, wholly owned by a true party-in-interest (e.g., a parent/buyer), solely for the purpose of merging with another (e.g., a target). In such a triangular relationship, the statutory requirements of the merger apply to the shell and the target, the formally combining entities, rather than to the parent/buyer and the target, as might occur in a less formalistic legal treatment. The “currency” used in a merger—i.e., whatever the combining corporations’ stock is to be converted into—need not even be owned as property by one of the combining companies, so long as the parties to the related agreement and plan of merger include a company that does own that currency. Another result of this combination of formalism and flexibility is that in the US the merger can also be used in post or extra-M&A reorganizations, for example to shuffle the hierarchy of related corporations, or to effect a recapitalization or reorganization, or to interpose a new holding company or intermediate holding company between an operating company and its shareholders or parent and company.

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

In the UK, the primary example is the scheme of arrangement,⁴⁴ which provides for mergers as well as a broader array of restructuring or combination transactions. Schemes of arrangement have their origin in stand-alone recapitalizations or reorganizations by financially distressed companies,⁴⁵ and are not limited to arrangements in which two or more companies be combined. But they can be, and UK law now expressly contemplates them to be used to coordinate shareholders in the approval of M&A transactions, effectively imposing the results on dissenting (or inattentive) shareholders.⁴⁶ In both jurisdictions, then, a statutory device originally aimed at different original goals (combinations, recapitalizations) has been repurposed to the other goal, and both goals are now commonly pursued together and separately through that device.

India, too, permits schemes of arrangement, but they play a less important role than in the UK, because among Indian companies dispersed control is rare, even in listed companies with dispersed ownership.⁴⁷ A related point is that corporate governance generally is less (p. 586) protective of minority investors in India (although it has been improving in that regard⁴⁸), with the result that control shareholders may find it more useful to preserve minority investment even after an M&A transaction than in the US or the UK, where it is difficult for control shareholders to exploit their control positions at the expense of minority investors.

5.1.2 Call Rights: Squeezeouts

A second way that law can facilitate M&A is to provide corporate decision makers with “calls” on stock. That is, provided a designated process is followed, a corporation can force its shareholders (typically less than a majority) to accept cash in lieu of their shares. By allowing controllers to “squeeze out” minority shareholders in this way, the law creates a means by which a bidder can obtain 100% ownership following a control acquisition, while avoiding the freeriding problem noted above. In the US, squeezeouts are typically achieved via merger—either under a special statutory provision designed for this purpose,⁴⁹ or under the more general-purpose merger statute described above;⁵⁰ occasionally, they are achieved via reverse stock split, in which a corporation via charter amendment converts all shares into a smaller fraction (e.g., three for one) and provides cash in lieu of fractional shares.⁵¹ In the UK, squeezeouts are achieved pursuant to a provision of the Takeover Code, now embodied in the Companies Act 2006, which expressly permits a more straightforward conversion of minority shares into cash (“compulsory acquisitions”) following a bid (and also provides shareholders equivalent “put” rights, to force such a conversion).

5.2 Constraining M&A

5.2.1 Notice and Disclosure

The least restrictive mode of regulation that is designed to constrain M&A requires special notices and disclosure. Advance notice to a board of directors of the parties is typically required for agents to have authority to engage in significant transactions, although norms vary on how far in advance, how frequently, and in how much detail a board should

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

be informed prior to formal board authorization. In conflict-of-interest transactions, at least, the safest practice would include advance notice at the earliest point that a conflicted fiduciary becomes aware of a transaction that has a material chance of occurring.⁵² It may be tempting (p. 587) for officers facing a conflict to treat notice to a single board member, such as a chairman or lead director, as the equivalent, but individual directors do not on their own have (as a default matter) authority to act on behalf of a corporation, and if the chairman or lead director chooses to not pass the information on to the full board, the conflicted officer may find the transaction in legal jeopardy.⁵³

Bidders or targets are sometimes also required to give advance notice to be given to shareholders, although how and when this is accomplished varies with jurisdiction and transaction structure.⁵⁴ In the US, a company's board may bind it to a merger agreement without advance notice to shareholders, but the agreement must thereafter be noticed to and approved by shareholders,⁵⁵ and for public companies, entry into any "material" agreement (including an M&A agreement) requires disclosure within four business days.⁵⁶ In the UK, listed companies must give notice to shareholders "as soon as possible" after terms are agreed for large transaction, defined to include those involving more than 5% of gross assets, profits, consideration, or gross capital.⁵⁷

Bids or tender offers for stock of public companies can only be completed if target shareholders are given advance notice and time to consider the offer.⁵⁸ If a buyer is using non-cash-deal currency and the target is held by more than a small number of investors, US law will treat an M&A transaction as if it were a securities offering to the target shareholders and require extensive disclosures in advance of any shareholder commitment to the deal.⁵⁹

Heightened disclosure requirements apply to a major class of conflict-of-interest transactions—those in which insiders ("affiliates") or controlling shareholders buy out the public shareholders and cause the target to "go private."⁶⁰ Advance notice is also typically (p. 588) required to be given to antitrust regulators for any significant transaction.⁶¹ Transactions that are premised on the expectation of layoffs may trigger advance notice requirements benefiting employees.⁶²

5.2.2 Special Approvals

M&A transactions are typically subject to approvals of parties. In the US, these requirements mainly arise on the target side, and effectively arise on the buyer's side only when stock is being used as deal currency. Where common stock is used as deal currency and more than 20% of the buyer's pre-deal outstanding shares are to be issued, US stock exchange rules require shareholder approval from the buyer.⁶³ In deals involving stock as deal currency in the UK, preemptive rights provide existing buyer shareholders with some ability to protect their interests, not by voting on the deal, but by investing on the same economic terms as are being offered to target shareholders.⁶⁴ In addition, in the UK, listed companies must obtain shareholder approval for any "substantial acquisition," that is, one involving a target with more than 25% of a bidder's gross assets, profits,

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

gross capital, or market capitalization.⁶⁵ No equivalent general requirement for bidder shareholder approval exists in the US.

Where the structure is a purchase of shares, property and contract law effectively require approval of target shareholders, subject to the deal-facilitating laws summarized above. Where the structure is a purchase of assets, the law augments rules of basic corporate governance by requiring special board and shareholder approvals for the target. But because most businesses conduct asset purchases in the ordinary course of business, the dividing line between those that do and those that do not require special votes is either arbitrary or (p. 589) uncertain. In Delaware, the trigger for shareholder approval is the sale of “substantially all” a target’s assets, with all of the vagueness such a standard implies.⁶⁶

In the US, the law imposes special approval requirements for mergers. In Delaware, for example, mergers must generally be approved by both combining companies’ boards of directors and shareholders, in each case by majority vote.⁶⁷ As noted above, triangular mergers effectively eliminate these requirements for bidders, but not for targets.⁶⁸ In the UK, schemes of arrangement are subject to even higher requirements, by both 75% in value and 50% of the number of each class of “members” (i.e., shareholders), and by a court, following receipt of an independent valuation report.⁶⁹ (However, court approval appears to be a pure formality in the UK, if shareholder approval and a reputable expert report are obtained.⁷⁰) In the US, a few states also offer a court-approved transaction path; California’s is occasionally used because it can reduce the regulatory burdens of federal securities regulation due to an exemption for court-approved stock issues.⁷¹ Requiring shareholder approval by the remaining minority of target shareholders following a bid would only exacerbate the collective action problem described above. Hence, no such approval is required in the case of post-bid squeezeouts, or else the law permits the controlling shareholder to effectively force through the merger over the objections of a minority shareholder.

Where M&A transactions involve a conflict of interest, they are typically governed by special approval requirements, either formally or through judicial incentives. In the UK, the Companies Act requires shareholder (“member” in UK parlance) approval of “substantial property transactions” involving directors and connected persons, which would cover deals structured as asset purchases.⁷² In Delaware, management buyouts structured as a merger are not formally subject to any different statutory requirements than any other M&A transaction, but because they present conflicts of interest, they face heightened judicial scrutiny unless subject to approval by a special committee of independent directors,⁷³ and failure to obtain such an approval will itself be a negative factor in the court’s assessment. One might think that court incentives of this sort might not have a strong effect for public companies, because dispersed shareholders would not use them, due to collective action problems, but the derivative lawsuit mechanism in the US enables any shareholder to sue on behalf of all, (p. 590) and nearly all large transactions—particularly those involving conflicts of interest—generate such lawsuits.⁷⁴

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

In addition to board and shareholder approvals, M&A transactions are often subject to other approvals. Regulators (antitrust, industry-focused, or national security-focused) must approve (or be given an opportunity to object to) significant M&A transactions, subject to court review. Contracts (e.g., bond indentures, loan agreements) may also require third-party consents, typically in circumstances where a change of control could reasonably be expected to increase or change the risks or value of the deal participants' performance. Such consents may effectively be "bought out" by M&A participants, however, either through explicit redemption or prepayment rights, or through renegotiation of contract terms. Similarly, preferred stock holders typically have approval rights unless the buyer effectively "rolls over" the preferred and preserves its dividend and other rights and powers. If a buyer uses a triangular deal structure, typically the preferred stock will be "rolled over" at the subsidiary level, which may be undesirable for the buyer, in which case the buyer may create incentives for preferred holders to exchange their stock for buyer (parent) company equivalents.⁷⁵

Where a class of preferred (or special class of common stock) has separate approval rights, an M&A deal can be "held hostage" by holders of that class, who may seek more value to flow to them to induce them to permit the transaction to be completed. This risk is most acute if the stock is neither common nor participating preferred (and so would not normally share directly in the benefits of the deal to the combining companies, other than through risk reduction), and if the class is either held by a small number of investors, or may be purchased on the market (as when the preferred is listed on an exchange), in which case hedge funds or other active investors may buy up the stock precisely to hold out against the deal.

5.2.3 Augmented Fiduciary Duties and Other Legal Obligations

As with all corporate decisions, M&A transactions must be approved by corporate decision makers who are subject to fiduciary duties of care and loyalty, but in the US, M&A transactions are generally subject to heightened judicial (as well as public) scrutiny, whether or not pursuant to formally distinct doctrinal treatment.⁷⁶ It is no accident that the few instances in which US courts have held directors personally liable for breaching their duty of care have been in the context of M&A transactions.⁷⁷ Conventional wisdom among US (p. 591) practitioners that the sale of a company should include at least two board meetings, at least one of which is lengthy; that a publicly held target company's board should obtain a fairness opinion from an investment bank in order to become reasonably informed about the relative value of the deal; that approval should be preceded by advance notice, review of deal documents or summaries, comparison of options, and preferably some process designed to insure that the deal represents the best reasonably obtainable value. Fairness opinions so obtained are themselves subject to judicial review for the adequacy of the underlying analyses, under both state law and federal securities law.⁷⁸

All of this remains true despite the fact that the Delaware legislature subsequently enabled and most corporations have elected to immunize ("exculpate") directors from liability for breaches of care, even in the M&A context, and the leading Delaware court has

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

disclaimed any per se rule requiring any particular “blueprint” for a sale.⁷⁹ US securities law reinforces this heightened duty of care when a deal involves stock currency and the target is publicly held. In such deals, the buyer is effectively issuing stock to the public (through the deal), with the result that its directors and officers have potential anti-fraud liability if they do not conduct (or have conducted for them) adequate “due diligence” to see that the prospectus delivered in advance of closing is accurate, materially complete, and complies with technical regulatory requirements.⁸⁰

The content of fiduciary duties may also be shifted in subtle ways depending on the nature of a transaction. For example, in Delaware, a company selling itself for cash faces slightly different and effectively more stringent judicial review than one that accepts a merger with all stock as the deal currency, even if the buyer is a much larger company, and in such situations, the target board may not openly prefer one bidder on the ground that its bid will benefit any “constituency” other than shareholders.⁸¹

In the UK, the Takeover Code (and now the Companies Act) forbids target directors from taking actions that tend to “frustrate” any bidder, essentially requiring them to be neutral between bidders—even if the target directors believe (for example) that one bidder is a stronger business partner than another. UK rules also effectively require target boards to remain “neutral” between different bidders. In the US, if a transaction involves contract provisions designed to deter competition that may arise after a bid emerges, those provisions (and possibly the entire deal) will also be subject to heightened judicial scrutiny, and while favoritism among bidders is not formally precluded, it is discouraged as a result of this review.⁸²

(p. 592) The strongest judicial review in the US is reserved for conflict-of-interest transactions—a sufficiently stringent type of review to deserve separate attention (discussed in the next section). In addition, one type of conflict transaction—insider trading—in the US is subject to extra regulation in the context of tender offers.⁸³

5.3 Fairness Review, Appraisals, and Minimum Payment Requirements

M&A is sometimes subject to special “fairness” approval requirements, designed to insure that the transaction is “fair” to a designated set of beneficiaries—typically, shareholders (or non-controlling shareholders in the case of transactions in which controlling shareholders participate directly)—or, alternatively, that those beneficiaries receive fair compensation for any change in ownership or rights caused by the transaction. “Fairness” is as vague as it sounds, and is typically evaluated on a case-by-case basis, with a view toward whether target shareholders are being treated equally, whether the transaction provides them with value equivalent to the value of their shares prior to the transaction, and whether controlling fiduciaries are benefiting at their expense.

In the US, Delaware law requires that for any conflict of interest transaction, fiduciaries must affirmatively show that the deal is “entirely fair,” that is, at a fair price and the result of a fair process. All deal terms and elements of the process leading to the deal are

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

subject to heightened ex post scrutiny, unless the deal meets stringent ex ante conditions.⁸⁴ If a court finds that the deal is not “entirely fair,” the result is that the fiduciaries are found to have violated their duties, with possible reputational implications.⁸⁵ The remedies available are not limited to compensation, but may exceed the compensatory value, potentially including the equivalent of punitive damages (although not typically so characterized).⁸⁶

In addition, in the US, appraisal rights may be an alternative form of fairness review available, but only for specified M&A transactions.⁸⁷ Appraisal rights permit any common shareholder to seek a judicial determination of the “fair value” of their shares, measured as (p. 593) if the transaction had not occurred (hence, excluding deal synergies), based on the value of the target firm as a whole, divided pro rata among common shareholders. Triggering transactions include cash mergers, mergers that rely upon short-form “squeezeout” procedures that avoid a shareholder vote, and stock-for-stock mergers involving private buyers or targets.⁸⁸ In Delaware (and indeed, in many US states), appraisal rights are not available in connection with asset or stock purchases, even if they have the same economic effects as a merger.⁸⁹

UK law regulates conflicts of interest differently, depending on whether the transaction is a bid or a scheme. For bids, elements of the Takeover Code create incentives for bidders to never obtain controlling but less than full ownership interests. For example, bidders are required to launch a “mandatory” acquisition bid at a regulated price once they acquire more than 30% of the target’s stock or if they acquire more shares after having acquired 30% but less than 50%, preventing creeping control bids and certain stock purchases raising a conflict of interest; bidders must obtain acceptances from at least 50% in the bid; and are required to conduct “squeezeouts” once they obtain 90% ownership, and are constrained to pay a price that is at least equal to the highest price paid for shares (and no less than the price paid in their control bid).⁹⁰ Together, these rules prevent or substantively regulate with bright-line rules some of the types of M&A transactions that commonly involve conflicts of interest in the US. For transactions structured as schemes of arrangement in the UK, court approval is required, following receipt of a report from an independent “expert” finding that the share exchange ratio in the scheme is reasonable.⁹¹

In India, squeezeouts are pursued through schemes of arrangement, and historically have been subject to little real judicial oversight or other regulation.⁹² The new Companies Act 2013 introduced one new protection similar to those required by UK law on schemes and induced by US fiduciary duty law—fairness opinions from independent investment banks on the value paid. It remains to be seen if the new statute will achieve minority shareholder protection absent broader judicial reforms to enhance the speed and efficacy of enforcement.⁹³

5.4 Regulation of Deal Terms, Deal Process, and Deal-Related Debt

Both the US and the UK impose further restrictions on the substance and process for M&A transactions. Tender offers in the US and bids in the UK must offer all target shareholders (p. 594) the same consideration. Mergers in the US and schemes in the UK, by contrast, need not, although equal treatment is a strong norm generally followed, except where the point of the transaction is to provide ongoing ownership to a buyer or controller and cash to minority shareholders. Stock purchases, by contrast, do not necessarily benefit all target shareholders, and can be sequenced over time in such a way as to benefit some target shareholders differently (subject, in the UK, to the mandatory bid rule described above, and, in the US, to fiduciary duty constraints on self-dealing). Asset purchases in some formal sense treat all shareholders equally, in that the consideration for the transaction flows to the corporation, which they own collectively; however, the control shareholders and/or board of a company selling assets need not then distribute that consideration to shareholders, and may thereafter use it in ways that may not benefit all shareholders equally.

Both the US and the UK impose limits on pre-bid solicitations of support for M&A transactions involving public targets. In the US, SEC proxy rules effectively limit bidders from obtaining support agreements from more than ten shareholders of a public target without going public (and filing documents with the SEC) for the deal,⁹⁴ while in the UK, the Takeover Code forbids bidders from obtaining pre-bid agreements from more than six target shareholders.

Restrictions on the use of debt to finance M&A vary significantly across countries. In India, banks are not permitted to finance share acquisitions, including whole-company deals. However, this requirement is imposed on banks, rather than on deals, creating an imbalance between foreign acquirers (who can finance bids from foreign banks) and domestic acquirers (who are generally dependent on local banks for finance).⁹⁵ The Indian Finance Ministry is considering relaxing these restrictions. Even if they are relaxed, however, India's laws further ban "financial assistance,"⁹⁶ making debt-financed buyouts of private targets difficult, and those of public targets even more so.

Like India, and consistent with the EU's bank-protective Second Company Law Directive,⁹⁷ the UK generally forbids companies from providing "unlawful financial assistance" to a bidder to facilitate a bid or other stock purchase involving a public target,⁹⁸ although this prohibition was essentially eliminated for private targets in 2008. In addition, and perhaps more importantly, the UK requires that bids be fully financed before they are launched, with cash on hand or fully committed agreements from lenders, subject to "very limited" conditions.⁹⁹

(p. 595) The US M&A market does not have a similar "certain funds" or similar requirement relating to bids and offers. Nor does the US forbid "financial assistance." Indeed, it was something sufficiently common in the 1980s to have earned a catchphrase: "junk-bond boot-strap bust-up two-tier takeover."¹⁰⁰ US tax law was modified in the 1980s to limit interest deductions for debt that trades at a discount at original issuance, curtailing

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

the tax subsidy of more extremely leveraged financing structures,¹⁰¹ and US bank supervisors have imposed modest constraints on the ability of banks to take on excessive risks in the “leveraged loan” market that funds the largest buyouts.¹⁰²

Instead, the US leans on target fiduciary duties and court-developed M&A-specific successor liability doctrines to reinforce contract and general creditor-protection laws such as fraudulent conveyance statutes.¹⁰³ Because target fiduciaries are not strictly required to remain neutral as between bidders, they have more flexibility than in the UK to prefer a bidder based on financing certainty, and they are at risk if they sell to a looter.¹⁰⁴ More generally, even when a buyer seeks to limit the liabilities it takes on—for example, by purchasing assets or employing a subsidiary to carry out the deal—it may find that many special types of liabilities are imposed on the buyer/parent by virtue of control of the target’s business.¹⁰⁵ In addition, depending on deal structure, post-deal consolidation choices, and the relevant jurisdiction’s law, a buyer or its subsidiaries may become subject to all of a target business’s (p. 596) liabilities under common law doctrines variously labeled “agency,” “de facto merger,” or “successor liability.”¹⁰⁶ While such doctrines do little more than fraudulent conveyance statutes to constrain total leverage resulting from a given deal, they do constrain the temptation to use M&A or restructuring to shift or amplify risks to creditors, or to extract value in violation of conventional priorities among claimants.

5.5 Bans or Structural Limits

Finally, many laws effectively ban or impose structural limits on M&A. At the request of a creditor, a court in the US may be willing to enjoin transactions that would cause a company to become insolvent, particularly if they involve transfers of value to shareholders or a subset of creditors. Banking laws in the US forbid acquisitions by banks of nonbank, or vice versa,¹⁰⁷ while in the UK the separation of banking and commerce is preserved through the discretion of bank supervisors to refuse permission for nonbanking entities to enter banking on prudential (“safety and soundness”) grounds. M&A transactions that would create monopolies or monopoly power are banned, unless (as is typical) a buyer is prepared to divest parts of the target’s business to reduce competitive concerns. Defense contractors, airlines, and telecommunications companies are typically forbidden from being acquired by foreign or foreign-controlled buyers, and restrictions on foreign ownership typically extend to more industries in developing nations.¹⁰⁸ (p. 597)

Figure 22.1 Deal Volume/GDP in US, UK, and India, 2013.

6 What Types of M&A Transactions Actually Take Place, and What Effects Does Law Have?

What effects do the foregoing laws have on the patterns of deal making in the US, the UK, and India? Although complete data necessary to answer such a question are not available, public data does provide a basis for some general observations about such patterns.

First, as illustrated in Figure 22.1, the overall US legal environment is highly conducive to M&A. US M&A levels are the highest in the world. This is true both in dollars and in numbers of deals, absolutely and (as depicted in the figure) relative to the size of the relevant economies, for both public and private targets, and across a range of industries. UK law is also highly facilitating, with robust M&A markets, albeit modestly less so for public targets than in the US. In part this is due to the rigidity of some UK laws that benefit target shareholders conditional on a bid, but also have modest inhibitory effects on bidders considering whether to initiate a bid.¹⁰⁹ The UK's ban on financial assistance also likely has a constraining effect on buyouts, although buyout volumes in the UK and elsewhere in Europe suggest that the UK's ban on financial assistance has had only limited effect, in part because its focus on debt incurred for transactional purposes does not extend to debt incurred near in time but not as part of a stock purchase.¹¹⁰ Deals in India have increased in significance, both absolutely and relative to the Indian economy, but remain well below levels in the US and the UK.

Second, deal structures are highly dependent on the ownership structures and sizes of the companies involved. In the US, as illustrated by Figure 22.2, deal structures take on a (p. 598) completely different distribution for public and private targets. In the UK, deals for larger public targets are more likely to use a scheme of arrangement than smaller deals, which are more likely to rely on bids.¹¹¹ In India, M&A transactions are almost completely structured as asset and stock purchases, owing to the concentrated controlling ownership structures, even among India's largest public companies.¹¹²

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

Figure 22.2 US Target Deal Structures by Ownership of Target.

Figure 22.3 Mean Deal Duration in Days, by Deal Size in the US.

Third, deal regulation has a clear impact on the way deals proceed. For example, as illustrated in Figure 22.3, deals take substantially longer to complete if they are large enough to trigger antitrust review in the US than if they do not.¹¹³ Similarly, as illustrated in Figure 22.4, deals are substantially more likely to be withdrawn once announced, if they involved (p. 599) a public target in the US.¹¹⁴ Some effects show up across jurisdictions too: acquisitions of US public targets (most of which are mergers that involve at least some non-cash consideration, and so require registration of securities with the SEC) typically take 60 to 90 days from announcement to complete; those of UK public targets take 25 to 30 days from announcement; and those of Indian public targets either occur simultaneously with the announcement (where they are structured as sales of control blocks owned directly or indirectly by one individual or family controlling shareholder to another) or take four to six months (where they are structured as asset purchases or, less commonly, bids for public company shares), or up to a year in the rare scheme of arrangement.¹¹⁵ Bid withdrawal rates are far higher in India for private target deals than in either the US or the UK, and while some of the differences may be attributable to non-legal factors, the legal process for M&A is likely to be a partial cause as well.

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

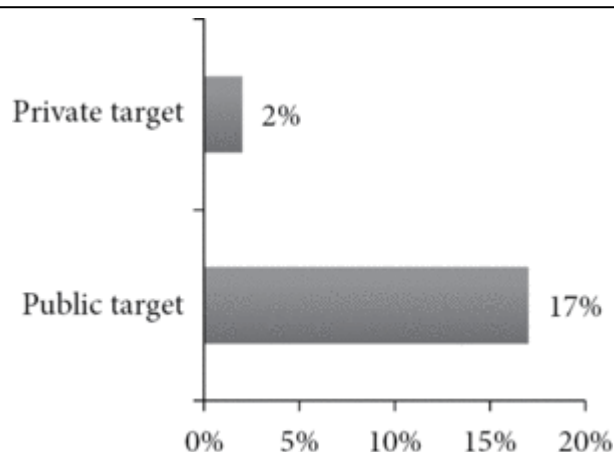

Figure 22.4 Withdrawn Bids by Target Ownership in the US.

A fourth empirical finding is also clear: M&A transactions generally generate significant gains to target shareholders who sell, regardless of jurisdiction. Premiums over pre-deal market prices for public targets average between ~25% and ~50%, depending on time period and sample, in each of the US, UK, and India.¹¹⁶ (In India, however, those gains may not be shared with minority shareholders in the typical deal structure, in which a control block is sold without a corresponding acquisition of other shares.) Comparisons of observed premiums across jurisdictions are difficult, in aggregate, due to differences in ownership, finance, and the economics motivating deals, so it is less clear whether law has an important influence on the relative benefits of M&A to target shareholders.

Data on and studies of topics of more general social, political, and economic interest—such as whether M&A transactions are good for bidders or society as a whole—are far more problematic. Part of the difficulty is that M&A is endogenous to a large number of forces, beyond corporate law, or even the law of M&A generally: finance, macroeconomic activity, monetary policy, politics, tax, culture, etc. Controlling for such factors is necessary to draw reliable inferences about the effects of law, but doing so is difficult if not impossible, given limits on the degree or frequency of variation in or observability of such factors.¹¹⁷ As a (p. 600) result, it remains a topic of some dispute even in the largest M&A jurisdiction whether M&A is, on balance, good for bidders.¹¹⁸

Similarly, the effects of M&A generally on non-shareholder constituencies, such as employees or creditors, are disputed. M&A generates substantial transaction costs, which might be viewed as wasteful rents (from a social perspective) if the net result of M&A to both bidder and target shareholders from a typical deal is zero or nearly so. In the US, the tax shield from higher leverage incurred through debt-financed M&A may also represent a form of rent seeking, but it is unclear why managers would not incur similar levels of tax-reducing debt without M&A (other than, perhaps, as a form of agency cost, in which taxpayers may be benefiting at shareholder expense). Employees are commonly laid off following mergers, particularly among general managers, as the buyer can achieve economies in management (e.g., no need for two highly paid general counsels),

but the most highly paid employees often receive side payments in the form of vested options or stock, or golden parachutes, and many find employment quickly. Some M&A transactions lead to more widespread layoffs, but it is hard to test whether such layoffs would have occurred anyway, as when M&A is a channel for globalization, or whether the firms involved are able to create new jobs at a faster pace than they would have done without M&A. Labor unions used to oppose hostile takeovers, but union pension plans now commonly embrace corporate governance strategies that tend to increase M&A. Few M&A transactions generate antitrust concern sufficient to attract more than minimal review by US antitrust agencies. Banks and other lenders are sufficiently unconcerned about the effects of M&A on risk or debt levels that they commonly omit event-risk covenants that would provide protection in the M&A context. Larger creditors may be protected by other means, while smaller creditors are “non-adjusting,” in the sense that the benefits of seeking contract protections may be outweighed by the transaction costs of doing so, making non-action by larger creditors of uncertain significance for estimating the effects of (leveraged or leverage-increasing) M&A on creditors generally.

7 Conclusion: What Do the Variations in Types and Modes Imply about Law Generally?

What general conclusions can we draw from this survey? At a very high level, corporate and securities law across jurisdictions treats M&A transactions differently from other, less (p. 601) dramatic and more routine types of transaction. Against a background of other laws that shape and structure the M&A process (tax, antitrust, etc.), corporate and securities law simultaneously facilitate M&A, by reducing collective action costs and the risk of strategic hold-up, but also impose tighter disclosure, process, and substantive constraints on M&A transactions. As a general rule, constraints are tighter for deals involving public companies, where dispersed owners are in need of more information and are less capable of protecting their own interests without additional protections, and are tightest for transactions in public companies that represent conflicts of interest (or would do so if permitted).

A second take-away from the survey is that different countries regulate M&A differently, and exhibit different patterns in M&A forms. These differences reflect at least in large part longstanding differences in structural features of the markets, particularly ownership structure, which itself may be at least in part a function of corporate law and governance. In the US, ownership dispersion led to the use of the collective-action cost-economizing merger; in the UK, greater institutional political power achieved shareholder-protective takeover regulation that has been extended largely, if incompletely, to schemes; and in India, schemes are used much less frequently, relative to simpler negotiated stock purchases, in part because the latter do not trigger a number of legal requirements imposed on the former, but also because they are unnecessary given the frequency of control blocks even among large listed companies, and because bidders often appear content to acquire control, rather than 100% ownership, as is typical in the US and the UK.

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

But other cross-country variations also seem to reflect the way that (as in chaotic systems) seemingly small differences in starting conditions can ramify and persist in the face of similar legal, historical, and economic conditions (common law, English language and heritage, republican democracies, long coastlands, dependence on trade, and for the past 20 years, at least, a relatively unmixed commitment to regulated capitalism) and strong market pressures to produce an efficient method to allocate resources rapidly through M&A. In the UK, courts play a background role in M&A, even when formally required to approve a scheme. Contested litigation is rare, and bright-line rules set (at least initially) by stock exchanges (which in turn are dominated by institutional investors) screen out whole classes of transactions that might harm the interests of shareholders, while other laws that protect creditors (e.g., against “financial assistance”) derive from the bank-centered governance politics of the early European Community. In the US, by contrast, the watchword is flexibility, but also litigation. Courts are central, even without a formal role in approving any given deal, and lawsuits are so commonplace as to transform the (Delaware) courts into a quasi-regulatory agency creating “regulation” as much as resolving disputes, driving deal-related disclosure decisions as much as the rival regulatory body (the SEC) with formal authority over disclosure. In India (with admittedly a very different history and more recent path to its current international position and economic and legal structure), litigation is common, but unavailing, given the delays in the court system; the regulatory body overseeing the stock exchanges has achieved the most discipline over corporate controllers in the M&A context, but M&A regulation is multifarious and frequently overshadowed in a given deal by the complex and often informal body of regulations of ownership of business itself. These differences in the details of how M&A is regulated are far greater than an outside observer might expect. Minor variations in similar laws with similar goals in similar legal systems, in other words, can have real effects on the amount and nature of economic activity.

(p. 602) A third and final bottom line of the survey is that some constraining aspects of M&A law can sometimes be evaded, and are. This stems from the fact that the corporate form—by interposing a legal entity between owners and businesses—makes it possible for economically equivalent transactions to be accomplished with a variety of transactional forms—asset purchases, as with non-corporate actors, but also stock purchases (including bids and tender offers) and mergers, schemes and squeezeouts. Because M&A law does not apply equally to all methods of pursuing a given transaction, opportunities arise for M&A to be structured to reduce the effect of or avoid some of these laws. Hence, we see the move from bids to schemes in the UK, illustrating both the incentive to avoid unnecessary (stamp) taxes, but also the greater flexibility of the scheme. Similarly, in the US, we see the emergence of the tender offer as a mechanism for hostile takeovers in the 1980s, followed by its use in negotiated acquisitions (followed by squeezeout mergers), to reduce the time needed to obtain control, while ensuring 100% ownership. Moreover, shifts in deal patterns respond to legal changes, and are themselves of economic consequence. Ironically, these patterns of avoidance are evidence that the law does in fact sometimes bind. If M&A laws were trivial or its constraints inconsequential, such patterns would not appear.

Ch. 2007) (permitting a board to undertake a post-signing 'go shop' period rather than a full auction process).

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

⁽³⁷⁾ E.g., Hart-Scott-Rodino Antitrust Improvements Act of 1976 § 5 (prohibiting mergers and acquisitions that constitute “unfair . . . competition”); Clayton Act of 1914 § 7 (prohibiting the acquisition of stock or assets where “the effect of such acquisition may be substantially to lessen competition, or to tend to create monopoly”); Federal Trade Commission Act of 1914 § 5 (declaring “unfair methods of competition in or affecting commerce, and unfair or deceptive acts or practices in or affecting commerce . . . unlawful”).

⁽³⁸⁾ See, e.g., Bank Holding Company Act of 1956 § 1972; Airline Deregulation Act of 1978; William Gillespie and Oliver M. Richard, Economics Analysis Group, U.S. Dept. of Justice, Antitrust Immunity and International Airline Alliances (“Recent decisions by the U.S. Department of Transportation . . . to grant immunity from the U.S. antitrust laws to large groups of airlines in alliances relating to international air transportation represent a significant development.”), available at <http://1.usa.gov/1lo9QXT>; Telecommunications Act of 1996; Federal Power Act of 1920.

⁽³⁹⁾ For the US, see the Defense Production Act of 1950 § 721, as amended by the Foreign Investment and National Security Act of 2007 (known as the Exon-Florio Amendment) and implemented by Executive Order 11858 and regulations at 31 C.F.R. Part 800, authorizes the Committee on Foreign Investment in the United States (CFIUS) to inspect M&A deals that may produce foreign control of a U.S. entity. Roughly 100 deals require filings under Exon-Florio in the US per year, and only a small number go through a second-stage review, and an even smaller number have been blocked. For one of the few, see Sara For den, Obama Bars Chinese-Owned Company from Building Wind-Farm, *Businessweek.com* (Sep. 28, 2012), <http://bloom.bg/1knObKB>. For yogurt in France, see France Flouts the Pepsi Challenge, *Telegraph* (July 24, 2005) (French Labour Minister, among other officials, pledged to do “all we can” to defeat PepsiCo bid for Danone.), available at <http://bit.ly/1knOoNT>. For tea in China, see US Government Accountability Office, Foreign Investment: Laws and Policies Regulating Foreign Investment in 10 Countries, GAO-08320 (Feb. 2008) at 44 (noting that tea production is protected industry in China). Foreign acquisitions in the UK are not governed by a single legislative framework, the UK is generally perceived as open to foreign investment, and the EU’s “single market” rules have encouraged openness generally in Europe. The UK government nonetheless has authority block deals that affect the national interest, water companies, or media companies, if they are against the “public interest,” as well as in “important” manufacturing concerns, and there have been six interventions since 2003 on national security grounds, and one on “public interest” grounds. As common in the EU, the UK owns a “golden share” blocking a transfer of control over key companies, such as Rolls-Royce (due to its nuclear business) and BAE systems (defense). *Id.* at 99–100. Although India has liberalized significantly in the past 20 years, India remains stricter than the US or the UK in regulating foreign M&A of domestic businesses across more industries. *Id.* at 65–72.

⁽⁴⁰⁾ See Internal Revenue Code § 368 for conditions for tax-free treatment. In general terms, US law requires recognition of capital gain, and taxes it, upon the occurrence of many M&A deals, unless they qualify for “tax-free” (really, tax-deferred) treatment, and even then, imposes a tax on any consideration other than stock received in the transac-

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

tion. In the UK, cash consideration will typically trigger tax, but tax may be deferred even upon the receipt of qualifying notes or debt from the buyer (as well as stock); stock transfer taxes may arise in bids structured as stock purchases, however. Laurence Levy, Jeremy Kutner and Simon J. Little, *Public Mergers and Acquisitions in the UK (England and Wales): Overview*, Practical Law (May 1, 2013), available at <http://us.practicallaw.com/8-502-2187#a688792>.

⁽⁴¹⁾ See *Odyssey Partners, L.P. v. Fleming Companies, Inc.*, 735 A.2d 386 (Del. Ch. 1999) (finding that the net asset value of company was zero or less, as a partial basis for holding that conflict of interest transaction involving majority shareholder and creditor of company was not entirely unfair); see also *S. Muoio & Co. LLC v. Hallmark Entertainment*, 2011 WL 863007 (Del. Ch. Mar. 9, 2011); *In re Vision Hardware Group, Inc.*, 669 A.2d 671 (Del. Ch. 1995), aff'd sub nom *Young v. Vision Hardware Group, Inc.*, 676 A.2d 909 (Del. 1996); *In re Hanover Direct, Inc. Shareholders Litigation*, 2010 WL 3959399 (Del. Ch. Sep. 24, 2010).

⁽⁴⁹⁾ See DGCL §§ 251(g) and 253.

⁽⁵⁰⁾ See DGCL § 251(c).

⁽⁵¹⁾ E.g., see Maryland Code of Pub. Gen. L. § 2-309; see also *Milton Applebaum v. Avaya, Inc.*, 805 A.2d 209 (Del. Ch. 2002) (holding proposed stock split complies with Delaware statute).

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

⁽⁵²⁾ An interesting and undeveloped question may arise if the target is or may become insolvent before or as a result of the transaction, in which case even a sole shareholder may face a conflict in pursuing or designing a transaction, in which case notice to creditors may become an effective requirement as a result of duties owed by that shareholder (or a board) of the insolvent company. E.g., *In re Central Illinois Energy Co-op*, 2012 WL 3638027 (Bank. C.D. Ill. 2012); *North American Catholic Educational Programming Foundation, Inc. v. Gheewalla*, 930 A.2d 92 (Del. 2007) (directors owe duties to corporation and shareholders, but creditors may protect interest through derivative action when corporation is in “zone of insolvency”); *Prod. Res. Gp., L.L.C. v. NCT Gp., Inc.*, 863 A.2d 772, 776 (Del.Ch. 2004) (same).

⁽⁵³⁾ E.g., *Southeastern Pennsylvania Transportation Authority v. Rubin et al.*, 2011 WL 1709105 (Apr. 29, 2011).

⁽⁵⁴⁾ If a shareholder approval is required, discussed below, advance notice of the meeting will be required both under state corporate law and under stock exchange rules. E.g., DG-CL 213 (setting of record date for meeting) and 222 (notice of meetings); NYSE Rules § 4; Amex Rules Part 7; NASDAQ Rule 5620.

⁽⁵⁵⁾ DCGL 251.

⁽⁵⁶⁾ SEC Form 8-K. “Material” for this purpose is not defined in a specific way, but would clearly include any merger agreement for a target, and the instructions to the SEC’s form indicates that material agreements include those for property, plant, and equipment if the consideration is 15% or more of a company’s fixed assets. Filings are also required for any material amendment or termination of a material agreement, for the completion of the acquisition or sale of significant assets (equal to 10% or more of the company’s assets), for private sales of more than 1% of the company’s equity securities, for material changes in rights of security holders, for changes of control, and for changes to the company’s charter or bylaws. In addition, SEC Regulation S-X requires pro forma and audited target financial statements to be filed on the bidder’s Form 8-K if the target’s assets or income exceed 20% of the bidder’s assets or income.

⁽⁵⁷⁾ UK Listing Authority Listing Rule 10.4. If the transaction exceeds 25% of those measures, shareholder approval must also be obtained, as discussed below.

⁽⁵⁸⁾ In the US, see Securities and Exchange Act § 14(d)-(f); SEC Regulations 14D and 14E; Schedule T-O (form used for tender offers); in the UK, see Takeover Code, Rule 24.

⁽⁵⁹⁾ SEC Rule 145; Securities Act of 1933 and Form S-4 (form used for M&A-related offerings).

⁽⁶⁰⁾ SEC Rule 13e-3. SEC Form 8-K also requires disclosure of contracts with directors or officers, subject to specific exceptions, and SEC Regulation 14A Item 404 separately requires disclosure of specified “related party” transactions involving more than \$60,000 or 5% of consolidated gross revenues in the issuer’s next proxy statement, including any

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

deal-related proxy statement, such as will be required to obtain any required shareholder approval.

⁽⁶¹⁾ In the US, the Hart-Scott-Rodino Antitrust Improvements Act of 1976, as amended (15 U.S.C. § 18a), and related rules require both buyer and target to file, and a buyer to obtain clearance, prior to the acquisition of more than ~\$70 million in value of equity securities (the amount is adjusted annually in line with growth in the economy). Mergers and most acquisitions of assets constituting a business also require such filings. In Europe, including the UK, a similar mandatory notification and clearance requirement exists under Regulation (EC) 139/2004 (“Merger Regulation”) for deals involving parties with global revenues over €5 billion and EU-wide revenues over €250 million, or if global revenues are over €2.5 billion, EU-wide revenues exceed €100 million for two or more parties, combined turnover in each of three EU-member states exceeds €100 million, and turnover in each of those member state by at least two of the parties exceeds €25 million. In addition, a deal involving a UK company may also entail a formally voluntary but practically desirable filing and clearance from the newly created Competition and Markets Authority if UK revenues are over £70 million or the deal will create or enhance a 25% share of the supply of goods or services in the UK.

⁽⁶²⁾ In the US, e.g., Workers Adjustment and Retraining Notification (WARN) Act, 12 USC §§ 2101–2109.

⁽⁶³⁾ NYSE Rule 312.03(c); see also Amex Rule 712; NASDAQ Rule 5635. Here, unlike US state corporate law, the stock exchange rules are less formalistic, and are triggered for the parent/buyer issuing the stock, even if the parent/buyer is not a formal party to the merger, and even if the issuance is achieved in a series of steps.

⁽⁶⁴⁾ UK Companies Act 2006, sections 561–577.

⁽⁶⁵⁾ UK Listing Authority, Listing Rule 10.1. For an empirical analysis suggesting that this requirement improves outcomes for bidders in the UK, see Marco Becht, Andrea Polo, & Stefano Rossi, “Does Mandatory Shareholder Voting Prevent Bad Acquisitions?”, 29 Rev. Fin. Stud. 3035 (2016).

⁽⁶⁶⁾ *Hollinger Int’l., Inc. v. Black*, 844 A.2d 1022 (Del. Ch. 2004), aff’d 872 A.2d 559 (Del. 2005).

⁽⁶⁷⁾ This is generally true even if the merger is essentially immaterial for the buyer. The formal requirement of board approval applies, for example, if the cash to be issued to target shareholders is a tiny amount relative to the buyer/parent’s assets. Where a triangular structure is used, the approvals under US state corporate law are generally applied formalistically to the combining companies, and not to the parent/buyer. Hence, the approvals for the shell corporation involved are pro forma, since subsidiary directors are typically officers, and an officer can also approve the merger on behalf of the parent company as sole shareholder of the subsidiary. A board’s approval is only required at one point in time, and does not need to continue throughout the M&A process: under DGCL §

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

146, a merger may proceed to stockholder vote even if a board has changed its recommendation on how to vote.

(⁶⁸) See Ehud Kamar, “Does Shareholder Voting on Acquisitions Matter?”, 64 Am. L. & Econ. Rev. 64 (2006).

(⁶⁹) UK Companies Act 2006, sections 904–918.

(⁷⁰) Payne, *supra* note 46.

(⁷¹) Cal. Corp. Code § 25142; Securities Act of 1933 § 3(a)(9).

(⁷²) UK Companies Act 2006, section 190.

(⁷³) *Barkan v. Amsted Indus., Inc.*, 567 A.2d 1279 (Del. 1989); see M&F Global, *supra* note 23.

(⁷⁴) Robert M. Daines & Olga Koumrian, “Recent Developments in Shareholder Litigation Involving Mergers and Acquisitions” (Cornerstone Research, Mar. 2012), available at <http://bit.ly/1yads5t>; Steven M. Davidoff, Corporate Takeover? In 2013, a Lawsuit Almost Always Followed, N.Y. Times (DealBook) (Jan. 12, 2014), available at <http://nyti.ms/1lt6lkg>.

(⁷⁵) See, e.g., *Kirschner Brothers Oil, Inc. v. Natomas Co.*, 185 Cal. App. 3d 784 (1986).

(⁷⁶) Directors and officers of UK companies are also subject to fiduciary duties, see generally Gower and Davies, *Principles of Modern Company Law* (9th ed. Paul Davies & Sarah Worthington eds., 2012), but it is significantly more difficult for dispersed shareholders to bring lawsuits to enforce such duties in the UK in a cost-effective manner, so these duties are less constraining and less significant to M&A practice than in the US. See generally John C. Coates et al., “Program on the Legal Profession: The Legal Profession of the United Kingdom”, available at <http://bit.ly/1pJ0Ld0> (contrasting US and UK legal systems, including availability of contingent fees, attorneys’ fees, discovery, and representative actions).

(⁷⁷) *Supra* note 28; see Bernard Black, Brian Cheffins, & Michael Klausner, “Outside Director Liability”, 58 Stan. L. Rev. 1055 (2006).

(⁷⁸) For US state law, see, e.g., *In re Toys “R” Us, Inc. Shareholder Litigation*, 877 A.2d 975 (Del. Ch. 2005); *In re Rural Metro Corp. Stockholders Litigation*, 88 A.3d 54 (2013); for US federal securities law, see *Herskowitz v. Nutri/System, Inc.*, 857 F.2d 179 (3d Cir. 1988), cert denied, 489 U.S. 1054, 109 S.Ct. 1315, 103 L.Ed.2d 584 (1989) (investment bank could be held liable under federal securities laws where the investment bank permitted its fairness opinion to be included in proxy solicitation materials, but without a genuine belief or reasonable basis for concluding that the economic assumptions upon which the fairness opinion was based were accurate).

Mergers, Acquisitions, and Restructuring: Types, Regulation, and Patterns of Practice

(⁷⁹) See DGCL § 102(b)(7); Edward P. Welch & Robert S. Saunders, “Freedom and its Limits in the Delaware General Corporation Law”, 33 Del. J. Corp. L. 845 (2008); *Barkan*, *supra* note 73.

(⁸⁰) Securities Act of 1933 § 11; *Escott v. BarChris Construction Corp.*, 283 F. Supp. 643 (1968).

(⁸¹) *Revlon, Inc. v. MacAndrews & Forbes Holdings, Inc.*, 506 A.2d 173 (Del. 1986); *Barkan*, *supra* note 73.

(⁸²) *Id.*; *Unocal Corp. v. Mesa Petroleum Co.*, 493 A.2d 946 (Del. 1985).

(⁸³) SEC Rule 14e-3.

(⁸⁴) Those conditions effectively and non-waivably precommit the target to a process that includes not only independent approval by a board, but also approval by disinterested shareholders. See *M&F*, *supra* note 23.

(⁸⁵) E.g., *Valeant Pharmaceuticals Int’l. v. Jerney*, 921 A.2d 732 (De. Ch. Dec. 1, 2006) (decision by directors to pay large cash bonuses to themselves and officers in connection with proposed transaction was found to fail entire fairness review).

(⁸⁶) *Weinberger v. UOP, Inc.*, 457 A.2d 701 (Del. 1983) (lower court awarded arbitrary \$1 per share after freezeout merger found to fail entire fairness test but merger price found to be above fair price for shares); *Valeant*, *supra* note 85 (president required to disgorge entire bonus and reimburse company for half of fees advanced by company for joint defense of president and CEO).

(⁸⁷) On one aspect of the complex relationship between the “fair price” component of the entire fairness standard of review in Delaware with the “fair value” standard in appraisal settings, see, e.g., *In re Orchard Enterprises, Inc. Stockholder Litigation* 88 A.3d 1 (Del. Ch. Feb. 28, 2014) (fair price is a point estimate, fair value a range, so while fair value might exceed a merger price by more than 200%, that does not compel a finding of unfairness, although it is “certainly evidence of financial unfairness”). See also cases cited in note 41 *supra* (cases in which fair value or fair price is found to “approach” or be zero, or less, due to insolvency).

(⁸⁸) DGCL § 262; Coates, “Fair Value,” *supra* note 25.

(⁸⁹) *Hariton v. Arco Elecs., Inc.*, 188 A.2d 123, 125 (Del. 1963).

(⁹⁰) Takeover Code Rule 9 (mandatory offer upon reaching 30% or acquiring more shares after having reached 30%, limited to cash or cash substitute, and at no less a price than the highest price paid during the 12 months prior to the offer); Companies Act §§ 979 (squeezeouts at 90%).

Groups of Companies: A Comparative Study of the Economics, Law, and Regulation of Corporate Groups

Klaus J. Hopt

The Oxford Handbook of Corporate Law and Governance

Edited by Jeffrey N. Gordon and Wolf-Georg Ringe

Print Publication Date: May 2018 Subject: Law, Company and Commercial Law

Online Publication Date: Jul 2015 DOI: 10.1093/oxfordhb/9780198743682.013.30

Abstract and Keywords

Groups of companies are common. The empirical data are heterogeneous. Agency problems arise between the controlling shareholder and the minority shareholders and between the shareholders and the creditors. Three regulatory models exist: regulation by general corporate and/or civil law (prototype: the UK); regulation by special group law (prototype: Germany); and regulation by areas of the law such as banking, competition, and tax. The main strategy is mandatory disclosure and group accounting. Related party transactions (including conflict of interest and tunneling) are dealt with by disclosure and consent requirements. In addition, appropriate standards for directors and controlling shareholders (corporate governance) have been developed. They become stricter, if insolvency is approaching. The concept of the shadow director extends liability to the controlling shareholder. Other mechanisms for creditor protection are indemnification, veil-piercing, subordination and substantive consolidation. A fair amount of international convergence exists as to shareholder protection, but not as to creditor protection.

Keywords: Groups of Companies, Corporate Governance, Convergence, Principal Agent Conflicts between Minority Shareholders and Controlling Shareholders, Creditor Protection, Related Party Transactions, Conflict of Interest, Tunneling, Mandatory Disclosure, Veil-Piercing

1 Groups of Companies: Phenomenon, Agency Problems, and Regulation

1.1 The phenomenon of the groups of companies

GROUPS of companies rather than single independent companies are the modern reality of the corporation, and most of them are multinational groups. As an example, take the Pirelli group in Italy, which is not one of the very biggest. It has over 100 companies in more than 30 countries, 16 of them in the European Union, with over 30,000 employees and an annual turnover of almost six billion euros.² Modern business can be organized in

Groups of Companies: A Comparative Study of the Economics, Law, and Regulation of Corporate Groups

different ways: the integrated firm working only with its own labor force is rare. More common is distribution by commercial agents or appointed dealers. As the firm becomes bigger, it sets up branches and, especially in trade that crosses over borders, it establishes separate companies as subsidiaries of the firm and forms multinational groups. The groups differ greatly as to structure, organization, and ownership. In the US, groups with 100%-owned subsidiaries are common. In continental Europe, the parents usually own less—very often much less—of the subsidiaries, just enough to maintain control. Some groups have holding structures—for example, the large US banks—and Swiss banks are (p. 604) beginning to follow.³ In Europe—for example, in Germany and Italy—pyramids⁴ are common, i.e., hierarchical groups with various layers of subsidiaries and subsidiaries of subsidiaries forming very complicated group nets. Groups are run very differently: some are tightly steered by the parent from the top, while others are loosely combined with largely autonomous profit centers and sometimes with fierce group-internal competition.⁵ If groups cooperate, they sometimes choose to jointly hold certain subsidiaries. Special—often cultural—problems arise if, as in rare cases, multinational groups have two parents from different countries. Accordingly, the economic concepts of the group differ.⁶

Groups also have different legal forms. This depends on the various corporate forms available in different jurisdictions and sometimes on an international level, such as the *Societas Europaea* (SE) in the European Union. Legal group regulation, if any, depends on these legal forms,⁷ which means that there are stock corporation groups,⁸ limited liability company groups, SE groups such as the German Allianz insurance giant,⁹ and also groups with commercial partnerships such as parents or subsidiaries. The choice of the form is most often tax-driven.¹⁰ In law, the concept of the group depends on the legal concept of control by the parent. There are different legal concepts of control according to the purpose of the regulation. For accounting purposes, but in some countries also under general corporate law, formal control by at least 51% of the shareholdings is the legal test. For antitrust and in countries with a special group law as in Germany, substantive control concepts are used, taking into consideration that economic control may be possible with much less than 50% (p. 605) depending on the shareholder structure, shareholder presence, and voting behavior in the general assembly, and other economic facts.

The objectives of group regulation under corporate law are usually twofold: the main objective is the protection of the minority shareholders and the creditors of the subsidiaries in the group. Under this objective, group regulation follows a bottom-up model. A second objective that appears frequently in many countries—including European countries as well as Australia,¹¹ for example—concerns the corporate law provisions aimed at assisting business and the economy by recognizing corporate groups as organizational forms and by facilitating group management. Here the regulatory perspective is rather top-down. In countries with strong protectionism and in most emerging countries, the emphasis is more on the organizational side.¹² This chapter concentrates on group regulation with the first objective, i.e., on agency problems in corporate groups and their regulation. Special problems arise for multinational groups, an old phenomenon that was already well known in the nineteenth century,¹³ for groups with the state or state enterprises as parent,¹⁴ for financial groups as evidenced by the financial crisis, and for listed groups,

Groups of Companies: A Comparative Study of the Economics, Law, and Regulation of Corporate Groups

i.e., groups in which the parent or a subsidiary or even both are listed. These problems cannot be dealt with here in more detail.

1.2 Empirical Data on Groups and their Use for Regulation

Empirical data on groups are available, but they are usually collected for specific purposes. More recently there has been growing research on corporate ownership with a view toward corporate governance law and codes.¹⁵ Ownership differs considerably between the various countries: dispersed ownership in the US¹⁶ and in the UK¹⁷ as prototypes;¹⁸ and controlling family enterprises and groups of companies as the general rule in continental European (p. 606) states, but also often found in Far Eastern countries and in emerging economies.¹⁹ Empirical data on multinational enterprises and groups of companies are collected by international organizations such as the OECD, UN, G20, Basel, and others.²⁰ Data on groups are also collected by studies on economic concentration and are used for antitrust and merger control regulation in many industrialized countries, including Germany, the European Union, and the US.²¹

Of particular relevance when studying the regulation of corporate groups are data on conduct and transactions in groups. Usually they are not collected systematically but are set out by regulatory agencies, in case studies, by national and international court cases, and by reports from practice.²² Much of the existing group law is not codified law but is case law by courts, such as the German limited liability group law, and sometimes by supervisory agencies, such as the former Belgian Banking Commission.²³ The extensive legal contributions of academia in many countries with group law do not usually add much in the way of empirical data.

1.3 Agency Problems: The Controlling Shareholder and Minority Shareholders, Creditors, and Other Stakeholders

It is generally understood that there are three main agency problems to be dealt with in corporate law: conflicts between managers and shareholders, conflicts among shareholders and here essentially between the controlling shareholder and the minority shareholders, and conflicts between the shareholders as a group and other stakeholders, in particular the creditors of the company and its workforce.²⁴ Sometimes the concept of stakeholders is (p. 607) conceived more broadly, encompassing consumers; municipalities, regions, and countries interested in keeping groups and group members within their area; the state as a tax authority; and even non-personal public goods such as the environment, fundamental rights, and others.

The classic agency conflict concerns the managers as agents of the shareholders. This conflict exists if the shareholders are dispersed as is common in the US, the UK, and some other countries.²⁵ Much corporate law in the various countries deals with this conflict.²⁶ For controlling shareholders and for the parent in a group of companies, this agency conflict is hardly relevant because the controlling shareholder will ultimately prevail against the management, not only in the parent company but also in the subsidiaries,

Groups of Companies: A Comparative Study of the Economics, Law, and Regulation of Corporate Groups

either by superior influence on the board or by voting power in the general assembly. It is true that under special circumstances—for example, in multinational groups—control may not be exercised so easily, especially if labor sides with the management of the subsidiary, or if state agencies in the country of the subsidiary pursue country-specific interests. But this is the exception.²⁷ As to groups of companies, the two most discussed principal-agent conflicts concern the minority shareholders and the creditors (as well as the employees).

1.3.1 Minority Shareholders versus the Controlling Shareholder

This agency problem occurs most frequently in continental European countries where family companies and groups of companies are common.²⁸ The controlling shareholder may abuse that control position in various ways, such as self-dealing and similar related party transactions, thereby reaping private benefits of control.²⁹ The corporate laws of most countries cope with this problem of controlling shareholder opportunism by various strategies and mechanisms of minority protection.³⁰

As we shall see, many jurisdictions deal with this agency problem without distinguishing whether these conflicts arise in the independent corporation or in a group of companies. Yet in groups of companies, this agency problem has several particular features.³¹ First and most conspicuous is the fact that the controlling shareholder in the subsidiary may not just act opportunistically in his own private interest; he may act responsibly in the interest not (p. 608) only of the parent, but of the group as a whole and/or other subsidiaries. While the controlling shareholder of an independent corporation has an individual interest in the well-being of “his” corporation which somewhat reduces the risk of opportunism at the expense of the minority shareholders, this is not necessarily the case if he has important stakes in other companies as a parent of the group or as a controlling shareholder of the parent. In this case, what may be disadvantageous for him in the one company may at the same time be beneficial for the other companies. This is what makes the agency conflict in the group generally more complex and acute than in the controlled independent company.

Second, steering a group of companies implies making difficult business judgment decisions that may be appropriate or even necessary for the group though they are disadvantageous or even harmful for the subsidiary. This implies a much more difficult balancing of interest between the subsidiary and the parent (and other subsidiaries) than between the minority and the majority in an independent corporation. Examples are easy to find: in most groups, there is a central cash management where the moneys of the subsidiaries are pooled. It is very common that the parent takes contributions from the subsidiaries for the group that may or may not be economically and/or legally justified from the perspective of the subsidiary, for example for services rendered within the group or more generally for the alleged benefits of belonging to the group. The parent or another group member may be in financial difficulties and need the help of the subsidiary. The parent may need to make a decision about where in the group layoffs or cut-downs should be effectuated or, more positively, which of the subsidiaries in the group should be attributed the opportunity to develop a promising new product or where, usually for tax reasons, a new subsidiary should be brought up that may take away business from the others. In a

Groups of Companies: A Comparative Study of the Economics, Law, and Regulation of Corporate Groups

sense, the latter cases present a horizontal agency problem, not just a vertical one as in the independent corporation. This is not to say that such balancing cannot be done in jurisdictions without separate provisions for groups, but it is considered by some jurisdictions the reason for treating the agency problem in groups of companies separately and differently.

Third, the agency problem is exacerbated if the controlling shareholder in the group holds only a block of shares that is enough for control instead of 100%.³² As seen before, depending on how control is defined, this may be just a 51% block, or even considerably less in corporations in many continental European countries in which the attendance rate of the common shareholders at the general assembly is low. In Germany, for example, this is sometimes under 30%. With the mandatory bid provision for takeovers in many European countries, 30% is usually considered control for the purposes of acquiring control in the sense of the takeover acts.³³ This line of exercising control with relatively smaller stakes is prolonged in a number of continental European countries by pyramiding,³⁴ i.e., exercising control over a subsidiary by another subsidiary and so on. The actual economic stake of the controlling shareholder at the top of the pyramid may thus become very small, with the consequence that his risk in the lowest part of the pyramid may be minimal. The temptation to take hidden private profits somewhere in the group increases correspondingly.

(p. 609) Fourth, in a group of companies, the agency conflict may not just be one that concerns the minority shareholders in the subsidiary. The minority shareholders in the parent corporation may also be affected. This is the case if the management of the parent, in agreement with the controlling shareholder, takes the business decision to invest heavily in a risky subsidiary without shareholder consent in the general assembly of the parent corporation. The famous German Holz Müller case is a good example of this.³⁵

1.3.2 Creditors versus the Controlling Shareholder

The other main agency problem concerns the creditors. As for the minority shareholder agency problem, this conflict is well known in general corporate law for the independent company, and a number of jurisdictions do not have separate rules for this problem in group situations.³⁶ But again creditors of groups may be more exposed to controlling shareholder opportunism than creditors of independent companies.³⁷

The above-mentioned special features of the conflict also apply here: a smaller incentive of the controlling shareholder to act in the sole interest of the subsidiary because of his stakes in other companies, difficult financial and investment decisions in steering the whole group, exacerbated risk in pyramidal groups, and agency problems not only for the creditors of the subsidiary but also of the creditors of the parent.

Furthermore, quite apart from the precarious situation of involuntary creditors, it is usually more difficult for a creditor of a subsidiary to evaluate the risk he runs than for a creditor of an independent company. The situation is just more opaque, and the divisions between the assets of group members are more blurred. This is true whether or not the

Groups of Companies: A Comparative Study of the Economics, Law, and Regulation of Corporate Groups

creditor knows that the debtor company is a group member. Disclosure under the various national and international transparency provisions is relatively well established as far as the parent corporation is concerned, in particular because of group accounting,³⁸ but transparency is much less developed as far as the subsidiaries are concerned. As a consequence, the general creditor risk—ex ante: misrepresentation of value; ex post: intra-group transactions, asset dilution, asset distribution, and debt dilution³⁹—is generally higher in groups of companies than in independent companies.

1.3.3 Labor and Other Stakeholders versus the Controlling Shareholder

Similar problems arise for employees and other stakeholders, whether these problems are considered to be agency conflicts⁴⁰ or not. The decision of whether employees are hired or fired may not just depend on the business situation of the subsidiary but may follow the interest of the group. Restructuring in groups of companies, in particular in multinational (p. 610) groups, belongs to the most controversial issues for labor. For example, in the case of a takeover threat against an independent company, labor will often seek a coalition with the management and the controlling shareholder against the minority shareholders; in other cases, however, the controlling shareholder in the group may take decisions in labor issues in the interest of the whole group. In a number of countries the employees may have a say in the co-determined board of the independent company, but this does not help if the decision is finally made at the top of the group, unless there is a special group codetermination there as well. Germany has such a group codetermination system, but only German labor has its representatives sitting on the board of the parent.^{40a}

Many countries deal with this labor agency problem in groups with specific labor group provisions. In some countries there is even a full-fledged labor group law, either codified or developed by case law. This whole area of group-specific provisions in employment law, industrial relations, and labor codetermination is highly complicated and controversial and cannot be treated here.⁴¹

Similar group problems arise in other areas of the law, including competition law, tax, and environment. These areas will be briefly mentioned later when we look at the different regulatory models for dealing with groups, but they cannot be treated in more detail here.

2 Groups of Companies: Regulatory Models, Legal Strategies, and Mechanisms

2.1 Regulation by General Corporate and/or Civil Law

Many countries deal with the agency problems we have described by law, either general law or group law. As we shall see, most of this law is mandatory,⁴² such as disclosure and group accounting as a reaction to opaqueness, the principles of related party transactions and tunneling, basic standards for directors and controlling shareholders in groups when

Groups of Companies: A Comparative Study of the Economics, Law, and Regulation of Corporate Groups

making decisions that affect minority shareholders, creditor protection provisions, and insolvency law. When we deal with these strategies and mechanisms, we shall look at their function, whether the provisions are mandatory, and what room is left for self-protection or for enabling law, in particular for creditor protection.⁴³ But it should be mentioned here that certain countries can do without rules for groups of companies, or at least with very (p. 611) few of them. This is the case in Sweden, for example, where there seems to be no felt need to deal with group agency problems in more detail. This is astonishing because in Sweden the shareholding structure is characterized by strong owners and weak minorities. The pertinent studies suggest that the reason may be that the country is small and social control is effective.⁴⁴ Furthermore, creditor protection in general—and more specifically in groups of companies—may be irrelevant or much less relevant for large voluntary creditors who can choose with whom they contract and can bargain for secured credit. Yet this is not the case for involuntary creditors, and even small and medium voluntary creditors may not really have the choice to protect themselves.

If countries choose to address the group agency problems more specifically, they can follow three regulatory models: first, they can choose between regulation by general corporate and/or civil law (section 2.1) and regulation by special corporate group law (section 2.2). These two models can and usually will be combined with group regulation by areas of law (section 2.3). The prototype of the first regulatory model is the UK.⁴⁵ There corporate group law as such (apart from group accounting, for example) is non-existent. The general civil and corporate law provisions for dealing with agency problems of minority shareholders and creditors are used for independent companies as well as for groups of companies. Many other countries follow the same route. As for the corporate law in these countries dealing with group problems, there are considerable differences between the various forms of corporations—for example, stock corporations—particularly if they are listed, limited liability companies, commercial partnerships, and in Europe the European company (SE).

In all these countries, the legitimacy of forming groups—i.e., creating different legal entities within the group and thereby partitioning assets⁴⁶ among the creditors of these entities—is principally uncontested, though in US academia there are pleas for unlimited shareholder liability for corporate tort creditors.⁴⁷ In the UK, the separate legal personality doctrine following the *Salomon* case⁴⁸ has been firmly upheld by the courts for groups as well.⁴⁹ But as we shall see, there are various civil or corporate law concepts that may catch group situations. One example is the concept of the shadow director who exercises de facto control in the company. The parent may qualify as such a shadow director—for example, in the context of wrongful trading under section 214 of the Insolvency Act 1986—though instructions given as directors of the parent are not a sufficient basis for this.⁵⁰ Another example is piercing the corporate veil.⁵¹ Still, it has been said that “[i]t is clear that British law (p. 612) is at one end of the spectrum as far as the regulation of liability within groups is concerned.” There, the group problems are “solved by a combination of creditor self-help, general company law strategies as section 214, or the unfair prejudice

remedy⁵² and targeted statutory interventions, such as the requirement for group accounts.”⁵³

2.2 Regulation by Special Corporate Group Law

Many other jurisdictions have chosen to deal with group agency conflicts by more or less extensive special corporate group law. The prototype for this second regulatory model is Germany, with its separate, extensively codified law of corporate groups. A number of other countries have basically followed the German example, specifically Brazil, Portugal, Hungary, the Czech Republic, Slovenia and Croatia.⁵⁴ The German group law has been described elsewhere in more detail,⁵⁵ so it suffices here to summarize its key elements. First, it is important to see that in Germany, group law is codified only for stock corporations (Aktien-Konzernrecht).⁵⁶ Group law for limited liability companies (GmbH) and for commercial partnerships exists and is extensive, but it is pure case law, which is rather different from codified corporate group law.⁵⁷ Second, German codified group law distinguishes between contractual groups and de facto groups. Contractual groups are formed by contract between the parent and the subsidiary, but de facto groups are formed by unilateral declaration.⁵⁸ In a contractual group, the parent is allowed to steer the group in the sole group’s interest, but the parent has to pay for this legal privilege by being obliged to make good the losses of the subsidiary and by adequate compensation for the minority shareholders of the subsidiary. The legislator’s thought was that the freedom to steer the group would be such an attractive incentive for the parent that in most cases it would enter such a group contract. Yet this hope turned out to be vain. Corporate reality in Germany is different: contractual (p. 613) groups are rare (and due to diminished tax benefits they are becoming even rarer)⁵⁹ and, apart from the few above-mentioned countries, the concept of corporate groups has not been attractive abroad. In the de facto group—i.e., control by the parent without such a group contract—the parent must fully compensate any subsidiary at the end of the year for all acts and transactions caused by the parent that are contrary to the subsidiary’s own interest.⁶⁰ This rule is complemented by a mandatory group report of the directors of the parent, by group audit, examination by the supervisory board of the parent, and by the right of each shareholder of the parent to have an investigation at the order of the court. Yet the efficacy of these mechanisms is an open question.⁶¹ Furthermore, new case law has established the liability of the shareholders for threatening the solvency of the corporation in closely held firms.⁶²

Italy introduced a special codified group law in 2004. The core is made up of Articles 2497–2497-septies of the Italian Civil Code on the activity of “direction and co-ordination of companies” exercised by holding companies.⁶³ Apart from various rights and duties of directors and group members, and protective measures such as disclosure, the main achievement of this reform was to provide for a liability of the holding company and its directors toward the subsidiary’s shareholders and creditors if the legal requirements are met. As we shall see, this liability can be avoided if compensatory damages are paid. The existence of a group need not be proven by the shareholders or creditors, but is presumed. In addition, the rules on conflict of interest have been tightened: they govern the

Groups of Companies: A Comparative Study of the Economics, Law, and Regulation of Corporate Groups

(independent) corporation as well as groups of companies. Under certain circumstances, the minority shareholders also have a right of withdrawal.

A third group of countries includes France, with its Rozenblum doctrine⁶⁴ and the crime of abuse of corporate assets,⁶⁵ and Belgium, with group provisions for publicly listed companies belonging to a group.⁶⁶ The Rozenblum doctrine has been developed as case law by criminal courts and is characterized by a more flexible balancing of interests of the parent and the subsidiary. This may be more functional than the German solution, but the (p. 614) subsidiary is better protected by German group law.⁶⁷ Other European countries, such as Spain⁶⁸ and Sweden,⁶⁹ as well as Japan⁷⁰ have no comprehensive group law, but various legal provisions for groups.

The situation in the European Union is still in its developmental stage. The Forum Europaeum Corporate Group Law,⁷¹ the High Level Group of Company Law Experts,⁷² the Reflection Group⁷³, the Forum Europaeum on Company Groups (FECG)^{73a}, The Informal Company Law Expert Group (ICLEG)^{73b}, the European Company Law Experts (ECLE)^{73c} and the European Model Company Act 2017^{73d} have all advocated European harmonization by core group rules, more or less in line with the French Rozenblum doctrine. In its Company Law Action Plan of 2012, the European Commission had announced its intention to proceed in this direction,⁷⁴ but then the difficult discussion on the Shareholder Rights Amendment Directive^{74a} and the Brexit process required more attention. In any case a full-fledged European group law is not in sight and cannot be recommended too.^{74b}

(p. 615) 2.3 Regulation by Areas of Law

In comparative law, the two above-mentioned regulatory models of dealing with group agency conflicts are usually contrasted with each other. But this is misleading. In those countries that apparently do not have group law, this is also true only as far as corporate group law is concerned. In the UK, group accounting existed well before it was made mandatory by EU regulation.⁷⁵ But group law provisions and very often quite extensive group law legislation exists in many countries, though in fields other than corporate law. The list is long and includes group law in accounting and auditing,⁷⁶ conflict of law,⁷⁷ securities regulation,⁷⁸ banking and other financial institutes,⁷⁹ insolvency,⁸⁰ labor,⁸¹ competition law,⁸² product (p. 616) liability,⁸³ and other public law such as tax,⁸⁴ environment, and others. Apart from some observations on group law accounting, these area-specific group laws cannot be treated in this chapter,⁸⁵ since their objective is not the solution of group agency conflicts⁸⁶ but depends on the specific—and highly diverse—regulatory goals in each of these areas.

2.4 Legal Strategies and Mechanisms

In the following sections, selected legal strategies and mechanisms for dealing with group agency conflicts will be analyzed, including disclosure and accounting (section 3), related party transactions (section 4), standards for the directors and for the controlling shareholder (section 5), transactions with creditors (section 6), and control transactions

(section 7). This is done with an emphasis on those jurisdictions that follow the second model, i.e., regulation by special corporate group law. For countries that follow the first model, examples alone are juxtaposed with what is done under the second model, since doing otherwise would necessarily be a repetition of general corporate law dealing with agency problems, as reported in the other chapters of the book, in particular under Part II: Substantive Topics.

3 Disclosure and Accounting

3.1 General Disclosure under Corporate Group Law

Disclosure and accounting are the most commonly used instruments for protecting minority shareholders and creditors in independent companies as well as in groups of companies.^{86a} Today much of this disclosure in Europe is harmonized.⁸⁷ There is a long discussion about (p. 617) why disclosure rules should be mandatory as they are in all core jurisdictions. The arguments for mandatory disclosure are both theoretical and empirical.⁸⁸ Without mandatory disclosure, there is an underproduction of information. Bad news is preferably suppressed. Voluntary disclosure of bad news may harm the company, in particular if other companies hide such news. Standardized mandatory disclosure helps the investors and the market to evaluate disclosure. Empirical evidence seems to support these arguments for publicly traded firms.⁸⁹ Group-specific disclosure⁹⁰ relates to the fact of control, to the relationship and transactions between the parent and the subsidiaries, and to the formation of the group at the stage of mere block building. The European Transparency Directive requires notification on changes in voting rights from 5% up at several thresholds.⁹¹ In general, disclosure is much stricter in the US and the UK, while it is more lenient in continental Europe and Japan.⁹²

An interesting example of limited disclosure is the German group dependency report for de facto groups.⁹³ This mandatory report by the management board of the subsidiary contains the details on the relationship between the corporation and the parent and other affiliated companies. It must be audited by the auditor of the company and by the supervisory board of the subsidiary. It is neither published nor available to the shareholders because it contains all the details of the internal life of the group. But the individual shareholders may ask the court for a special investigation if the auditors have refused to provide the audit certificate or have qualified it. In legal academia there has been a call for mandatory disclosure of the group dependency report to the shareholders; however, the legislators fear that this would be counterproductive because in practice the dependency report would become much less meaningful.

3.2 Group Accounting

As mentioned before, a special area of group law is group accounting. Consolidated accounts, though with many differences as to the reach and content, must be provided under various national and international group accounting provisions, including GAAP in the

Groups of Companies: A Comparative Study of the Economics, Law, and Regulation of Corporate Groups

US and International Accounting Standards (IAS) and, as of 2001, International Financial Reporting Standards (IFRS) in many other countries. The European Union has decided to basically follow IFRS standards for group accounting, but has reserved the right not to follow any specific standard. While IFRS standards apply for consolidated accounts, the accounting (p. 618) standards regarding annual financial accounts, i.e., those for the members of a group, differ greatly between the Member States.⁹⁴ While in the UK the issuer has an option to also prepare the annual financial accounts following IFRS standards, in France, Germany, Spain, and Sweden the annual financial accounts must be prepared in accordance with national accounting law. As far as listed companies are concerned there is a fair amount of convergence in Europe, but not for closely held groups.⁹⁵ There is work on more harmonization between US GAAP and IFRS, but progress is still slow.

3.3 Special Investigation with Group Dimension and the Role of Auditors and Independent Experts

Disclosure on groups of companies may be mandatory, but its effectiveness depends on enforcement, and enforcement differs greatly among the jurisdictions. As mentioned before with regard to the German dependency report, this is a task for the auditors as gatekeepers,⁹⁶ for special investigation procedures, and, on capital markets, for the stock exchanges and the various capital markets' supervisory agencies. Group auditing is a special area of group law. In Europe it is harmonized to a considerable degree.⁹⁷ In France there is good experience with the expert de gestion and the special reports by the commissaire aux comptes.⁹⁸ In Australia the Australian Capital Markets Authority has broad investigatory powers and even the right to start civil proceedings.⁹⁹

The special investigation procedure is a very promising mechanism since the shareholders may ask the court to appoint special experts to investigate suspected transactions and possible abuses in independent companies as well as in groups of companies. In the Netherlands this has been said to be a "most effective mechanism," and Switzerland has also had good experiences with it. Meanwhile in Germany, where the Stock Corporation Act has different rules for special investigation in the (independent) company and in groups of companies, the experience with the latter is less impressive, a fact that may be due to difficult valuation problems (valuation rules are not harmonized in the European Union) and lawsuits that last many years. The Forum Europaeum Corporate Group Law and the High Level Group of Company Experts have recommended that Europe provide for a harmonized mechanism of special investigation.¹⁰⁰

(p. 619) 4 Related Party Transactions

4.1 Related Party Transactions and Specific Disclosure

Disclosure and accounting—rendered effective by the help of auditors and independent experts if needed—makes agency conflicts transparent. While this may lead to appropriate behavior of the agents or self-protective measures by the principals, these beneficial

Groups of Companies: A Comparative Study of the Economics, Law, and Regulation of Corporate Groups

effects cannot be taken for granted, for the agents' temptation to skim off private benefits may be too great. This is also true for controlling shareholders and parents in groups of companies as agents of minority shareholders and creditors. Strong temptations arise for them in conflicted transactions, in particular in related party transactions (section 4) and control transactions (section 7). Conflicted transactions are part of the more general problem of conflicts of interest in corporate law that cannot be dealt with here in more detail.¹⁰¹ Related party transactions are regulated extensively by corporate law for directors and officers,¹⁰² but if they involve controlling shareholders they present special problems.¹⁰³ This is even more true for groups of companies. There such transactions between members of the group are far less visible and, since they are part of the normal group-internal business relations, it is hard—if not impossible—for minority shareholders of a subsidiary to judge whether they are made at arm's length or whether and to what extent private benefits have been extracted.¹⁰⁴ Related transactions can take very different forms and may include straightforward self-dealing as well as cash flow tunneling, asset tunneling, and equity tunneling.¹⁰⁵ Accordingly, (p. 620) the reactions by legislators and courts are manifold. A recent empirical study suggests that for listed companies, disclosure combined with consent of disinterested shareholders may be the best solution.¹⁰⁶ Special mandatory disclosure rules for related party transactions exist in many places, such as the US, the European Union, Germany and other continental European states, as well as Japan.¹⁰⁷ An empirical analysis of regulation and self-regulation of related party transactions has come up with interesting data for Italy.¹⁰⁸ Many of these disclosure rules are not found in the corporate law of these countries but are rather part of the securities laws, prominently in the US and in the European Union (the European Transparency Directive of 2004 as revised in 2013), or are national and international accounting rules, such as annual disclosure following US GAAP and IAS/IFRS. In most of these disclosure rules, one can find specific provisions for block holders, generally starting at 5%, and transactions with controlling shareholders. The test is usually that all material related party transactions that have not been concluded at arm's length—i.e., not under normal market conditions—should be disclosed. Many of these rules make distinctions according to the size and legal form of the firm. For non-listed firms, the requirements, if any, are much more lenient, while for listed companies, stricter disclosure rules for related party transactions may exist under the listing requirements of the stock exchanges than under the law. The dependency report under German group law has already been mentioned.¹⁰⁹ This report is not publicly available but is audited and given to the board of the subsidiary in order to protect the confidentiality of group-internal transactions. At the end, if one does not just look at corporate law, a considerable amount of convergence between the US, Europe, and Japan can be observed as far as disclosure of related party transactions is concerned.¹¹⁰ This is particularly true for related party transactions in listed companies for both directors and controlling shareholders.

4.2 Procedural Regulation of Related Party Transactions

Disclosure helps against related party transactions, but it is not sufficient. In most jurisdictions it is supplemented by mandatory rules. While these rules originally were substan-

Groups of Companies: A Comparative Study of the Economics, Law, and Regulation of Corporate Groups

tive, it became clear that fixing ceilings or the outright prohibition of certain related party transactions is too inflexible an approach and may sometimes run against the interest of the shareholders. This is also true in groups of companies where transactions between the members of the group may be economically beneficial. While a number of substantive rules are kept—for example, in tax law under the arm's length standard—more modern regulation is procedural. Usually there are consent requirements: either ex ante or sometimes ex post; by the whole board or by independent directors; in important cases by the (p. 621) shareholders; and sometimes by the supervisory agency.¹¹¹ An example of a conflict of interest procedure occurs under Belgian law where a board committee of three independent directors is in charge of carrying out an assessment of the decision or transaction.¹¹² In groups of companies, these consent requirements may not work fully because the board of the subsidiary is most often dependent on the parent, and consent resolutions by the general assembly are of little use if the parent is in control. Then the consent of independent directors or a decision of only the minority shareholders as in Australia¹¹³ may help.¹¹⁴ An interesting experiment is found in Italy where the minority needs to be represented on the board by a minority representative. This seems to be more effective than independent directors.¹¹⁵

The European Commission considered introducing a rule for related party transactions that would have required the consent of the general assembly for transactions upon a threshold of 5% of the assets of the company.^{115a} Similarly, transactions that have had a relevant impact on the profit or turnover of the corporation would have been subjected to such a consent requirement. A similar rule exists under the Listing Rules of the FSA in the UK.¹¹⁶ Yet the reactions in the Member States, in particular in Germany, were highly critical because the shareholder constituency, shareholder behavior in the general meetings, and the rules governing shareholder rights and voting differ greatly among the Member States. On the other side the case for moving forward on a European level has been made convincingly several times, for example by the Forum Europaeum on Company Groups.¹¹⁷ In general, the experience with shareholder approval of major transactions and the uncertainties under the German *Holz Müller* case suggested a careful balancing of the benefits and disadvantages of such a rule. In any case, such an initiative on the part of the European Commission would (p. 622) have needed to take better into consideration the group problem—for example, by providing for a minority shareholder vote or otherwise neutralizing the decisive influence of the parent. In the end, the final version of the shareholder rights amendment directive of May 17, 2017 provides a more modest version.^{117a} The compromise is a more lenient definition of related party transactions that is up to the Member State to concretize as well as a Member State option that allows to choose between the approval of the general assembly and the approval by the administrative or supervisory board, in the latter case the director or the shareholder concerned being excluded from the vote or at least from having a determining role in the approval process. This leaves German Konzernrecht more or less untouched. While with the directive of 2017 some harmonization as to group law in European law has been reached, there is more to be done on the European level and in particular on the Member State level.^{117b}

Similar to the case as for mandatory disclosure,¹¹⁸ the auditors also have a role in related party transactions. The special investigation procedure by independent experts described above may help to expose hidden abuses. Other gatekeepers such as evaluation experts can help. Under the Belgian procedure, the board committee of three independent directors can ask for the assistance of one or more independent experts who are to provide technical advice.¹¹⁹

5 Standards for the Directors and for the Controlling Shareholder

5.1 Standards for the Directors and the Controlling Shareholders in Independent Corporations and in Groups of Companies

Regulating related party transactions may practically cover a large part of the agency conflicts of directors and controlling shareholders in independent companies as well as in groups. But opportunism is not just a temptation for specific transactions; there are many other situations and business decisions that may be conflicted, such as acquisition, allocation, and distribution decisions made in the group that have different impacts for the various group member companies. It is therefore important to set the right standard for the directors if an agency conflict arises. The usual standard for the director when dealing with (p. 623) such conflicts is the duty of loyalty.¹²⁰ This duty is a fairness concept that is most open and flexible and will only be concretized ex post and over time by the courts. Traditionally, the duty of loyalty is very strict in the US, the UK, and other Commonwealth countries. One of the reasons for this is the fact that this duty of company directors has its origins in the strict fiduciary position of the trustee under old English trust law. Due to the particularities of US American procedural law, a considerable amount of case law has emerged. The situation in continental Europe is very different because the duty of care has traditionally played a greater role than the duty of loyalty. Only more recently has the latter become important while the former has lost some of its significance due to the import of the business judgment rule into continental Europe.^{120a} Many differences still exist, however, as to the reach, the burden of proof, the litigation, and the cultural perception of certain kinds of business behavior that may or may not be acceptable socially. In some countries, these agency conflicts are not only dealt with by corporate law, but also and sometimes very much so by criminal law. For example, in France, self-dealing is a criminal *abus des biens sociaux*¹²¹ and apparently the most frequently applied criminal rule of company law.¹²² In the aftermath of the financial crisis, criminal prosecution of directors is also on the advance in countries such as Germany, Austria, and Ireland.^{122a}

In groups of companies it is more difficult to find the right standard for the directors since there the conflicts are not only within the company—i.e., between the director and the shareholders—but also beyond the company between the different member companies of the group and possibly their shareholders. In fact, the group-specific duties and liabilities of directors are manifold, including limits to granting loans to directors in the

Groups of Companies: A Comparative Study of the Economics, Law, and Regulation of Corporate Groups

group,¹²³ prohibition on competition in the group, and limits to passing on information to other group members.

Standards for the controlling shareholders have been developed more slowly, unless, as in exceptional cases, they can be considered shadow directors.¹²⁴ They differ considerably under the national corporate laws, and the differences are striking as far as enforcement and litigation are concerned.¹²⁵ While in the US the standard is entire fairness or utmost good faith and loyalty, the standards are more lenient in continental European countries and in Japan, a fact that is due to the different shareholder structure and the economic and political influence of controlling shareholders and groups. In France there is the relatively vague concept of abuse of majority power.¹²⁶ Under German stock corporation law the use of the influence of a person over the corporation to the detriment of the corporation or its shareholders (p. 624) is forbidden.¹²⁷ This is not specifically addressed to controlling shareholders, but it is most important for those. Apart from this provision, it took a very long time for the courts to accept that there are duties of loyalty not only between the controlling shareholder and the company, but also of the controlling shareholder to his minority shareholders.¹²⁸

5.2 Specific Standards for Balancing the Interests of Member Companies in Groups

For groups of companies, the standards used by the various jurisdictions for evaluating the transactions and business relations in groups of companies differ greatly. In many countries there are rules that try to uphold the interest of the group members against the parent and compensate in one way or another the subsidiaries for damages suffered by intragroup transactions. In Germany, France, and Italy, an evaluation of the overall operation of an individual subsidiary and its individual transactions with the controlling company must be made.¹²⁹ In this context it has been mentioned that a rule that focuses on the individual transactions may be inefficient since in some cases it disfavors the controlling shareholder by free-riding minority shareholders while in other cases it lets the controller reap excessive private benefits.¹³⁰ German group law is the most stringent as it does not allow for weighing up the disadvantages or advantages the subsidiary derives from being a member of the group. The disadvantages are measured from the viewpoint of an independent corporation only. Italian group law is more flexible because it allows the consideration of compensatory advantages for the subsidiary.¹³¹ Spain has been advised to follow the Italian example.¹³² The French Rozenblum doctrine¹³³ allows an even more flexible balancing of the interests of the parent and the subsidiary. The criminal courts that developed this rule allow the subsidiary to also take into consideration the interest of the group, not only its own advantages (p. 625) from belonging to the group.¹³⁴ The requirements for doing so are threefold: the stable structure of the group, a coherent group policy by the parent, and an equitable distribution of benefits and costs among the group members. For Europe the Forum Europaeum Corporate Group Law, the High Level Group of Company Law Experts, the Reflection Group, and the European Model Companies Act have recommended following and further developing the French Rozenblum doctrine by legally acknowledging the group management.¹³⁵ The European Commission has re-

sponded to this recommendation, and, according to its Action Plan of 2012, will come up with such an initiative.¹³⁶ But it is expected that the form of this initiative will be a mere recommendation or at the most a directive rather than a regulation that is directly applicable in the Member States, and its content will be more on the side of the group than that of the minority shareholders. In the end, it may be concluded that, while there is some convergence on the standards for directors, controlling shareholders, and the parents in groups of companies despite different ownership regimes,¹³⁷ this convergence is and will be considerably less than has been observed for disclosure, and we shall see that for creditor protection there is even less convergence.

6 Transactions with Creditors

6.1 Creditor Self-Help and Guarantees by the Parent

The principle is unequivocal: no claims of creditors beyond the debtor corporation. This principle of separate legal personality that is most tightly upheld in the UK under the Salomon doctrine¹³⁸ also stands firm for groups of companies and is mandatory.¹³⁹ However, there is room for self-help on the part of the creditors and for voluntary action by the debtor parent. As was said before, large voluntary creditors of a group member will usually look after themselves and either refrain from dealing or bargaining to secure their credit by collateral. By monitoring the debtor in their own interest, it is sometimes said that these large creditors also protect the interests of the smaller, unsecured, or involuntary creditors. Yet this (p. 626) is true only in specific situations, in particular when the debtor gets into financial difficulties; even then, however, if a creditor is secured, he can sit back without risking his credit.

On the other hand, the parent corporation may have commercial reasons for loosening the asset partition within the group. Corporate guarantees given by the parent for their subsidiaries are a prime example. Such guarantees (letter of comfort, Patronatserklärungen, lettre de patronage)¹⁴⁰ differ considerably as to their form and binding force. They may be given to a particular creditor of the group member company or can be part of a general declaration to the market, sometimes in the annual report as in the case of the Deutsche Bank. Hard and soft forms should be distinguished carefully: in the former case, the parent stands up as a second debtor or as a guarantor of the debt;¹⁴¹ in the latter, this is a more or less meaningful letter of intent depending on its wording and the circumstances in which it is issued. So the letter of comfort may be treated as a mere statement of present fact, not a promise about future conduct.¹⁴² In France, a distinction is made between the obligation de moyens and the obligation de résultat, with only the latter giving the creditor a full guarantee of repayment.¹⁴³ In the bond market, such guarantees are frequent, but again with highly different reach and content.¹⁴⁴ In a way, the German contractual groups can also be mentioned in this context, since by entering such a group contract, the parent voluntarily accepts liability to the creditors of the subsidiary in return for liberty to steer the group in the group interest.¹⁴⁵ But in the end, as practice

shows and theory confirms, self-help is not a full substitute for creditor protection by mandatory law.¹⁴⁶

6.2 Standards for the Directors and the Controlling Shareholders

In the stage before outright insolvency, mandatory law protects group creditors mainly through the standards and liability of the directors and controlling shareholders. General creditor protection by disclosure rules was described above. Legal capital requirements, controversial as they are, and protection by limitations on asset distributions to shareholders are (p. 627) not treated here.¹⁴⁷ In normal times, these standards of conduct protect both shareholders and creditors. Actions of the management with the consent of the parent that are harmful to minority shareholders are usually also harmful to the creditors of the subsidiary.

Yet when the corporation gets into financial difficulties, in particular if insolvency is foreseeable, the standards change and the duties of the management become stricter. In principle, this is true for most jurisdictions. Prototypes are the wrongful trading of directors in the UK, the French *responsabilité pour insuffisance d'actif*, the Belgian *action en complément du passif*, and the German liability of the management of the limited liability company for negligent payments after the company has become insolvent or illiquid.¹⁴⁸ While these concepts of creditor protection differ considerably as to their reach, standards, entitled claimants,¹⁴⁹ and doctrinal nature, in the present context it suffices to state that they are functionally similar. It is true that most of these mechanisms come into play only when the company is actually insolvent, not before, and the receiver brings the claim against the director or controlling shareholder. But the liability is rooted in the wrongful conduct of the directors before, namely in the vicinity of insolvency, and the standard is not only fraud but negligence. The difficulty for the courts in applying this standard is on the one hand not to discourage directors from taking risks that may reasonably be expected to save the company, but on the other side not to allow them to engage in risky speculations at the expense of the creditors if the company has no prospects to go on (gambling for resurrection). The liability imposed on the directors is special insofar as it is not just a normal tort liability with the requirement of causation of the specific damage, but the judge may order the director to make a partial or full contribution to the assets of the insolvent company.

The group aspect of these mechanisms consists in holding liable the controlling parent as *de facto* director or shadow director. This functional extension of the notion of director is used by many jurisdictions, including the US, the UK, France, Germany, Italy, the Netherlands, Spain, and Switzerland.¹⁵⁰ These jurisdictions vary in the requirements for this liability of the controlling shareholder. Some are very reticent to do so. The prototype is the UK. There a company is not regarded as a shadow director by reason only that the (p. 628) directors of the subsidiary are accustomed to act on the instructions of the parent.¹⁵¹ This led commentators to state: "So, this is not 'group law' by the back door."¹⁵² But functionally it is, though in a very limited and carefully balanced way. Case law in some other jurisdictions seems less restrictive. The French courts treat controlling share-

Groups of Companies: A Comparative Study of the Economics, Law, and Regulation of Corporate Groups

holders and parents as *dirigeant de fait* if they continuously mix themselves into the management and control of the company or subsidiary.¹⁵³

A different instrument for holding parent companies liable well before insolvency should still be mentioned. In Switzerland, the parent may be held liable for the debts of the subsidiary if it creates the factual appearance of an economic unity of the group.¹⁵⁴ This concept is based on the reliance of the creditors and on the responsibility of the parent for this reliance. This instrument has gained some sympathy in Germany, Austria, and France, but the case law is rare and the majority of legal academia is not convinced.¹⁵⁵

6.3 Indemnification, Veil-Piercing, Subordination, and Substantive Consolidation

Four other mechanisms of creditor protection against controlling shareholders and group parents should be mentioned, two used before and independent of insolvency law—namely indemnification and veil-piercing—and two others that are typical insolvency law mechanisms—subordination and substantive consolidation.

A very farreaching, group-specific means of creditor protection is indemnification. It is a mechanism codified in the German Stock Corporation Act for protecting the creditors of the subsidiary in a *de facto* group of companies, and it characterizes the regulatory model of special group law regulation described above. As mentioned there,¹⁵⁶ the parent must fully compensate any subsidiary at the end of the year for all acts and transactions caused by the parent that are contrary to the subsidiary's own interest. This is a much more dangerous mechanism than merely mixing into the management and control of the subsidiary as the aforementioned condition for treating the parent as a *de facto* director. Instructions to the subsidiary are not necessary, mere recommendations or advice may qualify for the requirement of causation, and the recommendations need not be addressed to the directors of the subsidiary but may consist in resolutions taken by the general assembly and in acts of the representatives of the parent in the board of the subsidiary.¹⁵⁷ The relevant criterion is the disadvantage for the subsidiary under an arm's length standard for fully independent (p. 629) companies. In practice even all kinds of group contributions (*Konzernumlagen*) to the parent or to other subsidiaries for which there are no equivalent individual benefits for the subsidiary are considered to be disadvantages.¹⁵⁸

Veil-piercing or lifting the corporate veil is another mechanism that is used in many jurisdictions, both outside insolvency and in insolvency. It means that the veil created by the limited liability of the legal person is pierced, and the two entities or persons are treated as only one for the purposes of liability. This is obviously a very crude instrument that runs against the very economic and legal reasons for asset partitioning. It is therefore generally used with caution. At one end of the spectrum is the UK where the courts seem to be very reluctant to use this instrument and treat it as definitely more demanding than the concept of the shadow director.¹⁵⁹ In *Adams v. Cape Industries*, an asbestos case, the court upheld the limited liability of the parent against the asbestos victims of products distributed by one of its subsidiaries.¹⁶⁰ The observation of a UK expert is telling:

Groups of Companies: A Comparative Study of the Economics, Law, and Regulation of Corporate Groups

“(L)ifting the veil as a means of achieving group liability is a non-starter even in relation to what may be considered the most deserving case, namely the tort victims of a subsidiary company.”¹⁶¹ German courts also lift the corporate veil only rarely and under very tight requirements.¹⁶² On the other end of the spectrum seems to be the US, where the courts use this mechanism more frequently.¹⁶³ To be sure, we are dealing here with the corporate law mechanism of lifting the veil. When it comes to competition law, for example, there is much more willingness on the side of the antitrust authorities and the courts to hold the parent responsible for antitrust violations of its subsidiary.¹⁶⁴ As mentioned above, group legislation and regulation for specific areas is special since it has very different regulatory objectives. For competition law, this may amount to a liability of the parent without real negligent behavior if a subsidiary commits an antitrust violation, a rather controversial result.

The two mechanisms that are common to insolvency law in many countries are subordination and substantive consolidation. Subordination is known in many countries including Austria, Germany, Italy, Spain, the US, and New Zealand, but not in the UK.¹⁶⁵ In (p. 630) subordination, the controlling shareholder’s or parent’s debt claims are subordinated to the claims of all other creditors. This does not fully amount to what is now called a voluntary debt equity swap,¹⁶⁶ since the subordinated claims still rank before all equity that is held by the parent and other shareholders. The requirements for subordination as an insolvency mechanism differ considerably, reaching from inequitable behavior¹⁶⁷ to automatic subordination of shareholder credits given to the company under German insolvency law.

The insolvency regime can go further and allow the insolvency courts to consolidate the insolvency proceedings of several group members.¹⁶⁸ Consolidation can be merely procedural, in which case the companies belonging to the group are treated as a single unit under one bankruptcy proceeding. Consolidation can also be substantive, when the assets and/or debts of the different group members are pooled together. Procedural consolidation is possible, for example, under the New Zealand Companies Act 1993, and substantive consolidation is provided for under US insolvency law.¹⁶⁹ Under French and Belgian insolvency law, intermingling of assets (*action en confusion de patrimoine*) may lead to extending the insolvency of one company to another.¹⁷⁰ But this mechanism should be used with caution and is applied only when there is a real intermingling of the assets of the two corporations, and usually a fault on the side of the parent is necessary.¹⁷¹ The normal legal and commercial relationship between parent and subsidiary is not sufficient. Usually the insolvencies of multinational groups present particular difficulties. These difficulties are due not only to the different applicable laws and competent receivers and insolvency authorities, but also to the open or, in most cases, hidden opportunism of the latter in favor of their own national companies and creditors. Efforts to agree on international consolidation have been going on for a long time, but up to now only some steps in the direction of procedural consolidation have been made.

In the end, it may be concluded that creditor protection, in particular in corporate groups, is considered by many jurisdictions to be an agency conflict that needs to be regulated. But the strategies and mechanisms used for doing so are equivalent in function only on very basic terms. Fundamental differences remain in policy and even more so in legal doctrine. While we have observed a certain trend toward convergence for minority protection in the independent company and groups of companies by disclosure and, though less so, by standards, we would hardly dare to confirm this for creditor protection as well.

(p. 631) 7 Control Transactions

The second large category of conflicted transactions in corporate law besides related party transactions are control transactions, i.e., transactions by which the control over the corporation is transferred to another person or enterprise, usually by a public takeover.¹⁷² The two typical agency problems in takeovers are between the directors and the shareholders of the target, on the one hand, and between the majority and the minority shareholders of the target as to the premium and a possible exit, on the other.¹⁷³ In the first conflict, there are the fundamentally different positions of the UK and many continental European states that have the anti-frustration rule, and the US and other continental European states that give the directors full liberty to decide whether to refuse or to accept the bid.¹⁷⁴ As to the second conflict, a similar divide exists concerning the mandatory bid and the sharing rule for the minority shareholders.¹⁷⁵ In takeovers the situations and problems are different when the shareholders are diverse on the side of the target or there is a controlling shareholder.¹⁷⁶

Takeover regulation was developed first and primarily in the US and the UK where there is no—or no consistent—group law. In countries such as Germany, with an extensive, codified group law, takeover regulation appeared only very late. This is no coincidence since group law deals with some of the agency problems of minority shareholders at a later stage, namely when the group exists and the minority needs protection. Takeover regulation, in particular by the mandatory bid, comes in at a much earlier stage and allows the exit of the minority shareholders at the same price as those shareholders who accept the bid. The mandatory bid is a protective mechanism at the stage when a new controlling bidder might come in. The mandatory bid has therefore been considered functionally to be a group law provision, offering protection by exit before the (new) group is formed.¹⁷⁷ This is true even in cases of mere transfer of control by the takeover from the former controlling shareholder in the target to the new controlling shareholder whose bid has succeeded. The shareholders do not know in advance how the new controlling shareholder will use his control power and therefore might prefer an early exit at a fair price.¹⁷⁸ The exit after the takeover has been successful, either by squeeze-out or sell-out, can be allowed by takeover law and/or general corporate law. It is always the exit of a minority from a company with a controlling shareholder. This exit exists in independent companies as well as in groups of companies. As to squeeze-out (p. 632) and sell-out regulation¹⁷⁹ the dangers for the minority may be greater in groups.¹⁸⁰ As to convergence, the findings are

mixed. On the one hand, takeover regulation has spread from the US and the UK all over continental Europe and well beyond into Japan and other countries. But as to dealing with agency conflicts, the policies remain fundamentally different as the cleavage between the countries with and without the anti-frustration rule and with and without the mandatory bid shows.

8 Conclusion

1. The phenomenon of the groups of companies is very common in modern corporate reality. The empirical data on groups of companies are heterogeneous because they are collected for very different regulatory and other objectives.
2. Two main agency problems arise in groups of companies: between the controlling shareholder and the minority shareholders and between the shareholders viz. the controlling shareholder and the creditors. The conflict between labor and other stakeholders and the controlling shareholder is dealt with by labor law, industrial relations, and other fields of law.
3. There are three main regulatory models for dealing with groups of companies: regulation by general corporate and/or civil law (prototype: the UK); regulation by special group law (prototype: Germany); and regulation by areas of the law such as banking, competition, and tax law (to be found in many countries, either combined with the first or the second model).
4. The main strategy for dealing with groups of companies is disclosure and group accounting. It is effectuated by special investigation with a group dimension and by the help of auditors and independent experts. A fair amount of international convergence, at least for listed companies, can be observed.
5. Related-party transactions are a main area of concern for corporate and group law provisions. Specific disclosure is usually combined with consent requirements and other procedural regulation of related-party transactions.
6. In addition, appropriate standards for directors and controlling shareholders for dealing with agency conflicts in groups of companies have been developed in many countries. The duty of loyalty is an open standard to be concretized ex post by the courts. There is some convergence, but many differences remain, in particular as far as specific standards for balancing the interests of member companies in groups are concerned. The strict, codified German group law standard stands against more flexible standards in Italy, France, and other countries.
7. Protection of creditors can be achieved to a certain degree by self-help and guarantees by the parent. But mandatory protection is still considered necessary. There are various national standards for the directors and controlling shareholder in the independent (p. 633) company as well as in groups of companies. These standards become stricter if insolvency is approaching. The concept of the shadow director plays an important role in extending liability to the controlling shareholder and the parent.
8. There are various other mechanisms for creditor protection in the independent company and in the group of companies. Some of them, such as indemnification and veil-piercing, are used when the corporation is still doing well and is operating as a

Groups of Companies: A Comparative Study of the Economics, Law, and Regulation of Corporate Groups

going concern. Others are mechanisms of insolvency law, such as subordination and substantive consolidation. Creditor protection is still very path-dependent, and convergence is much less advanced.

9. A second group of conflicted transactions besides related party transactions comprise control transactions, in particular public takeovers. Takeover law was first developed in the US and the UK and from there has moved into other countries. Takeover law grew up separately from group law and only arrived in countries with group law such as Germany at a very late stage. The mandatory bid can be understood functionally as a group protection measure that allows the shareholders of the target to opt for an early exit at a fair price (group entry control or Konzerneingangskontrolle). There is some convergence, in particular in Europe, but fundamental differences remain as to the anti-frustration rule and the mandatory bid.

Corporate Social Responsibility and Corporate Governance

Cynthia A. Williams

The Oxford Handbook of Corporate Law and Governance

Edited by Jeffrey N. Gordon and Wolf-Georg Ringe

Print Publication Date: May 2018

Subject: Law, Company and Commercial Law, Law and Society

Online Publication Date: May 2016 DOI: 10.1093/oxfordhb/9780198743682.013.31

Abstract and Keywords

Corporate social responsibility is a subject of growing importance in business and law. Today, no analysis of corporate governance systems would be complete without considering the pressures on companies to be seen as responsible corporate citizens. This chapter provides a descriptive overview of developments in the field, including increasing voluntary and required environmental, social, and governance (ESG) disclosure; and proliferating voluntary and multilateral standards for responsible corporate behavior. It reviews some of the more significant empirical evidence on the financial results of companies' implementation of corporate responsibility initiatives, including the effects of such initiatives on innovation, trust, and social welfare. It concludes with an analysis relating these developments to arguments about the objectives of the corporation and the shareholder/stakeholder debate—with particular reference to the argument between Cornell Distinguished Professor of Corporate and Business Law, Lynn A. Stout, and Chief Justice of the Delaware Supreme Court, Leo E. Strine, Jr.

Keywords: social responsibility, corporate responsibility, ESG disclosure, environmental disclosure, social disclosure, governance disclosure, corporate behaviors

1 Introduction

CORPORATE social responsibility is a topic that has been given increased attention in the last two decades in practice and in theory, both in management and law. Defined in an influential 1970s article as “the firm’s considerations of, and response to, issues beyond the . . . economic, technical, and legal requirements of the firm to accomplish social benefits along with the traditional economic gains which the firm seeks,”¹ the European Commission more simply defined it in 2011 as “the responsibility of enterprises for their impacts on society.”² As the Commission stated in adopting that definition, “[e]nterprises should have in place a process to integrate social, environmental, ethical, human rights and consumer concerns into their business operations and core strategy in close collabo-

ration with their stakeholders.”³ Thus, the emphasis has shifted from philanthropy and attention to corporate action “beyond law” to an inquiry into how a company conducts its business. Indicative of this shift, many academics and practitioners in management now refer to the topic as corporate responsibility, not corporate social responsibility, as will this author.⁴

What is some evidence of a developing norm of corporate responsibility? Few global companies today fail to highlight their social initiatives and performance on their websites, (p. 635) while over 90% of the Global 250 companies voluntarily disclose more environmental, social, and governance (ESG) information than required by law.⁵ Voluntary, transnational standards of best social and environmental practices are proliferating in virtually every industry, many with associated certification schemes and requirements for third-party attestation or auditing.⁶ These voluntary initiatives are increasingly being supplemented by domestic and multilateral government actions to encourage, or in some cases require, companies to pay closer attention to the social and environmental consequences of their actions and to disclose more information about those consequences.⁷

Investors have also become more attentive in recent years to environmental and social risks in portfolio companies, and therefore more concerned with corporate responsibility. Global assets under management with sustainability screens have risen 61% since 2012, to US\$21.4 trillion at the start of 2014.⁸ Institutions managing US\$45 trillion of invested capital have committed to the UN Environment Program’s Principles for Responsible Investment (PRI), which require investors to incorporate ESG issues into investment practices across their asset classes.⁹ As of 2015, over US\$92 trillion of the world’s invested capital backs the Carbon Disclosure Project (CDP)’s work with 2,000 companies around the world to gather data on those companies’ greenhouse gas emissions.¹⁰ These data are then provided to Bloomberg for incorporation with other ESG data that Bloomberg has been selling (since 2009) to investors around the world.¹¹ Indeed, corporate responsibility itself has become an industry, one a critical NGO noted has rendered London “awash with PR consultants, social auditors, firms providing verification or ‘assurance’ for companies’ social and environmental reports, and bespoke investment analysts all vying for business.”¹²

While these trends indicate that corporate responsibility has achieved some place within mainstream corporate and investor activities, that place is deeply contested, in both theory and practice. Everything from the history of corporate responsibility, its importance, its effects, and its legitimacy is subject to challenge, depending on the underlying corporate governance system of the country in question, how countries arrange their social welfare provision, the relationship of the state to the market, and even the theory of the nature of the corporation one holds. In important respects corporate responsibility is both too strong and too weak: too strong an assertion of a social role for the corporation and its directors to coexist comfortably with the view of the purely economic role of the corporation within shareholder-focused corporate governance systems, and yet too weak for academics taking (p. 636) a stakeholder view of the corporation who are concerned with global problems they view companies as having helped to create, including climate change,

environmental degradation, exploitative labor conditions, and worsening economic inequality.

This chapter will proceed as follows. Section 2 will describe voluntary corporate responsibility initiatives, followed in section 3 by some of the more significant legal developments on the topic. Section 4 will discuss empirical evidence about the financial and social effects of corporate responsibility, including interactions with corporate governance structures. Section 5 will evaluate these corporate responsibility trends, and Section 6 will conclude.

2 Voluntary Corporate Responsibility Initiatives

2.1 Corporate Responsibility Reporting

The clearest demonstration of the evolution of corporate responsibility from academic theory to mainstream business practice is in the trends with respect to corporate reporting of ESG information.¹³ While some jurisdictions are starting to require ESG reporting (as described below), much of this reporting is still voluntary. It can thus be interpreted as an indication of companies' perceptions of the social expectations of business, even as companies seek to manage those expectations through their corporate responsibility reporting.¹⁴

The most comprehensive source of data on ESG reporting is that done by KPMG in the Netherlands. KPMG published its first ESG report in 1993, and its most recent in 2013. In 1993, 12% of the top 100 companies in the OECD countries (ex. Japan) published an environmental or social report.¹⁵ By 2013, 76% of the top 100 companies in the Americas published a separate corporate responsibility report, as did 73% of top 100 companies in Europe and 71% in Asia.¹⁶ Of the largest 250 companies globally, reporting rates are 93%.¹⁷ The Global Reporting Initiative (GRI)'s voluntary, multi-stakeholder framework for ESG reporting has emerged as the clear global benchmark: 78% of reporting companies worldwide and 82% of (p. 637) the Global 250 use GRI as the basis for their corporate responsibility reporting.¹⁸ Of particular note, slightly over half (59%) of the Global 250 now have their reports "assured," most often (two-thirds of the time) by the specialist bureaus of the major accountancy firms.¹⁹

In addition to the quantity of corporate responsibility reporting, KPMG also evaluates the quality of reporting. Here, European companies generally do substantially better than those in Asia or the Americas (average quality scores of 71 out of 100 in Europe versus 54 for companies in the Americas and 50 in Asia Pacific).²⁰ Within the Global 250, companies are starting to see more opportunities than risks from social and environmental factors, such as for the development of new products and services. Eighty-seven percent of the Global 250 identify climate change, material resource scarcity, and trends in energy and fuel as "megatrends" that will affect their business.²¹ Ultimately, KPMG concludes that "[m]any companies no longer see corporate responsibility as a moral issue, but as core

business risks and opportunities.”²² This conclusion is consistent with the views of prominent management academics Michael Porter and Mark Kramer,²³ and Abigail McWilliams and Donald Siegel,²⁴ who (among others) have argued for companies to use corporate responsibility initiatives as part of their business strategies to promote competitive advantage.

2.2 Substantive Corporate Responsibility Initiatives

2.2.1 Private Initiatives

The focus on expanded ESG disclosure has occurred concomitantly with the proliferation of transnational, voluntary standards for what constitutes responsible corporate action. Thus, over the past two decades such standards have been developed by states; public/private partnerships; multi-stakeholder negotiation processes; industries and companies; institutional investors; functional groups such as accountancy firms and social assurance consulting groups (many of which did not exist more than ten years ago); NGOs; and non-financial ratings agencies.²⁵ Standards have been developed in just about every industry, from apparel²⁶ to (p. 638) chemicals,²⁷ extractives such as oil, gas and minerals²⁸ to conflict-free diamonds²⁹; sustainable fisheries³⁰ and forestry;³¹ project finance;³² and fair-trade goods such as coffee, tea, cocoa, and cotton,³³ to name just a few examples. Thousands of individual companies have adopted voluntary codes of conduct establishing standards for responsible behavior, and some companies then engage third-party certifiers to ensure that their suppliers and subsidiaries are meeting those standards.³⁴ Multi-sector codes have also been developed with standards that are designed to apply across industries. Of particular note here is Social Accountability 8000 (SA 8000), which is based on the International Labor Organization (ILO)’s Fundamental Principles and Rights at Work,³⁵ but adds a commitment to a living wage, and a commitment to compliance with UN international human rights protections.³⁶ SA 8000 also includes a requirement for independent monitoring of code compliance prior to certification that specific productive facilities meet the SA 8000 standards. Another multi-sector example is the Ethical Trading Institute (ETI), which is a London-based tripartite labor, industry, and NGO organization working to incorporate ILO protections into supply chains for products bound for the Western markets.³⁷ ETI works in a deliberative (p. 639) fashion, using monitoring, evaluation, and ongoing learning to both improve standards for the 9.8 million people incorporated into the 70 companies’ supply chains (as of 2015), but also to teach workers their rights and how to advocate for them independently.³⁸

2.2.2 Multilateral Initiatives

A number of significant multilateral instruments have also been developed or recently strengthened by organizations comprised of government representatives. While these instruments do not establish binding treaty obligations, they do articulate governments’ expectations of responsible corporate action. Four are of particular note: the OECD’s Guidelines for Multinational Enterprises; the ISO 26,000 Corporate Responsibility standards;

Corporate Social Responsibility and Corporate Governance

the UN's Global Compact; and the UN's more recent "Protect, Respect and Remedy" framework articulating states' and companies' human rights responsibilities.

The OECD's Guidelines, initially promulgated in 1976 and most recently amended in 2011, encourage companies to promote sustainable development, and include standards based on ILO and UN treaty obligations, including standards of transparency, labor protection, international human rights protection, responsible supply chain management, environmental protection, anti-bribery standards, and fair tax contributions (added in 2011 and unique among international corporate responsibility standards).³⁹ A number of aspects of the OECD approach are of particular importance. First, the standards are developed through tripartite participation of governments (through the OECD itself), business (the Business and Industry Advisory Committee to the OECD), and labor (the Trade Union Advisory Committee to the OECD). This approach is typical of the "social partners" view of economic life in Europe. Second, the OECD is starting to develop sector-specific guidance for responsible business conduct in a number of areas: agricultural supply chains, financial sector due diligence, textile and garment supply chains, extractive sector stakeholder engagement, and mineral supply chains. Third, the OECD countries, which include most of the developed economies (excepting Brazil, Russia, India, and China), all commit to establish National Contact Points (NCPs) to whom challenges may be brought where individuals feel their OECD rights have been violated. Labor, in particular, has been proactive in using these NCPs to address violations, and by so doing a record of global labor rights and responsibilities is slowly being developed.⁴⁰

The International Standards Organization (ISO), which has developed thousands of technical standards since its establishment after World War II, developed the ISO 26000 standard for corporate responsibility in 2010, after five years of consultation among standards bodies.⁴¹ Unlike most of its standards, against which certification can occur, ISO (p. 640) 26000 is not a standard to provide guidance for certification. It does, however, provide a useful definition of corporate responsibility:

CSR is the responsibility of an organization for the impacts of its decisions and activities on society and the environment, through transparent and ethical behavior that contributes to sustainable development, including health and the welfare of society, takes into account the expectations of stakeholders, is in compliance with applicable laws and with international norms of behavior, and is integrated throughout the organization and practiced in its relationships.⁴²

ISO 26000 is important as evidence of the developing global norm of corporate responsibility: developed with representation from 90 countries and 40 international or regional organizations, it was drafted with input from consumers, governments, industry, labor, NGOs and "service, support, research, academics and others,"⁴³ and so can credibly claim to represent a global consensus about companies' social responsibilities. To read the specific standards one must buy them (somewhat ironic where one responsibility principle is transparency, but an apparently successful business model), but an outline of the topics is available. ISO 26000 defines general principles of accountability, transparency,

Corporate Social Responsibility and Corporate Governance

ethical behavior, respect for stakeholder interests, for rule of law, for international norms and human rights as the field of corporate responsibility; and core subjects include governance, human rights, labor practices, the environment, fair operating practices, consumer issues, and community involvement.⁴⁴

The United Nations began its work on corporate responsibility in 2000 under Secretary General Kofi Annan with the Global Compact, a policy initiative in which businesses commit to respect ten principles that cover four areas of concern (international human rights, labor protection, environmental protection, and anti-corruption).⁴⁵ By 2015, 12,000 businesses, academic institutions, and NGOs in 140 countries had signed onto the Global Compact. Governance efforts are underway to make corporate commitments to the Global Compact framework meaningful, including requirements for participants to communicate annually on their progress regarding the four areas of concern. Still, by 2008 close to 15% of companies had been de-listed from the Global Compact for failing to report on their progress, and the Global Compact continues to be criticized for its lack of specificity.⁴⁶

Among multilateral frameworks, the UN's Guiding Principles on Business and Human Rights, adopted by the UN Human Rights Council in 2011, seems to have the greatest potential to develop into a baseline global legal framework for companies' social responsibilities. (The OECD Principles only apply to companies in or from adhering countries.) The UN Guiding Principles set out the core spheres of obligation for states and companies with respect to human rights: states have the duty to *protect* their citizens from violations by third (p. 641) parties, including companies, by promulgating laws and regulations; companies have the responsibility to act with due diligence to *respect* citizens' human rights; and both states and companies have the duty to provide access to *remedies* for victims. Developed after the failure in 2004 of the UN Human Rights Commission's Draft Norms on the Responsibilities of Transnational Corporations and Other Business Enterprises with Regard to Human Rights, which "business vehemently opposed,"⁴⁷ the Protect, Respect, and Remedy framework was developed in a six-year process led by Prof. John Ruggie of Harvard University. The international human rights obligations applicable to companies through the Guiding Principles include those in the Universal Declaration of Human Rights, the International Covenants on Civil and Political Rights and on Economic, Social and Cultural Rights, and the Core Conventions of the ILO.⁴⁸ The state duty to protect human rights is now being incorporated into many European and other countries by the establishment of National Action Plans to disseminate and implement the Guiding Principles.⁴⁹ At the same time, an NGO called the Business and Human Rights Resource Centre, supported by the UK and German governments, has launched a ranking of companies' human rights records in response to the Guiding Principles.⁵⁰ The combination of global standards supported by and being implemented by a broad array of governments, a standards-development process that was inclusive, transparent and well-balanced between companies, labor, and NGOs, and a dedicated NGO collecting data and publicizing it, gives the UN Guiding Principles the potential to become the de facto global corporate responsibility standard.

3 Significant Legal Requirements

For the most part, corporate responsibility standards are voluntary, with the exception of new legislation in India, which has required companies to establish a corporate responsibility committee of the board and contribute 2% of net profits to corporate responsibility initiatives as of 2014,⁵¹ building upon strong cultural foundations for the social obligations of successful companies (and people) in India.⁵² That said, many of the topics that corporate (p. 642) responsibility addresses are subject to domestic regulation, such as labor rights, environmental protection, consumer protection, anti-discrimination, or anti-bribery. And these regulatory standards have implications for the degree to which voluntary corporate responsibility initiatives are necessary to fill important gaps, either in a domestic or transnational context. As has been argued by Dirk Matten and Jeremy Moon, in countries with stakeholder corporate governance systems and more expansive social welfare arrangements, corporate responsibility is “implicit” in doing business according to law, so companies do not need to be as “explicit” about taking on social responsibilities, as do leading companies in more shareholder-oriented countries.⁵³ As will be discussed below, recent empirical evidence suggests that these underlying regulatory standards effectively shape the sustainability culture within countries, and have both an effect on how companies handle corporate responsibility issues and an effect on the sustainability outcomes at the country level.⁵⁴ To the extent that governments have regulated corporate responsibility per se, however, such regulation is focused on disclosure.

By 2015, many European countries or their stock exchanges, and the EU itself, require some environmental or social disclosure, to varying degrees of specificity.⁵⁵ The EU’s requirement is a directive that entered into force on 6 December 2014; member states will need to transpose it into national legislation within two years.⁵⁶ It will require approximately 6,000 large companies and “public interest organizations,” such as banks and insurance companies, to “prepare a non-financial statement containing information relating to at least environmental matters, social and employee-related matters, respect for human rights, anti-corruption and bribery matters.”⁵⁷ This requirement builds upon EU accounting rules (the EU Accounts Modernization Directive) that have, since 2003, required companies to report on environmental and labor issues “to the extent necessary” to provide investors with an accurate view of the company’s financial position and the risks to that position.⁵⁸

In addition to the new EU non-financial disclosure requirements, the Nordic countries have been leaders in requiring corporate reporting that is more comprehensive than the reporting required by the EU’s 2003 Accounts Modernization Directive. Since 2008, public companies in Sweden must make a sustainability report consistent with GRI.⁵⁹ Since (p. 643) January 2009, approximately 1,100 large companies in Denmark, as well as institutional investors and loan providers, have been required to publish an annual corporate responsibility report, following a 2008 government Action Plan on Corporate Responsibility.⁶⁰ Companies may use their annual reporting to the UN Global Compact as the framework for their public disclosure, and institutional investors may report on their incorporation of the Principles of Responsible Investment (PRI) developed by the UN Environment

Corporate Social Responsibility and Corporate Governance

Program.⁶¹ And as of 1 July 2013, Norwegian companies must report on labor issues, gender equality, anti-discrimination and environmental issues, including reporting on what they are doing to incorporate these issues and human rights concerns into management practices.⁶²

These examples are indicative of a global trend toward required corporate responsibility reporting. According to a 2015 report by the Initiative for Responsible Investment of the Hauser Institute for Civil Society at the Kennedy School, Harvard University, 23 countries have enacted legislation within the last 15 years to require public companies to issue reports including environmental and/or social information.⁶³ These countries include Argentina, China, Denmark, the EU, Ecuador, Finland, France, Germany, Greece, Hungary, India, Indonesia, Ireland (specific to state-supported financial institutions after the 2008 financial crisis), Italy, Japan, Malaysia, the Netherlands, Norway, South Africa, Spain, Sweden, Taiwan, and the UK.⁶⁴ Of these countries, France is particularly noteworthy, having been a leader by requiring publicly listed companies to report data on 40 labor and social criteria since 2002, followed by requirements in 2009 for companies with more than 500 employees in high-emitting sectors to publish their greenhouse-gas (GHG) emissions.⁶⁵

In addition to these reporting initiatives, seven stock exchanges require social and/or environmental disclosure as part of their listing requirements: Australia's ASX, Brazil's Bovespa, India's Securities and Exchange Board, the Bursa Malaysia, Oslo's Børs, the Johannesburg Stock Exchange, and the London Stock Exchange.⁶⁶ Moreover, seven countries have enacted policies following those of the UK and Sweden, which since 2000 have required pension funds to disclose the extent to which the fund incorporates social and environmental information into their investment decisions.⁶⁷ These countries include Australia, Belgium, Canada, France, Germany, Italy, and Japan.⁶⁸

(p. 644) Notably missing from any of these lists of comprehensive ESG disclosure is the United States, which does have specific disclosure requirements in certain regulatory contexts but no general ESG disclosure framework. Since 1986, the Environmental Protection Agency has required facility-by-facility disclosure concerning the release into the environment and/or management through recycling of over 650 chemicals through the Toxic Release Inventory.⁶⁹ The US Securities and Exchange Commission (SEC) requires substantial corporate governance disclosure from its publicly listed companies, as do most countries. Nevertheless, generalized requirements for environmental or social disclosure tend to be narrower than those described above.

Current SEC regulations require disclosure of environmental litigation against any government agency where a penalty of \$100,000 is sought,⁷⁰ and the SEC has issued guidance for listed companies regarding the extent to which they should disclose climate risks to their future profitability, either from physical changes associated with climate change, or from regulatory initiatives designed to mitigate climate risk.⁷¹

Four relevant disclosure requirements (with rulemaking directives to the SEC) were enacted as part of the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010, each targeting an aspect of a company's social record: the ratio of the CEO's total

pay to the median employee pay⁷²; mine safety disclosure⁷³; “conflict minerals” disclosure where tin, tantalum, tungsten, or gold from the Democratic Republic of the Congo or neighboring countries were incorporated into listed companies’ products⁷⁴; and “publish what you pay” (p. 645) transparency disclosure for extractive company payments to host countries.⁷⁵ These latter two disclosure provisions have been challenged in litigation by the National Association of Manufacturers (challenging conflict mineral disclosure), and the American Petroleum Institute (challenging publish what you pay), joined in both instances by the US Chamber of Commerce.

The SEC’s implementing rule on conflict mineral disclosure, requiring listed companies to engage in a due diligence process to determine if their supplies of the named minerals were from mines supporting armed rebels or the Congolese army, was generally upheld by the District Court⁷⁶ and Court of Appeals for the District of Columbia Circuit, with one exception identified by the Court of Appeals.⁷⁷ That exception held that required language in reports to the SEC and on a company’s website that minerals “have not been found to be DRC conflict free” where a company’s due diligence could not exclude the possibility of conflict minerals in their supply chains violated companies’ First Amendment rights.⁷⁸ That aspect of the Court of Appeals’ decision was further reviewed and subsequently upheld by the Court of Appeals,⁷⁹ but the rest of the rule has gone into effect, requiring companies to evaluate whether their supplies are conflict free and to report on their due diligence procedures, without using the offending required language.

The 2012 “publish what you pay” rule promulgated by the SEC in response to Dodd-Frank was vacated by the District Court for the District of Columbia Circuit for failing to include any exemptions for public disclosure where host countries prohibit it (such as Angola, Cameroon, China, and Qatar), and for interpreting Dodd-Frank to require public disclosure rather than considering disclosure only to the SEC.⁸⁰ As of August, 2015, the SEC had not reissued the rule.

Generally, however, there is a clear trend toward an increasing number of environmental and social disclosure requirements around the world. A report by KPMG, UNEP, GRI, and the Unit for Corporate Governance in Africa which identified individual reporting initiatives in 45 countries found 180 such initiatives in 2013, three times the number they had found in 2006.⁸¹ Such reporting initiatives included ESG/sustainability disclosure frameworks, such as GRI; requirements or recommendations for disclosure of individual (p. 646) topics (e.g., GHGs) or addressed to specific industries (e.g., mining); or were standards regarding sustainability assurance. Of these 180 reporting initiatives, 72% were mandatory, compared to 58% mandatory in 2006.

(*) It should be noted that some significant number of articles in psychology, particularly industrial and organizational psychology, are published in management journals.

4 Empirical Findings

The trends described above of increasing voluntary corporate ESG disclosure, increasing numbers of voluntary corporate responsibility standards and multilateral frameworks, and increasing numbers of jurisdictions imposing standards for required ESG disclosure suggest that corporate responsibility is becoming important in the institutional and normative frameworks shaping companies' actions. Notwithstanding these trends, the concept of corporate responsibility remains contested from a number of perspectives. In the following sections, some empirical evidence about these trends in relation to institutions of corporate governance will be discussed, followed by a number of critical perspectives.

Two caveats, however, with regard to this discussion of the interaction of corporate responsibility and corporate governance. The topic of corporate responsibility has been given increasing academic attention in the past decades, as the table prepared by Timothy Devinney, University Professor of International Business at the University of Leeds, indicates (see Table 24.1). Table 24.1 shows the number of published articles on corporate responsibility within various fields, based on a database Devinney constructed.

The following discussion aims to bring forward a number of the more evocative empirical research findings about corporate governance influences on corporate responsibility, particularly those with implications for the future of this field. It clearly does not purport to be a comprehensive review of this burgeoning literature. Second, the empirical literature on corporate responsibility is equivocal in many respects, as will be discussed below. This is arguably not very different from the equivocal results of corporate governance research generally, as Ruth Aguilera, Kurt Desender, Michael Bednar, and Jun Ho Lee have shown in an argument for better understanding the effects of external corporate governance (law, the market for corporate control, external auditors, stakeholder activism, ratings agencies, and the media) on internal corporate governance and financial results.⁸² As with corporate governance, equivocal empirical results here simply suggest there is more work to be done.

4.1 Corporate Responsibility and Financial Performance

One of the perennial debates in this field is whether corporate responsibility initiatives lead to better firm-level financial performance, the “business case” for corporate responsibility.⁸³ There are a number of aspects to this debate, but two primary issues are: first, whether corporate responsibility initiatives pay off, or whether instead they are a waste of money and evidence of unaddressed agency costs; and second, if financial performance is found to be better in firms with robust responsibility initiatives, which way does causation go? Do better-performing firms invest in corporate responsibility because they have higher slack resources, or do the investments come first and the better financial results follow?

The research addressing both of these issues has led to a welter of conflicting results, which is likely due to three primary factors. First, the breadth of issues encompassed within “corporate responsibility” means different studies are very often looking at different things, while using the same generic labels, as Judith Walls, Pascual Berrone, and Philip Phan have argued in narrowing their own scope of quantitative analysis, as discussed below.⁸⁴ Moreover, there are different mechanisms by which corporate responsibility initiatives may contribute to a company’s results, as discussed by Archie Carroll and Kareem Shabana in arguing for a broader concept of “the business case” for corporate responsibility.⁸⁵ These differing mechanisms, including “business benefits of (1) reducing costs and risks; (2) strengthening legitimacy and reputation; (3) building competitive advantage; and (4) creating win-win situations through synergistic value creation,”⁸⁶ would affect results depending on the type of corporate responsibility issue and initiative being examined, the size of the firm, the industry, and the social and legal context.⁸⁷

Second, there are mediating variables that until recently were not being carefully disaggregated. A widely cited study by Abigail McWilliams and Donald Siegel from 2000 that discusses the equivocal financial results in studies of corporate responsibility is based on this point, showing that R&D intensity and advertising intensity of industries explain any significant financial out-performance from corporate responsibility, while recognizing close (p. 648) correlations between corporate responsibility and R&D and advertising.⁸⁸ As studies have become more sophisticated in identifying the mediating variables, the results are starting to be more consistent in showing positive financial results from corporate responsibility.

Third, until recently the data were not very good. Early studies had only a firm’s own disclosure to “measure” a firm’s social or environmental performance, and some of that disclosure was undoubtedly exaggerated. Today there are multiple databases collating much better quantitative and qualitative sources of information about firms’ actual social and environmental performance—such as the data Bloomberg sells to its clients. The misspecification issues are well-known and being addressed by targeted studies. As a consequence, certain results are emerging that substantiate the early (2003) meta-analytic result of Marc Orlitzky, Frank Schmidt, and Sara Rynes that corporate responsibility investments can pay off.⁸⁹ A number of examples follow.

In a paper showing superior corporate responsibility performance from companies in countries with a Scandinavian legal origin, and then German and French legal origins, and the superiority of all three in comparison to the common law countries (results discussed in more detail in section 4.4 below), Hao Liang and Luc Renneboog show that better corporate responsibility performance also increases firm value, as measured by Tobin’s Q.⁹⁰ This finding is consistent with the results of Bob Eccles, Ioannis Ioannou, and George Serafeim, who demonstrate based on 18 years’ worth of observations of 90 matched pairs of high-sustainability versus low-sustainability companies that companies with a strategic focus on ESG issues show financial outperformance, and stock market and accounting value premiums.⁹¹ As Eccles, Ioannou, and Serafeim recognize, these are long-term strategies and not consistent with short-term market pressures or results. One

can hypothesize that in the United States, where short-term activist shareholders are becoming increasingly powerful, corporate responsibility initiatives will be under pressure. More recent work by Serafeim and colleagues Mozaffar Khan and Aaron Yoon shows that management attention to material sustainability risks yields financial outperformance of 3–8%, evaluated within industries using specific concepts of industry-relevant materiality being developed in the United States by the Sustainability Accounting Standards Board (SASB).⁹²

If some corporate responsibility initiatives lead to better financial performance, in some industries and legal contexts, a follow-on question is why. Here a number of very recent empirical studies show that important mediating variables are innovation and trust. Companies with a longer-term management focus⁹³ or a stakeholder orientation⁹⁴ promote innovation within the firm and higher levels of trust of the firm among various external stakeholders. In one study, Caroline Flammer and Aleksandra Kacperczk used a “natural experiment” to demarcate a shareholder from a stakeholder orientation of a firm, which was the enactment in various states of the United States of “other constituency” statutes.⁹⁵ In the law literature, these statutes, which give directors the statutory discretion to consider constituents other than shareholders in making decisions, particularly decisions to resist takeovers, have generally been interpreted to be relatively unimportant, and underutilized, albeit with the potential to create ambiguity regarding directors’ duties.⁹⁶ What Flammer and Kacperczk found, however, based on regressions on 159,558 firm-year observations, is that measures of innovation—the number of patents issued and the number of citations to those patents—increased significantly (went up between 6.4% and 6.8%) in companies in states that enacted an “other constituency” statute.⁹⁷ They interpret these results to show that the protections of other constituency statutes allow for greater experimentation within the firm, which results in both more “flops” and more “hits” on which the firm can get a patent.⁹⁸ In another study, Flammer and Pratima Bansal found an increase in firm value after the firms adopted longer-term management compensation plans, and also found improved operating performance on each of three metrics (return on assets, net profit margin, and sales growth).⁹⁹ In year one after the firm adopted the longer-term plan, operating performance declined, which Flammer and Bansal suggest shows that “increased long-term orientation may take some time to materialize into higher profits.”¹⁰⁰ Flammer and Bansal’s results were mediated by increases in innovation after firms adopted a longer-term orientation, as measured by increasing investment in R&D; and increases in social capital investments and performance (legitimacy, reputation, and trust).¹⁰¹

Empirical results from Jordi Surroca, Josep Tribó, and Sandra Waddock support the theory that intangibles like innovation are a necessary mediating variable that explains the relationship between corporate responsibility and better financial performance.¹⁰² Their study shows that corporate responsibility strategies and operating procedures positively influence intangibles of innovation, human capital improvements, reputation, and corporate culture, (p. 650) and that these intangibles are significantly related to corporate financial performance.¹⁰³ If the effects on intangibles are statistically “pulled out,” then corporate responsibility performance does not show significant effects on corporate fi-

nancial performance.¹⁰⁴ These mediating influences are stronger in growth industries versus mature industries, and causality is shown in both directions in both growth and mature industries: better financial performance supports some of the same intangibles and leads to better corporate responsibility performance, and vice versa.¹⁰⁵ Taken together, Surroca et al. conclude that it is the necessity of understanding the mediating variables that explains many of the mixed results of previous investigations of the business case, and explains some of the modesty of the Orlitzky et al. results in their 2003 meta-analysis.¹⁰⁶

A comprehensive review in 2014 of empirical studies of the financial results of corporate responsibility by Gordon Clark, Andreas Feiner, and Michael Viehs found that 90% of studies show that sound sustainability standards lower firms' cost of capital; 80% of studies show that the stock price performance of companies is positively influenced by good sustainability practices; and 88% of studies show that better E, S, or G practices result in better operational performance.¹⁰⁷ While the answers are thus becoming clearer on the empirical questions related to the business case, it is not fully settled under what conditions corporate responsibility leads to better firm performance when it does, or the direction of causality.¹⁰⁸ As Devinney put the question in 2009: What are the corporate responsibility competencies that can be linked to which specific performance outcomes, and through which operational and managerial competencies?¹⁰⁹

4.2 Board Composition and Committees

One structural feature that would seem to indicate a seriousness of purpose about corporate responsibility, or at least the potential for a connection between a governance mechanism and corporate social performance, would be a board committee dedicated to the topic. Yet the empirical evidence is mixed on this point. Judith Walls, Pascual Berrone, and Philip Phan made the methodological observation that there are different aspects to a company's social performance, and so the mixed results from empirical studies could be a function of failing to untangle competing parameters.¹¹⁰ Moreover, the strategic use of disclosure to manage stakeholder relationships may obfuscate performance: the worst environmental performers (p. 651) might use the most environmental disclosure to manage public relationships, for instance, while the worst social performers (community, labor, and supply chain management) might use the least social disclosure.¹¹¹ Since disclosure was used as the evidence for corporate social performance in many previous studies, such patterns would produce conflicting—and inaccurate—results. Thus, Walls et al. only evaluated environmental performance (not environmental disclosure) as a function of various aspects of governance (size of a company, board structure, ownership, executive power, and executive compensation).¹¹²

The authors found two noteworthy effects regarding the board. First, the existence of a specialized environmental board committee was related to both better and worse environmental performance, suggesting that board committees could be established either to promote better environmental performance or as a reaction to environmental problems.¹¹³ Second, more independent, larger, and less diverse boards were associated

Corporate Social Responsibility and Corporate Governance

with worse environmental outcomes, possibly because of a lack of in-depth knowledge of environmental risks to the company.¹¹⁴ Moreover, an important interaction Walls et al. describe is between a strong CEO (having both the role of CEO and Chairman of the Board) and an insider board: companies with this configuration have better environmental outcomes than do companies with a split CEO/Chair and more independent board.¹¹⁵ As Walls et al. state “This interesting finding suggests that powerful CEOs may be important for environmental outcomes, and that the vision of such CEOs can be fostered by boards consisting of supportive inside directors.”¹¹⁶ The same general pattern was demonstrated by Surroca and Tribò, who found that increased independence of the board, split CEO and Chair, and the presence of independent committees reduced corporate social performance. Surroca and Tribò interpreted these results to suggest that corporate responsibility is a strategy for management entrenchment and thus indicative of agency concerns.¹¹⁷ That is, by establishing stronger ties with internal and external constituents, particularly employees and community elites, the top management team insulates themselves from the accountability mechanisms of an independent board and Chair.¹¹⁸

That a dedicated corporate responsibility committee on the board cannot be taken as an unambiguous signal of support for the topic is suggested in Table 24.2, which lists the top 25 companies in the world, by market capitalization, and some features of their corporate governance and responsibility arrangements.

From this table we can see both corporate responsibility leaders with dedicated committees (Johnson & Johnson; Novartis), as well as those companies in industries that have been subject to pointed social criticism (JPMorgan Chase, criticized for its role in the financial crisis; Coca-Cola for its role in water depletion in India and contributing to obesity generally through its products). Notable as well is that of the top 25 companies in the (p. 652) (p. 653) (p. 654) (p. 655) (p. 656) world, by market capitalization, 19 of which are from the United States, only one, Berkshire Hathaway, does not have a portion of its website dedicated to corporate responsibility or sustainability issues. Berkshire Hathaway may not need such a page, given that its CEO, Warren Buffett, is known for a clear commitment to simple guiding principles, such as this one prominently featured on the company’s website:

Corporate Social Responsibility and Corporate Governance

Given the variety and complexity of ethical questions that may arise in the Company’s course of business, this Code of Business Conduct and Ethics serves only as a rough guide.

Confronted with ethically ambiguous situations, the Covered Parties should remember the Company’s commitment to the highest ethical standards and seek advice from supervisors, managers or other appropriate personnel to ensure that all actions they take on behalf of the Company honor this commitment. When in doubt, remember Warren Buffett’s rule of thumb:

“ . . . I want employees to ask themselves whether they are willing to have any contemplated act appear the next day on the front page of their local paper—to be read by their spouses, children and friends—with the reporting done by an informed and critical reporter.”¹¹⁹

But that even Alibaba, a Chinese Internet sales company incorporated in the Cayman Islands which is being investigated for extensive sales of counterfeit products online,¹²⁰ would include a “sustainability” page on its website suggests at least two things: global companies feel pressure from social actors to be seen to embrace positive social and environmental values; and companies’ disclosure cannot be understood as an unambiguous signal of actual corporate responsibility.

4.3 Patterns of Shareholder Ownership

As noted in the introduction to this chapter, there is evidence that some types of institutional shareholders are paying more attention to ESG issues, and that this is one source of pressure on companies also to pay more attention.¹²¹ Trillions of dollars of invested capital supporting initiatives such as the UN Environment Program’s Principles of Responsible Investment or backing the Carbon Disclosure Project’s efforts to get better data on company’s management of GHG emissions send a signal to companies that at least some investors care about these topics. Of potentially greater significance, since 2009, Bloomberg has included 79 environmental and social data points in the information it sells to brokers and dealers throughout the world, as indicated in Table 24.3. (p. 657)

(p. 658) (p. 659) (p. 660) (p. 661)

(p. 662)

Table 24.3 Bloomberg Social and Environmental Metrics Chart		
Num-ber	Name	Description
Social Metrics		

Corporate Social Responsibility and Corporate Governance

1	Social Disclosure Score	Proprietary Bloomberg score based on the extent of a company's social disclosure as part of Environmental, Social and Governance (ESG) Data.
2	Number of Employees—CSR	This is the total number of company employees at the end of the reporting period disclosed in the company's Corporate Responsibility reports.
3	Employee Turnover %	Number of employees that left the company within the past year expressed as a percentage of the average total number of employees.
4	% Employees Unionized	Number of employees that belong to labour unions as a percentage of the total number of employees.
5	% Women in Workforce	Number of women employed at the company expressed as a percentage of the total number of company employees.
6	% Women in Management	Percentage of women employed in management positions at the company.
7	% Minorities in Workforce	Number of minorities employed at the company expressed as percentage of the total number of employees.
8	Lost Time Incident Rate	Total number of incidents resulting in lost time from work, per 200,000 hours worked or per 100 full time equivalent employees, assuming employees work 40 hours per week and 50 weeks per year.
9	Total Recordable Incident Rate	Total number of recordable incidents, per 200,000 hours worked or per 100 full time equivalent employees, assuming employees work 40 hours per week and 50 weeks per year.
10	Fatalities—Employees	Number of employees who have died on a company site or on a company facility or as a result of a company's operations.
11	Fatalities—Total	Total number of employees and contractors who have died on a company site, at a company facility, or as a result of a company's operations.

Corporate Social Responsibility and Corporate Governance

12	Social Supply Chain Management	Indicates whether the company has implemented any initiatives to reduce the social risks in its supply chain. Social risks might include poor working conditions, the use of child or forced labour, lack of a living, fair or minimum wage, etc.
13	Sustain Sup Guidelines Encomp ESG Area Pub Disclsd	Indicates whether a supplier's guidelines, which encompass all Environmental, Social, and Governance (ESG) areas, are publically disclosed.
14	Community Spending	Amount of money spent by the company on community-building activities in millions.
15	Total hours spent by Firm—Employee Training	Hours the company spent on employee training during the reporting period as reported by the company.
16	Health and Safety Policy	Indicates whether the company has recognized its health and safety risks and responsibilities and is making any effort to improve the management of employee health and/or employee safety.
17	Fair Remuneration Policy	Indicates if the company has demonstrated a group-wide commitment to ensure payment of a fair (could be defined as minimum, living, or some other criteria) wage to all group employees, even in those countries that do not legally require a minimum wage.
18	Training Policy	Indicates whether the company has implemented any initiatives to train new and existing employees on career development, education, or skills.
19	Employee—CSR training	Discloses whether the company conducts training courses for employees on Corporate Social Responsibility (CSR).
20	Equal Opportunity Policy	Indicates whether the company has made a proactive commitment to ensure non-discrimination against any type of demographic group.

Corporate Social Responsibility and Corporate Governance

21	Human Rights Policy	Indicates whether the company has implemented any initiatives to ensure the protection of the rights of all people it works with.
22	Policy Against Child Labour	Indicates whether the company has implemented any initiatives to ensure the prevention of child labour in all parts of its business.
23	Business Ethics Policy	Indicates whether the company has established ethical guidelines and/or a compliance policy for its non-management/executive employees in the conduct of company business.
24	Anti-Bribery Ethics Policy	Indicates whether the company has policies in place to prevent bribery of its employees, executives, and directors by others, and/or prevention of involvement in any corrupt business practices limiting open competition by deception, including but not limited to: cartels, collusion, fraud, embezzlement, nepotism, price fixing, and preferred patronage.
25	Whistle Blower Protection	Indicates whether the company has systems and policies in place for the reporting of internal ethical compliance complaints without retaliation or retribution, including but not limited to access to confidential third-party ethics hotlines or systems for confidential written complaints.
26	UN Global Compact Signatory	Indicates whether the company is a signatory of the United Nations Global Compact.
Environmental Metrics		
1	Environmental Disclosure Score	Proprietary Bloomberg score based on the extent of a company's environmental disclosure as part of Environmental, Social, and Governance (ESG) data.
2	Direct CO ₂ Emissions	Direct Carbon Dioxide (CO ₂) Emissions of the company, in thousands of metric tons.
3	Methane Emissions	Total amount of methane emitted by the company, in thousands of metric tons.

Corporate Social Responsibility and Corporate Governance

4	Direct Nitrous Oxide (N ₂ O) Emissions	Direct nitrous oxide (N ₂ O) emissions of the company, in thousands of metric tons.
5	Direct Methane Emission in CO ₂ Equivalent	Direct methane (CH ₄) emissions of the company, in thousands of metric tons of carbon dioxide equivalent (CO ₂ e).
6	Direct Nitrous Oxide Emissions in CO ₂ Equivalent	Direct nitrous oxide (N ₂ O) emissions of the company, in thousands of metric tons of carbon dioxide equivalent (CO ₂ e).
7	GHG Scope 1	Scope 1/Direct Greenhouse Gas (GHG) emissions of the company, in thousands of metric tons.
8	GHG Scope 2	Scope 2/Indirect Greenhouse Gas (GHG) Emissions of the company in thousands of metric tons.
9	Total GHG Emissions	Total Greenhouse Gas (GHG) emissions of the company, in thousands of metric tons.
10	Nitrogen Oxide Emissions	Total amount of nitrogen oxide (NO _x) emitted by the company, in thousands of metric tons.
11	Sulfur Dioxide Emissions	Total amount of sulfur dioxide (SO ₂) emitted by the company, in thousands of metric tons.
12	VOC Emissions	Total amount of volatile organic compounds (VOCs) emitted by the company, in thousands of metric tons.
13	Carbon Monoxide Emissions	Total amount of carbon monoxide (CO) emitted by the company, thousands of metric tons.
14	ODS Emissions	Total amount of ozone-depleting substances (ODSs) emitted by the company, in thousands of metric tons.
15	Particulate Emissions	Total amount of particulates emitted by the company, in thousands of metric tons.
16	Total Energy Consumption	Total Energy Consumption figure in thousands of megawatt hours (MWh).

Corporate Social Responsibility and Corporate Governance

17	Electricity Used	Total Amount of Electricity used by the company, in thousands of megawatt hours (MWh).
18	Total Water Use	Total amount of water used to support a company's operational processes, in thousands of cubic meters.
19	Total Water Withdrawal	Amount of water diverted for use by the organization from all sources, but not limited to surface, ground, salt-water, municipal, in thousands of cubic meters.
20	Surface Water Withdrawals	Amount of water diverted for use by the organization from all surface freshwater sources, including but not limited to lakes, rivers and streams, in thousands of cubic meters.
21	Groundwater Withdrawals	Amount of water withdrawn by the organization from underground reservoirs, in thousands of cubic meters.
22	Municipal Water Use	Amount of water diverted for use by the organization from municipal water treatment facilities, in thousands of cubic meters.
23	Total Water Recycled	Amount of process water and cooling water used by the company's operations that was derived from internal recycling/reuse processes, in thousands of cubic meters.
24	Water Recycled	Percentage of water usage from recycled sources.
25	Water Use	Amount of water used for company processes that is not immediately returned to the environment in the same uncontaminated state, in thousands of cubic meters.
26	Discharges to Water	Amount of discharges to water that influence the biophysical or chemical quality of the water.
27	Total Waste	Total amount of waste the company discards, both hazardous and non-hazardous, in thousands of metric tons.
28	Hazardous Waste	Amount of hazardous waste the company discards, in thousands of metric tons.
29	Waste Recycled	Total amount of waste the company recycles, in thousands of metric tons.

Corporate Social Responsibility and Corporate Governance

30	Waste sent to Landfills	Amount of company waste sent to landfills, in thousands of metric tons.
31	Number Spills	Actual number of spills of hazardous materials by the company in the period.
32	Number of Environmental Fines	Number of environment fines paid by the company in the period.
33	Environmental Fines	Total amount of environmental fines paid by the company in the period, in millions.
34	Environmental Accounting Cost	Cost of environmental conservation and other environmental initiatives undertaken during the normal course of business as defined by company.
35	Investments in Operational Sustainability	Amount of money spent by the company, in millions, on operational environmental and social compliance and other internal environmental and social initiatives, as defined by the company.
36	Energy Efficiency Policy	Indicates whether the company has implemented any initiatives to make its use of energy more efficient.
37	Emissions Reduction Initiatives	Indicates whether the company has implemented any initiatives to reduce its environmental emissions to air.
38	Environmental Supply Chain Management	Indicates whether the company has implemented any initiatives to reduce the environmental footprint of its supply chain.
39	Green Building Policy	Indicates whether the company has taken any steps toward using environmental technologies and/or environmental principles in the design and construction of its buildings.
40	Waste Reduction Policy	Indicates whether the company has implemented any initiatives to reduce the waste generated during the course of its operations.

Corporate Social Responsibility and Corporate Governance

41	Water Policy	Indicates whether the organization has undertaken any initiatives to reduce the quantity of water used or to improve the efficiency of its processes, and whether the company is considering the potential stress to its areas of operation.
42	Sustainable Packaging	Indicates whether the company has taken any steps to make its packaging more environmentally friendly.
43	Environmental Quality Management	Indicates whether the company has introduced any kind of environmental quality management and/or environmental management system to help reduce the environmental footprint of operations.
44	Climate Change Opportunities Discussed	Indicates whether the Management Discussion and Analysis (MD&A) and its equivalent section of the company's annual report discuss business opportunities related to climate change.
45	Risks of Climate Change Discussed	Indicates whether the Management Discussion and Analysis (MD&A) and its equivalent section of the company's annual report discuss business risks related to climate change.
46	Climate Change Policy	Indicates whether the company has outlined its intention to help reduce global emissions of the Greenhouse Gases that cause climate change through its ongoing operations and/or the use of its products and services.
47	New Products —Climate Change	Indicates whether the company has developed and/or launched products during the current period only which address future impacts of climate change and/or which mitigate customers' contributions to climate change by reducing Greenhouse Gas (GHG) emissions.
48	Biodiversity Policy	Indicates whether the company has implemented any initiatives to ensure the protection of biodiversity.
49	Verification Policy	Indicates whether the company's environmental policies were subject to an independent assessment for the reporting period.

Corporate Social Responsibility and Corporate Governance

Source: Bloomberg Reports, March, 2015. Credit due to Patrick Egit, Osgoode Hall Law School J.D. 2014 and LL.M. 2015.

Following the logic of Robert Daines, Ian Gow, and David Larcker, presumably Bloomberg would not be collecting, analyzing, and selling this information if there were not a market for it.¹²² Bloomberg has only sold these data since 2009, which gives further evidence of corporate responsibility as an emerging trend.

Richard Johnson and Daniel Greening have shown that the type of investors in a company has a significant effect on a company's environmental and social performance.¹²³ Firms with higher percentages of long-term, pension fund investors had significantly better performance on social issues and environmental issues than firms with lower percentages, although the effect on social issues was modest.¹²⁴ Donald Neubaum and Shaker Zahra replicated these results in 2006, finding that large (1% holdings) pension fund investors had a significant and positive effect on companies' social and environmental performance, particularly where funds coordinated their activism. Mutual fund and investment bank holdings had a significant and negative effect on corporate social performance, but only when these funds engaged in activism, not when they were simply passive investors.¹²⁵ These findings have implications for corporate responsibility going forward, as short-term shareholder activists become more visible, at least in the US.¹²⁶ Moreover, these findings have broader social welfare implications given the emerging research discussed above that shows a long-term management perspective fuels innovation.¹²⁷

4.4 Corporate Responsibility, Legal Origins, and Corporate Governance Systems

Consistent with what one might predict, empirical evidence shows that both country-level sustainability ratings and company-level corporate responsibility ratings are higher in countries with a stakeholder-oriented corporate governance system than in countries with a shareholder-oriented corporate governance system. One quantitative study using MSCI (Morgan Stanley Capital, International) Intangible Value Assessment data, supplemented with specific social and environmental data from MSCI's Risk Metrics, found that:

among different legal origins, the English common law—widely believed to be mostly shareholder oriented—fosters CSR the least; within the civil law countries, firms of countries with (p. 663) German legal origin outperform their French counterparts in terms of ecological and environmental policy, but the French legal origin firms outperform German legal origin companies in social issues and labor relations. Companies under the Scandinavian legal origin score highest on CSR (and all its subfields).¹²⁸

The authors of this study, Hao Liang and Luc Renneboog, also find from the analysis of country-level sustainability ratings and financial development that countries with higher financial development (which tend to be those with shareholder-oriented corporate governance systems) have lower country-level sustainability ratings, including lower environ-

mental responsibility ratings, and lower social responsibility and solidarity ratings.¹²⁹ While the law and finance literature has emphasized the greater financialization of countries with a common-law legal origin,¹³⁰ Liang and Renneboog's results suggest that financialization per se does not occupy the field of important social welfare outcomes.

A similar pattern for the importance of legal origins was found in another empirical study using a different data source (Innovest), but examining only differences between the Scandinavian legal system, the "civil and German" legal system, and the common law system (Great Britain and Ireland) within the EU.¹³¹ In that study Céline Gagnet again found that Scandinavian countries outperformed those based on civil and German law with regard to environmental performance, and that both outperformed countries in the EU with a common law origin.¹³² Gagnet found the pattern with respect to social performance to be mixed (Scandinavian countries outperformed both civil and common law in one year, but the common law countries in Europe, Great Britain, and Ireland outperformed the civil law countries in two years.) These mixed results may have been due to the short time frame (2004 to 2007) over which the social performance of the companies was being examined, given data availability, or they demonstrate convergence in labor protections at the EU level, as Gagnet suggests.¹³³

(p. 664) These studies give evidence of an important vector by which law structures the corporate social relationship, the legal origins vector, which shapes, among other things, a country's views on the proper role of the state in the economy. Where, as in the common law system, the state's role in the economy is understood to be more limited in addressing economic inequality or promoting and protecting labor or environmental interests than among Scandinavian countries or those based on civil law legal families, there is more pressure for voluntary corporate responsibility initiatives to address these issues, as Matten and Moon have argued.¹³⁴ The above evidence suggests those voluntary initiatives are less effective in promoting social and environmental social welfare than are the types of laws and institutional arrangements found in the Scandinavian and civil law legal contexts.

5 Implications and Analysis

Whether attention to corporate responsibility does lead to financial outperformance in some cases, and what those cases are, does not settle the "case of corporate responsibility," for there is a much deeper disagreement with which this chapter concludes. That is the perennial, one might say religious,¹³⁵ debate over the purpose of the firm. Is it "simply" to produce products and services that create economic rents to be distributed to rights' holders according to pre-existing contractual, statutory, and (possibly) normative obligations? (Given that close to 70% of new companies ultimately fail, that task cannot be taken as too simple.)¹³⁶ Or does the firm also have a social obligation to minimize harm to people and the natural environment in its pursuits of profits, or even a positive duty to promote social welfare beyond its creation of economic rents? In corporate governance and law, this debate tracks the competition between a shareholder versus stake-

holder view of directors' and officers' fiduciary obligations. The literature on each side of this debate is so extensive that the following will simply sketch out aspects of the various positions that have direct implications for differing views regarding corporate responsibility, and then give some indications of why it might be possible, and important, to narrow the gap between these seemingly irreconcilable positions.

5.1 Shareholder Primacy

Milton Friedman's articulation of firms' responsibilities is the iconic expression of a predominantly economic perspective on the nature of the firm:

There is one and only one social responsibility of business—to use its resources and engage in activities designed to increase profits so long as it stays within the rules of the game, which is to say, engages in open and free competition without deception or fraud.¹³⁷

(p. 665) This statement was part of a *New York Times* article in which Friedman contributed to a vigorous debate that was then ongoing within the business community. Some academics and members of the business community in the US had begun to argue that companies had responsibilities to respond to civil rights and anti-war unrest, as well as strategic interests in providing an attractive alternative to collectivist social movements like Marxism, socialism, and organized labor, by paying greater attention to making a positive social contribution.¹³⁸ Friedman and others taking his view responded that the social contribution firms make from running a profitable business, employing people, paying taxes, and distributing some part of net profits to shareholders *is* the business firm's positive social contribution. A concern that later writers in this vein articulated is that trying to create additional social benefits beyond those that flow from honest profit-making within the confines of law will dilute management's focus, undermine economic performance, and thereby ultimately undermine social welfare.¹³⁹

A number of arguments for a narrow view of managers' and directors' obligations devolve from shareholders' special position in the firm. One theoretical perspective, the contractarian view of the corporation as articulated by Steve Bainbridge (among others), asserts that an implicit term of the contract between shareholders and the firm is that the directors and managers will act in the shareholders' best interests, understood as maximizing their wealth.¹⁴⁰ A pragmatic perspective suggests that given the broad discretion directors and top managers have to run the firm, and given that in shareholder-oriented corporate governance systems only shareholders have direct rights to vote or to sue,¹⁴¹ it is

(p. 666) not surprising that firms and their managers will act in shareholders' interests in order to avoid being sued, voted out of office, or thrown out of office in a hostile takeover, as recently argued by Leo Strine, Jr., the Chief Justice of the Delaware Supreme Court.¹⁴² In another recent article, CJ Strine argues that acting in shareholders' interests is not only pragmatic but legally required, and so corporate responsibility could be a breach of fiduciary duty.¹⁴³ This argument will be discussed in more detail below.

From the shareholder-oriented perspective, corporate responsibility is too much responsibility to impose on directors. Advancing social policy goals is the job of government, not business.¹⁴⁴ In contrast, directors are elected by the shareholders to run the firm in the shareholders' interests. Balancing other constituents' interests by making "tradeoffs between the welfare of shareholders and that of non-shareholder constituencies"¹⁴⁵ is problematic because it is inconsistent with the proper exercise of directors' power to advance shareholders' interests, and because it risks undermining accountability by allowing directors to act in their own self-interest while claiming to act in other constituents' interests.¹⁴⁶

Given this perspective, the importance of the business case is obvious. If corporate responsibility initiatives do not make money for the firm, they fail. While many other business strategies can also fail, such as mergers and acquisitions, where half to two-thirds do not make money for the acquiring firm and resulting entity,¹⁴⁷ mergers and acquisitions at least aim to make money for the firm, and so their legitimacy as a business strategy is not in doubt. Corporate responsibility initiatives do not have that legitimacy of motivation, from the critics' perspective (although "strategic corporate responsibility" is intended to be profitable,¹⁴⁸ and many responsibility initiatives are profitable, as discussed above).¹⁴⁹ As a result, in this view, corporate responsibility is too strong a concept: it risks economic underperformance, it usurps government's policy roles, and it is beyond the boundaries of directors' and managers' legitimate exercise of power by seeking to advance non-shareholder interests.

(p. 667) 5.2 Stakeholder theory

In contrast, to many academic critics of corporate responsibility, it is still too weak a concept. There are a number of strands to this thinking, as with the shareholder perspective. One is stakeholder theory, which is the major theoretical competitor to shareholder primacy. Stakeholder theory is generally attributed to Ed Freeman,¹⁵⁰ although he attributes the idea to "a very old tradition that sees business as an integral part of society rather than an institution separate and purely economic in nature."¹⁵¹ From the perspective of stakeholder theory, economic value is created by voluntary relationships among many parties who cooperate to create successful businesses. It is an ethical theory about the values of management in relationships with those parties, and also a management theory about how to create and manage successful companies. As Freeman states, "[c]apitalism works because entrepreneurs and managers put together and sustain deals or relationships among customers, suppliers, employees, financiers, and communities."¹⁵² This theory does not deny that shareholders are important stakeholders in the firm, but does reject the view that shareholders' interests are the only interests that managers and directors should consider in managing a successful firm.¹⁵³

From a stakeholder perspective, successful companies incorporate and rely upon multiple social and natural inputs, such as an educated workforce, the physical infrastructure for the production, transportation, and distribution of goods, an effective legal system, and natural capital inputs of water, air, commodities, and so forth. Since some significant por-

tion of the inputs of corporate success, including financial inputs, have been contributed by parties other than shareholders, those parties also have interests to be considered in determining the responsibilities of managers and directors and in distributing the outputs of corporate action. Some, perhaps many, of those interests will be protected by contractual or regulatory arrangements, but others cannot be specified *ex ante*, and so must depend on corporate participants to fairly balance multiple parties' legitimate claims *ex post*, as in Margaret Blair and Lynn Stout's team production theory of corporate law.¹⁵⁴

To some stakeholder theorists, corporate responsibility is too modest, given its emphasis on disclosure and voluntarism. Some serious, even extreme, human rights problems persist despite two decades of corporate responsibility initiatives and expanded ESG disclosure. Andy Crane has shown that "modern slavery" (traditional slavery, bonded labor, human trafficking, and forced labor) is endemic in some industries (agriculture, mining, extraction, construction, brickmaking, carpet weaving, domestic work, and sex work); global estimates range from 12 million to 30 million people enslaved throughout the world.¹⁵⁵ The limits of corporate responsibility can be seen in the problem of slavery in the West African cocoa (p. 668) industry, for instance. That problem was widely publicized by NGOs, putting pressure on multinational companies to sign the Harkin/Engel Cocoa Protocol in 2001, which specifically directed the industry to self-regulate.¹⁵⁶ According to Crane, that Protocol has led to "pilot programs" to determine the most effective ways to eliminate the slavery, and "a mooted, but much delayed, program for monitoring and enforcement."¹⁵⁷ In other words, 14 years later the problem has not been solved by industry initiatives. Tragic evidence of the insufficiency of long-established voluntary company codes of conduct and industry responsibility initiatives continues to accumulate. The Rana Plaza collapse in Bangladesh in 2013, which killed 1,134 people producing clothes for 29 global clothing companies,¹⁵⁸ or Barrick Gold's settlement of claims in 2015 that its security personnel had raped 137 women in Papua New Guinea over a period of decades show some limits to the reach of the voluntary approach.

Moreover, the "business case" may never be strong enough to overcome the economic disincentives to invest in higher labor costs or expensive pollution abatement without a supportive regulatory framework that creates a level playing field for competition. Many of the business drivers of corporate responsibility depend on consumers being willing to pay more for goods produced in a socially responsible fashion; employees being selective about where they will work, choosing only the most responsible employers; and investors generally investing and disinvesting based on social parameters.¹⁵⁹ Jan Wouters and Leen Chanet bring both a moral and a pragmatic argument to show the limits of each aspect of this business case.¹⁶⁰ As a matter of morality, they argue that the business case is a means to the end of responsible business conduct, not an end in itself, and should be evaluated as such: "[I]f respect for human rights is fundamental to our society, whether or not ensuring such respect would bring economic advantages is irrelevant; achieving it remains our final goal."¹⁶¹ From a pragmatic perspective, neither the ethical consumer movement nor socially responsible investor pressure are strong enough to make a demonstrable contribution to the business case without a supportive regulatory environment, such as by requiring fair trade labeling of products at the point of purchase, or requiring

consistent, comparable ESG disclosure by public companies.¹⁶² Olivier DeSchutter also argues for the importance of a supportive regulatory framework.¹⁶³ Using an environmental example, he states:

for a government, the most direct solution to [advance] environmentally responsible conduct is simply to let the price of energy go up [via high taxes], to collect high fees for waste disposal (calculated according to volume) and to oblige companies to internalize the costs of the pollution they create. There would simply be no ground on which to build the business case for CSR, if we bracket these public interventions away.¹⁶⁴

(p. 669) Whether the voluntary “business case” is stronger than these assessments suggest may depend on the reputational benefits and risks of corporate responsibility or irresponsibility, and the role of the media in amplifying those benefits or risks. Estimates indicate that 70% to 80% of a company’s market value today is based on “intangibles” such as brand reputation, intellectual capital and goodwill.¹⁶⁵ High-profile tragedies such as the Rana Plaza collapse or the Deepwater Horizon explosion cause industry-wide reputational harm and societal (and investor) pressures for redress.¹⁶⁶ As BP found out after the Deepwater Horizon explosion, a gap between a company’s reputation and the company’s actual performance creates the potential for “reputational risk,” which may amplify the effects of media coverage of responsibility issues.¹⁶⁷ Apple is an interesting counter-example here, however. While its reputation may have suffered somewhat from a series of critical media coverage in 2010 concerning the harsh conditions under which Apple products are produced in China,¹⁶⁸ that negative media coverage has not dented Apple’s position as the world’s largest company by market capitalization.¹⁶⁹ This disconnect between media coverage of a social responsibility issue and consumer reactions was encapsulated brilliantly in the title of an article that empirically studied the limits of the business case, at least insofar as it depended on ethical consumption: “Sweatshop Labor is Wrong Unless the Shoes are Cute.”¹⁷⁰

Another criticism builds on assertions about the strategic use of the business case as an argument for voluntary corporate responsibility rather than regulatory intervention. From this perspective corporate responsibility is a business strategy employed specifically to resist regulation, thus undermining the ability of society to cause companies to limit and then internalize negative externalities. Ronen Shamir has argued that companies have “constructed” the field of corporate responsibility through teaching in business schools, through lobbying, and through litigation, as “an essentially voluntary and non-enforceable domain” in order to “resist the legalization of their social duties.”¹⁷¹ He has also argued that “through a set of social events, workshops, and public ceremonies,” businesses “shape notions such as ‘social responsibility’ and ‘social change’ in ways that are amenable to business and employers’ concerns,” thus “preventing the use of law as a means for bringing (p. 670) greater social responsibility.”¹⁷² His interpretation is supported by an historical analysis by Rami Kaplan, in which Kaplan argues that “corporate re-

sponsibility was devised [in the 1950's] by the corporate capitalist elite, broadly defined, as an instrument for pre-empting governmental intervention."¹⁷³

Thus, from both the stakeholder and the sociological perspective, corporate responsibility is too weak, and yet too strong. It is an insufficient constraint on how companies do business in a world of accelerating pressures on natural capital and ill-distributed opportunities for human flourishing. At the same time, however, it is effectively undermining the conditions for putting more substantive regulation in place.

5.3 Evaluating the Arguments

By 2015, the argument that corporate responsibility requires companies and the board to take on an essentially political role for which they are ill-suited rings hollow, given the extensive involvement of American companies in law-making, lobbying, litigation to narrow regulation, and constitutionally protected electoral politics.¹⁷⁴ But two arguments for shareholder primacy that are advanced in the US law literature remain important to address: the idea that balancing multiple stakeholders' interests will undermine accountability and allow directors and managers too much discretion to act in their own self-interest; and the argument that it is legally required for boards and managers to act in the interests of shareholders, and shareholders only, such that corporate responsibility initiatives could be a breach of fiduciary duty. This author will address the second argument first, because if shareholder primacy is required by law, that ends the discussion, at least in the United States.

Two points that are relevant to both issues are given insufficient attention in the law literature, however, and so will be highlighted in advance. First, the data do not support the view that corporate responsibility initiatives inevitably cause financial losses; in fact, on the contrary. In an overwhelming majority of cases there is no trade-off between a company's financial health and actions that arise from a broad concept of social obligation, as the studies evaluated by Clark, Feiner, and Viehs show.¹⁷⁵ The management literature is much more sophisticated on this point than is the law literature. Second, many of the arguments in the law literature against corporate responsibility ignore what large companies are saying they are doing, around the world. As set out above, 93 per cent of the world's largest companies discuss their environmental and social initiatives, many in great detail, and many including substantiated, audited data about the effects of those initiatives.¹⁷⁶ Unless one considers *everything* that a (p. 671) company says about its social responsibilities to be unsubstantiated public relations, then it should be incumbent upon judges and law professors who write about these matters to consider these facts in their analyses.

5.3.1 Shareholder versus Stakeholder Theory

The proper understanding of the implications of corporate boards' legal obligations for issues of corporate responsibility has become a matter of vigorous debate again in the United States, inspired by Prof. Lynn Stout's short, sharply critical book, written for a popular audience, entitled *The Shareholder Value Myth: How Putting Shareholders First*

Corporate Social Responsibility and Corporate Governance

Harms Investors, Corporations and the Public.¹⁷⁷ That book has inspired multiple, equally critical reactions by respected scholars,¹⁷⁸ including a number from CJ Strine.¹⁷⁹ CJ Strine recognizes that “directors are generally empowered to manage the corporation in a way that is not dictated by what will best maximize the corporation’s current stock price,”¹⁸⁰ but argues that “advocates for corporate social responsibility” make a more fundamental claim, and “pretend that directors do not have to make stockholder welfare the sole end of corporate governance within the limits of their legal discretion.”¹⁸¹ He rejects the argument of “these well-meaning commentators” that “the business judgment rule is cloaking a system of law giving directors the ability to act for any reason they deem appropriate.”¹⁸² Evaluating the arguments in this debate can provide the context for a number of observations regarding shareholder primacy, stakeholder theory, and corporate responsibility.

First, it is inaccurate to argue that shareholders have no special place in corporate law in Delaware and in the United States generally. They clearly do. Shareholders are the only group entitled to vote for the board and to approve important corporate transactions, although creditors can also exert control rights through their contracts; shareholders are the only group with rights to bring suit derivatively on behalf of a solvent corporation¹⁸³; and the board’s fiduciary duties run “to the corporation and its shareholders.”¹⁸⁴ These legal rights matter and should not be treated as unimportant, as Prof. Stout’s arguments can sometimes seem to do.

As just stated, the Delaware Supreme Court has in a number of cases articulated the fiduciary duties of directors as advancing the interests of “the corporation and its shareholders.” When these interests conflict, the Court has upheld board actions that frustrate shareholders’ short-term financial interests in favor of the board’s well-considered views about the company’s longer-term strategies and prospects (as CJ Strine recognizes but does not discuss in any detail).¹⁸⁵ In *Paramount Communications v. Time*, the Delaware Supreme Court upheld the directors’ power to reject the shareholders’ views and take defensive measures against a well-above-market tender offer.¹⁸⁶ While it might be argued that this simply reflects the authority structure of Delaware corporate law, since it is the directors and not the shareholders who have the statutory power to manage the company,¹⁸⁷ the Time board’s actions were demonstrably not shareholder wealth maximizing. If fiduciary principles required shareholder wealth maximizing in general, the directors’ actions in *Paramount v. Time* would not have been upheld.

There is one circumstance where shareholders’ wealth must be maximized, and that is where the shareholders are being cashed out, as in *Revlon, Inc. v. MacAndrews & Forbes Holdings, Inc.*¹⁸⁸ In that circumstance, “the duty of the board . . . change[s] from the preservation [of the company] as a corporate entity to the maximization of the company’s value at a sale for the stockholders’ benefit.”¹⁸⁹ *Revlon* duties have also been found where the control structure of a company is being changed, such as where a publicly held company with dispersed shareholders is being pursued by a company with a controlling shareholder, and will become a controlled company if the transaction goes forward. *Paramount v. QVC* was such a case.¹⁹⁰ But these are the only circumstances where the board’s

Corporate Social Responsibility and Corporate Governance

obligation is to maximize share value, according to the Delaware Supreme Court. Moreover, shareholder pressure cannot put a company into *Revlon* mode: that determination is reserved to the board.¹⁹¹

A former Chief Justice of the Delaware Supreme Court, Norman Veasey, has interpreted these precedents as follows:

[I]t is important to keep in mind the precise content of this “best interests” [of the corporate entity] concept—that is, to whom this duty is owed and when. Naturally, one often thinks that directors owe this duty to both the corporation and the stockholders. That formulation is harmless in most instances because of the confluence of interests, in that what is good for the corporate entity is usually derivatively good for the stockholders. There are times, of course, when the focus is directly on the interests of stockholders [citing *Revlon and Paramount Comms. v. QVC*]. But, in general, the directors owe fiduciary duties to the corporation, not to the stockholders.¹⁹²

Moreover, as Prof. Stout and others emphasize, the protection of the business judgment rule allows directors to make decisions that are in the longer-term interests of the corporation, such as investing in research and development, building new plants, or paying employees well, notwithstanding some shareholders who would rather have the company’s money spent on them.¹⁹³ As a practical matter, there is going to be no liability for a board that frustrates some shareholders’ short-term interests and decides to pay its employees more than the minimum wage, or reduces the prices its products could be sold for so that more employees can buy the product—Walmart did the former in 2015,¹⁹⁴ and the Ford Motor Company did the latter in 1915, a decision that was upheld by the Michigan Supreme Court in *Dodge v. Ford*.¹⁹⁵ This argument about the business judgment rule frustrates CJ Strine (p. 674) and Prof. Bainbridge, among others, but Prof. Stout (and others) are correct that this is how the law operates.¹⁹⁶ CJ Strine is undoubtedly correct that there could be problems if a board makes a social or environmental decision that has no conceivable long-term benefit to the company and thus the shareholders, but in today’s world it is hard to imagine what such a decision would be, given social expectations that companies will act as responsible citizens and the reputational implications of frustrating those expectations. It is much more likely that a managerialist decision would create problems, such as a company giving a retiring CEO an apartment in New York, maid service, and fresh flowers for life, which raises duty of loyalty concerns not implicated by corporate responsibility.¹⁹⁷

Thus, the law—at least as decided by the Delaware Supreme Court—does not yet require shareholder wealth maximizing as the standard of conduct in order for boards to meet their fiduciary obligations, except in the circumstances described as being in “*Revlon* mode.” Consistent with CJ Veasey’s view, we can conclude that shareholders are important beneficiaries of fiduciary obligations in Delaware, of course, but only so long as their interests and the corporation’s long-term interests are in harmony. Corporate responsibil-

ity initiatives are one type of strategy to promote the corporation's long-term financial well-being, as the empirical evidence shows, and thus there is no fiduciary breach.

However, even if it is lawful, is a multi-stakeholder focus going to mask officers' and directors' self-interest—and thereby undermine accountability—as has been argued?¹⁹⁸ On both the question of self-interest and that of accountability the prioritizing of shareholders' interests as it has been instantiated in the US over the last three decades has itself masked self-interest and created new agency problems. Regarding self-interest, as Lynne Dallas argued over a decade ago, "[a] 'new' managerialism has arisen that consists of short-term decision making and window dressing to impress the stock market at the expense of improving underlying corporation value."¹⁹⁹ In particular, the shift to stock option compensation "provides unique opportunities for managerial self-dealing."²⁰⁰ By 2015, the tight coupling of managers and markets has allowed managerial rent extraction in the US to an historically unprecedented degree.²⁰¹

(p. 675) With respect to accountability, we are back to the question of accountability to whom or what, and here the Delaware precedents provide a clear answer: accountability must be to the corporation and its shareholders, taking a long-term perspective on corporate well-being. Yet today's concern is that shareholders are putting short-term pressure on companies in ways that are unproductive for the future success of the corporate enterprise.²⁰² Activist investors exert a significant part of this pressure, and an empirical debate is raging over their economic influence.²⁰³ In terms of their influence on corporate decisions, Bill Bratton and Michael Wachter show that activist investors seek one of four things: that more money be given back to shareholders, in the form of share buybacks or special dividends; that the company sell itself or its premium assets; that the company increase leverage; or that the company cut costs.²⁰⁴ Some of the actions to cut costs might be productive, such as finding ways to save energy or use fewer physical inputs. Others destroy longer-term value, such as putting off needed maintenance of plant and equipment, delaying marketing campaigns, cutting back on research and development,²⁰⁵ or even engaging in financial reporting fraud or value-destroying mergers and acquisitions, a concern identified by none other than Michael Jensen.²⁰⁶

In 2014, S&P 500 companies spent 95% of their earnings on share buybacks and dividends, and they look set to spend over 100% in 2015.²⁰⁷ This level of share buybacks is so high that Larry Fink, head of the world's largest asset manager, Blackrock, has written to all of the CEOs in the S&P 500, expressing concerns that corporate leaders are meeting activists' short-term pressures while "underinvesting in innovation, skilled workforces or essential capital expenditures necessary to sustain long-term growth."²⁰⁸ One can argue that giving money back to shareholders is exactly what companies should be doing if they have no positive net present value investments to make. It is bizarre to think that American companies, with their incredible confidence, creativity, and organizational capacity, cannot find better, more productive uses of all of their earnings than giving them back to shareholders (with the not incidental benefit of keeping stock prices high and fueling a stock market rally),²⁰⁹ (p. 676) particularly in light of the enormous technical challenges facing the world from climate change, which scientists tell us requires a rapid transition

to a low-carbon economy. A more productive system would encourage managers and directors to manage their companies well and fairly for the longer term, which will benefit tomorrow's shareholders in addition to today's, but which will also give management greater latitude to pursue the positive implications of fair employment policies, high-quality research and product development, good relationships with suppliers, and careful approaches to natural capital. In stylized form, that is what we see in stakeholder economies such as Scandinavia, the Netherlands, France, Germany, or Austria, albeit under pressure, and that is what three-quarters of senior executives globally say they would want to see for their companies.²¹⁰

5.3.2 Corporate Responsibility Reconciliation

This chapter will conclude by trying to reconcile competing views of corporate responsibility as simultaneously too strong and too weak, assuming differing views of managers' and directors' obligations from shareholder and stakeholder perspectives, but rejecting the view that corporate responsibility is somehow inconsistent with boards' fiduciary duties even in a shareholder system. Even Friedman believed that business has an obligation to conform "to the basic rules of the society, both those embodied in law and those embodied in ethical custom."²¹¹ Economic theory recognizes negative externalities as one type of market failure justifying regulation. Each of the shareholder partisans quoted above thought that policies to address serious social problems should be developed through laws passed by democratic political processes, not by decisions of private companies' boards of directors.²¹² Looking at the self-regulatory initiatives that businesses have participated in can be used as a framework to determine which issues are broadly seen to demand regulatory solutions. At least in theory, the need for more hard law regulating social responsibility issues should be a point of agreement between those who consider corporate responsibility too strong when devolved to corporate boards for decision, and those who consider it too weak because it is voluntary and predominantly process based by emphasizing disclosure.

As both DeShutter and Wouters and Chanet argue, there is a range of regulatory approaches that can be used to produce a facilitative framework that permits voluntary initiatives to be more effective. In today's world, creative regulatory and voluntary approaches to the negative externalities of human rights abuses, labor exploitation, climate change, and declining natural resources (including, most critically, water) are both hypothesized and in place in some parts of the world, but in need of serious scaling up to meet the full scope of global challenges. These approaches can be canvassed for best practices and further learning. (p. 677) Moreover, the accounting industry has developed and is continuing to develop approaches to integrated financial and non-financial reporting, and true-value accounting to incorporate the cost of negative externalities.²¹³ Implementing intellectually justified integrated reporting and accounting systems could go a long way toward providing the information and prices necessary to support capital and products markets that actually work the way market theories suggest they should work, including fully internalizing in the prices of products the social costs of producing and using those products. Beyond such strategies, the voluntary initiatives that compa-

nies have adopted to date in just about every industry provide important information about what companies consider feasible. They also provide sources of empirical data about the effects of voluntary initiatives as a way to evaluate what more is needed to address particular social and environmental issues in each industry. If additional substantive regulation is needed to advance sustainability goals, Scandinavian legal and corporate governance approaches may be the most logical place to start to find models that work, at least as a good first approximation.

6 Conclusion

In conclusion, this author will offer the following anecdote. At a conference in Berlin on corporate responsibility four years ago, funded by the German government and held with some fair degree of pomp and circumstance in the German Parliament Offices Building, Dirk Matten, a leading management academic, described the importance of corporate responsibility using the following analogy. Having been told once by Jeremy Moon that of all the things that do not cure a cold, whiskey is the nicest, Matten said that his thinking on corporate responsibility is similar: that of all the things that won't cure contemporary capitalism, corporate responsibility is the nicest. At the least, in his view, it doesn't make the problems worse.

This chapter concludes by agreeing with Matten's assessment, with one important caveat. Corporate responsibility initiatives have likely improved the conditions of employment for at least hundreds of thousands of people around the world who would otherwise be subject to the mandates of unrestrained globalization. It certainly brings more attention to the environmental problems and opportunities of many productive processes and industries, and has thus motivated companies to develop innovative products and solutions to address those problems. It gives latitude to people who want to be change agents within organizations, and promotes deeper thinking among people and teams in organizations about the effects of the investments, products, services, and relationships they are developing. As the empirical evidence is starting to show, it can even be a smart business strategy.

Corporate responsibility does not fundamentally change underlying power relationships between companies and citizens, however, since companies are volunteering to act to address social and environmental problems—or not. It might dissuade governments from (p. 678) regulating, however, and in that sense is making problems worse. It leaves gaping holes, such as its failure to establish “no go” zones. We will no doubt see “responsible tar sands mining” before the decade is out, which would be an intellectually bankrupt concept and a tragic development for the stability of the climate. As economic development proceeds apace throughout the world, improving millions of people's standard of living, there are still *billions* of people living on the equivalent of \$2 a day or less. While those billions of people may surely benefit from greater access to productive enterprise, the underlying normative and material conditions of that access matter greatly. So to the extent that we actually want to solve any of the underlying global problems of modern capital-

ism, stronger medicines than the pleasant whiskey of corporate responsibility are required.

⁽⁶⁵⁾ See *id.*, citing the New Economic Regulations Act in France, 2002.

⁽⁶⁶⁾ See *id.*

⁽⁶⁷⁾ For a discussion of this requirement in the UK, and other early social and environmental disclosure requirements, see Williams & Conley, *supra* note 25 (arguing that differences in the “shareholder wealth maximizing” norm between the UK and US were sub-

stantial enough to cast doubt on the idea of an “Anglo-American corporate governance” system).

(⁶⁸) See Initiative for Responsible Investment report, *supra* note 63.

(⁶⁹) See Toxic Release Inventory, available at <http://www2.epa.gov/toxics-release-inventory-tri-program/learn-about-toxics-release-inventory>.

(⁷⁰) See Reg. S-K, Instructions to Item 103, No. 5(C), 17 C.F.R. § 229.103 (2015). For a discussion of this requirement, as well as an analysis of the statutory authority of the SEC to require much more extensive social and environmental disclosure, see Cynthia A. Williams, “The Securities and Exchange Commission and Corporate Social Transparency”, 112 Harv. L. Rev. 1197 (1999).

(⁷¹) See “Commission Guidance Regarding Disclosure Related to Climate Change”, Rel. 33-9106, 34-61469 (Feb. 8, 2010), available at <https://www.sec.gov/rules/interp/2010/33-9106.pdf>.

(⁷²) See Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010 (“Dodd-Frank”), § 953(b)(2). The SEC’s proposed rule to implement this provision was published on September 18, 2013 on a three to two divided vote, and the final rule promulgated close to two years later, on August 5, 2015. Pay Ratio Disclosure Proposed Rule, Rel. No. 33-9452; 34-70443 (Sept. 18, 2013), available at <https://www.sec.gov/rules/proposed/2013/33-9452.pdf>; Pay Ratio Disclosure Final Rule, Rel. No. 33-9877; 34-75610 (Aug. 5, 2015), available at <http://www.sec.gov/rules/final/2015/33-9877.pdf>. The pay ratio rule does not go into effect until January 1, 2017, so it will be some time before the effect of the rule can be judged.

(⁷³) See Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010 (“Dodd-Frank”), § 1503. The Securities and Exchange Commission has implemented this requirement as Item 104 of Regulation S-K, 17 C.F.R. § 229.104. This section was added to Dodd-Frank after an explosion in April, 2010, at the Upper Big Branch Mine in West Virginia, killed 29 miners. It soon became clear that Massey Energy, the owner of the mine, had a practice of ignoring the Federal Mine Safety and Health Act of 1977, having received over 1,300 notifications of violations about that particular mine in the years leading up to the explosion. Democracy Now, Massey Energy Mine Cited for 1,300+ Safety Violations in Years Leading up the Deadly Explosion, April 7, 2010, available at http://www.democracynow.org/2010/4/7/massey_energy_mine_cited_for_1.

(⁷⁴) See Dodd-Frank, § 1502, enacted as 15 USC. § 13(p).

(⁷⁵) See Dodd-Frank, § 1504, enacted as 15 USC. § 13(q).

(⁷⁶) *National Association of Manufacturers, Inc. v. SEC*, 956 F.Supp.2d 43 (D.D.C. 2013).

(⁷⁸) See *NAM*, 748 F.3d at 372–373.

(⁷⁹) Soon after the Court of Appeals decision in *NAM v. SEC*, the Court of Appeals for the District of Columbia Circuit, en banc, decided another disclosure case, rejecting a claim by companies that required country-of-origin disclosure for meat products violated their First Amendment rights, and using a lower level of constitutional scrutiny (“rational basis”) than had been applied in the *NAM* litigation challenging the conflict minerals disclosure. See *American Meat Institute v. US Department of Agriculture*, 730 F.3d 18 (D.C. Cir. 2014) (en banc). After *American Meat Institute* the SEC obtained further review of the conflict minerals disclosure, seeking to persuade the court to uphold its entire rule using the rational basis process of analysis. The *NAM* court’s original decision finding a First Amendment violation was upheld at *National Assn. of Manufacturers v SEC*, No. 13-5252 (D.C. Cir. Aug. 18, 2015) (on petitions for panel rehearing).

⁽¹³³⁾ See *id.* at 213.

⁽¹³⁴⁾ See *id.* at 49.

⁽¹³⁵⁾ See *id.* at 44.

⁽¹³⁶⁾ See Startup Failure Rate by Industry, available at <http://www.statisticbrain.com/startup-failure-by-industry>.

⁽¹³⁷⁾ See Milton Friedman, The Social Responsibility of Business is to Increase its Profits, N.Y. Times Magazine 6 (Sept. 13, 1970).

⁽¹³⁸⁾ See *id.* (e.g., note Friedman’s statement that “[t]he businessmen believe that they are defending free enterprise when they declaim that business is not concerned ‘merely’ with profit but also with promoting desirable ‘social’ ends; . . . In fact they are—or would be if they or anyone else took them seriously—preaching pure and unadulterated socialism. Businessmen who talk this way are unwitting puppets of the intellectual forces that have been undermining the basis of a free society these past decades.”). See Davis, *supra* note 1, for a delineation of the perspectives in that historical debate.

⁽¹³⁹⁾ See Henry Hansmann & Reinier Kraakman, “The End of History for Corporate Law”, 89 Geo. L. J. 439, 442–43 (2001) (writing that “[t]he point is simply that now, as a consequence of both logic and experience, there is convergence on a consensus that the best means to this end—the pursuit of aggregate social welfare—is to make corporate managers strongly accountable to shareholder interests and (at least in direct terms) only to those interests.”).

⁽¹⁴⁰⁾ See Stephen M. Bainbridge, “Director Primacy: The Means and Ends of Corporate Governance”, 97 Nw. U. L. Rev. 547 (2003). There are other theoretical arguments for shareholder primacy, such as those based on a concept of shareholders as principals and managers and directors as agents in an agency relationship. For a critical summary of this view see Bratton & Wachter, *supra* note 126.

⁽¹⁴¹⁾ While Canada is often included as a country having a shareholder-oriented corporate governance system, that is no longer correct. Canada permits non-shareholder constituents to bring derivative actions (sue) by statute, and the Supreme Court of Canada has twice articulated a stakeholder perspective on the firm and directors' obligations. See *Peoples Department Stores Inc. (Trustee of) v. Wise*, 2004 SCC 68, [2004] 3 S.C.R. 461 (stating at [42] that "[w]e accept as an accurate statement of law that in determining whether they are acting with a view to the best interests of the corporation it may be legitimate, given all the circumstances of a given case, for the board of directors to consider, inter alia, the interests of shareholders, employees, suppliers, creditors, consumers, governments and the environment"); *BCE Inc. v. 1976 Debentureholders*, 2008 SCC 69, [2008] 3 S.C.R. 560 (stating at [82] that "the question is whether, in all the circumstances, the directors acted in the best interests of the corporation, having regard to all relevant considerations, including, but not confined to, the need to treat affected stakeholders in a fair manner, commensurate with the corporation's duties as a responsible corporate citizen.").

⁽¹⁴²⁾ See Leo E. Strine, Jr., "Making it Easier for Directors to 'Do the Right Thing'?", 4 Harv. Bus. L. Rev. 235 (2014), available at http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2539098.

⁽¹⁴³⁾ See Leo E. Strine, Jr., "The Dangers of Denial: The Need for a Clear-Eyed Understanding of the Power and Accountability Structure Established by the Delaware General Corporation Law, ('Dangers of Denial')", University of Pennsylvania Law School Institute for Law and Economics Research Paper no. 15-08, available at <http://ssrn.com/abstract=2576389>.

⁽¹⁴⁴⁾ See, e.g., David L. Engel, "An Approach to Corporate Social Responsibility", 32 Stan. L. Rev. 1 (1979) (directors are not well suited to balance competing social policy interests, which is the job of legislators); Daniel R. Fischel, "The Corporate Governance Movement", 35 Vand. L. Rev. 1259 (1982) (redress for those concerned about a lack of corporate social accountability is through the political process, not through disrupting the "voluntary arrangements that private parties have entered into in forming corporations").

⁽¹⁴⁵⁾ Stephen M. Bainbridge, "Corporate Social Responsibility in the Night-Watchman State", 115 Colum. L. Rev. Sidebar 39, 49 (2015) (briefly summarizing his prior work discussing this concern).

Federal Election Comm'n.*, 558 US 310 (2010), which expanded corporations' and unions' First Amendment rights regarding electoral participation, and *Royal Dutch Shell v. Kiobel*, 133 S. Ct. 1659 (2013), which narrowed the potential Alien Torts Claims Act accountability of multinational corporations).

(¹⁷⁵) See text accompanying notes 84–108, *supra*. See also Clark, Feiner, & Viehs, *supra* note 107.

(¹⁷⁶) See text accompanying notes 5–6, *supra*.

(¹⁷⁷) Lynn Stout, *The Shareholder Value Myth: How Putting Shareholders First Harms Investors, Corporations, and the Public* (2010). Professor Stout has been a prolific critic of shareholder primacy in the law literature from economic and legal perspectives, but it is her short popular book that seems to have inspired this iteration of the corporate responsibility debate. See, e.g. Lynn A. Stout, "The Toxic Side Effects of Shareholder Primacy", 161 *U. Penn. L. Rev.* 2003 (2013); Blair & Stout, *supra* note 154 (the team production theory of boards' responsibilities).

⁽¹⁷⁸⁾ See, e.g., Jonathan Macey, “Sublime Myths: An Essay in Honor of the Shareholder Value Myth and the Tooth Fairy”, 91 Tex. L. Rev. 911 (2013) (critically reviewing The Shareholder Value Myth).

⁽¹⁷⁹⁾ See Strine, *supra* notes 142 and 143.

(¹⁹³) See Stout, *supra* note 177, at 2, 24–46. Other scholars have made this argument about the power of the business judgment rule as well. See, e.g., Lynne Dallas, “The New Managerialism and Diversity on Corporate Boards of Directors”, 76 Tul. L. Rev. 1363 (2002); Einer Elhauge, “Sacrificing Corporate Profits in the Public Interest”, 80 N.Y.U. L. Rev. 733, 770–772 (2005).

(¹⁹⁴) See Doug McMillon, “CEO Walmart, In Letter to Associates Walmart CEO Doug McMillon Announces Higher Pay”, Feb. 19, 2015, available at <http://blog.walmart.com/in-letter-to-associates-walmart-ceo-doug-mcmillon-announces-higher-pay>. In the letter, McMillon states that “today, we’re announcing a series of important changes that demonstrate our commitment to you, our associates” because the CEO concluded that “it’s clear to me that one of our highest priorities must be to invest more in our people this year.” There is no discussion of this decision being anything other than employee-focused. CJ Strine might consider this a “confession case,” and by his logic, “if a fiduciary admits that he is treating an interest other than stockholder wealth as an end in itself, rather than an instrument to stockholder wealth, he is committing breach of fiduciary duty.” Strine, *Dangers of Denial*, *supra* note 143, at 20. It is unlikely that the shareholders of Walmart would prevail in a suit based on that theory, though, given the business judgment rule, and given the likely positive effects of a decision like this one on employees’ “citizenship behavior,” which presumably translates into positive financial outcomes. See Russell Cropanzano, Deborah Rupp, Carolyn Mohler, & Marshall Schminke, “Three Roads to Organizational Justice”, in 20 Research Personnel and Human Resources Mgmt. 1–113 (2001) (discussing three decades of literature in organizational psychology showing that employees who perceive that they are being treated fairly are more productive, more engaged in the company, have lower absentee rates, and stay longer in the job).

(¹⁹⁵) *In Dodge v. Ford*, 204 Mich. 459, 170 N.W. 668 (1919), the Michigan Supreme Court stated that “there should be no confusion (of which there is evidence) of the duties which Mr. Ford conceives that he and the stockholders owe to the general public and the duties which in law he and his co-directors owe to protesting, minority stockholders. A business corporation is organized and carried on primarily for the profit of the stockholders.” 170 N.W. at 683. This is the oft-quoted language from this opinion. It is, however, dicta. What is often not discussed is that the Michigan Supreme Court refused to enjoin the Ford Motor Company’s plans to increase production and reduce the cost of its cars, in part so that more of its employees could buy the cars. The Dodge Brothers had argued that Henry Ford wanted to expand production and cut costs “not for the good of the company but to give more employment” and to allow more people to buy the cars. *Id.* at 678. Because of the business judgment rule, the Court refused to find that Henry Ford’s plan was legally impermissible, and so it did not enjoin the company’s actions, as had been requested, stating that “[t]he judges are not business experts.” *Id.* at 684. It did order a higher dividend to be paid because it found that the company could expand production, cut the costs of cars, and engage in some of its plans for vertical integration and still have substantial assets available from which to pay dividends. Thus, the opinion can support either CJ Stine or Prof. Stout’s views. That is, there is great latitude for company directors to act to promote the welfare of their employees, the communities in which they operate, their

customers and suppliers, or even the environment (Stout's view), but only so long as there is a plausible justification for how that advances the company's long-term financial well-being (Strine's view).

(¹⁹⁶) See Strine, *Dangers of Denial*, *supra* note 143, at fn. 72, discussing Bainbridge's view that this latitude is an "unintended consequence" of the business judgment rule.

(¹⁹⁷) GE's Jack Welch was forced to give up \$2.5 million per year in retirement benefits of exactly this kind—use of an \$11 million company apartment in NY for life, maid service, weekly fresh flowers and wine delivery, dry cleaning—when the benefits were disclosed by his second wife in a contested divorce proceeding. See Matt Murray, Rachel Emma Silverman, & Carol Hymowitz, *GE's Jack Welch Meets Match in Divorce Court*, *Wall St. J.* (Nov. 27, 2002), available at <http://www.wsj.com/articles/SB1038347809827912908>.

Comparative Corporate Governance in Closely Held Corporations

Holger Fleischer

The Oxford Handbook of Corporate Law and Governance

Edited by Jeffrey N. Gordon and Wolf-Georg Ringe

Print Publication Date: May 2018

Subject: Law, Company and Commercial Law, Comparative Law

Online Publication Date: Apr 2016 DOI: 10.1093/oxfordhb/9780198743682.013.5

Abstract and Keywords

This chapter examines issues relating to corporate governance in closely held corporations. It begins by describing the typical characteristics of closely held corporations, with particular emphasis on shareholder involvement in management, number of shareholders, share transfers, market for shares, and the broad spectrum of shareholders and applications. It then considers common governance issues and conflicts in closely held corporations and proceeds with a discussion of the governance framework for such corporations consisting of company law, model articles, articles of association, shareholder agreements, and corporate governance guidelines. It also explores the internal governance and management of closely held corporations, the governance of share transfer restrictions, and provisions for shareholder withdrawal and expulsion. The chapter concludes with an analysis of shareholder conflicts, especially oppression by majority shareholders and ex-post opportunism by minority shareholders, and how they are governed in closely held corporations.

Keywords: corporate governance, closely held corporations, share transfers, company law, shareholder agreements, share transfer restrictions, shareholder withdrawal, shareholder conflicts, majority shareholders, minority shareholders

1 Introduction

THE modern corporate governance movement in Europe and the world has, over the last two decades, dealt predominantly with listed, or at least publicly held companies. This focus becomes particularly clear when looking at three key texts in the UK, US, and German debate: (1) The British Cadbury Report released in 1992 with its widely recognized basic definition of corporate governance¹ recommended the introduction of a Code of Best Practice, aiming first and foremost at the boards of listed companies.² (2) The Principles of Corporate Governance, put out by the American Law Institute in 1994, target publicly held corporations in their key parts that deal with company structure.³ (3) The Ger-

man (p. 680) Corporate Governance Code published in 2002, according to its preamble, primarily addresses listed companies.⁴

In contrast, corporate governance issues in close corporations have been neglected for far too long.⁵ This is due to a number of factors: (1) The legal reform debate regarding improved company management and monitoring, has been sparked by scandals in listed companies; for example, the spectacular breakdown of Polly Peck, BCCI, and Barings in the UK,⁶ and German companies such as Philipp Holzmann, Metallgesellschaft, or Bremer Vulkan finding themselves on the brink of insolvency or beyond⁷. (2) Publicly held companies as a group are far more homogeneous than their privately held counterparts, which may take widely diverging forms, ranging from large third- or fourth-generation family-owned companies to medium-sized closely held companies and incorporated sole traders.⁸ (3) Companies listed on the stock exchange are better illuminated than close corporations. The wide-reaching disclosure requirements of accounting and capital markets law along with constant monitoring by analysts and the economic press produce an incessant flow of empirical information that the legislator and academia can use to formulate well-founded recommendations. In contrast, the data on close corporations is far less available, and therefore far less certain.⁹

It is only in recent times that researchers have begun to explore the corporate governance issues of closely held corporations more thoroughly.¹⁰ It is at this point that this (p. 681) chapter begins, by firstly identifying the fundamental governance problems in closely held corporations (2) and going on to explain their governance framework consisting of company law, model articles, articles of association and shareholder agreements, with specialized codes playing only a subordinate role (3). This is followed by an analysis of the internal governance of closely held corporations (4), the design of share transfer restrictions (5), and provisions for shareholder exit and exclusion (6). This analysis is completed by a detailed examination of the governance of shareholder conflicts (7).

2 Fundamental Governance Problems in Closely Held Corporations

Closely held corporations are not merely mini-public companies. They differ in a striking way from the typical *Berle Means* textbook corporation with its atomistic shareholder structure around which the international corporate governance debate has raged unabated for the last 30 years.¹¹ It is therefore worth starting this discussion with an exploration of these differences, as they provide the key for understanding the specific governance problems faced by closely held corporations.

2.1 Typical Characteristics of Closely Held Corporations

Small details aside, closely held corporations are characterized by a handful of traits that distinguish them from a typical publicly owned company.¹²

2.1.1 Shareholder Involvement in Management

A key feature of a closely held corporation is shareholder participation in the management, direction, and operation of the business. Shareholders regularly play a double role as director or employee in the company, and their remuneration is often the main source of income and return on investment. As a result, the usual separation of ownership and control typical for publicly owned corporations is often foreign to closely held corporations.¹³ Rather, shared ownership goes hand in hand with control over company resources. It is also not rare for shareholders to invest all or a large proportion of their wealth into the corporation, (p. 682) meaning that, unlike their counterparts in publicly traded companies, they do not have a broadly diversified investment portfolio. On the other side of the ledger, the collective action problem that regularly drives publicly held shareholders into rational apathy seldom features, as the individual shareholders have a much higher stake in the game.

2.1.2 Smaller Number of Shareholders

Typically, a closely held corporation has a small number of shareholders, often family members or friends bound by close bonds of trust. The smaller number of shareholders makes coordination of their interests easier, and contract negotiations cheaper, than could be achieved with a greater number of shareholders, and which would be practically impossible in a publicly traded corporation. Usually, the small number of shareholders corresponds with a smaller company—many closely held corporations are modest companies with a local customer base. There are however exceptions, so that company size itself is not the sole determining factor.

2.1.3 Share Transfer Restrictions

Another key characteristic of the publicly listed company, the ability to freely trade shares, is limited in the closely held corporation context. Depending on national law, the relevant provisions may be contained in legislation, the articles of association, or a shareholder agreement—enabling shareholders to control the composition of the shareholder group while maintaining and improving social capital within their organization.¹⁴

2.1.4 No Ready Market for Shares

Finally, there is no ready (secondary) market for the shares of closely held corporations—preventing dissatisfied shareholders from simply following the “Wall Street Rule” to sell their investment, as shareholders in public corporations often do. These same limitations often render conflicts regarding the payment of dividends more pointed, as minority shareholders are unable to balance out an unequal distribution with “homemade dividends,” i.e. divesting themselves of their shares.¹⁵ Even when there are no legal limitations on the selling of shares, minority shareholders have greater difficulty in finding a buyer, particularly as a reliable valuation for their holding is often lacking.¹⁶

(p. 683) 2.1.5 Broad Spectrum of Shareholders and Applications

All this needs to be qualified with the statement that the closely held corporation, as the “legal work horse”¹⁷ of the corporate world, is suited to a wide range of applications. It is the legal form of choice for inexperienced company founders and for highly professional market actors alike, providing the legal structure for a heterogeneous group of uses that includes startups, strategic joint ventures between big corporate players, and investment vehicles for private equity investors. This range of uses has implications for the legislator tasked with creating a functioning, yet flexible framework for closely held corporations that adequately reflects their regulatory needs.

2.2 Typical Governance Issues and Conflicts in Closely Held Corporations

In light of the above, it hardly merits saying that the governance mechanisms for publicly traded companies cannot simply be transferred to closely held corporations.¹⁸ The issues are fundamentally different from the outset: in a publicly listed corporation with a broad shareholder base, *vertical* governance problems predominate; the key challenge for the legislator and shareholders is to preserve the alignment of managerial and shareholder interests by means of institutional arrangements. In contrast, closely held corporations are far more troubled by *horizontal* governance issues,¹⁹ requiring statutory or contractual mechanisms to resolve conflicts between majority and minority shareholders.

The typical governance issues in closely held corporations seem to extend across international boundaries, with remarkable similarities existing between the German GmbH, the English private company, the French SARL, or the US close corporation.²⁰ The task for the legislator across the board is to provide a functional framework that meets the needs of closely held corporations as well as possible, thereby helping to reduce transaction costs during the foundation phase.²¹ Overall, allowing for share transfer restrictions is indispensable for the stability of the company, but it is equally important to provide carefully crafted exit and exclusion rights that preserve the ability of the company to continue operation. The biggest challenge, however, lies in the governance of shareholder conflicts. The goal here (p. 684) is predominantly to restrict the ability of majority shareholders to unfairly profit from the company,²² while also providing sufficient mechanisms to prevent ex post opportunism by minority shareholders, and to resolve deadlocks.

3 Governance Framework for Closely Held Corporations

The governance framework for closely held corporations is made up of various regulatory elements that are partially corporate and partially contractual in nature, and which vary in their ability to bind the parties.²³

3.1 Legislation

Comparative Corporate Governance in Closely Held Corporations

Legal persons are a creature of the national legislator, without whom they would not exist.²⁴ Therefore, legislation is the first, and essential layer of the governance regime for closely held corporations. Conceptually however, individual jurisdictions address this question in different ways, referred to in the British company law discussion as either stand-alone or integration models.²⁵

3.1.1 Stand-Alone Models

Many countries have independent codes for their private limited liability companies. The historical prototype is the German GmbH Act of 1892, representing Germany's most successful legal export, which found a footing prior to World War I in Portugal in 1901 and Austria in 1906, before being taken up in France in 1925, Turkey in 1926, Belgium in 1935, and Switzerland in 1936. It found equal favour outside of Europe, in Brazil in 1919, Korea in 1931, Argentina in 1932, and Mexico in 1934. Today, versions of the GmbH can be found in over (p. 685) 100 countries across the world.²⁶ Many jurisdictions that have taken on the GmbH concept have sought to improve upon the German model, or to give it a slightly different form. This applies particularly to Romanic jurisdictions which place a greater emphasis on the "personal" (*intuitus personae*) elements of the GmbH.²⁷

3.1.2 Integrated Approaches

The situation in Anglo-Saxon jurisdictions, with their traditional uniform company model is quite different.²⁸ In the United Kingdom where the Companies Act 1862 required a minimum of seven founding shareholders to establish a limited liability company,²⁹ hardly anyone envisioned small, closely held corporations: "First, they were all public"³⁰. It is only during the last thirty years of the nineteenth century that the number of smaller companies began to increase significantly,³¹ with it, the amount of available practice-based literature.³² This development was further advanced by the groundbreaking 1892 decision *Salomon v. Salomon*, in which the House of Lords confirmed that while the act required seven founding shareholders, it did not require they be independent, thus condoning what in effect was a "one-man company."³³ The regulatory requirements were tightened up in the Companies Act 1900 in response to numerous fraudulent companies, which had the unfortunate side-effect of making company foundation less attractive for small and medium-sized companies. After serious protests, Parliament appointed a reform commission which did not base their final report on the German GmbH, but rather put forward its own proposals.³⁴ These recommendations saw the Companies Act 1907 differentiate between public and private companies for the first time, with relaxed regulations for the latter. According to the legal definition in s. 37(1), a company was considered a private company when its articles of (p. 686) association³⁵ provided for restrictions on share transfer, limited the number of shareholders to a maximum of 50, and forbade the public offer of company shares or bonds. In the intervening period, the United Kingdom has remained true to its uniform company model; isolated calls for the introduction of specific reforms for small companies³⁶ have not met with much response.³⁷ The matter arose most recently in the preparation for the Companies Act 2006, where a freestanding approach was once again rejected for fears of complications in transforming from a private to a public company.³⁸ Despite this, the reform did take the needs of small and medi-

Comparative Corporate Governance in Closely Held Corporations

um-sized corporations into consideration under the slogan “Think Small First”³⁹ and introduced model rules for private companies.⁴⁰

It took even longer for the required adjustments to be made in the United States, where the close corporation was regarded as the “orphan of corporate law”⁴¹ until well into the twentieth century. The legislation of most of the states in the US were designed for large public corporations, and did not suit small companies with their distinct needs.⁴² These were normally accommodated in practice by specific shareholder agreements, which contained voting agreements, restrictions on the transfer of shares or pre-emption rights that were progressively acknowledged with some reservations by the courts. This approach resulted in the gradual development of a common law of close corporations,⁴³ closely tended by the lawyers of the day.⁴⁴ The first specific legislative step was taken in 1948 in New York, followed by a comprehensive regulation in North Carolina in 1955. Today, many states have their own close corporation statutes, albeit with considerable variations.⁴⁵ They mostly consist of a separate chapter in the local corporation legislation, which comes into play when the shareholders vote it into their articles of association. General opinion is mixed with regard (p. 687) to the advantages and disadvantages of this regulatory method.⁴⁶ Legal practice shies away from the uncertainties of special regulations that have yet to be subject to intense judicial scrutiny, or is reluctant to make use of them for other reasons.⁴⁷

In continental Europe, the single legislative model has won new supporters in the Nordic states: Denmark, Finland, and Sweden now regulate publicly owned and closed corporations under one legislative instrument, although Norway is continuing with its dual approach.⁴⁸

3.2 Model Articles

The term ‘model articles’ refers to articles of association provided by the legislator which business founders are free to adopt in whole or in part as an alternative to developing their own customized articles. Of these, the most prominent example is the UK Model Articles for Private Companies, issued by the Secretary of State pursuant to sec. 19(1) of the Companies Act 2006.⁴⁹ Some US states have adopted a similar approach in their close corporation statutes.⁵⁰ In continental Europe, by contrast, this regulatory technique did not gain a strong footing until the advent of fast-track incorporation procedures, with online registration processes like those in Spain, Italy, Greece, and Poland requiring the adoption of immutable model articles or sample protocols.⁵¹ Germany took a step towards model articles with the reforms of 2008, stipulating the use of a sample protocol for the simplified, more cost-effective incorporation procedure contained in §2 para. 1a sentence 2 GmbHG. France also introduced a *modèle des statuts types* for single member private liability companies (EURL) in 2009.⁵² While the use of model articles does permit a more rapid incorporation procedure with lower costs, for companies with multiple shareholders these advantages are often obtained at a price: the enforced waiver of customized agreements, for example on voting rights or dividend clauses.⁵³ The question as to whether the benefit of increasing the speed (p. 688) of incorporation outweighs limiting the potential

to tailor the articles of association to a business's specific needs is, as yet, still open to international investigation and debate.⁵⁴

For regular incorporation procedures, however, model articles are still the exception. The Dutch legislator rejected their introduction, citing concerns about flexibility,⁵⁵ although the Dutch Association of Notaries quickly stepped into the breach to offer sample protocols. Other countries refer potential company founders to professional expertise—New Zealand, for example, has discontinued its practice of offering professionally drafted model articles via the Companies Office website, instead advising business founders to deal directly with a private service provider.⁵⁶ On the supranational level, the European Commission recently revived the idea of a uniform template for articles of association in its SUP proposal,⁵⁷ after previous attempts at model articles for the European Private Company turned out to be unsuccessful.⁵⁸

3.3 Articles of Association

Across the globe, it is not the statutes, but rather the articles of association that include the most important governance regulations for closely held corporations.⁵⁹ This is usually due to the broad scope that legislation allows for shareholders to determine the internal affairs of the company.

3.3.1 Primacy of Private Ordering

Wide-ranging party autonomy for shareholders has been a hallmark of the German GmbH Act since its entry into force in 1892.⁶⁰ The economic advantages are clear: shareholders can (p. 689) establish custom made organizational structures with membership rights according to their own special needs. In the absence of any negative externalities, such agreements improve efficiency by increasing the common benefit of the company founders.⁶¹ However, much of this liberal spirit was lost in the twentieth century, particularly in jurisdictions like Italy or the Netherlands, who based their close corporation legislation (too) closely on that for stock corporations.⁶² It is only in recent times that there has been an almost universal return to private ordering in the law of closely held corporations. In France, for example, the *liberté contractuelle* resurfaced 20 years ago with the introduction of the *société par actions simplifiée* (SAS).⁶³ The Delaware Limited Liability Act has sought to allow the greatest possible effect for private ordering since 2004,⁶⁴ while the Court of Chancery takes an even stronger line, offering the members of LLCs “the maximum amount of contract, private ordering and flexibility.”⁶⁵ The English Department of Business, Industry and Skills put forward almost identical wording in the consultation paper for the Companies Act reform of 2006.⁶⁶ Japan formally included the principle of private ordering in its corporations legislation of 2005, giving shareholders a broad contractual scope for establishing the articles of association in closely held corporations.⁶⁷

3.3.2 Scope of Private Ordering

The freedom to determine the internal operations of a company is an important expression of private ordering. One key feature of this “libertà di autorganizzazione”⁶⁸ is the organizational freedom with respect to internal governance rules and decision-making procedures, namely the ability to choose between different management structures and the ability to drop (p. 690) individual organizational elements. In addition, an informal process for gathering information as well as simplified decision-making processes are now often possible, representing an “intramural informality in close corporations.”⁶⁹ To take an example from the UK company law reform: a private company is not required to appoint a company secretary, and may choose not to convene an annual general meeting; in addition, resolutions can be made in writing via circulated email.⁷⁰ This newly won freedom also presents itself in the liberalization of corporate shares. The Dutch close corporation law, for example, now allows shares without voting rights, shares with multiple voting rights or staggered voting rights, as well as shares with no dividend rights.⁷¹ A shareholder cannot, however, completely waive all rights, and shares that provide neither voting rights nor dividend rights are not permitted under the law.⁷²

3.3.3 Limitation to Private Ordering

Potential limitations to private ordering were recently discussed as part of the question of whether the duty of loyalty or other functionally similar remedies⁷³ have a mandatory or default character.⁷⁴ The US LLC forms the pointy end of the liberalization scale, with §18-1101(c) Del. The LLC Act permits the complete exclusion of fiduciary duties, naturally with the condition that the implied contractual covenant of good faith and fair dealing remain intact.⁷⁵ In contrast, according to the leading interpretation, the recently introduced Article 803 (3) OR only permits a specific and ad hoc exemption from the duty of loyalty for Swiss close corporation shareholders, but no general exemption.⁷⁶

3.4 Shareholder Agreements

In addition to the articles of association, shareholder agreements⁷⁷ (*pactes d'actionnaires*⁷⁸, *Gesellschaftervereinbarungen*⁷⁹) may contain further provisions for the internal affairs of (p. 691) closely held corporations. These agreements enjoy extensive use all over the world, as they assist shareholders more clearly to regulate their relationships with each other. The most common agreements cover voting rights, transfer restrictions, and exit rights, as well as the composition or remuneration of management or supervisory boards. Conceptually, they are separate contractual agreements between all or some of the shareholders that operate *alongside* the articles of association, as the Italian term *patti parasociali* and the Spanish term *pactos parasociales* suggest.⁸⁰ As a classical contract, it can only bind its immediate parties; in contrast to the articles of association, it can only be altered with the consent of all parties. In most jurisdictions, the existence and the content of shareholder agreements remain hidden from the curious gaze of outsiders. Noteworthy exceptions are the UK, and some of the former Commonwealth states such as Malaysia, where a copy of all shareholder agreements must be lodged with the Companies Commission.⁸¹ Some continental European jurisdictions, for example France, Italy,

Comparative Corporate Governance in Closely Held Corporations

and Portugal, require the disclosure of shareholder agreements only in listed companies.⁸²

Usually, statutory law says little, if anything at all about shareholder agreements. There are, however, individual codifications which generally alert shareholders to the permissibility of these agreements or even directly address some specific types. Article 17(1) of the Portuguese Commercial Company Act (*Código das Sociedades Comerciais*, CSC), for example, renders legally binding all shareholder agreements entered into by all or some partners. Similarly, Article 17(b) of the UK Companies Act 2006 provides that all shareholder agreements are regarded as part of the company's constitution.⁸³ Other jurisdictions are more selective, for instance, §7.32 US Revised Model Business Corporation Act (RMBCA) lists, and thus authorizes, only specific types of shareholder agreements. Some other jurisdictions single out voting agreements as the most important contractual device, as in Article 281 Belgian Companies Act (*Code des Sociétés*, C. soc.), where the exercise of voting rights may be the subject of an agreement between shareholders.

The overall trend around the world today is generally to respect and enforce shareholder agreements between company members. The courts have moved on from the open hostility displayed most prominently in a famous line of cases handed down by the New York Court of Appeals ("the Big Four").⁸⁴ Russia, one of the few jurisdictions under which shareholder agreements had remained unenforceable, amended its Limited Liability Companies Act to allow them in 2009.⁸⁵ Today, most jurisdictions grant shareholders significant latitude to enter into shareholder agreements. The best illustration comes from voting agreements, once viewed as incompatible with statutory corporate governance, they are nowadays recognized as lawful and enforceable, provided they observe certain limits. One typical limitation is spelled out in Article 17(3) Portuguese Commercial Company Act, which declares null and void any voting agreement that obliges a shareholder always to follow the instructions or (p. 692) approve proposals put forward by the company or one of its bodies or to exercise voting rights in return for special benefits. Article 281 Belgian Companies Act contains a similar list, with the proviso that these agreements must have an expiry date and always be justified in terms of shareholder interests.

Breaches of shareholder agreements are almost universally subject to liability sanctions. However, these are unlikely to be an appropriate remedy due to the difficulties in proving the damages incurred. As a result, practitioners across the board recommend liquidated damages clauses as an indirect enforcement mechanism. Moreover, many jurisdictions allow for specific performance and injunctions, as seen in §7.31(b) RMBCA, which expressly stipulates that a voting agreement is subject to specific performance. However, a number of jurisdictions, including Argentina and Japan, still reject this approach.

From a doctrinal perspective, the most difficult issue is whether shareholder resolutions that deviate from a shareholder agreement can be set aside by a shareholder rescission suit. This question has been vexing German corporate law scholarship for three decades: two Federal Court of Justice cases from the 1980s stated that a breach of an omnilateral shareholder agreement may be subject to a motion to set aside a shareholder

resolution.⁸⁶ In contrast, many scholars hold with the “separation theory,” arguing that articles of association and shareholder agreements should be kept strictly apart.⁸⁷ Internationally, this second view holds sway in many jurisdictions including Argentina, Belgium, Portugal, and Switzerland. The Danish Companies Act (*lov om aktie- og anpartsselskaber*, SEL) has authoritatively decided the issue, stipulating in Article 82 that shareholder agreements are neither binding on the limited liability company nor with regard to resolutions passed at general meetings. There are, however, many countries that show scholarly support for a legal “spillover” from the contractual to the corporate hemisphere.

3.5 Corporate Governance Guidelines

In contrast to listed companies, corporate governance guidelines do not yet play a significant role for closely held corporations. This is easily explained, as the corporate governance debate originated from the need to protect *external* investors. In addition, the principal-agent problems both company types face are considerably different: the corporate governance principles for listed companies cannot therefore simply be transposed to non-listed companies, let alone closely held corporations. That being said, there are some initial cautious attempts being made to develop a tailored corporate governance framework for unlisted companies. The Belgian *Buyse* Corporate Governance Code is one pioneering example, providing special rules for family enterprises in addition to recommendations for all non-listed companies.⁸⁸ Other recommendations, such as the Finnish Central Chamber (p. 693) of Commerce initiative “Improving corporate governance of unlisted companies”⁸⁹ and the British “Corporate Governance Guidance and Principles for Unlisted Companies,”⁹⁰ have a somewhat different focus, concentrating on larger unlisted or small and mid-size listed companies. It remains to be seen whether it is helpful or even feasible to draw up a voluntary corporate governance code for closely held corporations. The Colombian Framework of Good Corporate Governance for Small and Medium-Sized Enterprises provides one potential way forward, by serving as a model of reference for businesses attempting to craft their own corporate governance guidelines.⁹¹

4 Internal Governance of the Company

The pivotal issue for internal corporate governance in closely held corporations is the interaction between corporate bodies or organs.

4.1 Corporate Organs

Around the globe, almost all general statutory schemes consist of two decision-making organs: the shareholders’ meeting and the board of directors. In most jurisdictions the latter is also mandatory,⁹² although the company’s capacity to act does not, at least theoretically, require a board of directors, as general agency concepts could be used.⁹³ In France, directors were long viewed by the legislation as agents (*mandataires*) of the company.⁹⁴ One exception to the mandatory requirement for a board of directors comes from Delaware. According to §351 DGCL, appropriate provisions in the articles may permit a

close corporation to be managed by its shareholders. The most recent British corporate law reform did not follow this bold move, however, confining itself instead to introducing a less formal decision-making process for private companies to better accommodate shareholder-directors.⁹⁵

Occasionally, co-determination may call for a mandatory supervisory board—although this usually only applies to larger companies. For the German GmbH, for example, the threshold is 500 employees. Additionally, EU company law requires medium-sized and (p. 694) large corporations to engage an auditor, but opinions are divided as to whether this auditor qualifies as a corporate organ. Many jurisdictions also permit the creation of additional corporate organs, for example, advisory boards or committees. Shareholders are free to determine the name, function, and competences of these additional organs, as long as the exclusive responsibilities of the general shareholders' meeting and the board of directors remain intact.

4.2 Allocation of Powers between Shareholders and Directors

4.2.1 Omnipotence versus Parity Theory

Casting an eye across the globe reveals two basic models for allocating powers between shareholders and directors, snappily captured in the Swiss doctrine as the omnipotence theory and the parity theory.⁹⁶ The first is one of shareholder supremacy in which the board of directors is subordinated to the shareholders' meeting. This hierarchical structure has been included in §37(1) German GmbH law since its first enactment in 1892, allowing shareholders to pass a resolution issuing binding instructions for directors, even for the day to day running of the business. Portugal, Spain, and Japan also provide a similar organizational framework.⁹⁷ The Netherlands, where previously shareholders in a *besloten vennootschap* were only permitted to issue general instructions, has recently moved in the same direction with their closed corporation reform of 2012. Pursuant to Article 239(4) NBW, the articles of association may now provide that the board of directors has to behave according to the (specific) instructions of another body of the corporation.⁹⁸ In Italy, shareholders who represent at least one-third of the issued share capital of a *società a responsabilità limitata* can force a decision of the shareholders meeting in accordance with Article 2479 Abs. C.c.

The alternative approach, based on the principle of parity, is used in Switzerland. Although Article 804(1) OR nominates the shareholders' meeting as the supreme governing body of the company, Article 810(1) OR has put some checks and balances in place, by stating that directors have an inalienable duty of "overall management" ("Oberleitung").⁹⁹ British law follows a similar concept, albeit as a default rule, by vesting the board of directors with the management of the company (model Art. 3).¹⁰⁰ As a consequence, it is the directors, and they alone, who may exercise these powers.¹⁰¹ The only way in which the shareholders can (p. 695) control the exercise of these powers is by passing a special shareholder resolution (model Art. 4) requiring a majority of not less than 75%.¹⁰² However, the ability of shareholders to remove directors at any time by ordinary resolution under s. 168 CA 2006, induces the directors to regularly fol-

low the business strategy preferred by the majority shareholder. Australia¹⁰³ and the USA¹⁰⁴ have a similar division of power as the statutory or common law default—leading to the development of shareholders’ agreements that give minority holders a voice in the control and management of the corporation.

4.2.2 Default and Mandatory Competences of the Shareholder Meeting

Reflecting the high degree of organizational freedom granted by many jurisdictions,¹⁰⁵ the competences of the shareholder meeting are mostly default powers.¹⁰⁶ This enables shareholders to modify the distribution of powers between the corporate organs as they think fit. Mandatory involvement of shareholders is usually limited to those decisions that impact on their legal or contractual rights. These include alterations to the articles of association, an increase or reduction of share capital and structural changes such as mergers, divisions, conversions, or decisions to wind up the company voluntarily.¹⁰⁷ An example can be found in Article 27(1) of the Commission’s Draft SPE Regulation.¹⁰⁸

4.2.3 Mandatory Competences of the Board

In most continental European jurisdictions, the mandatory competences of the board are fairly limited. Under German law, for example, they include the board’s power to represent the company in relation to third parties and the specific-conduct duties in the interests of creditors such as the duties to keep the books of the company, to prepare the annual accounts, to communicate with the Commercial Register and to initiate insolvency proceedings if necessary.¹⁰⁹ Similarly, under UK law, the mandatory functions of directors relate to (p. 696) the production of the annual accounts and reports and the regular administration of the company, in particular its communications with Companies House.¹¹⁰

5 Share Transfer Restrictions

Closely held corporations are built on mutual trust and loyalty between their founders. This close-knit setting lends importance to the matter of “who” a shareholder is—success, or the lack of it, is often contingent on shareholders sharing goals and values. Conversely, a lack of personal bonds or latent conflicts between shareholders may endanger the organizational capital of a close corporation. Against this backdrop, there is a legitimate interest in restricting share transfers to keep out strangers and undesirable co-shareholders.¹¹¹ These transfer restrictions constitute one of the core characteristics of a close corporation.¹¹² However, they vary greatly in type and operation across jurisdictions, making them an attractive subject for comparative company law research.¹¹³

5.1 Default Rules

An initial question in this field is whether the national legislator should set the free transfer of shares as the default rule, or whether some restrictions should apply. A comparative glance across a range of jurisdictions reveals a somewhat mixed bag of results. One has to consider, however, that some codifications apply only to close corporations under

stand-alone legislation, while others do not differentiate between publicly and closely held corporations.¹¹⁴

The majority of jurisdictions begin from the perspective that shares are freely transferable, while allowing for transfer restrictions in the articles or in shareholder agreements. This group includes most US states, Germany, Italy, Denmark, Sweden, Finland, Japan, Argentina, and Australia with statutory and contractual transfer restrictions being equally common in these countries. In contrast, other countries have opted for the opposite default rule, requiring the company's consent for share transfers. This is the case for example in Norway and Switzerland, where share transfers require the consent of the shareholder meeting. Similarly, the model rules for private companies in the UK and Ireland require (p. 697) director approval.¹¹⁵ Still other jurisdictions, including Belgium, France, Portugal, and Spain have taken a middle course, a statutory consent requirement, with generous exceptions for share transfers between spouses, direct relatives (ascendant or descendent), or fellow shareholders.¹¹⁶ The basic idea here is that these potential shareholders are not strangers to the company, and that a smooth intergenerational succession is in the best interests of the company. The Netherlands provides a fourth variation, stating that, unless the articles of association provide otherwise, a shareholder looking to dispose of shares must first offer them proportionally to the other shareholders.¹¹⁷ As a final option, the legislator may require shareholders of close corporations to provide for transfer restrictions in the articles of association without any further specification. This is the approach taken in the European Commission's original Draft Proposal for a European Private Company¹¹⁸ and in the Malaysian Companies Act.¹¹⁹

The existence of valid statutory or contractual transfer restrictions raises the question of what mechanisms are available to protect shareholders "locked in" to the company. Some countries provide statutory relief, such as Switzerland which provides a right to resign from the company with good cause in Article 786(3) OR where the articles of association prohibit exit or the shareholder meeting refuses to consent. A similar withdrawal right has been put in place in Italy under Article 2469(2) C.c. for close corporation shareholders. In cases of valid transfer prohibitions, Portugal grants a statutory withdrawal right after 10 years of shareholding under Article 229(1) CSC. According to the new Dutch law, a shareholder may freely sell shares if they have been offered but not been bought by co-shareholders or other candidates within a three-month period.¹²⁰ In Japan, a company which does not ratify a share transfer must instead nominate a designated purchaser, with both the buyer and the seller authorized to ask the court to set the purchase price.

5.2 Types of Share Transfer Restrictions and their Legal Limits

Restrictions on share transferability come in different shapes and forms. Despite their great variety, one can discern a certain standardization around the world. The most common take the form of inalienability clauses, consent clauses, pre-emptive rights, and buy-sell agreements. Occasionally, the national legislator itself will provide a list of potential clauses to enable shareholders to make an informed decision. One nice illustration comes from the statutory regime of the French simplified stock corporation (SAS) that explicitly

mentions inalienability and consent clauses.¹²¹ Sweden has provided a similar “à la carte” approach in the Swedish Companies Act since 2006, discarding its former restrictive regulation as it was no longer in line with international standards.¹²² The new regulation describes and explains (p. 698) the function of consent clauses, rights of first refusal, and post-sale purchase right clauses in great detail. The Swiss law on private limited liability companies provides a third example, detailing the various permissible forms of transfer restriction agreement as an exhaustive list in Article 786(2) No. 1-5 OR.¹²³

Statutory mention of such clauses is helpful for legal practitioners, as it implicitly confirms their legality. A good illustration comes to us from Article L. 227-13 French C. com., which stipulates that the articles of association of an SAS may specify the inalienability of shares for up to ten years. In other jurisdictions, the validity of such clauses is less clear. US courts usually apply a reasonableness test to transfer restrictions, which would likely find indefinite inalienability clauses invalid, based on the venerable property law rule against unreasonable restraints on alienation.¹²⁴ According to Article 2:195 Dutch NBW, the articles of association may exclude transferability of shares for a specific period of time—based on legislative history, a fixed period of five years would not be contrary to the principles of reasonableness and fairness. Still other jurisdictions, such as Germany and Switzerland, consider inalienability clauses to be valid, but still protect the interests of locked-in shareholders with a mandatory right of withdrawal for good cause in the GmbH legislation.¹²⁵ Guidance is given for other common share transfer restrictions in § 202(c) DGCL which specifically identifies five permissible categories: first-options agreements, first refusal agreements, consent agreements, buy-sell agreements, and provisions prohibiting transfer to designated classes of persons.¹²⁶ Should the court find that a clause is not valid in a specific case, §349 DGCL dictates that the corporation still has the option, for a period of 30 days after the judgment setting aside the restriction becomes final, to acquire the shares at a fair value determined by the Court of Chancery.

5.3 Judicial Review of Consent Clauses

As we have seen, consent clauses in the articles or in legislation are often used to control the composition of the shareholder base. Where the responsible company organ—shareholder meeting or board of directors—refuses to grant its consent, the question comes down to whether, and to what extent, the courts will scrutinize this refusal. English courts are generally very hesitant in this regard, only stepping in to apply a subjective standard when the directors have unduly exercised their voting rights: “It is trite law that the court will not interfere with the exercise by directors of a discretion not to register a transfer if their decision was one which a reasonable board of directors could bona fide believe to be in the interests of the company.”¹²⁷ The same is true for Ireland, where the shareholder looking to dispose of (p. 699) their shares must prove bad faith on the part of the directors, and for Australia, where a refusal to grant consent is only unlawful when it amounts to fraud on the minority.¹²⁸ At least in theory, US courts offer slightly more protection, holding that consent to transfer may not be unreasonably or arbitrarily withheld.¹²⁹ However, as has been correctly observed in legal scholarship, reasonableness and arbitrariness are often in the eye of the beholder.¹³⁰ Under German law, there is considerable

disagreement on the appropriate test: some authors grant the decision-making body an absolute discretion, others call for a proportionate and reasonable exercise of judgment, while still others demand good reason for the refusal to grant consent.¹³¹

5.4 Legal Assessment of Drag-Along and Tag-Along Clauses

Joint venture and private equity agreements in the guise of a closely held corporation often contain drag-along and tag-along clauses.¹³² The former permit a shareholder to demand fellow shareholders offer their shares to a third party at the same price and the same conditions. The latter protects minority shareholders from being left behind when the majority shareholder decides to sell, enabling them to offer their shares for sale on the same terms as the majority shareholder.

Despite their widespread use, the enforceability of drag-along and tag-along rights has received little attention in legal scholarship, and relevant case law is also thin on the ground. A comparative analysis, while providing some valuable indications, does not yield any clear-cut answers. Authors in common law jurisdictions like Australia, Ireland, Malaysia, the UK, and the USA usually point out that there is no prohibition against these clauses and that, in principle, they are enforceable.¹³³ Recent UK legislation has even formally recognized them in the Growth and Infrastructure Act 2013 with respect to “employee shareholders.”¹³⁴ Civil law countries in Europe seem to be more cautious; Japanese scholars have expressed doubts as to whether these clauses could be inserted into the articles of association rather than being restricted to shareholder agreements. In general, tag-along rights are subject to less criticism than drag-along rights.¹³⁵

(p. 700) In so far as drag-along rights are concerned, US case law seems to suggest that they are enforceable where they serve a reasonable corporate purpose.¹³⁶ One UK case from 2005 expressed some reservation in a particular case where the compulsory transfer restriction was only later included in the articles of association by means of an amendment.¹³⁷ An Italian court ruling from Milan upheld a drag-along clause under the condition that it ensure a fair price for the minority shareholders.¹³⁸ According to Article 2:192 Dutch NBW, the articles of association may specify situations when the shareholder is obliged to transfer shares—thus seeming to accommodate drag-along rights, although in the preparatory documents, the reform legislator cautioned against imposing duties on minority shareholders that were too far-reaching and unreasonable.¹³⁹

6 Shareholder Withdrawal and Expulsion

6.1 Withdrawal Rights

It is a common refrain in company law that a shareholder cannot unilaterally withdraw his investment from the company, effectively locking in the capital contribution. This “lock-in” feature presents a stark contrast to partnership law, where the default position allows all individual partners to disassociate from the firm.¹⁴⁰ Locked-in capital has been

identified in legal scholarship as a crucial factor in the rise of the large public corporation in the nineteenth century, as it enabled managers to pursue long-term corporate goals irrespective of shareholders' personally motivated liquidity demands.¹⁴¹ The inability of shareholders to unilaterally trigger dissolution is equally important in closely held corporations, as it ensures the stability of newly established business and prevents opportunistic shareholders from holding the company to ransom by threatening to leave or dissolve the firm.¹⁴² This, in turn, is a precondition for the willingness of shareholders to provide specific investments.

There is, however, a considerable downside to capital lock-in in a close corporation.¹⁴³ Unlike shareholders in the public corporation, minority shareholders in a close corporation (p. 701) are unable to follow the "Wall Street rule" and sell their shares on the open market. The illiquidity of their investment leaves them vulnerable to oppression by the majority shareholder, and without an effective exit route in cases of fundamental changes to the corporate structure. In the face of this, national legislators and courts have to make a policy choice whether and to what extent minority shareholders should be granted protection in the form of exit rights. Although almost every jurisdiction has chosen to do so, the individual approaches vary widely, both with respect to the preferred instrument, and their substantive requirements.

6.1.1 Categories of Exit Rights

Exit rights for minority shareholders come in different shapes and forms. Categorizing them is a difficult task, as some find their legal basis in company law, others in insolvency law, and still others in contract law. There are, however, two distinctions that may provide a workable systemization.¹⁴⁴ The first may be linked to the specific technique employed to provide an exit route: the legislator may empower the court to declare the dissolution of the company under certain conditions (winding-up remedy), or grant minority shareholders a statutory right to be bought out by the majority shareholder (buyout remedy or withdrawal right). These two remedies are not mutually exclusive. The second distinction concerns the substantive reasons for allowing a minority shareholder to exit: whether it be to provide relief from oppression or abuse by the majority shareholder (oppression remedy) or in the face of fundamental changes in the structure of the company initiated by the majority shareholder, even where these changes are not necessarily detrimental to the minority shareholder (appraisal rights).

6.1.2 Oppression Remedies

A majority shareholder can take unfair advantage of his position in a myriad of ways, which will be analysed separately.¹⁴⁵ The question here is whether these maneuvers give rise to a statutory remedy—which in most jurisdictions is a resounding yes. The equitable remedies available under English law are perhaps the best known internationally. Ever since the introduction of the Companies Act in 1862, company law has made provision for a winding up on just and equitable grounds.¹⁴⁶ Currently this provision is contained in s. 122(1)(g) Insolvency Act 1986 (IA 1986). The leading authority, *Ebrahimi v. Westbourne Galleries Ltd*, concerned the removal of a director in a "quasi-partnership" company

made up of three members. Although the articles of association provided expressly for the removal of a director by ordinary resolution, the House of Lords decided that it was inequitable for the majority to exercise their power as they did, and ordered the company be wound up on just and equitable grounds.¹⁴⁷ Today, the classic winding-up remedy has taken a backseat to the (p. 702) unfair prejudice regime set out in s. 994 CA 2006. This may see the court order the majority shareholder, or the company itself, to purchase the shares of a minority shareholder to remedy demonstrated unfair and prejudicial treatment.¹⁴⁸ Similar oppression remedies have also evolved in the US, where many corporation law statutes now expressly empower the courts to dissolve a company on application from a minority shareholder where the directors of that company are guilty of fraud, gross mismanagement, or the oppression of minority shareholders.¹⁴⁹ Instead of an involuntary dissolution, courts can, and in practice most commonly do, order a buyout of the aggrieved party's shares.¹⁵⁰

Among the European civil law jurisdictions, the Scandinavian jurisdictions have historically been more restrictive with regard to exit rights for minority shareholders.¹⁵¹ Compulsory dissolution under Danish and Finnish law is confined to cases of serious abuse of majority powers. A court-ordered redemption of shares by the majority shareholder requires the minority to demonstrate either a breach of the Companies Act or the articles of association, or a deliberate abuse of power that is likely to continue. Only the Norwegian Private Limited Companies Act offers broader protection, providing aggrieved shareholders with a right to withdraw from the company not only in cases of abuse of power, but also in cases of serious and permanent conflicts of interest regarding the running of the company, unless the redemption procedure would seriously harm the activities of the company, or would otherwise be unreasonable.¹⁵²

The Dutch approach is also worth mentioning, with its detailed rules for resolving shareholder disputes, known locally as *geschillenregeling*.¹⁵³ The basic rule is contained in Article 2:243 NBW, which states that a shareholder, whose rights or interests are harmed by the conduct of one or more co-shareholders in such a way that continued membership can no longer be reasonably expected, may file a legal claim in court against those co-shareholders for his withdrawal, requiring them to buy out his shares. In Swiss company law, Article 821(3) OR provides that any shareholder of a GmbH may apply to the court to dissolve the company for good cause, with case law recognizing continued abuse of power or trust as good cause.¹⁵⁴ Along the same lines, the German courts also recognize a withdrawal right as a mandatory and inalienable right in a GmbH if there is good cause ("wichtiger Grund").¹⁵⁵ The doctrinal source of this exit right can be found in §314 German Civil Code, which allows for the termination of contractual agreements without notice for good cause. The requirements for good cause are often satisfied in cases of majority abuse,¹⁵⁶ that is when the terminating party, in (p. 703) light of all the circumstances of the case at hand and weighing the interests of both parties, cannot reasonably be expected to continue the contractual relationship until its agreed end.¹⁵⁷ In addition to this individual right for any shareholder, §61 GmbHG grants (minority) shareholders holding at

least 10% of the share capital the right to apply for a court-ordered dissolution for good cause.

6.1.3 Appraisal Rights

Moving on from oppressive actions to “no-fault situations,” we enter the field of appraisal rights. These allow shareholders who voted against an extraordinary corporate action, such as a structural change to the company, the right to sell their shares back to the company at a judicially appraised value. Unlike oppression remedies, appraisal rights are not contingent on a demonstration of illegality, fraud against the minority, or breach of fiduciary duties. Appraisal rights play an important role in stock corporation law, most notably in the United States, Japan, France, Germany, and Italy.¹⁵⁸ Their scope in the law of close corporations is more limited, however, a matter not facilitated by their being scattered throughout different legal or legislative sources, instead of presented as one coherent system. One exception in this regard is Italy, which introduced an extensive list of appraisal rights in Article 2473(1) C.c. in 2004. This provision entitles a shareholder of an s.r.l. to leave the company if he is opposed to a change of the corporate purpose or structure, a merger, a division, a transfer of the registered office to another country or a transaction that leads to fundamental modification of the company’s objects. Similar rules can be found in Spain and Portugal.¹⁵⁹ In Germany, the legal landscape is less clearly arranged for appraisal rights: according to the Reorganization of Companies Act (UmwG), a shareholder has a right to exit in case of a merger (§§29 et seqq., 36 UmwG), division (§125 UmwG), asset transfer (§§176, 177 UmwG) or change in company form (§§207 ff. UmwG). Moreover, the inalienable withdrawal right mentioned above may also be triggered by an alteration of the objects clause, or the integration of the GmbH as a subsidiary into a corporate group.¹⁶⁰ A final illustration comes to us from the original Draft Statute for a European Private Company (SPE) proposed by the European Commission, which combined appraisal rights and oppression remedies in Article 18. This provision, which was later deleted, would have allowed the shareholder to withdraw from the SPE if serious harm to the interests of the shareholder was caused by: (1) the SPE being deprived of a significant part of its assets; (2) the transfer of the registered office of the SPE to another Member State; (3) a substantial change of the activities of the SPE; or (4) failure to distribute dividends for at least three years, even though the SPE’s financial position would have permitted it.

(p. 704) 6.1.4 The Right to Exit “at Will”

A final question is whether the legislator should go even further and grant minority shareholders a right to exit “at will.” This has recently been advocated by several scholars—albeit subject to certain conditions.¹⁶¹ However, successful examples of this approach are scant in comparative company law practice. In 2009, the Russian law on limited liability companies abolished one of the rare examples which had allowed a shareholder to exit at any time.¹⁶² Comparative support for a more liberal approach is thus confined to Italy, which introduced a right to exit “at will” (*diritto di recesso*) in Article 2473(2) C.c. for private limited liability companies established for an indefinite term. This right can be exercised at any time, with a notice period of 180 days. The articles of association may pro-

vide for a longer notice period, but no longer than one year. In contrast, the majority of common law and civil law jurisdictions oppose the idea of facilitating an exit from close corporations. In England and Wales, the Law Commission investigated the matter in 1997, before denying a case for reform, stating: “In our view, there are strong economic arguments against allowing shareholders to exit at will. Also as a matter of principle, such a right would fundamentally contravene the sanctity of contract, binding the members and the company.”¹⁶³ Similar concerns have been expressed in Germany, where the prevailing doctrine strictly rejects the idea of an exit right “at will,” arguing that it would infringe on the venerable principle of *pacta sunt servanda*, and may potentially pose a significant risk of abuse and endanger the financial stability of small businesses.¹⁶⁴

6.2 Expulsion of a Shareholder

The plight of the oppressed minority shareholder is one story, the plague of the obstructive shareholder yet another. The latter raises the question as to whether the troublemaker whose behaviour is detrimental to the company can be expelled for good cause. A comparative analysis reveals two basic approaches to this problem.

A large number of jurisdictions provide for a statutory expulsion right for good cause, irrespective of any expulsion clause in the articles of association. This group includes Switzerland, Portugal, Spain, Belgium, and the Netherlands. Again, Dutch law stands out with its detailed rules for resolving shareholder disputes (*geschillenregeling*):¹⁶⁵ Its basic provision in Article 2:336 NBW permits one or more shareholders who solely or jointly hold at least one-third of the issued share capital to obtain a court order that another shareholder whose conduct has harmed the interests of the corporation, in such a way that a continued share ownership can no longer reasonably be tolerated, transfer his shares to the plaintiffs. Germany must be included here as well: Even though an expulsion right has not (p. 705) been provided for in the Limited Liability Companies Act of 1892, the courts have filled this gap by drawing an analogy to a provision in the law of general partnership¹⁶⁶—a nice example of a popular strategy in Germany to resort to principles of partnership law in order to find appropriate solutions for incorporated partnerships.¹⁶⁷ As a last illustration, the EU Commission’s Draft Statute for a European Private Company (SPE) also provided for an expulsion right: According to its Article 17, the competent court may, on the basis of a resolution of the shareholders and an application by the SPE, order the expulsion of a shareholder if he has caused serious harm to the SPE’s interest or if the continuation of the shareholder as a member of the SPE is detrimental to its proper operation. The overall policy behind a statutory exclusion right is that the proper functioning of the business enjoys priority and that its value as a going concern should be preserved and not destroyed by a dissolution of the company.

A second group of countries acknowledges expulsion clauses in the articles of association, but contains no statutory provision to that end and refuses to supplement with judge-made law in the absence of a provision in the corporate charter. This is the case, for example, in the United Kingdom where the matter is neither covered by the CA 2006 nor by the Model Articles for private companies, although the articles of association or

shareholder agreements may make provision for the termination of membership.¹⁶⁸ Typical grounds would include prejudicial behaviour on the part of the offending shareholder. Similarly, in Australia, a minority shareholder cannot ordinarily be expelled, whether for good cause or otherwise, unless the company's internal governance rules or a shareholder agreement so provide¹⁶⁹—which is rare. However, a court may order a buy-out under the statutory oppression remedy in cases where the minority shareholder has acted in a manner contrary to the interests of the shareholders as a whole or in a way that is unfairly prejudicial to or unfairly discriminatory against individual shareholders. Italy and France follow a similar route, but do alert business founders to the option of an exclusion clause in their codifications: Article 2473-bis Italian C.c. stipulates that the articles of association of an s.r.l. may provide for expulsion for good cause in specific cases, and Article L. 227-16 French C. com. permits the articles of association of a simplified stock corporation (SAS) to specify the conditions for expelling a shareholder. Interestingly, a couple of years ago, the French Court of Cassation decided that the shareholder is entitled to vote on (and in all probability: against) his own exclusion,¹⁷⁰ while German courts reached exactly the opposite result in cases of expulsion for good cause.¹⁷¹ The principal reason why all these countries do not provide a statutory mechanism for expelling shareholders from close corporations against their will is probably rooted in their perception of shareholdership: In the common law tradition, a share is a property right which cannot be expropriated, save where this is provided for in the constitution of the company.¹⁷² This view corresponds with the venerable French (p. 706) company law principle that a shareholder has a fundamental right to remain a member of the company,¹⁷³ which shifts the emphasis from the proprietary towards the personal element of shareholdership.

In order to provide a truly complete picture, one should add that a few countries have also introduced squeeze-out rights which enable shareholders who own more than 90% of the share capital to redeem the shares of minority shareholders without any further requirements. This is the case, for instance, in Sweden and Austria.¹⁷⁴ By contrast, many other countries confine an unconditional squeeze-out right to public or listed corporations.¹⁷⁵

7 Shareholder Conflicts

Shareholder conflicts pose possibly the greatest threat to the continued existence of a small firm, and they have, rightly, been called the Achilles heel of close corporations.¹⁷⁶ Case law in many countries abounds with graphic examples of feuding shareholders whose differences have resulted in disputes as bitter as between arguing spouses in an acrimonious divorce.¹⁷⁷

7.1 Oppression by Majority Shareholder

The plight of the minority shareholder in a close corporation is a global phenomenon. Minority shareholders are often depicted as particularly vulnerable to exploitation, given the

principle of majority voting and the lack of an effective exit option. Examples of squeeze-out techniques employed by the majority shareholder include excessive retention of profits,¹⁷⁸ inflated directors' remuneration,¹⁷⁹ and unbalanced transactions to the detriment of the company¹⁸⁰.

7.1.1 Opportunities for and Limits of Self-Protection

Forewarned is forearmed, or so one should think. A minority shareholder who is aware of the risk of opportunistic behaviour by the majority can seek to protect himself either through the articles of association or through a shareholder agreement. To this end, most (p. 707) jurisdictions permit a great variety of self-help measures, ranging from nomination rights and representation on the board to veto rights, supermajority requirements for certain transactions and buy-sell provisions or withdrawal rights.¹⁸¹

Despite the general availability of self-help measures, it is today widely acknowledged that supplementary minority protection by statutory or case law is indispensable. The oft lamented lack of preventative planning is due to several inter-related factors: Close corporation participants are often linked by family or other personal relationships, resulting in "overtrust" or an unwillingness to rock the boat in bargaining hard for protection.¹⁸² Moreover, they may be subject to over-optimism at the outset of a common venture, thus underestimating the potential for future dissension.¹⁸³ Similarly, they may be unable to write a contract that covers all eventualities due to their inability to foresee the countless variations of oppressive conduct.¹⁸⁴ In addition, having complete contracts drawn up for protection may be too expensive or even prohibitive for small businesses, especially at their inception.¹⁸⁵ Finally, there may be no opportunity at all to bargain for protection for certain shareholders who received their stock via gift or inheritance.¹⁸⁶ Given these findings, which appear to be well founded in empirical research, a large majority of legislators and courts worldwide have crafted protections for oppressed shareholders in close corporations. However, not everyone has been persuaded so far. A notable exception is Delaware, which refuses outright to provide additional protection for minority shareholders. In the words of the Delaware Court of Chancery: "It would be inappropriate judicial legislation for this Court to fashion a special judicially created rule for minority investors [. . .] when there are no negotiated special provisions in the certificate of incorporation, bylaws, or stockholder agreements."¹⁸⁷

7.1.2 Standards of Conduct for Majority Shareholders

The resolution of minority oppression cases depends crucially on the standards of conduct for majority shareholders which have evolved over time. Taking a global perspective, one can discern converging trajectories, but also gradual differences.

7.1.2.1 Fiduciary Duty and Duty of Loyalty

A number of jurisdictions use the concept of fiduciary duty or its civil law equivalent, the duty of loyalty, as the basis of their standards of conduct for majority shareholders. Two (p. 708) decisions handed down independently, but at almost the same time by the highest courts of the United States and Germany promoted the idea of fiduciary duty between shareholders, finding that shareholders in a closed corporation owe a duty of loyalty to

each other, as well as to the corporation. In a landmark decision that still holds today, the Massachusetts Supreme Judicial Court ruled: “We hold that stockholders in the close corporation owe one another substantially the same fiduciary duty in the operation of the enterprise that partners owe to one another.”¹⁸⁸ Five weeks later, the German Federal Court of Justice ruled that “the corporate law fiduciary duty governs not only the relationship between shareholders and the GmbH, but also the relationship between shareholders themselves.”¹⁸⁹ Swiss legislation recently codified the fiduciary duty between GmbH shareholders in Article 803(2) OR.¹⁹⁰ The Dutch legislator has established a similar standard of conduct, mandating in Article 2:8 (1) NBW that all legal persons and those who pursuant to the law and the articles of association are involved in its organization must behave towards each other in accordance with what is required by standards of reasonableness and fairness (*redelijkheid en billijkheid*).¹⁹¹ Finally, Greek company law resorts to the principle of equal treatment as a functional equivalent of fiduciary duties.

7.1.2.2 Abuse of Rights

Other countries like France and those following the French tradition shy away from recognizing a duty of loyalty between majority and minority shareholder in a close corporation. However, they do not leave the oppressed minority shareholder without protection, drawing on the concept of *abus de majorité* transposed from civil law notions of *abus de droit*.¹⁹² This is also the case in Italy where the courts tend to invoke the concept of *abuso di maggioranza*, especially in cases of shareholder voting,¹⁹³ while many scholars favour good faith and fair dealing (*correttezza e buona fede*) as a guiding principle in shareholder disputes.¹⁹⁴ Spain belongs to this group as well, applying the notion of *abuso de mayoría* to fight minority oppression.¹⁹⁵ Finally, the Nordic countries have included provisions in their respective Companies Acts, addressing an abuse of voting rights.¹⁹⁶ The Norwegian Private Limited Companies Act, for instance, does not recognize a general duty of loyalty between shareholders, but rather a specific provision on the “abuse of authority of the general meeting”: According to §5-21, the general meeting of the company cannot adopt any resolution which may give individual shareholders or other parties an unreasonable advantage at the expense of other shareholders of the company.

(p. 709) 7.1.2.3 Unfair Prejudice and Minority Oppression

Under UK, Irish, and Australian law, a majority shareholder is not treated as a fiduciary, and does not owe fiduciary duties to the company or to minority shareholders.¹⁹⁷ Rather, the law begins with the principle that any shareholder is free to vote in his or her own self-interest.¹⁹⁸ However, special statutory provisions place some constraints on the majority shareholder’s exercise of its voting rights and other relevant conduct. If an act or omission by or on behalf of the company or a resolution of the shareholders meeting is unfairly prejudicial or unfairly discriminatory against a minority shareholder, this shareholder may complain to a court under the unfair prejudice remedy in s. 994 UK CA 2006¹⁹⁹ or the oppression remedy in s. 232 Australian Corporations Act.²⁰⁰

7.1.2.4 Intensity of Judicial Review

Fiduciary duty, duty of loyalty, abuse of rights, unfair prejudice, and minority oppression: every jurisdiction has its own approach to combating overreach by the majority shareholder in close corporations. From a functional perspective, the crucial question is not which doctrinal label is attached to a particular legal instrument, but rather the intensity of judicial review. In this respect, there are differences in degree. The duty of loyalty under German case law demands that the majority shareholder consider the interests of the corporation and membership interests of co-shareholders.²⁰¹ This applies to the exercise and actual influence of rights and other entitlements within the close corporation, but does not completely prohibit the consideration of personal interests. UK courts define unfair prejudice as a breach of good faith:

Unfairness for the purposes of s. 994 Companies Act 2006 is not to be judged by reference to subjective notions of fairness, but rather by testing whether, applying equitable principles, the majority has acted, or is proposing to act, in a manner which equity would regard as contrary to good faith.²⁰²

Applying this test, the courts tend to protect the legitimate expectations of (minority) shareholders underlying the formation of their association, even where these are not explicitly included in the contract.²⁰³ In the US, courts are split on the issue as to what extent, if any, implied agreements between shareholders or unspoken expectations are protected by fiduciary duties.²⁰⁴ In France, the classical definition of abuse of rights is provided in a leading case from 1961, according to which a resolution constitutes abuse when it is made (p. 710) “contrary to the general interests of the corporation and with the sole purpose of benefiting the members of the majority to the detriment of the minority”²⁰⁵.

7.1.3 Legal Remedies for Minority Shareholders

It’s the enforcement, stupid! Standards of conduct for majority shareholders alone do not suffice, but must rather be supplemented by effective means of redress for minority shareholders. In this respect, civil and common law jurisdictions have crafted their own remedies.

7.1.3.1 Actions Challenging the Validity of Shareholders’ Resolutions

In most continental European legal systems, as well as those of Argentina and Japan, outvoted minority shareholders may bring an action to set aside a resolution of the shareholder meeting that violates the law or the articles of association. Usually, violations of the law include violations of general company law principles such as abuse of rights, duty of loyalty, and equal treatment of shareholders. This rather broad scope makes actions to set aside shareholders’ resolutions, or nullity suits as they are also referred to, potentially the most forceful weapon available to minority shareholders.

Technically, the regime of nullity suits is regulated differently from jurisdiction to jurisdiction.²⁰⁶ The German GmbH Act does not contain specific provisions to deal with unlawful shareholder resolutions; to fill this gap, courts draw on §§241 et seq. Stock Corporation

Act by analogy.²⁰⁷ The Swiss Code of Obligations states in Article 808c that the provisions for setting aside shareholder resolutions in stock corporations also apply *mutatis mutandis* to private limited liability companies. Other countries, for example Austria (§§41–44 Austrian Act on Limited Liability Companies) or Italy (Article 2479-*ter* C.c.), have an independent regime for actions against shareholder resolutions in private limited liability companies. Still other jurisdictions, namely France (Article L. 235-1 C. com.), provide a single set of rules for nullification suits across all forms of commercial companies. By contrast, in UK law, the concept of a general shareholders' right of review for majority decisions is completely unknown. Litigation is only available for resolutions pertaining to the transformation of a public company into a private company, for variations in share capital, and the purchase of a company's own shares (ss. 98, 633, 721 CA 2006). For all other matters, the minority shareholder only has recourse to general legal principles and remedies, such as an unfair prejudice petition. Similar findings can be made in Ireland, Australia, and the US. Given this great divide between civil and common law jurisdictions, the European Commission's SPE proposal saw no room for successful harmonization, providing in Article 28(4) that the shareholders' right to challenge shareholders' resolutions is determined according to the law of the individual state.

(p. 711) 7.1.3.2 Claims for Compensation

In almost all jurisdictions, minority shareholders' claims for compensation are divided into direct and derivative actions. Grounds for a direct action arise, for example, under German GmbH law when a shareholder suffers individual, direct loss over and above the indirect losses suffered due to damage to the corporation's assets.²⁰⁸ In the UK, a shareholder whose rights have been affected by the company can seek to have these rights enforced by a personal action; however, the no reflective loss principle rules out the recovery of indirect loss.²⁰⁹ In France, Article L. 223-22 C. com. allows shareholders of a SARL to file an action for the compensation of personal losses distinct from losses suffered by the corporation resulting from a breach of duty by corporation directors²¹⁰; however, this kind of direct action is often extremely difficult to enforce in practice.

Derivative shareholder actions are recognized in German GmbH law as an extension of the *actio pro socio* found in the law of partnerships, although they are not codified.²¹¹ They permit individual shareholders to bring an action against other shareholders on behalf of the corporation, to the extent that the corporation does not pursue this action itself. In the UK, this approach has been codified in s. 260 et seq. CA 2006, adopted from the famous decision in *Foss v. Harbottle*, allowing a shareholder to pursue a derivative action against directors of the corporation for actions that breach their fiduciary duty as illegal or *ultra vires*. The shareholder must apply to the court for leave to pursue this action, which must then pass a two-stage test to ensure the application is being made in good faith and to prevent frivolous actions against the corporation. However, the derivative action, despite being extended to include actions for simple negligence, continues to operate only on the legal periphery, as its practical application is extensively overshadowed by the remedy for unfair prejudice.²¹² Shareholders of a French SARL can use the actions for compensation (*action sociale ut singuli*) afforded by Article L. 223-22 (3) C.

com., if a director has breached his duty causing loss or damage to the corporation.²¹³ In Italy, Article 2476 (3) C.c. provides that any shareholder may file an action against the corporation's director.

Drawing a line between direct actions and derivative actions can lead to greater problems for closed corporations than for stock corporations.²¹⁴ Some jurisdictions in the US therefore tend to allow direct actions in all cases of breach of fiduciary duties to the detriment of minority shareholders,²¹⁵ while others do not differentiate between direct and derivative actions.²¹⁶

(p. 712) 7.1.3.3 Exit Rights

Exit rights, whether withdrawal or appraisal rights, are an additional remedy for minority shareholders and have already been discussed in a separate section.²¹⁷

7.1.3.4 Oppression Remedies

In common law jurisdictions, minority shareholders may seek a special remedy in cases of oppression. In the UK, the main remedial provision is found in s. 994 CA 2006, allowing a shareholder to apply to the court where membership interests have been unfairly prejudiced in the conduct of the company's affairs. If the court finds that there has been unfair prejudice, it can prescribe any remedy to rectify the situation, though the normal solution is to order the person responsible or the company itself to buy out the petitioner at fair value.²¹⁸ Similarly, many modern US corporation statutes give the courts power to dissolve a corporation in response to a suit from a minority shareholder if the majority shareholder is found guilty of fraud or oppression.²¹⁹ Likewise, s. 232 Australian Corporations Act allows a court to grant relief if it is of the opinion that a certain conduct was oppressive, prejudicial, or unfairly discriminatory against minority shareholders.²²⁰

7.2 Ex Post Opportunism by Minority Shareholders

A majority shareholder, in principle, does not need special protection, as his majority voting power usually carries the power to remedy any disadvantageous situations himself. There are, however, situations in which the majority shareholder is dependent on the cooperation of minority shareholders. This is often the case where legislation imposes a unanimous vote requirement for specific resolutions or where shareholders have a statutory right of veto. A similar situation arises where the majority shareholder does not possess a sufficient qualified majority to make changes to the articles of association.

7.2.1 Standards of Conduct for Minority Shareholders

There is widespread consensus worldwide that the majority shareholder is entitled to relief against various forms of ex-post opportunism by a minority shareholder. The doctrinal approaches differ, however, presenting a mirror image of the resolution of minority oppression cases discussed above. German courts have extended the duty of loyalty to minority shareholders with blocking power.²²¹ In the Netherlands, the standard of fairness and reasonableness set in Article 2:8 (1) NBW applies equally to minority shareholders. In France, the majority shareholder has increasingly called upon the court-based remedy of

abuse of rights (*abus de minorité*) in recent years.²²² The same is true for Spain (*abuso de* (p. 713) *minoría*)²²³ and, albeit to a lesser degree, Italy (*abuso di minoranza*).²²⁴ In Japan, majority shareholders may also invoke the general abuse of rights rule. In the UK and Australia, oppressive conduct of a minority shareholder may form the basis of an application to the court under the unfair prejudice or oppression remedy.²²⁵ Likewise, US courts may apply the provisions on oppressive actions contained in individual state statutes.²²⁶

7.2.2 Enforcement Issues

The effective remedy of minority shareholder misconduct is more controversial. The oft-cited case of a minority shareholder who uses veto powers to block an urgently needed capital increase in order to extract private benefits, may serve as an illustration. There is a range of potential solutions to this scenario. A first solution is to simply disregard the votes of a minority shareholder who exercises his voting rights in a disloyal or abusive way. This approach finds some support in German case law and academic writing,²²⁷ though it is far from being unanimously accepted. French and Belgian courts, by contrast, are hesitant to replace a resolution of a shareholders' meeting with a court order, since this would arguably violate the right of shareholders to vote. As an expedient compromise solution, the courts appoint an ad hoc agent (*mandataire ad hoc*) who is instructed to vote in place of and in the name of the recalcitrant minority shareholder²²⁸—a dogmatic construction derided as hypocritical by legal scholars.²²⁹ Alternatively and more pragmatically, one may think of initiating an expulsion procedure against the recalcitrant minority shareholder, as has been proposed and successfully implemented in Greece and Portugal. Less complicated solutions are available in most common law jurisdictions where capital increases are generally a matter for the board of directors and do not require shareholder approval, unless otherwise specified by the articles of association or a shareholder agreement. In the latter case, a majority shareholder in the UK, Ireland, and Australia may apply to the courts for equitable relief under the unfair prejudice or oppression remedy. It is well settled that access to this remedy is not limited to minority shareholders.²³⁰

7.3 Shareholder Deadlocks

Shareholder conflicts in close corporations can also arise for reasons other than opportunistic behaviour by majority or minority shareholders. These involve deadlocks at the shareholder and director level, for which neither or both parties may be responsible, but which make continuing commercial operation difficult or even cast doubt on the capacity of the (p. 714) corporation's organs to act. Legal practice shows that these deadlock situations most frequently occur in two-member corporations where each shareholder owns 50% of the shares.²³¹

7.3.1 Contractual Safeguards

Company law experts worldwide recommend that special arrangements to resolve deadlocks be included in the articles of association or in shareholder agreements.²³² Their practical use, however, varies considerably and they have only become standard procedure in certain types of cases such as joint venture contracts. Voting deadlocks on specif-

ic matters may be overcome by provisions stipulating that one member, for example the (rotating) chairperson of the general shareholders' meeting, holds the casting vote, or that the resolution is referred to another corporate body, particularly the supervisory board or advisory board, or that the decision should be made by an arbitrator. In case of permanent deadlock, the shareholders can make provision for a right of exit for good cause, or a duty to transfer shares to the other shareholder(s). A typical arrangement is a buy-sell procedure: Shareholder A, the party wishing to leave or take over the company, initiates the procedures by making an offer, either to sell all his shares to Shareholder B, or to purchase all of B's shares for a specific price. Shareholder B can then freely decide to buy or sell.

7.3.2 Conflict Resolution through Statutory or Case Law

Where voluntary mechanisms are lacking, the Gordian knot may only be severed through recourse to legislation or case law.²³³ This external intervention is justified by the fact that valuable resources would otherwise lie idle.²³⁴ Most jurisdictions consider the *ultima ratio* to be compulsory dissolution of the corporation upon application to the court by one of the members. In Germany, case law has confirmed that irreconcilable differences between the members of a two-member GmbH or a deadlock at a shareholders meeting constitute good cause as defined in §61(1) GmbHG.²³⁵ For these situations in the UK, courts have usually resorted to a winding up of the corporation in accordance with s. 124 IA 1986.²³⁶ In France, the courts have spoken in favour of exceptional dissolution for disputes between shareholders in a corporation.²³⁷ In the United States, s. 14.30(2) RMBCA provides a compulsory dissolution mechanism for deadlock situations, which has been adopted in different (p. 715) forms in the corporate law legislation of various states²³⁸; in Kansas, for example, only corporations with two members may be dissolved.²³⁹

As compulsory dissolution often reduces the value of otherwise prosperous corporations to nothing, there is scope for courts and legislature to consider less drastic conflict resolution measures. This could include setting a higher duty to cooperate for both shareholders on the basis of the duty of loyalty or the replacement of a disputed resolution by a court decision.²⁴⁰ This seems to have been the intent behind the newly introduced sentence to Article 821(1) Swiss OR, which states that the court is in a position to identify potential solutions that are appropriate and reasonable for the participants, rather than dissolving the corporation.

7.4 Role of Courts in Shareholder Disputes

Identifying the proper role for the courts in shareholder disputes²⁴¹ is possibly the most fascinating topic for future research. In this respect, we are witnessing a veritable "clash of civilisations," with the broad equitable remedies of common law jurisdictions on the one hand and the narrow approach of most civil law jurisdictions on the other.

7.4.1 Equitable Remedies in Common Law Jurisdictions

Broad equitable remedies for resolving shareholder disputes have long been a hallmark of common law jurisdictions. In fact, from the early days of modern company law, English courts were given the power to wind up the company compulsorily where they thought it “just and equitable” to do so. This power is now codified in s. 122(1)(g) IA 1986. It has been supplemented by a more flexible remedy, the unfair prejudice procedure, which has already been mentioned above.²⁴² At this point, attention should be drawn to the wide discretion of the court to shape an adequate remedy. If the court is satisfied that an unfair prejudice petition is well founded, it may, by virtue of s. 996(1) CA 2006, make such order as it thinks fit for giving relief in respect of the matters complained of. According to s. 996(2) CA 2006, while not being confined to doing so, the court’s order may, (1) regulate the conduct of the company’s affairs in the future; (2) require the company to refrain from doing or continuing an act complained of, or to do an act that the petitioner has complained it has omitted to do; (3) authorize civil proceedings to be brought in the name and on behalf of the company by such person or persons and on such terms as the court may direct; (4) require the company not to make any, or any specified, alterations in its articles without the leave of the court; (5) provide for the purchase of the shares of any members of the company by other members or by the company itself and, in the case of a purchase by the company itself, the reduction of the company’s capital accordingly. Going even further, s. 999(2)(b) CA 2006 (p. 716) indicates that the court can also order an amendment of the company’s articles of association.²⁴³ Comparable oppression remedies are available under Australian (s. 232 Companies Act)²⁴⁴ and Irish company Law (s. 205 Companies Act 1963).

Similarly, many US state statutes provide for a wide array of possible remedies in oppression cases. Section 41(a) Model Statutory Close Corporation Supplement sets out nine types of relief: (1) the performance, prohibition, alteration, or setting aside of any action of the corporation or of its shareholders, directors, or officers or of any other party to the proceedings; (2) the cancellation or alteration of any provision in the company’s articles of incorporation or bylaws; (3) the removal from office of any director or officer; (4) the appointment of any individual as a director or officer; (5) an accounting with respect to any matter in dispute; (6) the appointment of a custodian to manage the business and affairs of the corporation; (7) the appointment of a provisional director (who has all the rights, powers, and duties of a duly elected director) to serve for the term and under the conditions prescribed by the court; (8) the payment of dividends; (9) the award of damages to any aggrieved party. In practice, the most frequently used remedy is a court order requiring a buyout of the petitioner’s shares.²⁴⁵

7.4.2 Moving Towards More Discretion in Civil Law Countries?

Traditionally, civil law jurisdictions do not, in principle, confer broad discretionary powers upon the courts. There are, however, at least two recent counter-examples in continental Europe.

7.4.2.1 Recent Examples in Continental Europe

The most prominent example can be found in Dutch company law, which dedicates a whole section to rules for resolving disputes between shareholders (Article 2:335–2:343c NBW) and adds an additional section on the right of inquiry (Article 2:344–2:359 NBW). These inquiry proceedings date back to 1928, but gained practical importance after a reform in 1971, to become the most important source of minority shareholder protection today.²⁴⁶ Upon written request from a shareholder with at least 10% of votes, the Enterprise Chamber of the Amsterdam Court of Appeal may appoint one or more persons to conduct an investigation into the policy and the state of affairs of a legal person, either in full or with respect to a specific matter or period. If the investigation report indicates a mismanagement of affairs, then the Enterprise Chamber may order, by virtue of Article 2:355 NBW, that one or more of a statutory list of measures must be taken, depending on which of these measures it regards appropriate in view of the outcome of the investigation. According to Article 2:356 NBW, these measures are (1) a suspension or annulment (nullification) of a resolution (decision) of the directors, supervisory directors, the general meeting of shareholders or any other body (p. 717) of the legal person; (2) a suspension or dismissal of one or more directors or supervisory directors; (3) a temporary appointment of one or more directors or supervisory directors; (4) a temporary derogation from those provisions in the articles of incorporation that are designed by the Enterprise Chamber for this purpose; (5) a temporary transfer of shares for administrative purposes only; (6) a dissolution of the legal person.

There is a less recognized comparable remedy in Swiss company law, the so-called action for dissolution. According to Article 821(3) OR, any shareholder may request the court to dissolve the company for good cause, although the court may opt for an alternative solution that is appropriate and reasonable for the persons concerned, for example the payment of a commensurate financial settlement to the shareholder requesting dissolution. This remedy was introduced for stock corporations (AG) in 1991 and extended to private limited liability companies (GmbH) in 2008.²⁴⁷ Unlike the Dutch Enterprise Chamber, however, Swiss courts have not yet made extensive use of their new equitable powers.²⁴⁸

7.4.2.2 Pros and Cons of Equitable Remedies

Supporters of equitable remedies contend that they are ideally suited to resolving shareholder disputes. They provide courts with great flexibility to choose a remedial scheme that most appropriately responds to harm suffered by the aggrieved shareholder. This is particularly relevant for closely held firms where internal conflicts often involve an interwoven mesh of commercial and personal interests that is almost impossible to unravel.²⁴⁹ Closely related to this is the forward-looking aspect of equitable remedies: it empowers the court to make orders enabling the proper running of the company into the future. By contrast, the action to set aside a shareholders' resolution traditional to civil law jurisdictions is retroactive. Moreover, it addresses only one particular issue, making it unsuitable for comprehensive conflict resolution.²⁵⁰ In addition, it does not extend to board decisions; these must be challenged by a separate action. Finally, with respect to excessive retention of profits, courts in civil law jurisdictions struggle with the fact that “negative”

Comparative Corporate Governance in Closely Held Corporations

shareholders' resolutions cannot be transformed into positive ones by means of a nullity suit.²⁵¹ Equitable remedies, on the contrary, can easily overcome these doctrinal obstacles.²⁵² They also benefit from the fact that court orders under an unfair prejudice or oppression remedy can respond to both board decisions and shareholders' resolutions.

On the other hand, there are a number of potential disadvantages or drawbacks associated with broad equitable relief. A first objection is that arbitration panels are, for a variety of reasons, in a better position to offer proactive solutions for shareholder disputes than state courts, and that mediation is a superior means of dispute resolution whenever a review of the whole "relationship history" in a close corporation is deemed necessary. Secondly, judges may feel uncomfortable with the task of fashioning an adequate remedy, due to a lack (p. 718) of expertise or business acumen.²⁵³ Jurisdictions would be well advised to mitigate these circumstances by establishing specialized business courts to preside over such proceedings, as has been the case in Delaware and the Netherlands.²⁵⁴ Thirdly, the breadth of equitable remedies is potentially dangerous, as too much discretion may destroy certainty and predictability in company law.²⁵⁵ Fourthly, and on a more general note, conferring broad discretionary powers to courts may be incompatible with traditional notions of the role of judges in civil law jurisdictions with their strong aversion to a "gouvernement des juges."²⁵⁶

- (¹⁸) On this, see Frank H. Easterbrook & Daniel R. Fischel, “Close Corporations and Agency Costs”, 38 Stan. L. Rev. 271, 277 (1986): “Closely and publicly held corporations tend to have different types of governance mechanisms because of their different economic structure.”
- (¹⁹) Generally on the difference between vertical and horizontal governance issues, Mark J. Roe, *The Institutions of Corporate Governance*, in *Handbook for New Institutional Economics* 371, 372 (Claude Menard & Mary M. Shierley eds., 2005).
- (²⁰) For more on this and on the emergence of new types and subtypes of private limited liability companies, Fleischer, *supra* note 12, at 1088 et seqq., with further references.
- (²¹) In the same vein, Frank H. Easterbrook & Daniel R. Fischel, *The Economic Structure of Corporate Law* 237 (1991): “Development of special close corporation statutes reflects the utility of a set of presumptive rules tailored to closely held corporations.”
- (²²) Similarly, from an economic perspective, Nagar, Petroni & Wolfenzon, *supra* note 9, at 943: “The main governance problem in close corporations is the majority shareholders’ expropriation of minority shareholders.”

Comparative Corporate Governance in Closely Held Corporations

(²³) With some variance, see also McCahery & Vermeulen, *supra* note 10, at 5 et seqq., the “three pillars of the governance framework” differentiating between: “company law,” “contract,” and “optional guidelines.”

(²⁴) See also from a European perspective, ECJ [1988] ECR 5483 marg. n°. 19—Daily Mail, according to which a company “beyond the national jurisdiction that regulates its founding and existence, does not exist”; similarly from a U.S. perspective, Justice John Marshall, “Trustees of Dartmouth College v. Woodward” (1819) 17 U.S. 518, 636, according to whom a company is an “artificial being, existing solely in contemplation of state law.”

(²⁵) See Company Law Review Steering Group, *supra* note 8, marg. n°. 5.2.23: “A wide variety of approaches is possible and various models have been proposed and adopted in other jurisdictions; some have been found wanting, here and abroad. We have broken this down into two broad kinds of approach, which we shall call the ‘free standing’ and the ‘integrated’ approach.”

(²⁶) For an international picture, Marcus Lutter, Limited Liability Companies and Private Companies, in International Encyclopaedia of Comparative Law, Vol. XIII/1 (Alfred Conard & Detlev Vagts eds., 2006).

(²⁷) From a French perspective, see Maurice Cozian, Alain Viandier, & Florence Deboissy, Droit des sociétés marg. n°. 1079 (27th ed. 2014).

(²⁸) See Stephen Mayson, Derek French, & Christopher Ryan, Company Law 58 (30th ed. 2013): “British company law traditionally regards private and public companies as two variants of the same basic form of legal organisation, unlike legal systems in Continental Europe which tend to treat them as different forms of organisations.”

(²⁹) Ron Harris, “The Private Origins of the Private Company: Britain 1862-1907”, 33 Oxford J. Leg. Stud. 339, 343 (2013): “The 1862 Act, like those of 1844, 1855 and 1856, did not distinguish between companies based on the number of incorporators and shareholders, on capital, or on transferability of shares.”

(³⁰) According to a sub-title in Harris, *supra* note 29, at 342.

(³¹) Compare the numbers in Harris, *supra* note 29, at 343 et seqq.

(³²) Foundational Francis B. Palmer, Private Companies; Or How to Convert your Business into a Private Company, and the Benefit of So Doing (Nabu Press 1877).

(³³) *Salomon v. Salomon* [1897] AC 22 (HL); commenting on this decision Paul L. Davies & Sarah Worthington, Gower & Davies’ Principles of Modern Company Law marg. n°. 2-3: (9th ed. 2012): “Not only did it finally establish the legality of the ‘one person’ company (long before EC law required this) and showed that incorporation was as readily available to the small private partnership and sole trader as to the large public company.”

Comparative Corporate Governance in Closely Held Corporations

⁽³⁴⁾ See Report of the Company Law Amendment Committee, Parliamentary Papers, 1906, Vol. XLIV, Cmnd 3052, 17 et seqq.

⁽³⁵⁾ Emphasizing this, Timothy W. Guinnane, Ron Harris, Naomi R. Lamoreaux, & Jean-Laurent Rosenthal, *Ownership and Control in the Entrepreneurial Firm: An International History of Private Limited Companies*, Yale University Economic Growth Center Discussion Paper No. 959 (2007), available at <http://ssrn.com/abstract=1071007>, 28: “Whereas in Germany a company became private by organizing under a different law from a corporation, in Britain a company became private by including in its articles of association the above provisions.”

⁽³⁶⁾ See also A New Form of Incorporation for Small Firms: a Consultative Document (H.M.S.O. 1981), Cmnd 8171.

⁽³⁷⁾ For more on this, DTI, *Company Law Review: the Law Applicable to Private Companies* (1994); for a summary, Mayson, French, & Ryan, *supra* note 28, at 27 et seq.

⁽³⁸⁾ See Company Law Review Steering Group, *supra* note 8, marg. n°. 5.2.27 et seq.

⁽³⁹⁾ Company Law Review Steering Group, Final Report, July 2011, marg. n°. 1.53 et seqq.

⁽⁴⁰⁾ More under III 2.

⁽⁴¹⁾ Abram Chayes, “Madame Wagner and the Close Corporation”, 73 Harv. L. Rev. 1532 (1959).

⁽⁴²⁾ See the conclusion at the time of Robert Kramer, “Foreword”, 8 Law & Contemp. Probs. 433, 434 (1953): “One of the most striking facts about the close corporation is the extent to which it is the creation of business men and their counsel rather than of the courts or the legislatures. Most corporate legislation is admittedly drafted for the publicly owned company, at least in this country. Unlike Great Britain and Continental Europe, we have made little attempt in our corporate statutes to provide for the problems and the needs of the close corporation.”

⁽⁴³⁾ For a detailed analysis, Harwell Wells, “The Rise of the Close Corporation and the Making of Corporation Law”, Berkeley Bus. L.J. 263, 297 et seqq. (2008).

⁽⁴⁴⁾ See for example, William L. Cary, “How Illinois Corporations May Enjoy Partnership Advantage: Planning for the Closely Held Firm”, 48 Nw. U. L. Rev. 427 (1953).

Western versus Asian Laws on Corporate Governance: The Role of Enforcement in International Convergence

Hideki Kanda

The Oxford Handbook of Corporate Law and Governance

Edited by Jeffrey N. Gordon and Wolf-Georg Ringe

Print Publication Date: May 2018

Subject: Law, Company and Commercial Law, Comparative Law

Online Publication Date: Jul 2015 DOI: 10.1093/oxfordhb/9780198743682.013.32

Abstract and Keywords

This chapter examines the issue of when laws do and do not converge in the field of corporate governance, with particular emphasis on the cost of enforcement and the role of enforcement in international convergence. Focusing on Western versus Asian laws on corporate governance, it considers when, how, and why legal rules change and whether transplantation of legal rules from Western countries has been successful. It also explores the relationship between enforcement and substantive legal rules, mainly by comparing laws in Japan and the United States. Finally, it discusses three areas relating to corporate governance: the regulation of insider trading, financial disclosure and accounting rules, and corporate law rules on governance.

Keywords: corporate governance, enforcement, legal rules, Japan, United States, regulation, insider trading, financial disclosure, accounting, corporate law

1 Introduction

¹THE volume of academic research on corporate governance is immense. Not only corporate governance in Western countries but also that in emerging economies in Asia and other regions has been explored in recent years.

Developing countries often import laws and regulations from developed countries. However, today, we observe a variety of laws and regulations throughout the world. In this chapter, I will discuss when laws do and do not converge in the field of corporate governance by emphasizing the cost of enforcement. In general, there are three familiar questions: (1) when, how, and why legal rules change; (2) whether transplantation of legal rules from Western countries has been successful; and (3) how enforcement interacts with substantive legal rules. In this chapter, I will focus on the first and the third questions by looking at situations where Asian jurisdictions import laws on corporate gover-

Western versus Asian Laws on Corporate Governance: The Role of Enforcement in International Convergence

nance from Western jurisdictions.² Because of my limited knowledge, I will mainly compare Japanese law with US law, but I hope the general discussion in this chapter will be more generally applicable in the broader context where Asian jurisdictions import laws from Western jurisdictions.

(p. 722) More generally, a companion to the three questions noted above is the well-known inquiry of whether legal rules are converging around the world. Indeed, very often, Asian countries import laws from Western countries. For instance, Japan imported corporate law from the US in 1950.³ In the process of legal transplantation, we sometimes observe persistence or resistance.⁴ However, in my view, one aspect that has not been considered seriously in the past research on legal transplantation is enforcement. Thus, in this chapter, I will discuss the enforcement aspect of legal transplantation regarding corporate governance. I will limit my discussion to large publicly held business corporations. In section 2, I will present the general theme that the cost of enforcement affects the convergence of substantive legal rules. In section 3, I will discuss a few examples. In section 4, I will briefly discuss the convergence of enforcement. In section 5, I will briefly address whether and how the cost of substantive legal rules affect the convergence of enforcement. Section 6 is the conclusion.

2 When Laws Change: Interactions between Enforcement and Substantive Legal Rules

Every country has its own legal developments, and such developments are the result of cultural, social, political and historical contingencies. Thus, for instance, the legal rules regarding the liability of managers and directors (and regarding shareholder derivative actions) seem to be developing quite uniquely in Japan.⁵ For instance, shareholder derivative actions were unknown to the original Japanese corporate law codified as the Commercial Code of 1899, and were transplanted from the US in the amendments to the Commercial Code in 1950. The Japanese system is structured similarly to the US counterpart. In both (p. 723) countries, typically shareholders are entitled to sue directors who are liable for damages to the company. Historical developments after 1950, however, have made the rules in both countries quite different. Just to illustrate one point of difference, most states in the US have recognized the dismissal of a derivative action where a special litigation committee of disinterested directors is set up and decides that the action is not for the benefit of shareholders,⁶ while in Japan that type of dismissal is unknown and the plaintiff shareholder is entitled to maintain the action no matter what decision is made by a litigation committee or the like, or even by majority shareholders.⁷ There are mechanisms that have been developed in Japan to disallow strike suits, but it is noteworthy that a single shareholder is entitled to maintain a derivative action even where most shareholders do not want the action.

In this chapter, however, I am inclined to argue, generally, that unique developments are producing non-unique results, and that the state of Japanese corporate law today is more, rather than less, similar to that of other countries' corporate law. In shareholder deriva-

Western versus Asian Laws on Corporate Governance: The Role of Enforcement in International Convergence

tive actions, I am inclined to think that cases where derivative actions would be dismissed in the US would very often result in court decisions holding that the defendant directors should not be held liable. In this chapter, I focus on the interactions between enforcement and substantive legal rules.⁸

2.1 Legal Rules as a Component of a System

Any social system can be viewed as consisting of components or sub-systems, and legal rules are an important example. Thus, for instance, a corporate governance system consists of a variety of components or sub-systems, such as the firm size, the ownership structure, the financial system, the capital market, the labor system, the culture, and the law.

Legal rules, as a component or sub-system, have several distinctive characteristics. First, they are brought into a system automatically without any action by the parties who are subject to them. Second, many such rules may be brought into a system even if the parties do not want them (although there must be a decision by a state adopting and implementing such legal rules). Third, legal rules often must be enforced by courts or through other institutional mechanisms, which means that many legal rules are not self-enforcing.

From an economic standpoint, it is interesting to see how the coexistence of a sub-system that has these characteristics and one that does not shapes and affects the system. It is also interesting to see how this affects the behavior of the parties who are subject to the legal rules in question.

Legal rules, like other sub-systems, change over time. In a perfect world, other things being equal, there must be pressure in the marketplace or politically to make an inefficient (p. 724) legal rule a more efficient one. A system with an inefficient rule as a component is of course less efficient than a system with an efficient rule as a component, because the overall value of the system is the sum of the values of each component; a system with an inefficient rule is at a competitive disadvantage and has to adjust. In reality, however, we observe different legal rules in different corporate governance systems, and legal rules sometimes converge and sometimes do not.

This is quite simply due to the fact that the world is not perfect and that other things are not equal. This also indicates that different components of a corporate governance system cannot be considered in isolation. In theory, there are at least two general explanations as to why the legal rules component of each corporate governance system differs from that of other corporate governance systems, and why they do not converge.

First, one theory providing an analytical tool to understand corporate governance more deeply is the idea of substitutabilities. This theory—though not uncommon in traditional legal scholarship—suggests that one component of the system often serves as a substitute for other components. For instance, where the market for corporate control is active, as is or has been the case in the US and the UK, there is less need for other monitoring mechanisms. Similarly, a country having less developed capital markets might have

Western versus Asian Laws on Corporate Governance: The Role of Enforcement in International Convergence

stronger bank monitoring or, if bank monitoring does not work, something else might supplement capital markets, such as a strong board of directors or a controlling shareholder (including state ownership). Thus, France and Italy, for instance, have histories of heavy monitoring by the government. Indeed, the state has been the controlling shareholder in many major corporations. It is also possible for various components to combine in substitution for another component. In Germany, both banks and families as controlling shareholders substitute for capital markets. The theory holds even if nothing seems strong in isolation, as appears to be the case in Japanese corporate governance. In this particular situation, one can still argue that each of the various components serves some monitoring role, even if not necessarily a strong one, so that in total the system functions.

Second, another interesting theory concerns complementarities.⁹ The idea is that various components (or sub-systems) of a given system are complementary to one another in certain situations. Where complementarities exist, the value of the system is not equal to the simple sum of the standard values of individual components. The integrated value of each component may vary, depending on the degree to which the component, as a whole or in part, is complementary to another component of the system. Thus, any given legal rule might have a different effect on the value (and efficiency) of the system. A legal rule that would have to be considered inefficient on a stand-alone basis is not necessarily a bad thing as part of a system if there are complementarities with its other components. This suggests that the same mechanism—bank monitoring, for instance—can have different effects in different corporate governance systems, depending on the complementarities it has with other components of the given system. Where (as in Germany) most firms are small or medium sized, bank (p. 725) monitoring is more effective and thus plays a more important role than where (as in the US) firms are mostly very large or very small. On the other hand, where (as in France) state influence pervades both lender and debtor decision making, bank monitoring is all but meaningless, despite the fact that loans are the major source of financing. Japan can serve as a further example, because in Japan, employees under the lifetime employment system are dominant in the firm's decision making, and managers (who are former employees) are relatively familiar with respect to daily business activities, and thus information provided by banks and other business partners might be more valuable to them, which increases the value of bank monitoring. Finally, where (as in the UK) managers who come from outside are relatively good at using valuable information supplied by banks and other business partners, as a relative matter, the value of monitoring by banks and other business partners diminishes when lifetime employees, as opposed to outsiders, become managers.

Thus, given the existence of substitutabilities or complementarities, the fact that different systems have different legal rules should not be a surprise. To date, however, little attention has been paid to the interaction between legal rules and enforcement; if so, there must be insufficient understanding of the role and function of legal rules in corporate governance. In the following discussion, I will focus on the third characteristic of legal rules noted at the outset, namely that legal rules must be enforced. My central argument is that substantive legal rules sometimes converge, but sometimes they do not, and that

Western versus Asian Laws on Corporate Governance: The Role of Enforcement in International Convergence

they can even diverge because of the cost of enforcement. Enforcement is thus an important variable in the convergence or divergence of substantive legal rules.

For instance, the value of monitoring by shareholders should increase in conjunction with the reduction in the cost of enforcing legal rules regulating capital markets. This suggests that monitoring by shareholders should function better in the US than elsewhere, because the US has the class action system and other law enforcement mechanisms that are more effective than those of other major countries. In addition, I propose that the linkage between substantive legal rules and enforcement can operate the other way. Namely, the degree of convergence in substantive rules can affect the level and cost of enforcement.

2.2 Enforcement Affects Convergence of Substantive Legal Rules

With differing historical, cultural, and legal peculiarities, mechanisms and levels of enforcement are expected to vary from country to country, especially because of differences in the cost of enforcement relative to its value to enforcers.

Although substantive legal rules must be enforced, variations in enforcement costs do not necessarily affect the value of the legal rules component of a corporate governance system, if the component has substitutabilities or complementarities with other non-legal components. Thus, in a given corporate governance system, a component such as the structure of ownership might substitute for the legal framework. In that case, difference in the cost of enforcement might not be relevant, so long as the structure of ownership does not change. Similarly, variations in enforcement cost might simply reflect different complementarities. For instance, bank monitoring might be improved by a lower level of enforcement of manager liability by shareholders.

(p. 726) On the other hand, within the legal framework component, enforcement necessarily interacts with substantive legal rules. Because substantive legal rules must be enforced, the cost of enforcement affects the value of any substantive legal rule. In this sense, enforcement has complementarities to substantive rules. This suggests, first, that other things being equal, substantive legal rules do not converge when the cost of enforcement is different among jurisdictions. Second, we can expect convergence in substantive legal rules where the cost of enforcement is low. In such a situation, courts and regulators will develop substantive legal rules without worrying about their enforceability. This also holds where substantive legal rules are self-enforcing. Third, I submit that rules do change when enforcement is too costly. Indeed, there is then reason to think that market and other forces might arise to make substantive legal rules change to those that are enforceable at lower costs.

Simple numerical examples might be helpful to illustrate these points. First, suppose that the cost of enforcement for Rule A in Country X is 50, that that for Rule B in Country Y is 80, and that their substantive legal rules, Rule A and Rule B, differ from one another. Assume that the value (defined as how efficient the rule is to the system concerned, aside from the cost of enforcement) of Rule A is 100 and that that of Rule B is 120. Disregard-

Western versus Asian Laws on Corporate Governance: The Role of Enforcement in International Convergence

ing complementarities and the like, other things being equal, the situation in Country Y is worse because the combined value of the legal rule (the value of Rule A or Rule B minus enforcement cost) is 50 in Country X and 40 in Country Y. If complementarities exist, however, this might not be so, because the combined value of the rule in Country Y might be more than 40: say, 50. If that is the case, both countries might well stay as they are by maintaining different rules and different enforcement situations.

Second, suppose that the cost of enforcement for each of Rule A and Rule B is zero. In this environment, Country X, if it knows Country Y's situation, might well change Rule A to Rule B. The value of Rule B is higher than that of Rule A.

Third, suppose that the cost of enforcement for Rule B in Country Y is 10,000. We then would hardly believe that complementarities would offset the disadvantage of Country Y having the too costly enforcement situation. In such situation, because enforcement of Rule B is too costly, Rule B might change. Similarly, if Country Z, having a different substantive legal rule, Rule C, with the value of 110, has an excessively costly enforcement situation—say, with an enforcement cost of 10,000—one might expect that Rule C would change too. Thus, since both Country Y and Country Z might change their rules to those that would be enforceable at lower costs, the rules of the two countries might well converge.

In the following discussion, I will briefly examine three areas relating to corporate governance and focus on these points: the regulation of insider trading, financial disclosure and accounting rules, and corporate law rules on governance.

3 Examples

3.1 Insider Trading

The regulation of insider trading is a good and straightforward example showing that substantive legal rules do not converge where the cost of enforcement differs. The basic purpose (p. 727) of the substantive legal rule on insider trading is similar in most jurisdictions (which is the prohibition of trading of stock based on material non-public information), but the exact rule varies from jurisdiction to jurisdiction. For instance, the exact rule in the US is different from that in Japan. In short, the Japanese rule is narrower, as insiders and inside information (known as “material facts”) are both defined in the statute more restrictively than in the US.¹⁰ For instance, a recipient of insider information from a corporate insider (such as an officer or director of the relevant firm) is subject to prohibition, but a further recipient of the information from the first recipient (known as a “tippee” in the US) is not.¹¹ Additionally, even if a certain fact materially affects the stock price, if that particular type of fact is not on the statutory list, then trading based on that information is not prohibited.¹² Additionally, because this Japanese rule was adopted as late as 1988, the indication is that rules are not converging between the two countries.

Western versus Asian Laws on Corporate Governance: The Role of Enforcement in International Convergence

The rule in the US developed on the basis of court cases concerning civil remedies under the SEC's Rule 10b-5, which was promulgated under Section 10(b) of the Securities Exchange Act of 1934. While there are several criminal cases on this point, the dominance of civil cases produced by private litigation is noteworthy in the US and resulted in continuous expansion of the basic prohibition stated by Rule 10b-5.

By contrast, in Japan, there have been no civil cases on this point at all, and all existing cases involve criminal sanctions and administrative fines. In fact, when the rule was adopted in 1988, it was designed to be enforced via criminal sanction, not civil sanction. Given the general importance of private action for enforcement, this necessarily implied a lower level of enforcement in Japan than in the US. Japan introduced administrative fines in 2005, and since then several insider trading cases have been dealt with by this means.¹³ Yet, today, the lack of civil enforcement in Japan still makes the US and Japan different.

Thus, the difference between the US and Japanese enforcement mechanisms somewhat neatly explains the difference in the substantive legal rule between the two countries.

I might add that certain securities regulation, such as the regulation of insider trading, needs a strong enforcement agency, such as the US Securities and Exchange Commission, in addition to courts. A study of the data on the budgets and staffing of public enforcers shows that public enforcement is not so bad.¹⁴ This also suggests that the cost of enforcement is quite different among jurisdictions, and if so, it is no surprise from my argument here that the substantive legal rules are different in the US and Japan.

(p. 728) 3.2 Financial Disclosure and Accounting

Financial disclosure and accounting rules, particularly those for “hard” information such as data in the firm's financial statements, are often enforceable at low cost. If a publicly held company keeps supplying false accounting numbers in its financial statements, it is most likely to be uncovered and penalized in the marketplace.

Thus, contrary to the rule on insider trading, legal rules on financial disclosure and accounting are often self-enforcing. This implies that it is the value of the substantive legal rule itself that matters, and not so much the cost or level of enforcement. In that situation, there is reason to expect that various jurisdictions' financial disclosure and accounting rules will converge in a more efficient direction.

This simple statement needs a few cautions. First, we have found some cases of accounting fraud all over the world. Enron in the US¹⁵ and Olympus in Japan¹⁶ are well-known examples. These cases may show that disclosure rules are not self-enforcing. However, for the purposes of this chapter, I submit that in both cases, the fraud was ultimately uncovered and dealt with by heavy legal sanctions, so that, overall, the cost of enforcement of disclosure rules is rather low compared to other regulations.

Western versus Asian Laws on Corporate Governance: The Role of Enforcement in International Convergence

Second, over the decades, there have been efforts to develop an international accounting or financial reporting standard, called the International Financial Reporting Standards (“IFRS”), by an international body, called the International Accounting Standards Board,¹⁷ yet, to date, accounting standards throughout the world have not completely converged into IFRS or any other uniform standards. This might be contradictory to the theme I present above. However, as substantive legal rules, what matters is not the detail of the contents of the accounting standards but the mandatory disclosure of financial statements, and basic accounting figures in financial statements are not drastically different among jurisdictions in the world. Indeed, it is fair to say that the detailed contents of the accounting standards throughout the world have been converging, rather than diverging, in the past. If so, overall, I am inclined to argue that in financial disclosure, the low cost of enforcement has been stimulating convergence of substantive legal rules in this field.

3.3 Corporate Law

Corporate law rules seem more complex than rules on insider trading or on financial disclosure. There is a wide variety of rules, from voting rules, to monitoring devices such as board systems, and to shareholder litigation. This diversity, coupled with differences in enforcement mechanisms across jurisdictions, implies that corporate law rules might and might not converge. As noted before, convergence is more likely to occur with respect to two categories of rules: rules whose value does not depend on enforcement (self-enforcing rules) and rules having no value because of the low level of enforcement in the relevant jurisdictions. (p. 729) Convergence is less likely to occur with respect to the rules having a value determined by complementarities with the applicable enforcement mechanism.

For instance, rules regarding management duties have a value which varies depending upon rules regarding shareholder litigation, such as rules regarding shareholders’ derivative actions. Consequently, there are complementarities with the enforcement mechanism, and if enforcement levels vary among jurisdictions, one should expect a lack of convergence in substantive rules about management duties. As far as Japan is concerned, the popularity of shareholder derivative actions today seems to suggest that the cost of enforcement in this area has changed in the past 20 years and that it is quite low today in Japan.¹⁸ If so, my analysis suggests that substantive legal rules tend to converge toward those of other jurisdictions where such rules are enforced at low cost, as in the US.¹⁹ By contrast, in transition or emerging economies where there is no solid judicial system and the level of enforcement is low, there might be pressure to adopt rules that have a value independent of enforcement (self-enforcing rules) or that are enforceable with little involvement of the courts. As a matter of fact, and quite unsurprisingly, we observe the dominance of voting rules and other more self-enforcing rules in these economies. In other words, the low level of enforcement makes substantive rules tend to converge.

Western versus Asian Laws on Corporate Governance: The Role of Enforcement in International Convergence

My convergence proposition can be tested by considering two areas in which corporate law rules differ markedly among major industrialized jurisdictions. One is the area of corporate takeovers, and the other is that of board structures (one-tier versus two-tier board systems). Regarding rules on takeovers, the test is rather easy: such rules have more value in jurisdictions where there is both a well-developed capital market (inter-component complementarity) and a high level of enforcement (intra-component complementarity). Indeed, the value of substantive legal rules on corporate takeovers, including those on defensive measures by incumbent management, particularly depends on how the market for corporate control operates. In the US, the well-developed capital market and the well-functioning judicial system led to quite distinctive features of detailed substantive rules on corporate takeovers. This situation is unique, especially insofar as the level of enforcement is concerned. For this reason, one cannot expect a convergence of rules in the near future on corporate takeovers among major jurisdictions in Europe and the US. This conclusion might not, however, be relevant in the longer term. Indeed, substantive rules on corporate takeovers have changed in the US over the past decades, and the market for corporate control was sometimes strong and sometimes weak. As a vast quantity of scholarship suggests, the value of the US corporate governance system was probably maintained (or possibly improved) over time because of the emergence of substitutes: institutional investors served as substitutes for the market for corporate control. The same has been happening in Europe, which would make divergence in the legal framework component of little importance.

In Japan, laws on takeover defenses are complicated. Securities regulation, codified as the FIEA, regulates tender offer processes, while most of the defense measures raise legal issues under corporate law, codified as the Companies Act (effective from May 1, 2006 as a successor of the Commercial Code with respect to business corporations), and not the (p. 730) FIEA. In this sense, the distinction between the FIEA and the Companies Act roughly corresponds to that between the federal (and state) securities law and state corporate law in the US. The validity of some of the defenses was challenged before the courts, and in those cases the relevant issues were the ones under the Companies Act, not the FIEA.²⁰ In fact, the current tender offer regulations under the FIEA permit the target company to adopt defensive actions even after the commencement of a tender offer by a hostile bidder. Thus, like in Delaware, case law under the Companies Act shapes the landscape, although the substance of the case law is not identical between Delaware and Japan.²¹

In Japan, the Companies Act is important for the critical issues in the area of hostile takeovers and defenses, and courts play an important role in applying the relevant rules under the Companies Act. The Tokyo Stock Exchange also plays an important role in shaping the landscape in this area, since such issues are not directly regulated by the FIEA.

The existing variety of substantive rules on board structures does not fit into my analysis very well. Enforcing substantive rules on board structures does not seem to be costly. Rather such rules seem to be self-enforcing. If this is true, then rules on board structures

Western versus Asian Laws on Corporate Governance: The Role of Enforcement in International Convergence

should converge. The fact is, however, that we observe quite different rules on board structures across jurisdictions.

One might be inclined to say that differences in rules on board structures might be explained by the existence of substitutes or other components of the system having complementarities. One might also try a different argument. For instance, apparent differences in substantive rules might not be important, because different rules can solve the same problem without perceptible effect; or more bluntly, having a one-tier or a two-tier board might not matter, as firms with one-tier boards need to institute executive boards to make operational decisions. This argument is supported by the fact that major jurisdictions seem to be converging on what is the most important of structural features: the existence of an independent committee or body. Major jurisdictions tend to require the establishment of an independent monitoring body, such as an audit committee, for each publicly held firm, regardless of whether such firm has a one-tier or two-tier board system.

Japan imported the board of directors system from the US in the amendments to the Commercial Code in 1950, but did not abolish the statutory auditor system noted below. Since the amendments in 2002, a choice is permitted between a two-board company and a one-board and three-committee company. In the former, a board of directors and a board of statutory auditors are required, while in the latter, there are no statutory auditors and the board of directors is required to have three committees: a nominating committee, an audit committee, and a compensation committee. This latter form was introduced by the amendments to the Commercial Code in 2002 (effective from April 1, 2003), and more (p. 731) than half of each of the committees' members must be "outside" directors. For two-board companies, at least half of the members of the board of statutory auditors must be "outside" statutory auditors, but the board of directors does not have to have outside directors. In practice, one-board and three-committee companies are not popular given the number of firms that have adopted that form. Only 2.2% of the listed firms on the Tokyo Stock Exchange (TSE), as of September 10, 2012, are one-board and three-committee companies.²²

A brief further note on two-board companies may be worthwhile, because statutory auditors are not well known outside Japan. For a two-board company, there must be at least three directors. Directors are elected at the shareholders' meeting, and form the board of directors. The board elects representative directors, the Japanese counterpart of US officers or executives. There must be at least one representative director. Representative directors are the management, and they run the company. The Companies Act requires that the board of directors make important corporate decisions and supervise the management. Each director, as a member of the board, owes a duty of care and loyalty to the company.

A two-board company must have a "kansayaku," often (somewhat misleadingly) translated as a statutory auditor. Statutory auditors are elected at the shareholders' meeting, and do not have to be accountants or other professionals. A "large company," which is defined under the Companies Act as a joint-stock company having either legal capital in the

Western versus Asian Laws on Corporate Governance: The Role of Enforcement in International Convergence

amount of 500 million yen or more, or total debt (on the balance sheet) in the amount of 20 billion yen or more, must have at least three statutory auditors, and at least half of them must be “outside” statutory auditors. An auditor is “outside” where he or she does not, and did not in the past, serve as a director or employee of the company or its subsidiary. In a large company, there must be at least one full-time auditor.

In addition, a large company must have an accounting auditor, who must be a certified public accountant or certified auditing firm. An accounting auditor is elected at the shareholders’ meeting, and is responsible for auditing the company’s financial statements annually before they are submitted to the annual shareholders’ meeting, where the audit opinion is also submitted. In contrast, a statutory auditor is responsible for overseeing the activities of management. This is understood to mean confirming the legality of management’s activities. The Companies Act requires collaboration between accounting auditors and statutory auditors, providing complex rules, the details of which are beyond the scope of this article.

A two-board company may elect an outside director, although this election is not mandatory. If the company has an outside director, the Companies Act permits some special treatment. For instance, decision making on certain important matters may be delegated from the board of directors to a smaller special board. A director is “outside” where he or she is not, and was not, an executive director or employee of the company or its subsidiary.

There are two recent trends in this area. First, the Tokyo Stock Exchange today requires listed firms to have at least one “independent” director or statutory auditor, and (p. 732) the TSE has adopted a policy that encourages all listed firms to have independent directors. Second, as noted below, the Companies Act was amended in June 2014 (the amendments went into effect in May 2015). Under the 2014 amendments to the Companies Act, the definition of “outside” is stricter in two respects.²³ In addition to the requirement of lack of an employment relationship with the company or its subsidiaries, lack of an employment relationship with the company’s parent firms will be required. Also, lack of a family relationship will be required. Note, however, that lack of a business or trade relationship, required by the current TSE rule for independence, will not be required under the new regime of the Companies Act. Aside from this, having an outside director is encouraged by a “comply or explain” rule. Specifically, two-board companies are to be subject to a rule where they must explain the reason why they do not have an outside director, if they do not have one, at the annual shareholders’ meeting.²⁴

In addition, under the 2014 amendments, a new type of company will be introduced allowing for a type with a one-board and one-committee structure (where there are no statutory auditors and the majority of the committee members must be outside directors).²⁵ As a result, listed firms will have the choice of three board structures: (1) two boards; (2) one board and three committees; and (3) one board and one committee. This one-board and one-committee structure is intended to encourage listed firms with a two-board structure to move to that structure and thereby have outside directors.

At any rate, it is noteworthy that enforcement alone does not seem to explain the non-convergence of substantive rules on board structure.

4 Convergence of Enforcement

My discussion thus far has assumed that enforcement mechanisms do not converge. This assumption, however, is not plausible, at least in theory. Like a legal rule, an inefficient enforcement mechanism must face pressure to change.

In this line of thinking, one important point must be made. Unlike substantive rules, the value (or cost) of enforcement can be defined in a straightforward way. That is, it is most efficient when the enforcement cost is zero. Viewed this way, talking about convergence of enforcement appears misleading because as far as the cost of enforcement alone is concerned, the lower the better. However, one could still discuss the level of enforcement. A rule is enforced up to the point where the cost of enforcement outweighs the cost of non-enforcement. Thus, a certain institutional mechanism, say, the court system, might be better or worse than another mechanism, say, the arbitration system, so that one could discuss convergence or divergence of enforcement mechanisms in this vein. Similarly, one could argue that if the number of judges and private attorneys is decreasing in one country and increasing in another country, the enforcement systems are converging. However, insofar as the area of corporate governance is concerned, I am inclined to make an empirical assumption that (p. 733) enforcement mechanisms have too many hurdles to converge, and will leave the discussion on convergence of enforcement to further research in the future.

5 Convergence of Substantive Legal Rules Affects Enforcement

My discussion thus far has examined how enforcement affects substantive rules. In theory, one can think of the reverse linkage between enforcement and substantive rules: how convergence of substantive rules affects enforcement. For instance, if certain substantive rules are similar in two jurisdictions, judges in one jurisdiction might borrow precedents from the other jurisdiction, so that similar substantive rules might result in quicker and cheaper court decisions. If so, convergence of substantive rules affects the level of enforcement. Similarly, when a jurisdiction prepares a new enforcement mechanism, if a similar substantive rule is adopted, the jurisdiction might be able to prepare a new enforcement mechanism rather quickly and easily by importing it from elsewhere. I believe that this phenomenon is in fact observed in the areas of consumer protection and environmental law. In corporate governance, this can happen where a large-scale law reform is considered in any given jurisdiction; for instance, where Asian jurisdictions attempt a large-scale law reform on corporate governance by introducing a new monitoring mechanism.

Western versus Asian Laws on Corporate Governance: The Role of Enforcement in International Convergence

Indeed, when European countries introduced or strengthened the regulation of insider trading, there was pressure to adopt a US style of substantive rule, which operated as pressure for enforcement mechanisms to converge. Ultimately, the path to establish an enforcement agency like a US Securities and Exchange Commission was not imposed on the EU Member States, but to date, the discussion on the enforcement mechanism has continued.²⁶ Additionally, convergence of financial disclosure and accounting rules toward a more stringent standard has forced jurisdictions to give a higher legal profile to professional accountants and auditors as an additional monitoring body to facilitate the self-enforcing character of the relevant financial disclosure and accounting rules.

6 Preliminary Conclusion

In this chapter, I have examined the interrelationship between substantive legal rules and enforcement. I have shown that the cost of enforcement affects convergence or divergence of substantive legal rules in corporate governance. I have submitted a hypothesis that where enforcement costs are very low or too high, there is reason to expect that substantive rules will converge. Otherwise, differences in enforcement predict differences or divergence in substantive rules. As the cost of enforcement becomes lower in certain jurisdictions, there (p. 734) is more chance that their substantive legal rules will converge. I have also touched briefly upon the reverse linkage between rules and enforcement: convergence of substantive rules may affect enforcement. In my view, enforcement should be paid more serious attention in the research on comparative corporate governance. A proper focus on enforcement would shed new light on the issue and justify revisiting the familiar debate on convergence or divergence of substantive legal rules in world corporate governance systems. I hope the framework presented in this chapter will provide for a better understanding of the situations in which Asian jurisdictions import laws on corporate governance from Western jurisdictions.

The Oxford Handbook of Corporate Law and Governance

Edited by Jeffrey N. Gordon and Wolf-Georg Ringe

Print Publication Date: May 2018

Subject: Law, Company and Commercial Law, Comparative Law

Online Publication Date: Aug 2015 DOI: 10.1093/oxfordhb/9780198743682.013.33

Abstract and Keywords

Despite deep differences in their political systems, legal regimes, and economic structures, emerging markets share a recent history of rapid economic growth and capital market expansion. This chapter explores the degree and direction of transformation in corporate governance in emerging markets in the last decades. It begins by surveying the interaction between the ownership structures prevailing in emerging markets – marked by the presence of controlling shareholders, business groups, and state ownership – and the underlying institutional environment. It then examines the driving forces of change by comparing the relative roles played by legislatures, regulators, courts, and alternative institutional arrangements in corporate governance reform in Brazil, Russia, India, and China (collectively known as the BRIC countries). The chapter concludes by evaluating the degree of convergence and persistence in emerging markets governance, and underscoring the need to consider the particular contextual significance of different practices.

Keywords: corporate governance, emerging markets, capitalism, ownership, business groups, state intervention, economic reforms, legal reforms, capital markets, BRIC countries

1 Introduction

¹THE corporate governance movement, as well as the vast literature and industry to which it gave rise, is predicated on the premise that the structure, practices, and balance of power within the corporation matter for economic outcomes. The movement as we know it today first emerged in the United States in the late 1970s and early 1980s—a context of economic malaise and fear of imminent decline in view of the then booming economic performance of Germany and Japan.² In an era marked by growing skepticism of government intervention, the cure for economic woes had to lie in the private sector. As a result, governance substituted for government.³ Adopted in 1977, the New York Stock Exchange listing rule requiring audit committees to be composed of outside directors was a first step in this direction.⁴ Subsequently, the far more active role of private shareholders

Corporate Governance in Emerging Markets

as corporate monitors in Germany and Japan would provide an attractive model for the revitalization and increased competitiveness of US firms.⁵

While comparisons between foreign models of corporate ownership and control have been a staple of the corporate governance movement since its early days, the first such studies centered on a handful of mature economies—most conspicuously the United States, (p. 736) the United Kingdom, Germany, and Japan. It was not until the 1990s and 2000s that the focus expanded to cover a larger array of jurisdictions. A number of economic and political factors help explain why corporate governance in emerging markets became an increasingly prominent theme in business, academic, and policy circles alike.

First, the fall of the Berlin Wall and the spread of the Washington consensus reinforced the wave of privatizations around the globe, and especially in the state-heavy economies of the old Second and Third World. A new system of corporate governance and financing was needed to replace the existing one based on state ownership of enterprise. It soon became apparent that privatization alone was unlikely to produce the desired improvements in economic performance in the absence of accompanying legal reforms that ensured a well-functioning corporate governance regime.⁶

Second, the 1990s witnessed the publication of several academic studies pointing to the existence of a causal relationship between financial development and economic growth.⁷ Concurrently, a series of highly influential, albeit controversial, works on “law and finance” suggested that corporate governance institutions and practices—in particular, the level of legal investor protection afforded to minority shareholders—helped explain the variation in the ownership structures of business corporations and the level of financial development observed around the world.⁸ In a period where the ascent of institutional economics persuaded international development agencies such as the World Bank to shift their strategy from the financing of physical infrastructure to the financing of improvements in institutional infrastructure, promoting corporate governance reform in emerging markets became a top policy priority.⁹ This concern was only reinforced as commentators blamed the Asian financial crisis of the late 1990s on sub-par corporate governance practices.¹⁰ Corporate governance improvements in emerging markets thus became a main area of concern at both domestic and international levels as an integral part of a developmental agenda.

Third, the growing attention to corporate governance in emerging markets is also attributable to strictly financial considerations. The spread of globalization, international trade, and financial liberalization worldwide in the last decades dramatically amplified cross-border investments. In 2012, for the first time in history, developing countries absorbed the lion’s share of global flows in foreign direct investment.¹¹ Domestic equity markets in emerging economies also flourished, with firms from non-OECD countries raising a staggering 60% (p. 737) of the world’s total IPO proceeds between 2008 and 2012.¹² In this context, foreign investors exploring emerging market opportunities had a keen interest both in better understanding their existing corporate governance structures and in ascertaining the extent to which the introduction of superior practices could boost firm value.

Corporate Governance in Emerging Markets

This is especially so given the increasing appreciation of the economic importance of the so-called “BRICs”—an acronym devised by Goldman Sachs in 2001 to designate the giant emerging markets of Brazil, Russia, India, and China.¹³ According to estimates by the UN Development Program, the joint economic output of Brazil, India, and China alone is expected to exceed the combined production of the United States, Canada, France, Germany, Italy, and the United Kingdom by 2020.¹⁴ Growth rates in the BRICs significantly outperformed those of developed economies in the 2000s, and played a key role in sustaining global demand in the immediate aftermath of the 2008 financial crisis.

For all these reasons, there has been a noticeable increase in the number of country-level corporate governance studies in different emerging economies,¹⁵ even if they still lag far behind the immense literature covering developed countries. Nevertheless, devising a common framework to examine the state of corporate law and governance in emerging markets remains challenging, for the simple reason that these countries are a diverse bunch. The very label “emerging markets” was first crafted in the 1980s, not as a scholarly category, but simply as a marketing tool for a new index of foreign stocks—as a substitute for the then prevailing, but evidently unappealing, designation of “Third World” countries. Since then, the tag has also come to encompass certain ex-communist economies of the Second World, hence rendering the group even more heterogeneous.

Yet the shared trait of underdevelopment is evidently insufficient as a signal of underlying commonalities. Emerging markets are arguably even more diverse than developed economies, even though the latter’s corporate governance systems are seldom grouped and studied as a unitary category. Indeed, countries such as Brazil, Russia, India, China, South Korea, and Turkey—to list only a few prominent examples—have deeply diverse histories, political systems, legal regimes, and economic structures. It should therefore come as no surprise that their corporate governance practices too look significantly different. Consequently, most sweeping generalizations about corporate governance in emerging markets—even if illuminating at a high level of abstraction—are unlikely to provide an accurate depiction of individual countries’ realities.

With this caveat in mind, the remainder of this chapter explores some of the key characteristics shared by corporate governance systems in emerging markets, examines the degree of convergence to international standards in the recent past, and identifies promising avenues for future research. Although the exposition will concentrate on the BRICs—the giant countries that achieved notably high levels of economic growth in the 2000s—it will (p. 738) also incidentally address the experience of other emerging markets as appropriate. The analysis will focus, in particular, on the driving forces, extent, and contours of corporate governance change in the last decades.

Figure 27.1 Market capitalization by year as a percentage of GDP. Prepared by author based on World Bank data available at <http://data.worldbank.org/indicator/CM.MKT.LCAP.GD.ZS>.

Despite their differences, emerging market economies are all latecomers in terms of capital market development, at least in recent history. But if the “emergence” of their capital markets was once a prophecy, it has since turned into reality, especially for the BRICs. As depicted in Figure 27.1, their stock markets have experienced significant growth since the 1990s—and along the way they have also shown a tendency to rise and fall in tandem. Apart from the intrinsic interest in these systems, the examination of the changing structures of corporate governance in emerging markets helps illuminate the variety of institutional arrangements that make capitalism viable around the world.

2 Ownership Structures

Most, if not all, emerging market economies operate in a taxing institutional environment that fails both to fully protect property rights and to expediently enforce commercial agreements. These institutional shortcomings, in turn, require different adaptations to the way of doing business. For instance, a lack of property rights protection may concentrate ownership in the hands of the state itself or of otherwise powerful cronies, hence discouraging investment by outsiders. Likewise, difficulties in obtaining timely and impartial court enforcement of commercial agreements may lead firms to rely on extra-contractual (p. 739) commitment mechanisms—such as family relationships and longstanding reputation—or resort to vertical integration.¹⁶

2.1 Ownership Concentration and Business Groups

In contrast to the model of dispersed ownership of publicly traded companies often observed in the United States and the United Kingdom, but similarly to the developed economies of continental Europe, emerging markets boast a system of mostly concentrated corporate ownership in the hands of wealthy families or the state. Accordingly, the average free float of listed companies in India and Russia does not exceed 35%, compared to over 90% in the United States and the United Kingdom.¹⁷ The presence of a powerful

Corporate Governance in Emerging Markets

controlling shareholder affords political influence and reputational bonding that compensates for a lack of formal property rights protection and contract enforcement. This, in turn, entails that the primary agency costs in listed firms concern the divergent interests of controlling shareholders and minority shareholders—and not of managers and dispersed shareholders, as is the case in the widely held corporations that populate Anglo-Saxon markets.

In addition, emerging markets tend to offer lower levels of legal protection to outside investors, a feature which, according to the large literature on “law and finance,”¹⁸ also encourages ownership concentration and stifles capital market development, for at least two reasons. First, where minority shareholders are not adequately protected, entrepreneurs will be unwilling to give away control for fear of subsequent expropriation. Second, dispersed ownership—if it were to emerge—would be inherently unstable, since a corporate raider would have much to gain by acquiring a controlling stake in the market so as to extract hefty private benefits to the detriment of vulnerable minority investors.¹⁹ Conversely, concentrated ownership can be self-perpetuating, as existing controlling shareholders will have every incentive to lobby against corporate reforms that enhance minority shareholder rights, hence decreasing their wealth and power.²⁰

It is particularly common for controlling shareholders in emerging markets to exert uncontested control over the firm without holding a majority of the voting stock. This is made possible through the use of control-enhancing devices that dissociate cash-flow rights and voting rights—a strategy that induces large shareholders to monitor management, albeit at the risk of significantly increasing their incentives to extract private benefits of control to the detriment of minority investors.²¹ Brazil, for instance, had the world’s largest incidence of dual-class firms, with voting shares held by mostly corporate insiders and nonvoting shares (p. 740) by outside investors.²² In other jurisdictions, such as Chile and South Korea, corporate pyramids are the preferred method through which shareholders control the firm without holding a commensurate equity stake.²³

Controlling shareholders in emerging markets often control not a single corporation, but rather an entire group of formally independent firms. Business groups play such a pivotal role in different emerging market economies that commentators have questioned the use of the term corporate governance, suggesting that, in such an environment, the group, not the individual firm, is the proper unit of analysis.²⁴ The economic implications of business groups, however, remain the subject of debate. While the pyramidal structures adopted by some groups can be particularly conducive to expropriation of minority investors, the literature suggests that, in allowing for vertical integration, internal capital markets, and relational contracting, business groups may serve as a valuable adaptation to a weak institutional environment.²⁵ More recently, commentators have come to underscore the strategic advantages of emerging market business groups in promoting long-term performance, suggesting that their conglomerate structure provides a useful model for developed markets as well.²⁶

But if business groups are pervasive in most emerging markets, their precise contours vary from context to context. Diversification across different industries is the norm in some countries, such as Chile and South Korea, but less common in others, most conspicuously China.²⁷ Their recent trajectory following economic liberalization in the 1990s has not been uniform either. Business groups became ever more connected and centralized in “small-world” fashion in Mexico and Brazil during this period, but more decentralized and fragmented in South Korea.²⁸

2.2 State Ownership and Influence

Even after the wave of privatizations in the 1980s and 1990s, state ownership remains alive and well in most emerging markets. All of the BRIC countries continue to exhibit high levels of state ownership. By 2011, companies under direct government control comprised 80% of (p. 741) the market capitalization in China, 60% in Russia, and 35% in Brazil.²⁹ In fact, the relevance of state ownership for the corporate governance debate has arguably increased in recent decades, as a number of former governmental divisions came to assume the corporate form.

China has famously pursued a strategy of “corporatization, not privatization,” which resulted in the massive floating of minority stakes in its newly created stock exchanges in the last two decades.³⁰ Despite subsequent reforms decreasing the number of non-tradable shares held by the state and the increase in private sector activity, SOEs remain dominant in the Chinese economy.³¹ Moreover, some of the earlier key privatizations in developing countries’ natural resource sector have been reversed—either indirectly, as in Russia’s renationalization of Yukos following inflated tax charges levied against the company, or directly, as in Argentina’s outright expropriation of the controlling stake held by Spanish company Repsol in oil company YPF. In Brazil, privatizations often changed the form, but kept the substance, of government control. For instance, following privatization the federal government’s majority stake in Brazilian mining giant Vale was replaced by a controlling coalition made of state-controlled institutional investors and members of business groups tied by a shareholders’ agreement.³²

State ownership, in turn, can be both a product of, and a contributing factor to, the weak institutional environment in emerging markets. In laggard economies, capital market failures prevent the financing of large-scale projects by the private sector and hence prompt the state to assume an entrepreneurial function.³³ Yet, once established, there is the risk that SOEs may crowd out, rather than crowd in, private sector firms.

State ownership may also help perpetuate low levels of legal investor protection through a more subtle mechanism: the political role of the state as a shareholder in corporate law reforms. In the 1990s, the Brazilian government, desirous of obtaining a larger control premium for itself in privatization sales, sponsored a series of statutory amendments explicitly aimed at eliminating various minority shareholder rights, to the detriment of outside investors.³⁴ In China, the interests of the government as controlling shareholder have shaped the development of different areas of the law, from the structure of its first

corporations' statute, to the availability of securities class actions and the doctrine of veil piercing.³⁵

The government's sway over corporate governance in emerging markets far exceeds its direct influence as a controlling shareholder of large SOEs. In Brazil, the state has also resorted to minority shareholdings—in the form of captive public pension funds and equity (p. 742) investments by its Development Bank (Banco Nacional de Desenvolvimento Econômico e Social—BNDES)—to shape corporate policy.³⁶ These state-controlled actors exercise influence not only through their regular statutory voting rights in the shareholders' meetings, but also by explicit control-sharing arrangements as parties to shareholders agreements, which habitually grant the state-controlled institutional investors both board representation and veto rights over key corporate decisions.³⁷ In China, the government's sway over, and support to, private sector corporations has effectively blurred the distinction between public and private modes of ownership.³⁸

Still another avenue for state intervention in corporate governance in emerging markets comes from the provision of subsidized debt financing to selected private firms. The loan volume extended by Brazil's BNDES alone in 2012 reached nearly four times that of the World Bank.³⁹ Development economists have also long attributed the rapid catch-up process in Asia to the export requirements inserted in governmental loan agreements to business groups.⁴⁰ The Korean government has never been a major shareholder in Korean chaebols, but was nevertheless able to direct industrial policy through its grip on the financial sector.⁴¹

3 Reform Efforts

Capital markets in BRIC countries underwent major developments in the last two decades. As depicted in Figure 27.1, these countries transitioned from having meager or virtually non-existent stock markets in the early 1990s to boasting sizable market capitalizations in the mid-2000s, even if they faced a substantial retreat thereafter as underlying economic conditions worsened. At the height of the bubble in 2007, China and Brazil, together with the United States, placed as the top three IPO destinations worldwide.⁴²

Nevertheless, the precise makeup of stock markets in emerging markets continues to vary widely. With only a few hundred listed companies (most of which of relatively large size), Brazil has struggled to induced medium-sized firms to access public markets. At the other end of the spectrum, India boasts the largest number of publicly-traded companies in the world. Whereas most Latin American countries exhibit low ratios of market capitalizations to GDP, Chile stands out as an exception, displaying ratios comparable to the robust equity markets of the United States and the United Kingdom in recent years.⁴³

(p. 743) The expansion of equity markets in emerging economies paralleled both economic and legal reforms. On the economic side, full and partial privatizations induced the private sector to assume the role of entrepreneur and financier that had been relinquished by the state. The elimination of barriers to trade and financial flows, in turn, encouraged

foreign investors to jump in. On the legal side, the BRICs witnessed both the implementation of legal reforms and the adoption of superior corporate governance practices on a voluntary basis, with varying degrees of success.

3.1 The Tortuous Path of Legislative Change

Russia's experience is emblematic of the challenges inherent in large-scale reform. In the 1990s, prominent US legal scholars conceived its new corporate statute, which was deliberately based on a model of "self-enforcing" corporate law designed to compensate for the country's otherwise fragile legal system.⁴⁴ Nevertheless, the good intentions and the attentiveness to local circumstances were insufficient to make the new law effective, as it notoriously failed to constrain subsequent instances of self-dealing.⁴⁵

Adopted in 1994 as the legal framework for China's corporatization strategy, its company law mixed standard Western elements with local idiosyncrasies. Molded by the vision of a state-dominated economy, the Chinese corporate statute imposed a rigid mandatory framework that, while arguably suitable for SOEs, was woefully inadequate for private sector enterprise.⁴⁶ The law was also reticent on the fiduciary duties of corporate managers and the means of enforcement, with no provision for derivative suits.⁴⁷

In 2005, China's corporations and securities statutes underwent a major overhaul that was strongly acclaimed by local scholars as an improvement to the existing statute that changed it "almost beyond recognition."⁴⁸ The new regime imposed fiduciary duties on managers and controlling shareholders, required listed firms to have independent directors, permitted derivative suits, and recommended (though it did not compel) cumulative voting in director elections.⁴⁹ Nevertheless, a gap remains between the "law in the books" and the "law in action." For instance, the prominent role of the state has prompted a double standard in terms of legal enforcement, with SOEs appearing to face more lenient regulatory scrutiny than private sector firms.⁵⁰

Brazil's 1976 Corporations Law—an innovative statute that borrowed freely from US and European sources to address local challenges—remains largely untouched, as subsequent legal reforms turned out to be modest in scope. A 1997 amendment to the statute eliminated (p. 744) the requirement of a mandatory bid for minority shares in sale-of-control transactions with the purpose of allowing the state to appropriate the entire premium control to itself in privatization sales. These legal changes—which applied to firms under both state and private control—facilitated a series of abusive going-private transactions, thereby destroying investor confidence in Brazil's capital markets. After the bulk of privatization sales, a legal reform in 2001 reinstated some of the minority protections that had been previously abrogated, but was otherwise timid, as political opposition from controlling shareholders frustrated attempts at more transformational change.⁵¹

Major legislative change was also slow to come by in India. Subject to several amendments primarily designed to relax governmental controls and increase governance flexibility, India's Companies Act of 1956 remained in force until the significant overhaul by the Companies Act of 2013.⁵² Some of the changes introduced by the new statute were

designed to incorporate US-inspired mechanisms (such as class actions) into Indian law, while others clearly surpassed prevailing international standards, as in the new requirement of a maximum term limit of ten years for independent directors.⁵³

3.2 The Role of Government and Private Regulation

Most of the progress in Brazil's corporate governance practices did not stem from sweeping statutory changes, but rather from a combination of private regulation and the increasingly activist stance by the Securities Commission (Comissão de Valores Mobiliários—CVM). Brazil's experience with the Novo Mercado—a premium voluntary listing segment of the São Paulo Stock Exchange (BM&FBovespa)—was instrumental in the revitalization of the country's equity markets in the 2000s. By leaving the existing legal regime intact, this strategy of “regulatory dualism” successfully circumvented the powerful political opposition to reforms by existing corporate elites.⁵⁴ Firms opting for a Novo Mercado listing are subject to strictures such as a ban on nonvoting shares, a mandatory bid rule in sales of control, and director independence requirements.

Modeled after the US Securities and Exchange Commission, CVM was established in the 1970s as the sheriff of Brazil's capital markets. Subsequent statutory amendments in 1997 and 2001 increased its autonomy vis-à-vis the executive and expanded the scope of its regulatory oversight and disciplinary authority. Since capital markets boomed following a series of IPOs on the Novo Mercado, CVM has advanced the investor protection agenda in various fronts.⁵⁵

(p. 745) First, the Commission made progress with respect to enforcement, culminating, for instance, in Brazil's celebrated first criminal conviction for insider trading in 2011.⁵⁶ Second, CVM came to embrace more protectionist interpretations of existing law, as in the famous Tractebel decision. By preventing controlling shareholders from voting to approve interested transactions, the Commission's new interpretation effectively implemented a “majority-of-the-minority” approval requirement at shareholders' meetings. Third, CVM improved the existing regulatory landscape through a variety of channels: it published a series of stringent advisory opinions on matters ranging from fiduciary duties to the scope of antitakeover defenses, instituted more expansive disclosure regulations that are stricter than the original Novo Mercado standards, and innovated in permitting proxy access (or conferring reimbursement of expenses incurred in proxy solicitations) to shareholders holding more than 0.5% of the company's stock. And, finally, CVM has effectively exercised its statutory authority to punish unlawful actions by company managers, as exemplified by the imposition of fines to the CFO and directors of listed firm Sadia. The Commission concluded that their failure to abide by the company's risk own management policies with respect to exchange rate derivatives, which resulted in hefty financial losses following the 2008 financial crisis, constituted a violation of their fiduciary duty of care under Brazilian law.

Similarly, until very recently corporate governance reform in India proceeded more quickly via the regulatory agency than the legislature.⁵⁷ Established and strengthened as an

oversight body between 1988 and 1992, the Securities and Exchange Board of India (SEBI) provided the regulatory framework for the country's expanding capital markets. Like CVM, SEBI's aggressive posture has at times led to accusations that it was overstepping its regulatory authority.⁵⁸

Among the innovations embraced by SEBI is the watershed "Clause 49" of stock exchange listing agreements. First enacted in 2001 and revised in 2005, Clause 49 reflects a set of corporate governance standards following the voluntary Corporate Governance Code sponsored by the Confederation of Indian Industry (CII)—which, in contrast to the business establishment in Brazil, played a prominent role in sponsoring, rather than opposing, corporate governance reforms. The requirements described in Clause 49, which came to apply to all listed firms in India, ranged from a minimum percentage of independent directors to the institution of an audit committee and the requisite of chief executive certification of financial statements. Empirical studies documented a positive stock market reaction to the announcement of Clause 49, as well as a positive effect of stricter enforcement of these standards on firm value,⁵⁹ even though actual compliance remained far from universal.⁶⁰

(p. 746) 3.3 The Role of Courts

Courts have generally played at best a modest and at worst a positively detrimental role in the transformation of corporate governance in emerging markets. The disadvantages of relying on the judiciary for investor protection include unreasonable delays, lack of technical sophistication, and even outright corruption. In most emerging market economies, corporate and securities litigation is a comparatively less significant means to rein in abuses by managers and controlling shareholders compared to more developed economies, and especially the United States.

There is a paucity of derivative lawsuits involving public company shareholders in both Brazil and India, even though these jurisdictions experience distinctively high levels of litigiousness in other areas of law.⁶¹ China's more recent recognition of derivative actions "on the books" did little to encourage their filing.⁶² Corporate litigation was also virtually non-existent in South Korea before the East Asian crisis of the late 1990s (with actual derivative lawsuits being unheard of until 1997), but it has since soared.⁶³ At another extreme, Russia's highly dysfunctional judicial system allows for the filing of lawsuits that are frivolous—but potentially successful, considering the specter of corruption—to be used as a takeover strategy.⁶⁴

Resistance to legal change is still another issue plaguing courts' role in emerging markets governance. In both Brazil and India the judiciary has been receptive to the use of constitutional law arguments to thwart reform efforts. In an attempt to cure the deficiencies of Brazilian laws on executive compensation disclosure, CVM issued new regulations in 2009 requiring companies to reveal the aggregate amounts paid to executives, as well as the highest, lowest, and average compensation packages of directors and officers. Executives have so far successfully challenged the rule by contending that—in view of the

privacy rights guaranteed by the Brazilian constitution and the country's particularly high levels of violence—CVM rules were unconstitutional as a violation of their fundamental rights to privacy and personal security.

In India, too, several constitutional challenges to new laws on insolvency and secured credit have delayed the implementation of important reforms for the development of India's credit market.⁶⁵ A 2002 legal attempt to circumvent India's notoriously slow courts by creating a separate judicial body to enforce the provisions of the Companies Act was likewise (p. 747) frustrated by constitutional challenges.⁶⁶ The Korean judiciary, in turn, has unduly oscillated between formalistic and liberal methods of statutory interpretation in reaching conservative opinions that favored the interests of chaebols over those of outside shareholders.⁶⁷

The few exceptional instances of judicial innovation in corporate law prove the rule. Despite their notorious subordination to the Communist Party's wishes, Chinese courts played a surprisingly activist part in imposing American-style fiduciary duties notwithstanding the lack of explicit statutory provision under the 1994 Corporations Law.⁶⁸ In recent years, Brazilian courts have come to consistently grant minority shareholders' requests for partial dissolution of closely held corporations, even though such a remedy is not available under the Corporations Law. One might be tempted to interpret this newly recognized right as a creative solution to protect minority shareholders from abuse in situations where they would otherwise be unable to prove the existence of wrongdoing by controlling shareholders and managers.⁶⁹ Such innovation, however, is not without costs, for it carries the risk of undermining the company's ability to "lock in" capital, a distinguishing—and economically crucial—feature of the corporate form.⁷⁰

3.4 Alternative Institutional Arrangements

Substitute mechanisms compensate for the difficulties in judicial enforcement. Given the substantive and procedural legal hurdles to derivative actions in Brazil and India, aggrieved shareholders have typically turned to the securities regulator instead—CVM or SEBI—for more expedient and effective redress.⁷¹ In some countries—such as Chile, Brazil and, to some extent, China—listed firms have often attempted to circumvent the judicial route altogether by embracing arbitration as the preferred method of dispute resolution.⁷²

Whereas in Italy and the United States public company arbitration is either outlawed or frowned upon as a scheme for potential investor abuse; in emerging markets arbitration may operate as a second-best solution given the deficiencies of the court system.⁷³ Novo (p. 748) Mercado, the premium corporate governance segment of the São Paulo Stock Exchange (BM&FBovespa), in fact mandates the arbitration of all internal affairs and securities law disputes, operating on the assumption that this is the most investor-friendly method of resolving corporate conflicts. Moreover, numerous other companies have voluntarily inserted arbitration clauses in their charters and shareholder agreements.⁷⁴ Nevertheless, the choice for arbitration brings about challenges of its own, especially

where, as in Brazil, the proceedings are confidential, thus hindering the development of case law and contributing to the opaqueness of the institutional environment.

At any rate, changes in formal statutes, regulations, and enforcement at the national level are insufficient to account for the extent of the transformation in emerging markets' corporate governance practices. Brazil's positive experience with the Novo Mercado shows that self-regulation through stock exchange listing requirements may play a crucial role in kick-starting much-needed reform. Scholars have argued that, in China, reputational sanctions through public criticism by the Shanghai and Shenzhen stock exchanges help deter corporate wrongdoing in the absence of formal public enforcement.⁷⁵ Individual emerging market companies are also free to adopt sensible corporate governance practices, which empirical studies have found to be associated with improvements in firm performance.⁷⁶

Finally, international (and especially US) cross-listings by emerging market corporations have been another engine of corporate governance change. The existing literature has posited two different theories to explain firms' decisions to list their shares on a foreign exchange. According to the market segmentation (and liquidity) hypothesis, the benefits of cross-listings lie in permitting foreign issuers to expand and diversify their investment base. Proponents of the competing bonding hypothesis, by contrast, interpret overseas listings as a mechanism by which firms can make a credible commitment to the higher standards of corporate governance and transparency prevailing in the host jurisdiction.⁷⁷ But whether or not bonding considerations are determinative, overseas listings certainly play a role in corporate governance convergence.

4 Convergence and Persistence in Emerging Markets Governance

If the recent transformation of corporate governance practices in emerging markets is evident, the extent and direction of change remains contested. A main theme of the academic literature in the last decades concerns the impact of globalization on corporate structures and practices. Specifically, the question is whether corporate governance systems around the (p. 749) world have become increasingly uniform (the "convergence thesis"), or if, instead, path dependence significantly constrained the course of subsequent developments (the "persistence thesis").⁷⁸ While this debate focused primarily on the usual mature economies, it is easily replicated with respect to emerging markets.⁷⁹

On the one hand, rising globalization, foreign competition, and international investment flows all militate in favor of some form of convergence. Mounting competitive pressures increase domestic firms' need for outside financing, which, in turn, creates demand for stronger forms of investor protection. As foreign investors flock into emerging market economies, they bring with them the corporate governance practices, structures, and norms of their home country, even if not always with due regard to local specificities.

On the other hand, the theoretical arguments favoring persistence in corporate governance structures are also strong. The political economy of corporate lawmaking is tilted toward existing structures, as controlling shareholders, dispersed investors, managers, and workers engage in lobbying efforts to maintain their status and privileges. And, perhaps more importantly, there are significant institutional complementarities between the corporate governance regime and other political and economic dimensions, such as the form of industrial organization, the flexibility of labor markets, the characteristics of the educational system, and the structure of political representation, which, taken together, engender different “varieties of capitalism.”⁸⁰ As a result, particular corporate governance systems may be less amenable to change than a closer focus on corporate dimensions alone would suggest.

4.1 Forms, Functions, and Idiosyncrasies

The corporate structure has long become universal. Irrespective of their origin, corporations around the world today share certain core attributes, such as legal personality, tradable shares, limited liability, delegated management, and investor ownership.⁸¹ These features, in turn, are increasingly relevant in emerging markets, as state-owned enterprises previously operating as governmental divisions in countries such as China and Russia, among many others, came to adopt the corporate form. But beyond the spread of corporate organization itself, there has been a visible tendency toward the implementation of the wide array of corporate law and governance features prevailing in developed, and especially Anglo-Saxon, markets—ranging from independent directors and fiduciary duties to insider trading bans and securities agency enforcement—to emerging market economies. Still, the intensity of such convergence, as well as the precise mix of best practices, can vary dramatically from one jurisdiction to another.

(p. 750) Focusing only on the adoption of identical corporate governance practices prevailing in developed countries would certainly understate the degree of actual convergence. Functional, rather than formal, convergence is often the norm.⁸² Diverse arrangements such as public company arbitration, stiff reputational sanctions, and governmental oversight of firm performance all operate as institutional substitutes that further the goal of investor protection without conforming to international “best practices.”

Yet it would be both naïve and misguided to overstate the convergence thesis in its strong form. Just as functional convergence is feasible without accompanying formal convergence, the reverse is also true, as formally identical practices can have disparate significance in different underlying environments. Scholars have duly admonished the “elusive quest” for universal corporate governance standards, recognizing that identical practices can have diverse consequences depending on the prevailing ownership structures.⁸³

Take, for instance, a longstanding policy prescription of the US corporate governance movement: the separation of the roles of board chair and CEO. By providing the board with independent leadership, the split of roles is designed to ensure that directors are in a position to effectively monitor the company’s management. However, despite major

Corporate Governance in Emerging Markets

strides, this recommendation remains highly contested in the US context of powerful CEOs, as independent chairs are still far from universal. In Brazil, where political opposition to corporate governance changes is particularly fierce, companies have refrained from vetoing the inclusion of a mandatory split of positions as a listing requirement for all premium corporate governance listing segments on the BM&FBovespa.

The greater receptivity to independent board leadership by Brazilian firms is less due to their especially strong commitment to best practices of corporate governance than to its different contextual significance. In a system of highly concentrated corporate control, the primary source of agency costs is not managerial omnipotence but rather the potential of abuse by controlling shareholders. While controlling shareholders typically seek to keep management on a tight leash, they do not always covet the consuming office of chief executive. And, even when they do, having an independent board chair may not be exactly threatening when she is elected by the controlling shareholder himself. In fact, a substantial number of Brazilian companies already had a split in place—with the controlling shareholder serving as board chair and delegating everyday managerial decisions to a professional CEO—before the advent of the listing requirement, which makes it far less consequential in the Brazilian context of concentrated ownership than in the US system of dispersed ownership.

Similarly, while the United States has only recently embraced an advisory shareholder vote on executive compensation (“say on pay”) at least every three years, Brazilian corporate law has long required shareholders to approve executives’ overall pay packages on an annual basis. In a context of concentrated ownership, however, the rule has different implications: it provides controlling shareholders with yet another opportunity to supervise management as well as to approve their own salaries as board members. In some Brazilian (p. 751) firms, director compensation to members of the controlling family even exceeds the pay of the professional CEO.

As a general matter, the recent transformation in emerging markets’ governance has combined the influence of prevailing practices in mature markets with indigenously designed improvements. More recently, the origins of institutional transplants from foreign sources have also begun to change. Rather than invariably looking to developed countries for model norms and practices, emerging market economies have increasingly learned from each other’s experiences. The apparent success of Brazil’s Novo Mercado has invited similar initiatives in India and the Philippines.⁸⁴ After taking over traditional US firms such as Heinz and Burger King, Brazil’s 3G Capital fund has exported its ruthless efficiency-oriented management style. In the future, one can expect the cross-fertilization in corporate law to become ever more multidirectional, with mature economies receiving the influence of emerging markets’ norms and practices—not least due to the rising levels of foreign direct investment by multinationals and national champions from China, India, Brazil, and the like.

4.2 Evolving Ownership Structures

Changes in ownership structure have proceeded at a somewhat slower pace. Given the continued predominance of concentrated ownership in the BRICs, hostile takeovers either remain exceedingly rare, or assume a very different meaning. In Russia, a “hostile takeover” is not, as one might expect, the acquisition of a controlling stake from public shareholders against managers’ will—a strategy which is hardly feasible given the presence of a controlling shareholder in most companies. Instead, it refers to the relatively common, if extreme, practice of gaining control over a firm through dubious practices ranging from fraud and corrupt law enforcement to outright violence.⁸⁵

In Brazil, the failure of the hostile bid by meat-processing firm Sadia for its chief competitor Perdigão—the first and only hostile takeover attempt in recent history—illustrates how the apparent increase in ownership dispersion in recent years may be illusory.⁸⁶ Despite the absence of a single controlling shareholder, the target’s several blockholders were party to a shareholders’ agreement, and acted swiftly to reject the offer notwithstanding its sizable premium. Even in India, where a non-trivial minority of firms is widely held, hostile takeovers have faced practical difficulties thanks to hefty regulatory hurdles to control changes as well as the presence of founder-friendly financial institutions. Past hostile bids have failed for reasons ranging from the outright refusal of the target companies to register the acquired shares to strong political opposition leading to the enactment of regulatory impediments.⁸⁷ (p. 752) A notable exception is Korea, where reforms following the Asian crisis left local firms vulnerable to foreign threats.⁸⁸

When it comes to ownership structures, convergence came mostly from the opposite direction: while dispersed ownership remains rare in emerging markets, there has been a visible trend toward concentrated corporate control in the United States. Dual-class shares, once banned by the New York Stock Exchange (NYSE) listing standards until 1984, used to be commonplace only in the South and continental Europe. In the 2000s, however, they experienced a revival in the US market, as founders of highly prominent technology firms, such as Google and Facebook, resorted to multiple voting shares to lock in control of the company before going public.⁸⁹ Ironically, the US market might become a refuge for foreign firms seeking entrenched management structures. In 2013, Chinese internet giant Alibaba announced that it would pursue a NYSE listing after the Hong Kong Stock Exchange—its initially preferred venue—refused to exempt it from the listing rules prohibiting dual-class stocks.

4.3 Stakeholders and Corporate Governance

Through the effect of concentrated ownership structures and accompanying legal institutions, the interests of (controlling) shareholders often take center-stage in emerging market firms.⁹⁰ Yet—at least on the books—consideration of stakeholder interests is also particularly salient in their governance. Even though the spurt in economic growth in the 2000s ameliorated social conditions for many, poverty and inequality—not to mention human rights violations—remain a major challenge in emerging market economies.⁹¹ In this

Corporate Governance in Emerging Markets

context, issues of distribution assume particular significance in shaping different doctrines of corporate law.

In assessing the distributive effects of corporate governance policies, the degree of equity ownership by the general population plays a fundamental role. In a “society of shareholders,” the norm of shareholder primacy assumes greater legitimacy compared to contexts in which only a small fraction of the citizenry has a direct stake in stock market outcomes⁹²—as is generally the case in emerging markets, where the recent capital market boom was mostly (p. 753) fueled by foreign investors. While on average 40% of the population in developed countries is invested in stock markets, the proportion falls to 5% in emerging economies (ranging, in turn, from a minuscule 0.3% in Brazil to approximately 10% in China).⁹³

Consequently, in an environment where stockholders are few and far between (and mostly well-off to begin with), the conflict between the interests of shareholders and non-shareholder constituencies assumes special significance. Distributional concerns aside, the norm of shareholder primacy might also fail to generate efficient outcomes if product markets are uncompetitive,⁹⁴ a still common feature of developing countries.

Perhaps unsurprisingly, emerging markets have not fully embraced the pursuit of shareholder value as the exclusive normative goal of corporate law. Under Brazil’s corporations statute “the controlling shareholder must use its influence so as to make the company fulfill its purpose and its social function, and has duties and responsibilities to the other shareholders, employees and the community in which it operates, whose rights and interests he must loyally abide by and respect.”⁹⁵ The statutory concept of abuse by controlling shareholders is broad enough to explicitly encompass actions that harm not only the company or its minority shareholders, but also the “national economy.”

Social concerns have impinged on other facets of corporate law as well. Brazil, for instance, has embraced a particularly extensive version of the veil-piercing doctrine, thereby mitigating the attribute of limited shareholder liability in critical areas of law. Whenever the creditor is an employee or a consumer (as defined by consumer protection legislation), shareholders may be—and recurrently are—held liable whenever legal personality poses an obstacle to the discharge of the companies’ obligations, despite the absence of fraud or other forms of abuse.

Rules addressing stakeholder interests appear in Chinese corporate governance as well. The main such interests are, of course, those of the state as run by the Communist Party. But the formally communist regime also pays considerable lip service to workers.

China has implemented employee board representation since its first modern Company Law of 1994. The 2006 legal reforms gave the prior requirement teeth by fixing the minimum participation of workers at one-third of the supervisory board.⁹⁶ The same statute provides that “[i]n the course of doing business, a company must comply with laws and administrative regulations, conform to social morality and business ethics, act in good faith, subject itself to the government and the public supervision, and undertake social re-

sponsibility.”⁹⁷ Moreover, concerns about pay disparities and internal pay equity have led the Chinese government to cap executive compensation at 20 times average employee salary in all SOEs overseen by the State-Owned Asset Supervision and Administrative Commission of the State Council (SASAC), the governmental agency that serves as the controlling shareholder for China’s largest SOEs.⁹⁸

(p. 754) While instances of human rights abuses, environmental degradation, and hazardous consumer products are still recurrent, China, at least on paper, has made formal progress when it comes to the embrace of Western-style corporate social responsibility (CSR) with “Chinese characteristics.”⁹⁹ Chinese stock exchanges have required listed companies to disclose their CSR policy. The State-Owned Asset Supervision and Administrative Commission of the State Council (SASAC)—the governmental agency that serves as the controlling shareholder for China’s largest SOEs—has issued a Guide Opinion on CSR.¹⁰⁰ While labor rights and environmental obligations figure prominently in the CSR movement in China, the promotion of human rights remains conspicuously absent.¹⁰¹

India’s Companies Act of 2013 is particularly innovative in its approach to social considerations. Although reasonable minds may differ on its merits, the statute breaks new ground in requiring companies to spend at least 2% of average net profits to promote their corporate social responsibility policy, preferably in local areas, or to otherwise explain the reasons for noncompliance. Moreover, the Act requires directors to “act in good faith to promote the objects of the company for the benefit of its members as a whole, and in the best interests of the company, its employees, the shareholders, the community and for the protection of the environment.”¹⁰² It also seeks to promote female participation on corporate boards, albeit timidly, by conditioning the increase in the number of directors beyond fifteen to the presence of at least one female board member.

Yet emerging markets are not alone in the trend (however meritorious) of internalizing social issues in corporate governance. In the last decade, a number of European countries, such as Norway, France, and Italy have mandated minimum quotas for female directors on boards. Under the UK Companies Act of 2006, directors are under a duty to promote the success of the company for the benefit of shareholders, but must pay due regard to other interests such as those of employees, customers, and the community. In the United States, too, social concerns have recently made a reappearance, even if mostly in the form of new disclosure requirements on subjects such as the consideration of diversity in director appointments, the pay gap between chief executives and their employees, and even in the use of “conflict minerals” from the Democratic Republic of the Congo.

5 Conclusion

Today’s emerging markets comprise a historical category rooted in the early promise, and later success, of capital market development. The rapid stock market growth in the last decades was associated with a deep transformation in the underlying institutional infrastructure, even if not always through the adoption of the same mechanisms prevailing in developed markets. Instances of formal convergence to international (and especially US)

corporate governance best practices abound. The significance and practical consequences of these transplanted practices in this new context may, however, be quite different from what (p. 755) would be expected in their original environment. Critically, emerging markets governance is far from uniform, and the degree of internal diversity might even increase in the future, as the great variation in their political, economic, and legal conditions will likely continue to impact the performance of their economies and stock markets going forward.

Finally, the very category of emerging markets itself is unlikely to remain stable over time. As the BRIC economies seemed to falter in the second decade of the twenty-first century, new acronyms surfaced to describe then popular investment destinations. Irrespective of the precise mix of jurisdictions, attention to the corporate laws and governance structures in a broader array of jurisdictions beyond the traditional few of the wealthy West is likely here to stay—to the great benefit of those interested in the role of legal institutions in shaping capitalism’s different incarnations.

The Governance Ecology of China's State-Owned Enterprises

Curtis J. Milhaupt

The Oxford Handbook of Corporate Law and Governance

Edited by Jeffrey N. Gordon and Wolf-Georg Ringe

Print Publication Date: May 2018

Subject: Law, Company and Commercial Law, Comparative Law

Online Publication Date: Jun 2015 DOI: 10.1093/oxfordhb/9780198743682.013.6

Abstract and Keywords

This chapter focuses on the governance ecology of China's state-owned enterprises (SOEs). More specifically, it examines the mechanisms of state capitalism in China by analyzing the distinctive system of industrial organization in which the country's largest SOEs were assembled and currently operate. After providing the conceptual background, the chapter charts the origins of Chinese corporate capitalism and how it is presently organized. It then considers the key components and main organizational characteristics of the national business groups and contrasts them with those in Japan and Korea. It also explores SASAC's behavior as a controlling shareholder within the larger institutions of the party-state and how it shares the role of controlling shareholder with the Communist Party. Finally, it assesses the implications of the analysis for comparative corporate governance scholarship.

Keywords: state-owned enterprises, capitalism, China, industrial organization, national business groups, Japan, Korea, SASAC, Communist Party, corporate governance

1 Introduction

¹CHINA'S emergence as a global economic power poses enormous explanatory challenges for scholars of comparative corporate governance. While China appears to present a new variety of capitalism, frequently labeled "state capitalism," the features and implications of this system are still poorly understood.² Particularly since China's economic system may be in its early stages of development, understanding the mechanisms by which state capitalism currently operates and how they may change as Chinese enterprises globalize is a pressing task for researchers.

One highly distinctive characteristic of state capitalism in China is the central role of about 100 large, state-owned enterprises (SOEs) controlled by organs of the national government in critical industries such as steel, telecom, and transportation. Although only a

The Governance Ecology of China's State-Owned Enterprises

handful of these firms, such as Sinopec and China Mobile, have become household names in the West, the state sector dominates major industries in China and is increasingly active in global markets. As *The Economist* noted, “as the economy grows at double-digit rates year after year, vast state-owned enterprises are climbing the world’s league tables in every industry from oil to banking.”³ China now has the world’s second largest concentration of (p. 757) Fortune Global 500 companies (73),⁴ and the number of Chinese companies on the list has increased at an annual rate of 25% since 2005. These are China’s national champions.

More than two-thirds of Chinese companies in the Global Fortune 500 are SOEs. Excluding banks and insurance companies,⁵ controlling stakes in the largest and most important of the firms are owned ostensibly on behalf of the Chinese people by a central holding company known as the State-Owned Assets Supervision and Administration Commission (SASAC), which has been described as “the world’s largest controlling shareholder.”⁶ In many respects the concept of state capitalism in China—particularly the organizational structure and broad governance regime surrounding these national champions—remains a black box. In part, this is due to scarcity of reliable data, but it is also a result of the way scholars have approached the subject.⁷ Most corporate governance scholars working on China, for example, have taken the individual firm—the publicly listed company—as the unit of analysis, even though corporate groups are pervasive in China’s state-owned sector and the listed firm is just one part of a complex web of corporate entities and relationships that characterize Chinese state capitalism. Moreover, scholars often begin and end their analyses by benchmarking the governance attributes of Chinese listed companies against global (which typically means US) corporate governance standards and institutions. This approach produces insights, to be sure, but it invariably focuses the analyst’s attention on what the Chinese system lacks, as opposed to how it is constructed and actually functions. As was the case with scholarship on Japanese corporate governance in the 1990s, real headway in understanding China’s variety of capitalism will come by analyzing the system on its own terms, rather than by reference to what it lacks.

This chapter explores the mechanisms of state capitalism in China by analyzing the distinctive system of industrial organization in which the country’s largest SOEs were assembled and operate. To aid in the exploration, the focus is extended beyond the usual corporate governance concern with agency relationships in an attempt to understand the relational ecology that fosters production in a system where all roads eventually lead to the party-state. Two simple analytical constructs are introduced for this purpose: Networked hierarchy is the way top-down governance features within individual state-controlled corporate groups are coupled with extensive linkages to other state-controlled institutions. Institutional bridging is the pervasive use of personnel rotation systems, equity ownership structures, and strategic forms of cooperation such as joint ventures, which serve to unite separate components of the state sector. These mechanisms create networks among business and other organs of the party-state, promote information flow and provide high-powered incentives to actors in the system by linking corporate performance and political (p. 758) advancement. Together, these features can be thought of as means to assemble what Mancur Olson called an “encompassing organization”—a coali-

tion whose members “own so much of the society that they have an important incentive to be actively concerned about how productive it is.”⁸

The chapter proceeds in six parts. Part 2 provides conceptual background for the study of Chinese SOEs. Analyzing the relational ecology in which large state-owned corporate groups operate provides a framework for understanding where Chinese corporate capitalism originated and how it is currently organized. Part 3 uses the conceptual frame to illuminate the key components and main organizational characteristics of the national business groups, contrasting certain features of the groups with those in Japan and Korea. Part 4 analyzes SASAC's behavior as a controlling shareholder within the larger institutions of the party-state. It explores the ways in which SASAC shares the role of controlling shareholder with the Party, and the institutional bridges linking the Party, the national champions, and the government in the management of state-owned enterprises. Part 5 discusses the implications of the analysis for comparative corporate governance scholarship. Part 6 concludes.

2 Understanding Chinese Industrial Organization

2.1 Introduction

Two decades of comparative corporate governance scholarship have shown that successful forms of corporate capitalism do not have identical features around the world. On the contrary, firms differ systematically in their ownership structures, sources of financing, and the surrounding set of national legal and market institutions in which they develop.⁹ The spark for this insight, now so thoroughly explored as to seem prosaic in hindsight, was the striking economic ascendance of another East Asian country—Japan—in the 1980s. Two decades ago, observers recognized that while Japanese firms were globally competitive, their ownership structures, financing patterns, and governance norms bore little outward resemblance to those of US public firms, whose features had long been taken for granted as the natural end point of an evolutionary process in the formation of the “modern” corporation.¹⁰

Today, the world is once again confronted with a distinctive and globally important economic system in East Asia whose features appear opaque and even menacing to outsiders. Although China's economic system has received a label, much work remains to understand how “state capitalism” is organized. As in the case of Japan in the 1980s, most of the corporate governance literature on China is preoccupied with agency costs and monitoring in publicly listed firms. Indeed, Ronald Gilson and Mark Roe's 25-year old observation on the (p. 759) intellectual obstacle to understanding Japanese industrial organization remains apt in relation to China: “Viewing the Japanese system through Berle-Means blinders, in the belief that it reflects only an effort to bridge the separation of own-

ership and control, will cause us to misunderstand it and, as a result, to miss the lessons that comparative analysis can offer.”¹¹

Similar to the way in which the early literature on Japan sought to locate the “missing monitor” in the main bank system, many analysts of Chinese corporate capitalism have focused exclusively on agency problems in listed companies.¹² The search for solutions has taken most commentators down a path whose grooves were cut by US corporate governance logic, with a focus on independent directors, the market for corporate control, and robust securities regulation. This approach generates a lengthy list of (predominantly US-style) formal institutions whose development is deemed crucial to the future transformation and improvement of Chinese corporate governance. What it fails to do is confront a puzzle at the core of contemporary Chinese capitalism: how is a system without a plethora of formal institutions deemed important to Western firms producing a rapidly expanding list of Fortune 500 companies, and possibly supporting sustained levels of economic development in China?

Some commentators, recognizing but largely sidestepping the puzzle, claim that “relationships” are the key to success of the Chinese economy.¹³ This is almost certainly an accurate observation. But analysis of the precise nature of these relationships and their role in the scheme of Chinese industrial organization is typically omitted in favor of references to cultural proclivities or historical influences.¹⁴ As one of us has argued in joint work with Ronald Gilson, “governmentally encouraged commercial performance” under an authoritarian political regime attuned to incentives may be doing the work of formal legal institutions in the Chinese economy, allowing small-scale reputation-based trading to be scaled up to the point where entry into the global economy is possible.¹⁵ And as we suggested there, business groups fostered by the political regime and deeply entwined with Chinese Communist Party leadership may be central to the developmental success of the regime.

This chapter represents an attempt to dig deeper into the structure and organizational ecology of the business groups at the center of China's system of state capitalism. The account attempts to unearth the mechanisms underlying the uniquely encompassing nature of Chinese industrial organization and its concern not only with corporate governance, but (p. 760) also with production, the transmission and implementation of industrial policy, and the maximization of state welfare, at least as interpreted by elite actors within the system.

2.2 Chinese Industrial Organization as a Networked Hierarchy

State capitalism as practiced in China has a remarkably complex architecture. To help make sense of it, this section develops a simple stylized model of Chinese industrial organization as it relates to nationally important firms and the corporate groups in which they are nested.

2.2.1 A Simple Analytical Construct

The organizational structure of state capitalism as practiced in China can be thought of as a networked hierarchy. This term captures a chief characteristic of the scheme of industrial organization: vertically integrated corporate groups organized under SASAC, the state-affiliated controlling shareholder, with strategic linkages to other business groups as well as to governmental organs and state institutions such as universities, enmeshed in a helix-like personnel appointment process of rotations managed jointly by the Communist Party and SASAC.

The hierarchical aspects of Chinese industrial organization are readily apparent. They range from the vertical integration of firms along the production chain to the top-down character of industrial policy formulation and transmission in an authoritarian political regime.¹⁶ But the Chinese system is not simply one in which vertically integrated groups transmit commands from state economic planners to SASAC and down through a chain of vertically integrated firms. These hierarchical structures are embedded in dense networks—not only of other firms, but also of party and government organs. These networks appear to facilitate information flow from the bottom up as well as from the top down. They foster relational exchange and collaboration on many levels of the production and policy implementation processes. And they provide high-powered incentives to leaders within the system because success in business leads to promotion and accompanying rewards in the political realm, and vice versa. This combination of authoritarian hierarchy and collaboration within high-powered incentive structures is reminiscent of another mechanism of economic transitions—private equity investments.¹⁷

As discussed below in detail, these dense networks are the result of numerous pathways that link individual components of the system. Some are engineered through formal legal means, such as by contract or through shareholding relationships. Others are the result of personnel practices followed by the Communist Party and SASAC. Still others are incorporated into the distinctive notion of “representation” in Chinese governmental organs, which (p. 761) assigns seats to select business leaders. The term institutional bridging is used to describe this practice.

One helpful way to view these constructed networks at the center of Chinese state capitalism is through the lens of Mancur Olson's concept of an “encompassing coalition.” For Olson, this is a group representing a large enough segment of the population that it has incentives to grow the pie, as opposed to a “distributional coalition” representing a narrow segment of society, which tries to get a bigger slice for its members.¹⁸ Olson focused on group size as the key distinguishing characteristic between encompassing and distributional coalitions, but in addition to size, it seems important that the encompassing coalition includes all members whose participation can have a major impact on development—a broad cross-section of political and business elites in society. The networked hierarchy resulting from institutional bridges is a means of creating precisely this type of large managerial coalition with control over developmental policy formulation and implementation.

The aim in introducing these concepts is descriptive, not normative. These features of Chinese industrial organization do not necessarily lead to production efficiency. Olson himself noted that encompassing organizations will not necessarily lead to efficiency under all circumstances. The networks described here likely produce countervailing effects: They enhance efficiency by fostering information sharing, reducing opportunism through repeat play, providing high-powered incentives, and reducing frictions in policy implementation. But they also reduce competition and transparency, multiply agency relationships, and soften budget constraints. The interesting question for purposes of this chapter is not whether the state sector is more efficient than the private sector, but how the state sector has produced globally important firms and supported economic growth in the absence of formal infrastructure deemed essential in the standard theories on the relationship between institutions and development.

2.2.2 A Stylized Model

The networked hierarchy and institutional bridging concepts bring into focus the main organizational features of, and linkages among, the corporate group structures in which the national champions are nested. Figure 28.1 is a stylized picture of a national champion group.

Four features of this structure are highlighted here, as they will be the focus of attention in the succeeding parts of the chapter. First, in contrast to the main postwar Japanese keiretsu and Korean chaebol corporate groups, Chinese business groups are vertically integrated firms focused on a particular industry or sector, not diversified groups involved in a wide range of industries. In complementary fashion, and again in contrast to keiretsu and chaebol structures, shareholding is hierarchical: firms higher in the structure own downstream subsidiaries, but there is very little upstream or cross-ownership among group firms. Second, most of the national business groups in China contain four main components: (1) the core (parent holding) company, whose shares are wholly owned by a government agency in the form of SASAC; (2) one or more publicly traded subsidiaries—the global face of the national champion—a majority of whose shares are held by the core company; (3) a finance (p. 762) company, which serves many important financing needs of the group, and has certain parallels with the Japanese main bank; and (4) a research institute that coordinates innovative processes of the group. Third, monitoring is carried out within two parallel structures, a familiar one provided by the corporate law, with SASAC as controlling shareholder, and a party-based structure that shadows the corporate hierarchy, especially as to high-level managerial appointments.

Figure 28.1 National Champions as Networked Hierarchy.

Crucially, however, these group components, as well as their top individual managers, are extensively networked to the larger system of industrial organization. Although the various corporate groups are distinct from each other both legally and functionally, complementary groups are linked in important ways. Inter-group joint ventures, strategic alliances, and equity holdings are the corporate mechanisms providing such linkages. But the party-state, acting through SASAC and the Organization Department of the Party, provides another, probably more crucial, means of uniting the groups into a complementary whole. Finally, the economic aspects of this structure are linked through institutionalized personnel channels and political practices to governmental organs such as the National People's Congress, to important party organs, and to non-economic state institutions such as universities. These are the institutional bridges that unite separate components of the system.

2.3 Background

After an unsuccessful experiment with the formation of contract-based business alliances in the initial economic reform period, the Chinese central government took more control over the creation of business groups in the 1990s. The State Council formed 120 groups concentrated in critical industries, such as automobiles, machinery, electronics, steel, and transportation. The groups benefited from a range of preferential policies in areas ranging from taxation to government contracts and eligibility for stock exchange listing. The stated (p. 763) purpose of the government in forming these groups was to achieve economies of scale, facilitate inter-firm collaboration, and enhance international competitiveness. Formation of vertically integrated groups also had the administrative advantage of streamlining control over the economy: a small number of major firms would serve as conduits through which policy could be transmitted to vast numbers of enterprises organized under the core firms. By the mid-1990s, creation of national champions was explicitly recognized as a goal of the central government.

After years of experimentation with organizational structure, in 1998 a relatively clear concept of the business group emerged with the promulgation of Provisional Rules on Business Group Registration. Though "provisional," these rules are still in effect. Subject to various threshold qualifications, a business group is defined as a group of entities com-

prised of four layers: (1) a parent company and (2) its controlled subsidiaries (the two required layers), along with (3) non-controlled subsidiaries and (4) other firms which collaborate with the core company or its subsidiaries (two optional layers). In order to be registered, group members must enter into an agreement (Articles of Grouping) specifying the group's boundaries and internal governance rules. Only registered business groups qualify for important benefits, such as eligibility to establish a finance company.

This group formation process, together with the more basic step of “corporatization” of state enterprises—that is, the transformation of state agencies involved in economic activity into joint stock corporations—raised a variety of well-documented agency problems, including the most vexing: When a corporate asset is theoretically owned by “the people,” who is the principal? In recognition of this problem, several attempts were made to create a controlling shareholder, leading to the establishment of SASAC in 2003. In theory, SASAC represents the state as “owner” and exercises shareholder's rights on its behalf. SASAC's distinctive role as a controlling shareholder within the context of the party-state will be examined in Part 4 below.

3 National Business Groups

The networked hierarchy and institutional bridging concepts are now used to examine the key members, networked structure, and internal governance mechanisms of the groups.

3.1 Components

3.1.1 Core (Parent) Company

As noted, Chinese corporate groups have a multi-tiered hierarchical structure. At the top of the group is the core company. Core companies were typically formed by “corporatizing” a government ministry with jurisdiction over a particular industry. For example, each of the core companies in the national petroleum groups was hived off from the former oil ministry and transformed into a corporate entity. The core company acts as a holding company, serving as an intermediary between SASAC and group firms that engage in actual production. The core company coordinates information flow and resource allocation within the (p. 764) group. It transmits policy downward from the state to group members, and provides information and advice upward from the group to state economic strategists and planners. As Chinese commentators explain, “The key sectors and backbone industries are still controlled by the state through wholly state-owned or state-invested enterprises. . . In reality, the state can control the nationally important industries and key areas to lead the economy simply by grasping a few hundred large state-owned holding companies or business groups.”¹⁹

3.1.2 Listed Company

The external face of the national champion is not a group of companies but a single firm, whose shares are publicly traded on the Chinese or Hong Kong stock exchanges and often on other major exchanges as well. For example, PetroChina, one of the largest oil

companies in the world, whose shares are listed on the Shanghai and New York stock exchanges, is the external face of the CNPC Group, whose core company is the China National Petroleum Corporation. SASAC's strategy in managing groups under its supervision has been to consolidate high-quality assets in specific companies and to seek public listing for those firms. These listed firms are the focus of most scholarship on Chinese corporate governance to date.

3.1.3 Finance Company

One of the key benefits of registration as a group is eligibility to establish a finance company—a nonbank financial institution that provides services to group members.²⁰ Finance companies are exempt from the general prohibition on inter-company lending.²¹ Under the current legal framework, a finance company provides services on behalf of group members similar to those of commercial and investment banks. Subject to approval by banking regulators, they are authorized to engage in a wide range of activities, including accepting deposits from and making loans to member companies, providing payment, insurance, and foreign exchange services to members, and underwriting the securities of member firms. They also engage in consumer finance related to the products of group members, and invest in securities issued by financial institutions.²² Deposits from group member companies comprise their main source of funds. Almost all finance companies are members of state-owned groups, either at the national or provincial level, and many are formidable in size.

In its role as the hub of group financial transactions, the Chinese finance company is a partial analogue to the Japanese main bank, at least as it operated in the heyday of post-war Japanese corporate finance and governance. However, there are several key differences. In (p. 765) contrast to widespread, if low-level, cross-shareholding ties between Japanese main banks and their most important borrowers, the Chinese finance company holds virtually no equity in other group member firms, and few or no firms other than the core company own shares in the finance company. While the finance company can be utilized by the core company to help monitor group members, there is no evidence that finance companies perform an independent monitoring function, particularly with respect to the core company or listed companies in the group.

The Japanese banking system, particularly its perceived corporate governance benefits, was attractive to Chinese observers during the formative period of China's process of economic transition in the early 1990s.²³ In this period, legal and economic scholars widely argued that equity ownership by the main bank in its borrowers had important governance benefits,²⁴ and that the main bank served as a “delegated” or “contingent” monitor on behalf of other lenders to group firms.²⁵ It was even argued that the main bank substituted for the market for corporate control in Japan by displacing managers of financially troubled firms.²⁶ Yet China's finance companies bear only weak resemblance to the main bank system, serving primarily as an instrument of the core company for the purposes of internal group capital allocation. Moreover, unlike the situation in Japan, at

this stage there is relatively little equity ownership of banks by the corporate sector, although this may be changing.

Given China's attraction to the Japanese model during a formative period in the formation of business groups, why did the country's economic strategists not pursue a financial and governance structure for its business groups that bore closer resemblance to the Japanese system circa the late 1980s? Two complementary explanations, closely linked to China's overall system of economic governance, might be offered. The first is that dispersion of governance rights in member firms to nonbank financial institutions would potentially dilute and complicate the hierarchical structure of economic management made possible by group formation under centralized state supervision. Second, the creation of nonbank finance companies within business groups—what one commentator has called “outside the plan financial intermediaries”²⁷—poses an obvious competitive threat to the (largely state-owned) commercial banking sector. As such, Chinese regulators have been vigilant about not expanding the scope of finance company activities to the point that they constitute a complete substitute for Chinese commercial banks.

(p. 766) 3.1.4 Research Institutes

Chinese policy makers have encouraged business groups to include research institutes as members in order to promote high-technology development and increase international competitiveness. Most of the national business groups contain one or more research institutes. The research institutes conduct R&D, particularly applied research in areas related to the group's products and production processes. Often, the research institutes collaborate with universities on particular projects to derive complementarities between the applied focus of business R&D programs and the theoretical approach of academic researchers.

Typically established as not-for-profit institutions, the research institutes receive funding from the core company in the group. Research institutes in groups with a diverse range of products may be multi-layered, with a chief institute affiliated with the core company and second-tier institutes established under particular operating subsidiaries. Intellectual property arising out of the research activities is typically owned by the core company, or allocated by contract in joint projects with outside institutes.

3.2 Membership and Internal Governance

Membership in most business groups is based on equity ownership of member firms by the core company. Although membership based on purely contractual relations among firms is permitted under the regulations on business groups, it is not common. The predominance of equity ties is a reflection of governance concerns by both the core company and the state. For the core company, equity ownership provides a more direct and flexible form of control than contract. For the state, the objectives of group formation are more effectively advanced through corporate ownership than loose affiliations of business partners.

In considerable contrast to business groups in Japan and Korea, equity ownership in Chinese business groups typically runs only in one direction: from the core company to downstream subsidiaries. Very little cross-share ownership is found in Chinese business groups. Again, governance concerns—both corporate and political—appear to be the primary reason. The core company, as the dominant player in the group with ultimate group-wide decision-making authority over personnel and strategic issues, has little use for upstream share ownership; top-down stock holdings reflect and reinforce the hierarchical structure of the group. For the government, the core company's role as delegated manager and monitor of group firms would not be enhanced—indeed it may be complicated—by cross-shareholding linkages among group firms. Moreover, to the extent that cross-shareholding is used to promote enhanced monitoring of, or risk sharing among, group members in countries such as Japan, this function may not be complementary to Chinese corporate group structures given pervasive party involvement in group firms and other forms of party-state monitoring outside the confines of corporate law norms.

Internal group governance structures are specified in a legally binding agreement called Articles of Grouping, which is adopted by all members. The Articles are state-supplied standard form contracts required of all registered business groups, but their specific provisions are largely composed of default rules. In reality, the core company dictates the terms of the Articles, and the internal governance rules grant it veto rights and other enhanced governance rights with respect to the group. Many Articles provide for plenary or (p. 767) management bodies to facilitate group or delegated decision making, respectively, but these organs typically either have only advisory power or are structured so that the core company effectively controls their decision-making processes. In short, governance in a Chinese business group is a largely top-down process, but one that is open to information and participation from below.

3.3 Networks

The foregoing are the main components of the corporate groups and the mechanisms by which member firms are linked. But the mechanisms of Chinese state capitalism operate by joining the corporate groups into a much larger network of organizations affiliated with the party-state. It is this aspect of Chinese state capitalism that generates its most distinctive features and raises the thorniest questions for competitors and regulators abroad. The larger networks in which individual corporate groups are embedded are examined below.

3.3.1 Inter-Group Networks

While groups in the same industry do sometimes compete domestically, SASAC has encouraged collaboration among the national groups in overseas projects to increase their global competitiveness. These linkages, often among groups in complementary industries, are designed to facilitate technological development, as well as a host of other objectives, such as information sharing, marketing, and pooling of capital for capital-intensive projects. These linkages typically take two forms: equity joint ventures and contractual alliances. We illustrate a few of the inter-group networks in the national steel groups by

The Governance Ecology of China's State-Owned Enterprises

way of example. The number of relationships involving companies in these groups is actually much greater than is pictured here.²⁸ Figure 28.2 illustrates the use of both ownership and contract to construct inter-group networks. It also shows how networks are constructed among both complementary groups and groups of erstwhile direct competitors.

3.3.2 Central-Local Inter-Group Networks

National groups under SASAC control are sometimes linked to business groups under the control of local governments. (Figure 28.2 provides an example from the steel industry: provincial group Hebei Iron & Steel has an equity ownership interest in national champion BaoSteel.) These linkages are the result of an evolving dynamic between the central and local governments. Initially, local governments sought investment from the national groups to rescue moribund local SOEs. As the national groups expanded, local governments began to view them as a competitive threat to local business. Local protectionism increased, and a push was made to create “provincial champions.” The relationship between national and local groups changed again as a result of the global financial crisis, which prompted renewed cooperation. The local governments came to view the national champions as sources of (p. 768) support for small and medium-sized enterprises, which suffered when they lost the backing of foreign and private companies. For the national groups, which are under pressure from their governmental supervisors to grow, tie-ups with local groups are an avenue of expansion.

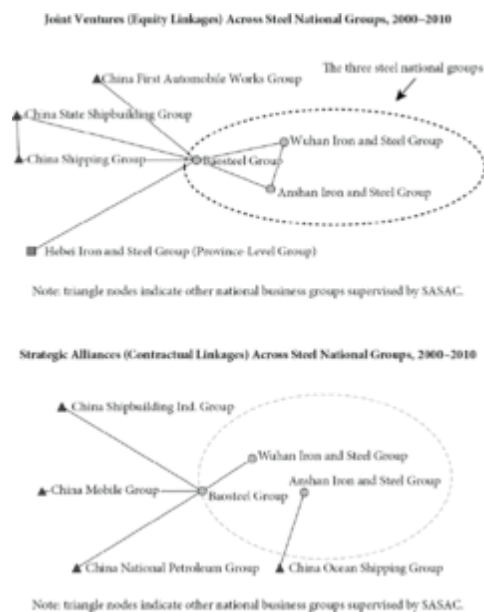

Figure 28.2 Inter-Group Networks: An Illustration.

3.3.3 Business Group-Government/Party Networks

Of course, as “state-owned” enterprises supervised by SASAC, all national champions are connected to the central government. But this simple syllogism masks the density of the networks which tie the leading business groups to institutions of the central government and the Communist Party. Multiple institutional bridges facilitate the network. The first is

The Governance Ecology of China's State-Owned Enterprises

the China Group Companies Association, which is formally designed as an intermediary between the national business groups and the central government. It is overseen by both (p. 769) SASAC and the Ministry of Commerce. The Association's board of directors is composed of senior government officials from these and other economic ministries, as well as top managers of the most important national business groups. The Association functions as a vehicle for airing issues of concern to the central SOEs and reporting to the State Council. Recent issues discussed by the Association include streamlining the government approval process for foreign investments and improving internal risk controls in connection with foreign investments. The Association also lobbied, against strong resistance from banking regulators, for the establishment of the finance companies within corporate groups.

A second bridge is the practice, with roots dating to the period prior to the establishment of SASAC, of granting substantive management rights in a nationally important SOE to the ministry with supervisory authority over the industry in which it operates. For example, the Ministry of Industry and Information Technology retains important management rights over China Mobile, including the power to nominate its top managers, even though China Mobile is part of a national business group whose core company is 100% owned by SASAC. In some industries, high-level two-way personnel exchanges between ministries and national groups reinforce this link.

A third institutional bridge is the routine exchange of personnel between SASAC and the central SOEs it supervises. In a policy designed to promote "mutual adaptation in political and professional qualities,"²⁹ 50 to 60 SOE managers are seconded to SASAC annually for one-year periods, and vice versa. Available data on this practice suggest that the corporate managers seconded to SASAC are fairly senior and are sent from leading enterprises. The SASAC officials are relatively junior. This suggests that the practice is not primarily designed to facilitate SASAC's monitoring of the SOEs, but rather to build SASAC capacity and promote cooperation between the SOE sector and the government.

A fourth institutional bridge between the national champions and the government is the practice of reserving a number of positions in several elite (if functionally obscure) government and party bodies for leaders of the national SOEs. Chief among these are the National People's Congress—the central government's symbolic legislative body—the National People's Political Consultative Conference, an advisory body composed of representatives of different social and political groups, and the National Congress of the Chinese Communist Party, the Party's general assembly. For example, based on a pool of candidates recommended by the party committees of the 120 central enterprises extant at the time, SASAC nominated 22 managers as representatives to the 11th National People's Congress, and 99 managers to the 11th National People's Political Consultative Conference, both of which ran from 2008 to 2013. In 2007, the Party Committee of SASAC and the party committees of the 120 central enterprises selected 47 members to the 17th National Congress of the Chinese Communist Party. The composition of the selected members was determined on instructions from the Central Organization Department of the Party, which specified that no more than 70% of the positions should go to top managers

of the core companies, and no less than 30% to middle managers of core companies and top managers of their subsidiaries.³⁰

(p. 770) The Party also plays a major role in personnel appointments in the national business groups. One-third of the employees in the national SOEs are members of the Party,³¹ and party organizations exist within each level of the business group hierarchy. At one time, there may have been ideological reasons for the Party's pervasive role in SOEs. But a compelling political economy explanation for the practice is also apparent. The party constitutes a massive interest group that maintained extensive ties to economic enterprises in the central planning era. Indeed, in this era there was often little separation between governmental, economic, and social organizations, with party involvement pervasive across all three spheres of activity. Corporatization and other economic reforms could have posed a major threat to important dimensions of party rule. Institutionalized party involvement in the post-reform state-owned sector can be seen as a way of buying the support of the party for reforms that it may have otherwise blocked. The Party is also functionally well situated to monitor personnel in the SOEs. As one commentator notes, "[t]he Party's control over personnel was at the heart of its ability to overhaul state companies, without losing leverage over them at the same time The party body with ultimate power over personnel, the Central Organization Department, is without doubt the largest and most powerful human resources department in the world."³²

4 The Party-State as Controlling Shareholder

Atop the national groups is SASAC, ostensibly "the world's largest controlling shareholder."³³ Controlling shareholder regimes are prevalent throughout the world, and in this sense, China's variety of capitalism shares an important trait with corporate capitalism in many other developing and recently developed countries, including, for example, Brazil, India, and Korea. Although, in contrast to state control in China, in other countries the controlling shareholder is typically the founding heir or members of his family, as one scholar has recently argued, "it is easy to overstate the extent to which the interests of the government as a controlling shareholder differ from those of private controlling shareholders."³⁴ This is because, regardless of identity, all controlling shareholders face similar incentives. On the one hand, the size of their ownership stakes provides incentives to monitor managerial performance more closely than do shareholders in dispersed ownership systems. But controlling shareholders also have unique incentives to maximize "private benefits of control" by engaging in transactions that expropriate wealth from minority shareholders.

(p. 771) Macro-level generalizations and comparisons with other controlling shareholder regimes, however, are likely to mislead, because several aspects of China's regime make it highly distinctive. For one, it is uniquely encompassing in scope. In no other developed or developing country is a single shareholder—private or public—so pervasively invested in the leading firms in the national economy. More importantly, as explained below, it is

misleading to attribute to SASAC the same bundle of control rights associated with controlling shareholders in other regimes.

4.1 SASAC as Ostensible Controller

The complex nature of SASAC's control rights in the national champions cannot be understood without at least a thumbnail sketch of its origins. The national SOEs were carved out of central government ministries in the "corporatization" process, which transformed governmental organs into joint stock companies. Initially, control shares in the SOEs were held by the ministries from which they had been created, with predictably negative results, such as lack of central coordination and weak oversight. In 1988, the State Council established the Bureau of State Assets Management, an agency supervised by the Ministry of Finance. Despite its name, the bureau did not actually centralize management rights over the SOEs; in reality, control remained dispersed among a range of ministries with jurisdiction over separate corporate activities such as investment and trade, as well the Communist Party, which was involved in labor and wage issues. The bureau was eventually absorbed by the Ministry of Finance, effectively abolishing it, and control rights remained dispersed.

SASAC, established under the State Council in 2003, represents a second attempt to consolidate control rights over the national SOEs. But SASAC is a work in progress, and the legacy of shared control rights was not overcome by its mere establishment. This is particularly true given its location in the government organizational chart: although SASAC is a ministerial level agency, so are 53 of the most important SOEs under its supervision. SASAC faces potential resistance not only from the firms it supervises but from the competing agendas being pursued by other important ministries such as the Ministry of Finance.³⁵ As one commentator notes, "In practice, SASAC has faced an uphill struggle to establish its authority over the SOEs that it supposedly controls as a representative of the state owner."³⁶

Until recently, there was no overarching legal authority governing SASAC in its role as controlling shareholder. In 2008 a Law of the PRC on State-Owned Assets of Enterprises (SOE Asset Law) was enacted to "safeguard[] the basic economic system of China . . . , giving full play to the leading role of the State-owned economy in the national economy."³⁷ In essence, the law formally recognizes SASAC as an investor—a shareholder in the national SOEs, with the ordinary rights and duties of a shareholder. Ostensibly, the law confines SASAC to this role³⁸ (p. 772) and governs the agency's performance of its functions as an investor.³⁹ But there are no formal mechanisms in the law to enforce SASAC's responsibilities, and in reality, the law grants SASAC powers greater than those available to it as a shareholder under China's Corporate Law. In short, SASAC has both less and more power as a controlling shareholder than meets the eye.

4.1.1 Control Rights in Management

As with controlling shareholders everywhere, one of SASAC's main powers with respect to the national champions is the selection and compensation of top managers. But SASAC exercises this power in the shadow of party control. As just noted, various party organs held appointment power in the central SOEs prior to the establishment of SASAC, and this practice was retained even after its establishment. "Political qualities," including party membership, are one of the major criteria against which managerial performance in the national champions is evaluated.⁴⁰

There are two parallel personnel systems in all Chinese SOEs: the regular corporate management system and the party system. In the corporate management system, positions are similar to those commonly found in firms elsewhere, such as CEO, vice CEO, chief accountant, and if the company has a board of directors, a chairman and independent board members. A leadership team in the party system includes the Secretary of the Party Committee, several Deputy Secretaries, and a Secretary of the Discipline Inspection Commission (an anti-corruption office), along with other members of the Party Committee. Institutionalizing party penetration of corporate roles is formal policy, and overlaps between the two systems appear rather uniform, such that a corporate manager of a given rank typically holds a position of equivalent rank in the party system.

Party and corporate leadership appointments take place in a highly institutionalized sharing arrangement between the party and SASAC. The top positions in 53 central enterprises, including board chairmen, CEOs, and Party Secretaries, are appointed and evaluated by the Organization Department of the CPC. This is a legacy of appointments practice prior to the establishment of SASAC. Some of these positions hold ministerial rank equivalent to provincial governors and members of the State Council; others hold vice-ministerial rank. Deputy positions in these enterprises are appointed by the Party Building Bureau of SASAC (the Party's organization department within SASAC). A separate division of SASAC, the First Bureau for the Administration of Corporate Executives, assists in this appointment process. Appointments and evaluations of top executives in the remaining central enterprises are made by yet another division of SASAC, the Second Bureau for the Administration of Corporate Executives. While appointment power formally resides with SASAC, appointment decisions are made with inputs from various party organs and ministries supervising relevant business operations, and are subject to approval by the State Council.

(p. 773) The appointment and evaluation process for top managers of the national SOEs is supported in two ways: ministry recommendations and party leadership training. The Party's Organization Department and SASAC compensate for information asymmetries about talent and suitability of individual SOE managers by obtaining input from the ministries that supervise the industry in which a national SOE operates. Moreover, SOE managers are trained in the party school system, which serves as a think-tank and mid-career training center for cadres. The Central Party School in Beijing, the most important and prestigious of these schools, offers specialized training classes for SOE managers.⁴¹ While little information is available about the content of this training, the party school

system would appear to provide an excellent opportunity for party leadership to evaluate the intelligence, skills, and commitment of those who pass through its programs.

Note that the standard corporate mechanism for the appointment and evaluation of senior executives—the board of directors—is missing entirely from this process. Indeed, many of the core companies of the national business groups still lack boards of directors. Although SASAC and the Party have begun taking steps to bring boards of directors into the appointment process and to create boards for those core companies which do not yet have them, the steps taken thus far leave little doubt that the party does not intend to relinquish appointment authority with respect to the most important enterprises and the highest-level appointments.

In order to understand how the party-state manages executives in the national champions, Table 28.1 reports hand-collected data on appointments and removals of “leaders” of the enterprises under SASAC supervision from 2003 to 2009. The term “leaders” is used by SASAC to refer to holders of top positions in both corporations and the party. These data include a limited number of high-level corporate appointments for which SASAC runs a public recruitment process.

Table 28.1 shows that from one-third to three-quarters of the national SOEs experienced at least one appointment or removal of a leader by SASAC in the covered years. SASAC does not explain why the number of appointments systematically exceeds the number of removals. But the most likely explanations are that (1) some appointments are actually reappointments of incumbents without any corresponding removal, and (2) some enterprises established a board of directors during the covered period, creating new positions for appointment.

SASAC also rotates senior corporate and party leaders among business groups. Table 28.2 shows that rotations are fairly common. Analysis of the data suggests that most of the corporate rotations reflected in the table are of directors or vice CEOs, and the party rotations are for positions below Secretary of the Party Committee. However, from time to time SASAC has rotated top executives in key industries. For example, in April 2011, SASAC rotated CEOs of the three central petroleum enterprises, each of which is a Fortune Global 500 Company. SASAC made similar rotations among top executives in the energy sector in 2008 and telecom in 2007 and 2004. Such rotations obviously ignore the separate identity of the corporate groups and flout standard corporate law concepts. But the practice is less jarring conceptually if all the national SOEs are viewed as one diversified meta-group under common (if somewhat attenuated) control of SASAC. The rotations are viewed, or at least explained, by Chinese (p. 774) actors within the system as a monitoring device in groups without boards of directors. Rotations are said to reduce concentration of authority in a single individual in firms where institutionalized corporate oversight organs have yet to be developed.

The Governance Ecology of China's State-Owned Enterprises

Table 28.1 Appointments and Removals of the Leaders of the Chinese Central Enterprises

Year	Number of Central Enterprises	Number of Central Enterprises with Appointments or Removals	Percentage of Central Enterprises with Appointments or Removals	Number of Appointments	Number of Removals
2003	196	65	33.16%	150	79
2004	178	77	43.26%	224	155
2005	169	113	66.86%	237	158
2006	159	101	63.52%	323	136
2007	155	90	58.06%	317	113
2008	148	95	64.19%	358	146
2009	129	97	75.19%	312	145

(*) Leaders include members of board of directors, CEOs, vice CEOs, chief accountants, secretaries of Party Committee, deputy secretaries of Party Committee, and secretaries of the Party's Discipline Inspection Committee.

The Governance Ecology of China's State-Owned Enterprises

As Table 28.2 shows, leaders are also rotated across the spheres of business, government, and the Party. These data, together with the data on appointment of business leaders to various government and party positions presented above, are another powerful illustration of institutional bridging at work in China's system of state capitalism.

Unfortunately, available data on appointments/removals and rotations do not permit more fine-grained assessments about a number of important issues such as the specific enterprises involved, the reasons for removals (e.g. firings versus promotions), and distinctions between corporate and party personnel management. But, taken as a whole, the available data suggest that SASAC exercises fairly extensive control rights over top managers in the central SOEs (or at least that SASAC is the mechanism through which the Party exercises such control rights), albeit in ways that pay little obeisance to ordinary corporate law norms.

Concomitant to its appointment power, SASAC also supervises executive compensation at the central SOEs. Prior to SASAC's establishment, managerial compensation was determined by the SOEs themselves, which led to a series of problems as well as major inequalities in pay across firms. In 2004, SASAC introduced a system to supervise compensation at the central enterprises. Under this system, the basic structure of managerial compensation consists of base salary, performance bonuses, and mid to long-term incentive (p. 775) compensation.⁴² Again, note that the standard corporate law organ for determining executive compensation—the board, or perhaps the board in cooperation with the shareholders—is bypassed by this process. Indeed, there is evidence that the compensation paid to executives of listed national champions which has been approved by the board and disclosed to shareholders is something of a fiction—the actual compensation received by the executive is the one set by SASAC.

The Governance Ecology of China's State-Owned Enterprises

Table 28.2 Leader Rotations in the Chinese Central Enterprises

Year	Leader Rotations				
	Between Central Enterprises	From Central Enterprises to Government/ Party	From Government/ Party to Central Enterprises	From Local SOEs to Central SOEs	Total Rotations
2004	27	6	13	0	46
2005	27	5	14	0	46
2006	20	3	10	1	34
2007	33	7	16	0	56
2008	NA	NA	NA	NA	50
2009	NA	NA	NA	NA	27

(*) Leaders include members of board of directors, CEOs, vice CEOs, chief accountants, secretaries of Party Committee, deputy secretaries of Party Committee, and secretaries of the Party's Discipline Inspection Committee.

4.1.2 Control Rights in State Enterprise Assets

SASAC's central mission is to preserve and increase the value of state assets while transforming SOEs into public companies. Since its establishment, SASAC has pursued a policy of building several large enterprises in each key industry. In recent years, SASAC has consolidated smaller and weaker SOEs into larger business groups. In the process, the number of SOEs under SASAC supervision declined to 121 in 2010, from 198 in 2003. SASAC's goal is to bring the number under one hundred. Simultaneously, as the Fortune Global 500 list attests, SASAC has successfully pursued a goal of building globally competitive conglomerates.

(p. 776) This central mission makes SASAC a gatekeeper with respect to transfers of state enterprise assets. With passage of the SOE Asset Law, SASAC now has solid legal backing for this role. Under the SOE Asset Law, share transfers involving national SOEs require SASAC's approval, even with respect to transactions over which it does not have veto power as a shareholder under the Company Law.⁴³ Some Chinese courts have upheld SASAC's superior control rights under the SOE Asset Law, holding that contracts for transfer of shares entered into without SASAC's approval are unenforceable or invalid, even where they are consistent with the Company Law.⁴⁴ SASAC has super-control rights in the transfer of SOEs.

4.1.3 Cash Flow Rights

As a large amount of corporate governance literature attests, the separation of cash-flow rights from control rights is a central problem in controlling shareholder regimes. Where a shareholder's control rights exceed its rights to cash flows, the agency problem between the controller and minority shareholders is magnified, with the scale of the problem growing as the wedge increases.

In controlling shareholder regimes outside the SOE context, the separation of control rights from cash-flow rights, and the ensuing potential to extract private benefits, arises because controllers are able to magnify equity's voting power through pyramiding and circular stock ownership arrangements among corporations in the group. In the SOE context, regulators and politicians acting as "owners" on behalf of the state may reap private benefits of control not shared with ordinary financial investors, in the form of political influence, opportunities for patronage or corruption, and national prestige. These types of pecuniary and nonpecuniary private benefits of control over the national champions are clearly available to the Chinese party-state managerial elite, and SASAC is a major vehicle through which such control is exercised. Beyond its role as a vehicle for party-state governance of the central SOE sector, the organizational incentives of SASAC as the formal "owner" of the national SOEs are affected by a peculiar historical circumstance: its control rights exceed its right to cash flows because until recently, the state collected no dividends from wholly state-owned enterprises.⁴⁵ This decision was reversed in 2007, with the wholly owned subsidiaries of SASAC—the core companies—now paying dividends to the state, but still at rates below those of the publicly traded SOEs. Moreover, SASAC receives only a portion of the dividends collected by the state, which it uses for as-

set acquisitions, restructurings, and emergency support for failing enterprises.⁴⁶ Thus, SASAC does not (p. 777) fully internalize the financial consequences of its control rights over the national champion groups, and it cross-subsidizes the firms under its supervision with the cash-flow rights that it does hold.

These realities suggest that the central SOE sector collectively, rather than individual firms, are of greatest concern to SASAC in carrying out its governance responsibilities, and they may account for several outwardly puzzling aspects of national champion governance in China. For example, the practice of rotating top management among firms in the same industry makes a good deal of sense if maximizing shareholder wealth at individual firms is less important to the controlling shareholder than building up a number of globally competitive firms in critical industries. Another example is SASAC's heavy emphasis on the "corporate social responsibility" (CSR) of the enterprises under its supervision.⁴⁷ CSR is a theme typically trumpeted by non-shareholder corporate constituencies or NGOs, not large investors. But the CSR campaign by SASAC might be a means of building support for state capitalism domestically, improving its image abroad, and justifying management of the SOEs in ways that are not explicable solely from the standpoint of profitability and efficiency of individual firms.

4.2 Consequences

SASAC is not only the largest controlling shareholder in the world, at least in formal terms; it is also quite possibly the most idiosyncratic. Deconstructing SASAC's control rights in the firms it ostensibly owns reveals that it is simultaneously weaker and more powerful than a typical controlling shareholder in other regimes. It is weaker, because it lacks exclusive appointments power with respect to top management of the most important enterprises whose shares it owns, and it defers to other agencies—and even to the SOEs themselves—on substantive issues outside its realm of expertise. It is more powerful, due to the vast scope of its holdings over the most important firms in the national economy, and as a result of its super-control rights in state enterprise assets, which trump standard corporate law norms. SASAC appears, by design, to be yet another institutional bridge in the networked hierarchy—a high-level link between the national SOEs and other major components of the party-state. To be sure, many questions remain about SASAC's internal operations, relationships with the firms it ostensibly controls, and its oversight by party and governmental organs.

One major consequence of this arrangement is clear, even if all of its implications are not: the national champions represent much more than a purely financial investment for the party-state. SASAC, as the organizational manifestation of the party-state in its role as controlling shareholder, seeks to maximize a range of benefits extending from state revenues to technological prowess, and from soft power abroad to regime survival at home.

(p. 778) 5 Implications for Comparative Corporate Governance Scholarship

The last decade of comparative corporate governance scholarship has been dominated by two big, related questions: whether and how law influences corporate ownership structures around the world, and whether global systems of corporate governance are converging, particularly on a shareholder-centered, market-oriented model. In these debates, particularly the seminal works that set the terms of the inquiry, China is conspicuous by its absence, raising something of a “China Problem” for both bodies of literature.

5.1 Law and Finance

The familiar “law and finance” literature asserts that the quality of legal protections for investors determines the degree to which share ownership in a given country is dispersed. “Bad” law, which protects investors poorly, leads to concentration of corporate ownership; “good” law results in dispersed ownership. Legal systems of common law “origin” appear to systematically provide superior protections than systems of civil law origin, explaining pronounced differences in ownership structures around the world.⁴⁸

Critiques of this literature are legion; suffice it to note that China's experience, like that of many other countries, seems consistent with the hypothesis on a surface level but far less so upon careful examination. At first blush, China's experience comfortably fits the hypothesis. China's legal system, ostensibly of civil law origin, is weak in the formal protections it provides to investors. The stock market is underdeveloped, corporate ownership structures are highly concentrated, and the economy is populated by corporate groups. But as this chapter has shown, large elements of the structure of contemporary Chinese corporate capitalism are products of conscious policy design, or at least governmentally structured experimentation. Corporate groupism may have partially been a response to institutional voids in the early reform period, but production concerns and the desire to transmit industrial policy played major roles in motivating the assembly of business groups. Where the state chose to use corporate law and other legal concepts such as contract-based alliances and business group registration in assembling its firms, it had the required capacity. Thus, it is hard to identify specific corporate law defects, let alone any negative effects that could be generally attributed to China's civil law “origin,” that promoted formation of corporate groups under the control of the party-state.

Rather than asking whether China's experience supports the predictions of the law and finance literature, the discussion that follows uses the big questions in that body of work to motivate inquiries about the role of law and legalism in the growth of large, globally active Chinese firms, and, at least by plausible extension, the development of the Chinese economy.

The law and finance literature emphasizes the sticky effects of a country's “legal origin” on the structure of firms. Putting aside the thorny question of how to properly code

(p. 779) legal families, which bedevils attempts to support this assertion empirically, let's

consider whether the approach of Chinese economic strategists in building national champions has been heavily influenced (or bounded) by a particular tradition of legalism inherited from the civil law system. The Chinese approach certainly shares with the French civil law tradition a high degree of comfort with state involvement in the economy and regulatory paternalism. Moreover, contrary to the distrust of bigness that has animated US corporate law, governance, and institutional design over the course of the past century, bigness has not only been tolerated but celebrated in the Chinese economic reform period. Generalizing to a high degree, it is thus possible to say that China's approach to corporate law and governance resonates with attitudes prevalent in the civil law tradition.

But ending with this generalization would not capture the full story of how the legal order has influenced China's approach to corporate governance. Chinese institutional designers have been highly eclectic in the foreign models they have used in building the state sector. In early phases, Japanese and Korean corporate groupism held a high degree of attraction. More recently, the rights-based, shareholder-oriented approach of the US, with its emphasis (if less than perfect track record) on accountability and transparency has held sway on the drafters of Chinese corporate law, policy makers, and regulators. SASAC's rather schizophrenic role in national champion governance may result from the amalgam of these two sentiments—the quest for size and state control alongside an emphasis on independent accountability mechanisms and at least outward adherence to global corporate governance standards. Importantly, the absence of a firmly developed and entrenched legal order in reform-era China may have freed the hands of economic strategists to select forms of organization that were believed to best promote Chinese corporate development at a given moment in time.

The law and finance literature also raises the important question of precisely what matters in corporate law—which of its features are key to the growth of firms? For the authors of this literature, of course, the answer is legally enforceable investor protections. The law and finance literature emphasizes investor protections because capital is scarce, so that governance rights should be allocated to attract investment. But China's experience (along with those of Korea and Japan during their formative periods of development) suggests that where capital is available, at least to firms favored by the state, investor protections are not a first-order priority.⁴⁹

Yet China's experience appears to confirm the importance of the corporate form to firm growth and, perhaps by extension, economic development. We have seen how central the corporatization process has been to the hydraulics of industrial organization in China's state sector: separating the regulatory from the operational aspects of enterprise in the corporatization process was a crucial first step in the development of a functional SOE sector. Corporatization alone, of course, did not complete the separation, and to a significant extent the line between regulation and operation remains blurred in China's SOEs today. But use of the corporate form is a powerful channel for organizational behavior, and it has provided a template for the structure of the state sector. Throughout the reform period, Chinese economic strategists have selectively chosen from among the menu

of corporate attributes, making extensive use of the corporation's hierarchical governance structure and (p. 780) separate legal existence in building networks of firms responsive to direction from the party-state in its ostensible role as controlling shareholder. At the same time, the corporation's key decision-making and oversight organ, the board of directors, has been largely sidelined, and shareholder rights enforcement mechanisms have been downplayed. We have also seen how important the rearrangement of assets within, and creation of linkages among, corporate entities has been to the formation of industries deemed critical by the party-state. Unlike the early contractual business alliances, the corporate form has proven to be extraordinarily useful in providing the Chinese state with an enduring, highly adaptable, and to some extent anonymous vehicle for investment and economic activity. China's state capitalism is thus powerful confirmation of the genius of the corporate form as a vehicle for promoting investment and productive enterprise. Corporate law, however, in the narrow sense of an effective menu of readily enforceable legal protections for investors, has played little role in the emergence of large Chinese firms.

Indirectly, the law and finance literature raises an existential question about the linkage between corporate ownership structures and economic growth. The unstated assumption in the literature is that such a linkage does exist, and that dispersed ownership structures produce better economic outcomes than concentrated ones. Yet business groups which are the form of corporate structure prevalent in "bad" law jurisdictions around the world,⁵⁰ have been the engine of development in countries pursuing a diverse range of economic strategies over the past half century. These countries now prominently include China, pursuing a strategy of state capitalism. Thus, while the genius of the corporate form is present in all economic miracles, "good" corporate law (again in the narrow sense) is not an essential contributor to its genius; and dispersed corporate ownership is not a necessary condition for transformative economic development.⁵¹ In this respect, China's recent history confirms the lessons provided by the experience of the United States in the late nineteenth and early twentieth centuries.

5.2 Convergence

Law and finance scholarship added fuel to the convergence debate, which considers whether corporate governance systems around the world are converging on a single shareholder-centered, market-oriented model. In the decade since the debate flowered and then promptly reached a theoretical stalemate,⁵² China has emerged as one of the world's major economic powers. With the benefit of hindsight, the turn-of-the-century convergence debate now (p. 781) seems rather quaint. Scholars never seriously considered the possibility that domestic political legitimacy and international influence could be a major goal of a corporate governance regime. The concept of "nonpecuniary private benefits of control" was developed to help explain the persistence of controlling shareholder regimes, but this concept was used to describe social standing and influence of private founding entrepreneurs within the domestic political economy.⁵³ State capitalism as practiced in China blurs the distinction between pecuniary and nonpecuniary benefits of corporate control, and highlights major international soft-power ramifications of corpo-

rate governance structures, at least in a world where “state capitalism” is posing challenges to “market capitalism.”

It was previously noted that Chinese corporate governance is often defined by what it lacks in comparison to other systems, and hopefully this chapter has made some headway in understanding its features other than by reference to negative space. In regard to the convergence debate, however, it bears emphasizing that, regardless of where the Chinese system may be headed, it presently does not fit neatly into any of the standard taxonomies. Chinese corporate governance for the national champions is not bank-based or stock-market-based. It is not shareholder-oriented or stakeholder-oriented, unless the concept of a corporate “stakeholder” is stretched to include the ruling political party and the government in its policy making, regulatory, and enforcement capacities. Nor is it a liberal market economy (LME) or a coordinated market economy (CME) per the “varieties of capitalism” literature. None of these taxonomies provides much analytical leverage on a system of national champion capitalism in which a party-state is residual claimant, controlling shareholder, financier, and chief engineer of an Olsonian encompassing coalition that ties the economic and political fortunes of a vast array of actors to national economic growth.

Of course, each country's governance structures are unique. The point is that the map used by comparative corporate governance scholars in recent decades to understand the world may lead observers of China astray, or at least cause them to overlook fertile areas for further investigation. To take an example relevant to the convergence question, most scholars have assumed that state capitalism in China is transitional, with the speed of the transition a function of state capacity and political will to make improvements in the formal institutional environment. Relatedly, many observers have emphasized the vast divergence between formal law and actual practice in Chinese corporate governance.⁵⁴ The gulf, some commentators imply, will close up when China becomes more “law abiding.”⁵⁵

The analysis here points in a different direction. There is certainly a yawning gap between law and practice in Chinese state capitalism if one focuses on the corporate law and related institutions. Direct involvement of the Communist Party in high-level executive appointments, SASAC's practice of bypassing the board of directors in the appointments and remuneration processes, and its veto power over downstream corporate transactions are all inconsistent with basic corporate law principles. (They also violate soft-law norms (p. 782) on SOE governance promoted by international organizations such as the OECD.) But if one focuses on the regulations governing business group formation and governance, and the SOE Asset Law governing SASAC in its formal role as controlling shareholder over the national champions, the gap between law and practice in China's SOE sector narrows substantially. The existing legal environment is actually quite complementary to the current economic system, in which the state sector continues to play a major role in the government's economic and political policies.

Whatever its disadvantages, and they are likely substantial, state capitalism as it has evolved in China over the past 30 years represents a form of industrial organization that

produces substantial benefits to members of the encompassing coalition—the managerial elite within the party-state system. The national champions themselves are now forceful players in the Chinese political economy. We need look no further than the US historical experience to see that large corporations—even ones not linked to the state—can exert tremendous influence on the design of national institutions and the nature of social relations. It is therefore quite possible that China's formal legal institutions may “improve” in ways that reinforce the current system of industrial organization rather than prompt a transition to different forms of corporate organization. State capitalism may prove to be a durable institutional arrangement as a result of interest group politics, public policy, and path dependence.

Thus, for the convergence debate, China raises the possibility of a new, durable, and possibly influential variety of capitalism. The Chinese system has already garnered attention as a model of political intervention in the economy among countries with authoritarian political traditions such as Russia, and interventionist tendencies, such as Brazil. Of course, imitating the Chinese model may prove difficult for a host of reasons. But as we have seen, Chinese firms have entered the global economy through a path that bears almost no resemblance to the standard institutionalist account of how firms grow and large-scale commercial economies develop. Thus, even short of replication elsewhere, China's variety of capitalism may prove influential to countries lacking the formal institutional foundations of growth. Quite apart from these forms of influence, it is apparent that China's rise is a significant disruptive force in global capitalism. It has disrupted previously settled notions about the nature of capitalism,⁵⁶ and sparked a predictable backlash in some realms.⁵⁷ The competitive challenges posed by an economic system in which, for the largest and most globally active firms, the country is the unit of maximization are profound. At a minimum, China's global economic rise, like that of Japan two decades ago, will likely encourage reconsideration of cooperative links between the state and the private sector, and refocus attention on networked varieties of corporate capitalism. In corporate governance, as in politics, the “End of History” is nowhere in sight.

(p. 783) 6 Conclusion

This chapter has begun the task of unpacking the black box of “state capitalism” in China by examining business group ownership structures within the national state-owned enterprises and exposing the mechanisms connecting the national champions to organs of the party-state. Shifting the focus from agency problems in individual listed firms to networks of firms enmeshed in the party-state has provided a richer understanding of China's state sector and the architecture supporting a central component of the state's economic development model. It has also brought the organizational dimension of China's developmental experience to bear on important recent debates in the comparative corporate governance literature.

The Rise of Foreign Ownership and Corporate Governance

Merritt B. Fox

The Oxford Handbook of Corporate Law and Governance

Edited by Jeffrey N. Gordon and Wolf-Georg Ringe

Print Publication Date: May 2018

Subject: Law, Company and Commercial Law, Comparative Law

Online Publication Date: Jun 2016 DOI: 10.1093/oxfordhb/9780198743682.013.34

Abstract and Keywords

This chapter explores the link between corporate governance and the rise of foreign ownership. It presents statistics that illustrate the dramatic rise in foreign ownership over the last few decades and then seeks to explain this rise and its relationship to corporate governance. In order to situate the subject under study within its larger context, this explanation starts with an exploration of the factors independent of corporate-governance considerations that favor a global market for securities and those that impede it. It will be shown that the rise in foreign ownership globally can be explained in significant part by the weakening of the impeding factors. The chapter then shows why, as a matter of theory, improvements in corporate governance can be expected to cause a rise in foreign ownership and a rise in foreign ownership can be expected to cause improvements in corporate governance, with the weakening in the non-corporate-governance factors that impede a global market for securities acting as a catalyst for the causal pathways going in both directions. The chapter concludes with a review of substantial empirical evidence suggesting that both causal pathways are in fact at work.

Keywords: corporate governance, foreign ownership, investor holdings, equities, securities, portfolio investment, diversion constraints

1 Introduction

ONE of the most striking changes in the world's capitalist economies has been the rise of cross-border share ownership over the last two decades. This chapter is devoted to understanding the relationship between this rise and corporate governance.

The chapter begins by documenting this rise statistically. Then, in order to situate the subject under study within its larger context, it explores the factors independent of corporate-governance considerations that favor a global market for securities and those that impede it. It will be shown that the rise in foreign ownership globally can be explained in

The Rise of Foreign Ownership and Corporate Governance

significant part by the weakening of these impeding factors. The remainder of the chapter is devoted to the interaction between the rise in foreign ownership and corporate governance.

The underlying theme of the chapter is as follows. The demand outside a country for the shares of its issuers is determined both by how much the forces impeding a global market for securities have weakened and by the corporate governance of the country's issuers. This observation suggests pathways of causation between increased foreign ownership and improved corporate governance that run in both directions. For each, the weakening of the forces independent of corporate governance that impede a global market for securities acts as a catalyst. As they weaken, foreign ownership increases, leading to improved corporate governance, which in turn leads to increased foreign ownership. More specifically, we will consider the role of the weakening of these impeding forces in the following three regards.

First, a weakening of the forces impeding a global market for securities leads to a greater potential increase in foreign ownership for issuers in a poor governance jurisdiction if these issuers then in fact credibly improve their governance. This increased opportunity to tap the large global pool of capital abroad creates incentives for any country with a poor corporate-governance regime to make improvements. It also creates incentives for individual issuers (p. 785) within the country to improve their own governance above and beyond whatever floor is set by the country's overall regime. To the extent that countries and firms respond to these incentives, foreign ownership increases.

Table 29.1 Proportion of US investor holdings in foreign issuers and the proportion of foreign issuer holdings of US issuers, 1993

	US Issuer Equity	Non-US Issuer Equity	Total
Equity market capitalization	\$5.2 trillion (37%)	\$8.9 trillion (63%)	\$14.1 trillion
Holdings by US investors	\$4.9 trillion (94%)	\$.3 trillion (6%)	\$5.2 trillion
Holdings by non-US investors	\$.3 trillion (3%)	\$8.6 trillion (97%)	\$8.9 trillion

Note: Figures in the 1993 table come from the following sources: US equity market capitalization in 1993 = \$5.2 trillion, Securities & Exchange Commission, Annual Report, 28 (1994) available at: https://www.sec.gov/about/annual_report/1994.pdf; worldwide equity market capitalization in 1993 = \$14.1 trillion (non-US equity market capitalization = \$14.1 trillion—\$5.2 trillion), id.; holdings by non-US investors of US equity securities in 1993 = \$340.0 billion, Russel B. Scholl, The International Investment Position of the United States in 1994, Survey of Current Business, June 1995, at 52; hold-

The Rise of Foreign Ownership and Corporate Governance

ings by US investors of non-US equity securities in 1993 = \$297.7 billion, id.; holdings by US investors of US equity securities in 1993 = \$5.2 trillion - \$340 billion = \$4.9 trillion; holdings by non-US investors of non-US equity securities = \$8.9 trillion - \$297.7 billion = \$8.6 trillion.

Second, some countries with poor corporate-governance regimes improve their regimes for reasons independent of the weakening of the forces impeding global share investing. With a weakening of the impeding forces, however, the improvement in corporate governance leads to a greater increase in foreign holdings of the shares of their issuers than would have been the case without the weakening.

Third, a weakening of the forces impeding a global market for equities leads to more foreign investors purchasing shares in issuers from countries with poor corporate governance even if, at the time, there is no improvement in their corporate governance. As the foreign investors acquire a larger portion of the outstanding shares of these issuers, they generate new pressure for governance improvement.

2 Documenting the Rise in Foreign Ownership

The dramatic rise in foreign ownership is illustrated in Tables 29.1 and 29.2, which compare 1993 and 2015 in terms of the proportion of US investor holdings in foreign issuers and of the proportion of foreign issuer holdings of US issuers. Comparing Table 29.1 with Table 29.2, we can see that over these 22 years, the proportion of non-US equities in US investor stock portfolios, and the proportion of US equities in the portfolios of non-US investors, have each more than quadrupled. (p. 786)

Table 29.2 Proportion of US investor holdings in foreign issuers and the proportion of foreign issuer holdings of US issuers, 2015

	US Issuer Equity	Non-US Issuer Equity	Total
Equity market capitalization	\$25.1 trillion (41%)	\$36.7 trillion (59%)	\$61.8 trillion
Holdings by US investors	\$20.5 trillion (75%)	\$6.8 trillion (25%)	\$27.3 trillion
Holdings by non-US investors	\$4.6 trillion (13%)	\$29.9 trillion (87%)	\$34.5 trillion

Note: Total market capitalization figures for US issuers and foreign issuers are derived from World Bank, Market Capitalization of Listed Companies, <http://data.worldbank.org/indicator/CM.MKT.LCAP.CD>. The cross-border holdings of both US

The Rise of Foreign Ownership and Corporate Governance

and foreign investors come from Int'l. Monetary Fund, Coordinated Portfolio Investment Survey (2015) Table 11.1, available at <http://cpis.imf>.

The same pattern can be observed at the more granular country-to-country level. For example, in 1989, Japanese investors on average held only 0.3% of their portfolios in US issuer stocks and US investors on average held only 1.3% in Japanese issuer stocks.¹ In 2015, Japanese investors on average held 8.2% of their portfolios in US issuer stocks, a twenty-seven-fold increase in the proportion held, and US investors on average held 2.5% in Japanese issuer stocks, an almost twofold increase in the proportion held² (a much more significant increase than it appears because the market capitalization of Japanese stocks as a proportion of the total capitalization of all the world's publicly traded issuers dropped from 28% in 1995³ to 8% in 2015⁴).

While starting from a much lower base, similar trends can be observed in the case of various emerging economies. US investors on average held only 0.02% of their portfolios in Indian stocks in 1994, but by 2015 the figure was up to 0.44%, a twenty-two-fold increase; for South Korea, the comparable figures are only 0.09% for 1994 and 0.51% for 2015, a more than fivefold increase.⁵

Finally, and importantly for our later discussion of the influence of foreign ownership on corporate governance in such countries, there has been a sharp increase in the proportion of the shares of issuers from countries with less well regarded corporate-governance regimes (p. 787) held by investors from countries with more well regarded regimes. Between 1994 and 2015, the proportion of Japanese issuer stocks held by US investors increased from 2.7% to 14.1%, a more than fivefold increase; for South Korea, the comparable figures increased from 2.3% to 11.3%, a more than fourfold increase; for India, the comparable figures increased from 0.9% to 7.9%, an almost ninefold increase; and for Brazil, the comparable figures increased from 4.5% to 13.5%, a three fold increase.⁶

All in all, at year end 2012, 38% of the capitalized value of all the world's publicly traded issuers was held by investors from a country different from that of the issuer.⁷

3 Trends in Non-Corporate-governance Factors Affecting the Extent of Foreign Ownership

As will be developed below, under ideal conditions, the typical passive portfolio investor around the world, to maximize her utility, should hold an equity portfolio containing shares of issuers of different countries roughly in proportion to the countries' respective total market capitalizations.⁸ Thus, for example, a US and a Japanese passive investor should each have a portfolio with about 8% invested in Japanese corporations and 41% in US ones. This is because the market capitalization of Japanese public companies represents 8% of the total market capitalization of the world's publicly traded issuers and that of US corporations represents 41%.⁹

The Rise of Foreign Ownership and Corporate Governance

If all investors around the world followed this rule, all corporations would be predominantly foreign owned. Keeping with our examples, as the figures in Table 29.2 reveal for 2015, US investors held about 44% of the equity wealth in the world and non-US investors hold the remaining 56%, including 8.0% that is held by Japanese investors.¹⁰ So the typical US corporation would have 56% of its shares owned by non-US investors, compared with 13% today.¹¹ Japanese investors hold about 8% of the equity wealth in the world and non-Japanese hold the remaining 92%, including the 44% that is held by US investors.¹² Therefore the typical (p. 788) Japanese corporation would have 92% foreign ownership (compared to 18% today) including 44% of the ownership coming from US investors (compared with only 9% today).¹³ These figures show that while there has been a striking increase in cross-border ownership of equity over the last two decades, there would be potential for much more if the remaining impediments to a global market for securities disappeared. This would have possibly profound corporate-governance implications.

In sum, the world of 20 years ago fell far short of the extent of cross-border holdings that would be welfare maximizing for passive portfolio investors. Today, with a severalfold increase in the foreign ownership of the typical, large established corporations around the world, it still falls well short, but not by as far. The distance that could still be traveled would represent a yet much greater amount of foreign ownership. This section considers trends in the factors that favor globalization and in the counter-factors that resist it. An examination of these factors and their trends both helps to explain the increase in foreign ownership that has occurred so far and predicts a substantial further increase in the future.

3.1 Factors Favoring Greater Foreign Ownership

Two factors push investors to hold shares of foreign issuers. First, when investors from a country rich in savings relative to its real investment opportunities are net positive purchasers of securities sold by issuers or persons from a country poorer in savings relative to such opportunities, savings are reallocated from the savings-rich country to the savings-poor one. This profits the residents of both countries. Second, when an investor holds a portfolio that is diversified across issuers of multiple countries, instead of across just the issuers of her own country, she can reduce the risk of the portfolio relative to its expected return and thereby increase the expected utility from her investment activities.

3.1.1 Returns to a Reallocation of Savings

One factor working in favor of foreign ownership is the existence of differences among nations in their amounts of domestically generated savings relative to the quality of the available opportunities for domestic real investment.¹⁴ Real investment opportunities in each nation display diminishing marginal returns in the sense that the proposed projects that constitute any given nation's set of domestic real investment opportunities are bound to have differing earnings prospects and, if the projects are implemented down the list in rank order of their prospects, the more of a nation's projects that are implemented—i.e.

The Rise of Foreign Ownership and Corporate Governance

the greater the amount of total domestic real investment—the lower the expected return on the marginal project.

(p. 789) The amounts of available domestic savings and the sets of domestically available real investment projects have not historically been, and are not likely in the future to be, distributed among nations exactly in the same proportions. In other words, if there were no transnational investment, so that each nation simply took all of its savings and invested them in just its projects, the expected return on the marginal project of each nation would be unlikely to be exactly the same. For example, if Country A's marginal project would have, in the absence of transnational investment, an expected rate of return (say 8%) that is lower than Country B's marginal project would have been (say 10%), Country A can be said to have more savings relative to the quality of its investment opportunities than Country B. A reallocation of savings for investment from A to B will reduce the number of projects implemented in A and increase the number of projects implemented in B. This reallocation enhances global economic efficiency because the projects that are now left unimplemented in A have a lower expected return than the resulting additional ones that are implemented in B. Until such point that any further a shift of funds from A to B will no longer have this result, there will be incentives for persons with savings in A to invest them in B rather than A because they can get a higher expected return.

One of the ways that such a transnational reallocation of savings can occur is when an investor in one country purchases shares in a primary offering of shares issued by an issuer in another country. Further, when, on a net basis, investors in one country make secondary market purchases of securities from investors in a second country, this will have the same effect, and often the securities so purchased will be of issuers from the second country. There are other ways through which such savings reallocations occur, such as internal financial flows of multinational corporations engaging in direct investments, bank lending, private block purchases of securities, and even purchases of government debt. However, the purchase of shares that will be, or already are, publicly traded has the advantages of being an investment that is liquid and that facilitates diversification.

3.1.2 Greater Diversification

A share's future return is probabilistic, not certain, and so each stock has a certain riskiness associated with it. Global investing offers investors a more effective way of reducing the negative impact of this riskiness on their welfare than does exclusively domestic investing. To understand why requires a brief diversion into the theory of portfolio choice, which is a pillar of the modern approach to finance.

Portfolio choice theory teaches the investor to focus on what the acquisition of a given security does to the returns on his whole portfolio of securities, not on the security's characteristics in isolation.¹⁵ The critical lesson of portfolio choice theory is that holding a (p. 790) diversified set of risky securities results in lower risk for any given level of expected return.¹⁶ The expected return of a portfolio is the aggregate of the expected returns of its individual securities. The variance of a portfolio is not, however, the aggregate of the variances of its individual securities. This is because of the likelihood that the actual re-

The Rise of Foreign Ownership and Corporate Governance

turns of some of the securities will exceed their expected returns and the actual returns of others will fall short of their expected returns. Consequently, the deviations of the two groups will, to one extent or another, cancel each other out, which reduces the amount by which the actual return of the portfolio as a whole deviates from its expected return. By diversifying in accordance with the dictates of portfolio theory, the investor maximizes, for any given level of portfolio expected return, the extent to which this type of canceling out is likely to occur.

There are limits, however, to the effectiveness of diversification for lowering risk. This is most easily seen in terms of a simplified model of portfolio choice theory that focuses on the correlation between the return on each individual risky security and the return on the market of securities as a whole (rather than with each other individual security).¹⁷ Each security has two kinds of riskiness associated with it: unsystematic risk (the portion of the security's variance that has a 0 correlation with the market) and systematic risk (the portion of its variance that is perfectly correlated with the market). Unsystematic risk is due to factors specific in their effects to the issuer or its industry, for example, uncertainty concerning the quality of an issuer's management. Systematic risk is due to factors affecting all issuers whose securities are traded in the market, for example, uncertainty concerning future interest rates. The contribution of the unsystematic risk of individual securities to a portfolio's overall risk can essentially be fully eliminated by sufficient diversification. This is because the deviations of the individual securities are unrelated to each other and will cancel each other out. The systematic risk of the individual securities, however, cannot be eliminated by diversification. To the extent that individual securities deviate from their expected returns due to factors causing systematic risk, generally all securities deviate in the same direction.

With this background, one can easily see why global investing offers an investor an opportunity to construct a portfolio with lower risk for any given level of expected return. The extent to which diversification can eliminate overall portfolio risk depends on the proportion of each security's total variance that results from unsystematic risk. This again is because unsystematic risk can be diversified away, but systematic risk cannot. The less each issuer in a market shares in common with the others, the smaller the proportion of systematic risk and the higher the proportion of unsystematic risk. Issuers worldwide share less in common with each other on average than issuers of a given country share in common with each other. Thus, if the relevant securities market is global rather than merely domestic, a (p. 791) larger proportion of each issuer's variance will constitute unsystematic risk and diversification will reduce portfolio risk more.

The concern with diversification highlights the fact that capital markets not only decide which proposed real investment projects should be implemented, but also who will bear the risk resulting from uncertainty concerning projects' future returns. This observation suggests two modifications of the simple model that views transnational investment simply as reallocation of savings. First, the desirability of a given project now depends not only on its expected return but also on its risk characteristics. Second, if all investors were to diversify globally sufficiently to achieve the maximum reduction in risk, the level

The Rise of Foreign Ownership and Corporate Governance

of each investor's cross-border holdings as a proportion of all her holdings would be determined, not by the amount of savings reallocated transnationally, but by the investor's desire to eliminate unnecessary risk through diversification. If one nation consistently has more savings relative to its real investment opportunities than another, its investors would accumulate a larger absolute share of the joint pool of securities of the two nations.¹⁸ But for investors in each country, the proportions of the securities of the two countries held in their portfolios would be the same and would depend on the respective total market capitalization of the issuers of each.¹⁹

3.2 Non-Corporate-governance Factors Impeding Global Securities Markets

We will now consider the factors independent of corporate governance that play major roles in why investors in fact fall so far short of being fully diversified globally.

3.2.1 Specialized Information Concentrated Nationally

Finance theorists often assume that all investors share identical beliefs concerning the probability distribution of the future returns of the available securities. This assumption is useful for understanding certain aspects of investor behavior. For example, it permits the demonstration that a totally passive investor, who in fact has no specific information concerning the future prospects of the available securities, can minimize risk for any given expected return by simply randomly choosing a sufficiently large number of different securities from all the securities available in the market.

In reality, however, investors in different countries still possess significantly different bodies of information. The assumption of identical beliefs in the face of this obvious reality obscures two other aspects of investor behavior that have been important contributors to a strong home bias in the holdings of securities. First, for the totally passive investor to be willing to undertake the strategy of randomly choosing securities, she needs a basic faith in the market pricing of the securities from which she makes her selection. This faith arises (p. 792) from a level of familiarity which, for many investors, is today still attained only for their particular domestic market.²⁰ Second, some investors ("speculators") choose their portfolios on the basis of their own beliefs, not randomly, and these beliefs in turn are based on specialized information not possessed by all participants.²¹ Speculators are likely to do better concentrating their buying and selling in equities of issuers about which they and their advisers start with natural information advantages.²² These are likely to be domestic issuers, (p. 793) because the futures of most issuers are determined more by forces occurring within the borders of their own respective countries than by forces occurring outside.

For several reasons, historically, residents of a given nation have had advantages over foreigners in gaining specialized information about forces acting within their own nation. To start, the costs of simply acquiring bits of local information have been lower for a resident, whether that be through timely purchasing of published materials (in, or translated into, a language readable by the recipient) or computerized data, engaging in telephone

The Rise of Foreign Ownership and Corporate Governance

conversations, or traveling in order to engage in face-to-face conversations or to make on-site physical observations. Thus it has traditionally been far easier for residents to gather a larger number of bits of information at a reasonable expenditure.

More importantly, these same economies that have permitted residents to receive large numbers of such bits of, permit them as well to develop refined rules for evaluating these bits of information: to choose which bits to analyze seriously and by which to be influenced.²³ This evaluation must be based both on the source of the information as well as on its content. The concern with the source goes to the accuracy of the information. It asks the questions, "How trustworthy is the source?" and, assuming that the information has an interpretative element, "How competent is the source?" The concern with content asks the question, "How much does the bit, even assuming the information conveyed is accurate, tell the recipient about whether a particular security is underpriced or overpriced?"

Moreover, the resident recipient, through his education and his continuous absorption of general information concerning his nation, has started with a much richer context in which to make these evaluations. He has also obtain, cheaply, much more concerning both the structure of the source's motivations and the reputation of the source (i.e., the experience of others with the source concerning his trustworthiness and competence). Since the source has been less expensive to acquire information from generally, the resident recipient is also more likely to have had prior personal experience with the source and hence to have had more feedback on the quality of information the source provides.²⁴ The resident recipient is, for the same reasons, more likely to have had prior experience with the usefulness of bits with any particular content when the information involved relates to local forces. For many of the same reasons, he is also more familiar with the institutions involved in the process of price formation for his own nation's issuers.

Technological change, of course, has been a game changer in this story. It can help explain the severalfold increases in the proportion of cross-border holdings in investor portfolios. It also forecasts further increases to come. Over the last 20 years, technological change has (p. 794) substantially narrowed, and in many cases eliminated, the differences in the respective costs of timely acquisition of information from foreign and domestic sources. Consider email, transmission of documents by email attachment, the web, links to computerized databases, all of which have no cost sensitivity to distance, and international telephone calls and travel for face-to-face meetings and on-site inspections, each of which has declined greatly in cost. This reduction in the difference between acquiring information domestically and from abroad applies with respect to both information directly relevant to predicting the prospects of issuers and information about the motivations and reputation of the sources of such directly relevant information. These same technological changes have also contributed to the development of truly transnational securities firms with the trust and control advantages of communications within a single organization. Finally, these technological changes, through their effect on mass media, marketing, education, scholarly research and direct personal interaction, are working toward creating a more uniform social and economic culture among the capitalist nations of the world and

The Rise of Foreign Ownership and Corporate Governance

the coalescence around English as the international language. This greater uniformity of culture and language assists the speculative investor in evaluating the information he receives from abroad and gives the passive investor more faith in how stocks of foreign issuers are priced. Moreover, the rules by which investors and their advisers evaluate information have a “learning by doing” aspect and improve with experience, so that even the decline in information costs to date has not yet had anywhere near its full impact on reducing the impediment to global securities markets traditionally arising from the cost advantages of local information.

3.2.2 Currency Exchange Risks

If the resident of one nation, for example the United States, purchases a security of an issuer of another nation, for example the United Kingdom, the investor must consider the possibility that when he converts the return back into dollars, the rate of exchange may be different than at the time of the purchase. Thus, to the United States investor, the UK security has an additional element of risk—an additional source of variability of return—that would not be present with an otherwise identical United States security. With holdings of foreign securities from a diversified set of nations, the variations in return of individual securities caused by exchange rate fluctuations would tend to cancel each other out. There is still remaining risk, however, that comes from the extent to which the investor’s home currency’s value has changed relative to a basket made up of the currencies of the other nations of the world. This is a risk that will discourage cross-border stock holdings.

Two factors moderate this risk, changes in each of which have contributed at least slightly to the increase in cross-border holdings over the past two decades. One factor comes from the fact that an increasing portion of the goods and services consumed by the typical investor comes from abroad. For example, from 1993 to 2012, the percentage of goods and services imported from abroad increased from 10% to 17% for the United States, from 16% to 24% for China, from 7% to 17% for Japan, and from 26% to 34% for the United Kingdom.²⁵ Future fluctuations in currency exchange rates create risks concerning how much of these foreign (p. 795) goods and services the investor will be able to consume when, in the future, she liquidates her investments to consume. Holding foreign issuer securities is a hedge against this risk. In domestic currency terms, exchange rate fluctuation will affect the return on foreign securities and the cost of imported goods in the same direction. Since one is income and the other expenditure, the effects tend to compensate for each other. With the increase in international trade, there is more room for holdings of foreign securities to act as a hedge, thereby reducing an investor’s overall risk from exchange rate fluctuations, rather than adding to it.

The other factor is the ability to use currency futures to hedge against the effect of future exchange rate changes on the returns of foreign securities. Futures markets for securities have become less expensive to use and allow for longer-term hedges than was the case a few decades ago.

3.2.3 Government Impediments to Transnational Investments

The Rise of Foreign Ownership and Corporate Governance

Governments can impede transnational securities transactions through currency controls and taxes and through securities regulation.

3.2.3.1 Currency Controls and Taxes

Consider a potential transnational transaction involving an issuer or secondary seller of one nation and an investor of another. The government of either nation can have tax or currency exchange regulations that create sufficient disincentives such that the transaction does not take place. The government of the investor, for example, may make it difficult or impossible to obtain the foreign currency with which to purchase the security, may tax the returns on foreign securities at a higher rate than it taxes the returns on domestic securities, or may refuse to grant the domestic holder of a foreign security a tax credit for taxes withheld from the returns by the government of the issuer. The government of the issuer may make it difficult or impossible for a foreign investor to turn returns paid in the local currency of the issuer's nation into the investor's domestic currency. Alternatively, it may impose a withholding tax on the returns which, for a number of possible reasons, may not reduce the investor's home tax obligations by a commensurate amount. Transnational transactions can be discouraged not only by currently existing regulations of these sorts, but also by the fear that they might be imposed at any point in the future during the life of the security.

The period after World War II witnessed a variety of such currency control and tax measures imposed by many of the world's most advanced economies. These measures tended to reinforce segmentation of securities markets along national lines. The countries involved had largely dismantled these measures by the end of the 1980s, however. A return of such measures in these advanced economies is unlikely because such nations compete with each other to provide environments congenial to the financial services industry, which regards such taxes and regulations as anathema.

Because of the rise of the emerging market countries as significant players in the world economy, however, such measures still play an important role impeding cross-border equity ownership. Many of these countries, most notably China, continue to impose such controls. There is much talk of liberalization concerning these countries, which would lead to a further weakening of this impediment to foreign ownership. For many of these countries, it is unclear, however, whether this talk will materialize into action. Among other reasons, they (p. 796) may hesitate because of the experiences of some emerging countries that have lifted such controls, which have then been subject to fluctuating capital flows. These fluctuations have accentuated upswings and downswings in their overall economies, leading to cycles of boom and bust. While equities, which have no fixed repayments, presumably contribute less to this boom-and-bust problem than do short-term fixed repayment securities, they may still play some role and in any event may still be subject to the same blanket restrictions that apply to all other capital market instruments.

3.2.3.2 Securities Regulation

There cannot be foreign ownership without transnational transactions. These transnational transactions in turn inevitably give rise to potential regulatory claims by multiple countries. When more than one country in fact imposes its regulations on an activity associated with a transnational securities transaction, the transaction becomes more expensive to undertake, thereby creating an impediment to a global market for the issuer's shares.

To see how such impediments can arise, we will review some US regulations and legal actions and consider their application to the shares of established foreign firms that are efficiently priced in trading markets abroad. Section 5 of the Securities Act of 1933 (the "Securities Act") prohibits the offer or sale of any security by any person unless the security is registered under the Act. Such registration requires a complex process of disclosure. The SEC has always been clear that it interprets Section 5 as covering public offerings made in the United States by foreign issuers. Further, any foreign issuer wishing its securities to be listed on a US stock exchange must, just like a US issuer, register these securities with the SEC pursuant to Section 13 of the Securities Exchange Act of 1934 (the "Exchange Act"), which again involves a complex process of disclosure. This registration automatically makes the issuer subject to the Exchange Act's periodic disclosure regime,²⁶ as does the registration of a public offering under the Securities Act.²⁷ This disclosure regime is generally regarded to be as strict as that of any country in the world.

Listing on a US exchange can also create the potential for a foreign issuer to be liable for large damages payments as the result of a fraud-on-the-market class action.²⁸ This kind of private action allows secondary market purchasers, who suffer losses because the price they paid was inflated by an issuer's misstatement made in violation of Exchange Act §10(b) and Rule 10b-5, to recover as a group their total damages. These actions give rise to the bulk of all the damages paid out in settlements and judgments pursuant to private litigation under the US securities laws and are what gives the United States the reputation in the rest of the world of being the securities damage action "Wild West."²⁹ No other country has a civil liability provision that regularly imposes a similar level of damages on issuers.

(p. 797) As discussed above, technological advances have substantially reduced the costs for US investors to acquire information about, and to evaluate, foreign issuers relative to the costs they face doing the same with respect to comparable US issuers, especially large established foreign issuers trading in efficient markets abroad. The US decision to apply these regulations and causes of action to foreign issuers creates costs on an expected basis that would not be present if the issuer were subject only to its home country's laws with respect to the activities involved. These expected costs lead some foreign issuers to avoid offering, or promoting the trading of, their shares in the United States. As a result, there are situations in which a public offering to US residents would provide a foreign issuer with the lowest cost of capital, but the offer is not made. Similarly, there are situations where a United States trading venue would offer the best liquidity services, relative to cost, for the trading of the issuer's shares but the issuer does not list or otherwise promote trading there. US investors suffer from these lost transactions as well. Be-

The Rise of Foreign Ownership and Corporate Governance

cause the issuer's securities are not conveniently available in the US primary or secondary trading markets, US investors face barriers to enjoying the risk-reduction benefits from full international diversification.³⁰

The traditional rationale of the US decision to apply these regulations and causes of action to foreign issuers has been to protect US investors and markets.³¹ I have argued elsewhere that in the case of foreign issuers trading in efficient markets abroad, such US application is not necessary to protect US investors against investing at unfair prices. This is because, if these US laws and causes of action were not applied to these foreign issuers, prices would be appropriately discounted to reflect this fact.³² Rather, regulations and causes of actions of this type serve corporate governance and liquidity enhancement functions. These regulations have costs and benefits that depend on their intensity. The optimal level of regulatory intensity varies from one country's issuers to those of another. The benefits of getting the level of regulatory intensity right redound mostly to the issuer's home country, which thus has the greatest incentive to do so. Accordingly, the impediments to global trading arising from the US application of these regulations and causes of action to foreign issuers are needless from both a US and a global economic welfare point of view.

Perhaps in growing recognition of the costs associated with impeding global trading, the United States has in recent decades been pulling back. Since the early 1980s, foreign issuers have not been required to disclose as much in either their public offering or in their ongoing periodic reports as US issuers are required to disclose, whereas previously they were.³³ (p. 798) More recently, the SEC decided to permit foreign issuers to report their financials in their US filings in accordance with International Financial Reporting Standards ("IFRS"), which many foreign issuers use to satisfy their home country requirements, whereas previously such financials needed to be reconciled with US GAAP.³⁴ Finally, in *Morrison v. Nat'l Austl. Bank*,³⁵ the US Supreme Court concluded in 2010 that Exchange Act §10(b)—and hence fraud-on-the-market actions—reached only situations where the securities were listed on a US exchange or where their purchase or sale was effected in the United States.³⁶ For most foreign issuers, this means that any need to pay fraud-on-the-market damages or settlements would be confined to only the portion of the foreign firm's shares that are purchased in US trading, whereas previous lower-court decisions created possible liability to purchasers worldwide.³⁷

There are likely to be further reductions in these US impediments in the future. Consider what would happen if the United States were to maintain them at their current level. The global integration of equity markets outside the United States would continue to progress. This integrating market outside the United States would improve the non-US options available to foreign issuers. Fewer and fewer foreign issuers would find that the benefits of offering their shares in the United States, or promoting US trading of their shares, would be worth the costs. US capital markets would be left mostly with only US issuers,³⁸ while competing markets abroad would have the opportunity to be the trading venues for all the rest of the world's issuers. Thus, the level of activity in the US capital markets would fall further and further short of what it could be, and with it the skill-

The Rise of Foreign Ownership and Corporate Governance

based rents earned by the US residents employed by enterprises associated with these markets. This prospect is likely to lead to increasing political pressure to reduce these US impediments, an effort that is particularly likely to succeed given, in my view, their lack of any real value in protecting US investors or markets.

3.2.4 Transaction Costs of Acquiring Foreign Securities

A final factor impeding foreign ownership of a corporation's shares are the extra costs associated with the transactions by which foreign investors acquire its shares. Two kinds of transactions can result in share ownership by foreign investors. One is a purchase by the foreign investor on an exchange in the issuer's home country, or in an offering being conducted in the issuer's country. Such a transnational transaction involves the additional costs associated with international communications, currency exchange, and clearances and settlements that are not present with transactions occurring at home. The other kind of transaction is a purchase by the foreign investor on an exchange in the investor's home country, or in an (p. 799) offering being conducted in that country. This avoids the costs to the investor of a transnational transaction, but it imposes on the issuer the additional costs of maintaining an exchange listing in the investor's home country or conducting an offering there.

The same technological changes that have been narrowing the cost differential of obtaining information from foreign and from domestic sources have been greatly reducing differences in real resource costs between executing a purchase on a domestic exchange, or in a domestic offering, and making these purchases abroad. This is particularly true of secondary trading. It also has become much more practical for the major exchanges around the world to compete for listings from foreign issuers and orders from foreign traders. Share-trading venues in the advanced economies have all become electronic limit-order books, where a computer matches electronically posted limit orders with electronically submitted incoming marketable orders. It is essentially as easy and inexpensive to post a limit order or submit a marketable order from a country distant from the venue as from within the same city as the venue. The only remaining impediment to each of these venues serving a truly global market (other than that, as discussed above, posed by national securities regulation systems) is the need to perfect a seamless transnational system of clearance and settlement.

4 The Interaction of Foreign Ownership and Corporate Governance

As many of the other chapters in this book make clear, what constitutes good corporate governance is a matter of considerable contention. This chapter will not wade deeply into this fight. Rather it focuses on one dimension of an issuer's corporate governance: its capacity to support portfolio investment, i.e., to support a shareholding base that includes a substantial portion of the issuers shares held by persons who individually do not hold

The Rise of Foreign Ownership and Corporate Governance

enough to exert control and who are numerous enough that it would be difficult to form a group to exercise control.

This choice to focus on portfolio supportive corporate governance is made for positive, not normative, reasons. Most publicly traded firms outside the United States and the United Kingdom have control shareholders. Control shareholders in turn are most often of the same nationality as the issuer. These control shareholders might sell a block of shares to a foreign holder, but the relationship thereafter between the control shareholders and the foreign block holder is likely to be governed by a contract specific to the particular transaction. Thus, for there to be some kind of more general relationship between foreign share ownership and corporate governance, this will arise out of a situation where the foreign holders are portfolio investors, i.e., holders of freely trading non-control shares. A firm's potential for having foreign portfolio investors depends on its potential for having portfolio investors more generally, which, in turn, depends on the portfolio supportiveness of its corporate governance.

This section begins with an elaboration of the concept of portfolio-supportive corporate governance and its implications. Subsequently, we review the literature suggesting that improved corporate governance in fact does lead to greater foreign ownership. Finally, we review the literature suggesting that increased foreign ownership leads to improved corporate (p. 800) governance. In each case, the review will consider the catalytic role played by the weakening of the non-corporate-governance impediments to foreign ownership discussed in section 3.

4.1 Portfolio-Supportive Corporate Governance

In an efficient market, the market price for an issuer's shares reflects an unbiased prediction of the cash flows to be received by the holder. Thus, the price of a stock trading in such a market should fully discount for the extent to which some feature of an issuer's corporate governance reduces this expected cash flow. At first take, this observation would appear to suggest an issuer's corporate governance should have no effect on the extent of foreign ownership. For an issuer with poor corporate governance, the market would expect the portfolio holder of its shares to receive a lower future cash flow discounted to present value than would be expected of an issuer with good governance. Thus the share price of the poor governance issuer would be commensurately less than that of the good governance issuer. As a consequence, this reasoning would go, the share of the poor governance issuer is an equally attractive purchase: the lower price would make up for its lower value.

This first take on the problem, however, ignores a fundamental precondition. A firm will never have portfolio investors of any kind—foreign or domestic—unless these initial control shareholders decide to sell some of their shares to such investors, or to direct the firm to issue and sell shares to such investors. Someone has to start a firm and so all firms inevitably start out their existence with only control shareholders and no portfolio shareholders. The control shareholders will not make the decision to effect a transaction

that results in portfolio shareholders unless the portfolio investors are willing to pay a share price sufficiently high that controlling shareholders find the transaction to be worthwhile. Thus, to determine a firm's potential for having portfolio shareholders, we need to examine what portfolio investors are willing to pay and how this interacts with what control shareholders would think is a sufficiently high price to make a sale to the portfolio investors worthwhile.

4.1.1 The Problem of Information Asymmetries

As just noted, the value of an issuer's shares to portfolio investors is determined by the discounted present value of the distributions, including dividends, that the portfolio holder of each such share can expect to receive in the future. The value of these distributions in turn depends in important part on the extent to which the issuer's future discounted-to-present-value net cash flow is expected to be diverted to benefit just the control shareholders. Such a diversion can occur in either of two ways. In one, the firm's assets are deployed in a way that would maximize the value of their expected future cash flow, but the control shareholders give to themselves a greater than pro rata distribution of cash, or obtain the equivalent amount of cash by directly or indirectly entering into a contract with the firm on terms more favorable to them than market terms. The other way involves the control shareholders operating the firm in a way that benefits them, but does not maximize the discounted-to-present-value expected future cash flows of the firm.³⁹

(p. 801) A sale to portfolio investors by a firm's control shareholders, or by the firm they control, will only be worthwhile to the control shareholders if the price that the portfolio investors are willing to pay is greater than the control shareholders believe, based on what they know, to be the value to them of simply retaining their ownership position as it is. The prospect of diversions by a firm's control shareholders would not affect this calculation, however, if, unlike the real world, the control shareholders and portfolio investors were equally well informed as to what size the diversions will be. Larger expected diversions would mean that control shareholders would enjoy more in the way of the private benefits of control in the future, but they would pay for this benefit now in terms of a commensurately lower price for the shares sold to portfolio investors. The fundamental problem is that control shareholders are in fact better informed about the expected size of these future diversions than portfolio investors.

This asymmetry of information creates a classic "lemons" situation. Consider two types of issuers. The first type has "high-quality" shares. Based on the better information possessed by the controlling shareholders of these high-quality issuers, the expected value of the distributions of these shares is high because they plan to engage in little or no diversion. The second type of issuer has "low-quality" shares. Based on the better information possessed by the controlling shareholders of these low quality issuers, the expected value of the distributions of these shares is low because the planned diversions by these issuers' control shareholders are large. Because the portfolio investors have less information, they are unable to distinguish between the two types of shares.

The Rise of Foreign Ownership and Corporate Governance

As George Akerlof showed in his classic 1970 article concerning adverse selection, if nothing alters this asymmetric information situation, the low-quality version of any item of sale can drive the high-quality version out of the market.⁴⁰ Suppose, in our example, that potentially there were an equal number of high-quality and low-quality shares offered in the market. Given that buyers cannot distinguish between what in fact are the high-quality shares and the low-quality ones, the price they rationally will be willing to pay will be the same for all the shares: the average of the expected values of the high-quality shares and the low-quality shares. This is because there would be a 50% chance a purchased share was (p. 802) from a high-quality issuer and a 50% chance that it is from a low-quality issuer. This result would not be an equilibrium solution, however. The blended price that portfolio investors are willing to pay may well not make a sale worthwhile for the controlling shareholders of the high-quality share issuers. If so, the controlling shareholders of the high-quality issuers would decide not to offer their shares at all. The potential portfolio investors would then know that only the low-quality shares would be available and the shares would be priced in the market accordingly.

Now imagine a range of issuers in terms of their share qualities, with the worst, because of some mix of poor expected underlying cash flow and diversions by control shareholders, that are worth nothing. The highest-quality issuers, as just described, would not enter the market in the first place. Now the next-highest-quality issuers would be in the same position as the highest-quality issuers would have been if they had stayed in the market. This is because the price offered to them would be an average of the expected value of these next-highest-quality shares and the values of the shares of all the lower-quality issuers. So now these next-highest-quality issuers would not enter the market. Moving down the list in terms of the quality of an issuer's shares, this story can be repeated again and again. In the end, the market unravels completely and there are no share offerings to portfolio investors.

4.1.2 The Incentives for Control Shareholders to Create Portfolio Holders

If this information asymmetry problem can be solved, however, the control shareholders of a firm have a number of motives for selling to, or causing the firm to sell to, portfolio investors. To start, when the control shareholders are the sellers, they are able to diversify their investment portfolios by taking the cash received from the sales and investing it elsewhere. By doing so, they can have a reduced level of risk for any given level of expected return, as discussed earlier. Further, the existence of an active trading market in the shares of the firm makes the remainder of their holdings more liquid, especially when sold in small chunks. Finally, the prices of the firm's shares in an efficient secondary trading market can serve as useful guides to the firm's management. A firm's managers ordinarily know more about what is going on within the firm than does anyone else, but they are not so expert relative to others with respect to many features of the outside environment within which the firm operates. Prices in an efficient market very usefully incorporate all publicly available public information concerning these features of the outside environment. Thus market prices incorporate better predictions of the effects of these fea-

tures of the outside environment on the firm's future cash flows than the parallel predictions of the managers.

4.1.3 Overcoming Information Asymmetry Problems and the Role of Corporate Governance

A number of market-based antidotes to the information asymmetry problem allow some sales to portfolio investors to occur that would otherwise be blocked by the asymmetry problems described above.⁴¹ Each of these market-based antidotes to the information (p. 803) asymmetry problem has significant limitations, however.⁴² Mandatory disclosure law can supplement these market-based antidotes and allow more such sales to occur. So too can improved corporate governance, which is key to the theoretical story of how corporate governance can affect the level of foreign ownership.

4.1.3.1 Market-Based Antidotes to the Information Asymmetry Problem

The high-quality issuers, in our example above, may be able to credibly "signal" facts demonstrating their quality. This is so, however, only if making a false claim as to quality would not be worthwhile to the controlling shareholders of any issuer that is not high quality because of legal liability or loss of reputation. To avoid these costs, the low-quality issuers would remain silent rather than falsely claiming facts suggesting that they are high quality. The market then would infer from their silence that they are low quality.⁴³

A high-quality issuer can also sell its shares to an investment bank that then resells them to portfolio investors at a premium that investors are willing to pay because of the bank's involvement. The bank will be able to sell the shares at this premium price if the bank has the capacity to distinguish between high- and low-quality issuers and has a reputation for honesty that the bank, as a repeat player, finds it worthwhile to retain.⁴⁴

To the extent that the quality of an issuer can be demonstrated by accounting information concerning assets, liabilities, and financial performance to date, a high-quality issuer can also distinguish itself by having its accounts certified by an outside accounting firm with a reputation worth preserving.⁴⁵

4.1.3.2 Mandatory Issuer Disclosure at the Time of an Offering to Portfolio Investors

Effective mandatory disclosure at the time of a public offering of shares can address aspects of the asymmetry directly and, because each of the market-based solutions has limitations, allows additional sales to portfolio investors that the asymmetry problem would otherwise block if only the market-based antidotes were available. Truthful information about an issuer's prior history of diversions, and about the histories of the control shareholders in connection with other business ventures, will narrow the gap between control shareholders and portfolio investors in terms of their respective abilities to predict the level of future diversions.⁴⁶

(p. 804) 4.1.3.3 Corporate Governance

In this information asymmetry story, corporate governance is also relevant to the level of portfolio investor ownership and hence the possibility of foreign portfolio investor ownership. A principal focus of corporate law is the prevention of diversions. Much of modern corporate law has been built around this goal. The goal is reflected not only in rules requiring that dividends and distributions be made pro rata, but also in the basic fiduciary rules policing non-arm's-length transactions involving insiders and the corporation.⁴⁷ The more limited the possible extent of such diversions, the less important is the existence of information asymmetry between the controlling shareholders and portfolio investors concerning what the actual expected level of diversion will be. The information advantages of the controlling shareholders as to the expected extent of diversions will matter less since the maximum possible amount of diversion is less. The less important the asymmetry, the fewer stock sales are blocked that would have occurred absent the asymmetry.

The prospect that an issuer will be subject to an effective ongoing mandatory issuer disclosure regime—a regime that requires an issuer to regularly update its disclosures—can also reinforce the constraints that corporate law and reputational concerns put on diversions. Diversions are less likely to occur if control shareholders know that the diversions will subsequently become publicly known.⁴⁸ There is a general recognition that transparency is necessary for good corporate governance.⁴⁹

These restraints on diversions arising from corporate law and from an effective ongoing periodic disclosure regime are especially important in the case of an issuer with no existing portfolio investors and whose controlling shareholders do not have significant involvement in prior business ventures. With such an issuer, disclosure at the time of the offering will do little to reduce the information asymmetry between the control shareholders and potential investors concerning the expected extent of future diversions. The conclusion that these diversion constraints are especially important for IPOs of first-time entrepreneurs should be highlighted because a public market for issuers of this kind is important for the dynamism of an economy,⁵⁰ which can contribute to economic growth even for emerging countries.

(p. 805) 4.1.4 Conclusion and Some Terminology

In sum, corporations inevitably start their lives with control shareholders. For most countries of the world, control shareholding is the preponderant ownership structure even for their older, larger firms.⁵¹ In many such firms, the control shareholders would enter into, or direct their firms to enter into, transactions that would result in a larger portion of the firm's shares being held by portfolio investors if it were not for adverse selection's negative effect on what potential offerees would be willing to pay. Subjecting the firm to more effective corporate law constraints on diversions by control shareholders reduces this impediment to greater portfolio holdings. So does subjecting the firm to a more effective ongoing periodic disclosure regime. Thus, where one or both of these diversion reduction constraints are mandatorily imposed on the firm pursuant to its home country's legal system, or where a firm is otherwise individually subjected to one or both of these con-

The Rise of Foreign Ownership and Corporate Governance

straints, we would expect, all else equal, that a greater portion of the firm's shares would be held by portfolio investors.

The remainder of this chapter will refer to both corporate law constraints on diversions and obligations to provide ongoing disclosure as "diversion constraints." This terminology will be used whether the constraint or obligation is imposed by a firm's home country's laws or by the firm's individual actions. The expression "more effective diversion constraints" will be applied to the situation where the rules constituting a diversion constraint stay the same but are enforced in such a way that the frequency of compliance is increased. It will also be applied to the situation where the rules constituting a diversion constraint are tightened but the frequency of compliance with new rules is not any greater than the frequency of compliance had been with the old, laxer rules.

4.2 More Effective Diversion Constraints Leading to Greater Foreign Ownership

There is a strong argument, based on a growing empirical literature, that being subject to more effective diversion constraints leads on average to a greater portion of a firm's shares being held by foreign investors. As elaborated below, this argument suggests that the continued lessening of the non-corporate-governance impediments to global shareholding is acting as a catalyst that is resulting both in increasing foreign ownership and in firms around the world being subject to increasingly effective diversion constraints.

4.2.1 Implications from the Discussion of Portfolio Supportive Corporate Governance

In the preceding discussion, we concluded that firms with more effective diversion constraints can be expected to have a higher proportion of their shares on average held by portfolio investors. This conclusion gives rise to two important implications.

(p. 806) First, the weakening of the non-corporate-governance impediments to foreign ownership discussed in section 3 increases the pool of the firm's potential portfolio investors. As a result, more situations arise where, absent the impediments created by adverse selection, both the firm's control shareholders and portfolio investors would find advantageous a transaction that increases the portion of the firm's shares held by portfolio investors. For any firm where this is the case, its control shareholders would, with the weakening of these impediments, have the incentive to adopt more effective diversion constraints. Using the same logic, a country with a relatively poor-quality corporate law or mandatory ongoing securities disclosure regime would have incentives to strengthen each. Individual firms, and countries as a whole, tend to respond to incentives.⁵² When they respond to these incentives for more effective diversion constraints, the portions of firms' shares held by portfolio investors, including in particular those of foreign portfolio investors, should increase.

Second, some countries that start with a relatively ineffective corporate law or mandatory ongoing periodic disclosure regime will decide to strengthen their corporate law or dis-

The Rise of Foreign Ownership and Corporate Governance

closure rules for reasons independent of the weakening of the non-corporate-governance-related factors impeding global markets that is discussed in section 3.⁵³ With the weakening of these impediments, however, this strengthening of the country's corporate or securities disclosure laws will lead to a greater increase in the proportion of shares held by foreigners in the country's firms than would have occurred otherwise.

(p. 807) Keeping in mind these two implications, we can now move on to consider what the existing empirical literature suggests about whether more effective diversion constraints in fact lead to increased foreign ownership and the role played in this process by the weakening of the non-corporate-governance-based impediments to the global markets for equities.

4.2.2 Strong Effective Domestic Corporation and Securities Disclosure Laws and the Size and Depth of Capital Markets

There is evidence that countries with stronger corporate-governance rules and enforcement have substantially larger equity markets as a proportion of their GDPs and more listed firms.⁵⁴ A large, deep capital market relative to a country's GDP suggests that more of its economy is composed of firms with a significant portion of their shares held by portfolio investors. Thus, this evidence suggests a link between the effectiveness of a country's diversion constraints and the proportion of its firms' shares held by portfolio investors. Even more to the point, there is also evidence that countries with stronger corporate governance have a lower concentration of ownership.⁵⁵ These two kinds of evidence are relevant to the issue under examination—whether more effective diversion constraints lead to greater foreign ownership—because, as we have seen, for a firm to have a significant portion of its shares held by foreign portfolio investors, a precondition is that a significant portion of its shares be held by portfolio investors more generally.

4.2.3 Strong Effective Domestic Corporation and Securities Disclosure Laws and the Extent of Foreign Ownership

Evidence that laws imposing more effective diversion constraints lead to larger, deeper domestic capital markets logically suggests that such laws facilitate greater foreign, as well as domestic, portfolio ownership of a country's firms. There is, however, more direct evidence. The starting point is a substantial body of scholarship showing a correlation between indicators of the effective strength of a country's corporate and securities laws and the extent of foreign ownership of its corporations, a correlation that holds even after controlling for (p. 808) the level of a country's economic development.⁵⁶ Concluding that this correlation is the result of effective laws leading to more foreign ownership, however, requires ruling out that the correlation is instead primarily the result of the reverse causal pathway, i.e., that a larger percentage of foreign shareholders in a country's firms leads to the country adopting more effective diversion-constraining laws. There is a good case for ruling out this possible alternative explanation, however.

As the data at the beginning of this chapter suggests, for most firms in the world, home bias means that at most only a minority of the shareholders of a country's firms are foreign. These foreign shareholders are unlikely on their own initiative to push through legal

The Rise of Foreign Ownership and Corporate Governance

reforms abroad. As foreigners, they do not tend to wield much influence within the political systems of a firm's home country. Moreover, their stakes tend to be smaller and more disorganized than those of the opposing control shareholders. Thus, it seems unlikely that the correlation between more effective laws constraining diversions and foreign ownership is explained by the foreign owners prompting the legal changes.⁵⁷

4.2.4 The Effectiveness of Individual Firm Diversion Constraints and the Extent of Foreign Ownership

Earlier discussion suggested that being subject to effective home-country corporate and securities laws is only one way for a firm to persuade investors that future diversions will be limited, and thereby resolve the adverse selection problem that impedes ownership of its shares by portfolio investors.⁵⁸ One alternative way would be for the firm to subject itself to one or more of a variety of ongoing transparency enhancing devices. These devices include credibly pledging to comply with a private disclosure code or to obtain certified financials on a periodic basis. They would also include listing on a stock exchange that requires certain ongoing disclosures or that requires registration with a foreign securities (p. 809) disclosure regime that imposes such disclosure requirements on the firm. Another alternative would be to include provisions in the corporate charter that would reduce the chance of diversions.

There is considerable empirical evidence that there is a correlation between such individual firm efforts at good governance and greater foreign ownership.⁵⁹ Again the question arises as to whether this correlation is at least in part the result of good individual firm corporate governance leading to more foreign ownership, or instead is primarily the result of the reverse causal pathway, i.e., that a higher proportion of foreign shareholders leads a firm to adopt better corporate governance. Here we cannot rule out so easily this second reverse causation explanation. The fact that shareholders are foreign puts them at no particular disadvantage in the individual firm's governance process, unlike their situation with respect to the national political processes of a firm's home country. As discussed below, there is empirical evidence that foreign shareholders do in fact have at least some influence on firm governance.⁶⁰

Theory, however, suggests that the correlation would be due at least in part to more effective diversion constraints at the individual firm level leading to greater portfolio share ownership, which presumably would include increased foreign ownership.⁶¹ Fortunately, also, the much (p. 810) larger number of observations allowed by using firm-level data, as compared to using country-level data, permits the use of econometric techniques that can help disentangle the question of causal direction. For example, Covrig, Defond, and Hung, using fixed effects regression techniques, show that foreign ownership increases after a firm switches from local to international accounting standards ("IAS").⁶² Khanna and Palepu reach a similar conclusion in an investigation of the relationship between foreign ownership and measures of transparency of publicly traded firms that are affiliated with business groups.⁶³ Because the affiliated firms in a business group are all controlled by the same owners, they are particularly vulnerable to diversions. These common owners can use their control to have one affiliate, for below-market consideration, enter into a

transaction with another affiliate in which the owners have a larger interest, thereby benefiting the owners at the expense of the portfolio shareholders of the first affiliate. Further, due to the possibility of highly frequent non-arm's-length transactions among a group's affiliates, they have a particularly high potential of being non-transparent in their accounts. As evidence that more transparency attracts foreign investors, Khanna and Palepu find that after India, in the early 1990s, lifted a number of provisions that had been preventing or discouraging foreign ownership of shares in Indian corporations, affiliates of business groups that were more transparent displayed a larger gain in their percentages of foreign ownership.⁶⁴

4.2.5 Bonding to Better Governance by an Offering Abroad or Cross-Listing on a Foreign Exchange

A number of scholars have suggested that one way that an individual firm from a country with weak or ineffective corporate-governance laws can impose on itself a stricter regime is to conduct a public offering in, or cross-list on an exchange located in, a country that imposes on the firm the host country's own stricter regime.⁶⁵ Most of this "bonding" literature refers specifically to a public offering or cross-listing in the United States, which is generally believed to have as strict securities disclosure laws as any country. The discussion above suggests that firms that impose on themselves more effective diversion constraints will attract more foreign investors. So, to the extent that such a US offering or cross-listing by a foreign firm really does result in the firm being subject to more effective diversion constraints, the availability of these tools has played a role in the rise in foreign ownership.

How effective, though, is a US public offering or cross-listing as a bonding technique? Answering this question requires both an examination of the theory as to how these actions might work as bonds and a review of the related empirical literature.

(p. 811) 4.2.5.1 How Bonding Might Work and its Limitations

As discussed above,⁶⁶ any foreign issuer that does a first public offering in the United States or cross-lists its shares on a US exchange is required to file an initial disclosure statement, after which the issuer becomes subject to the Exchange Act's ongoing periodic disclosure obligations.

Several things should be noted at the outset about a US public offering or cross-listing as a bonding device. First, the applicable US securities laws do not impose any obligations on the controlling shareholders of the issuer undertaking the offering or cross-listing to refrain from engaging in diversions. Rather, these acts of bonding work, to extent that they are effective, by the threat of US legal sanctions if the bonding firm misstates facts in its disclosure filings or omits required information. Thus, a controlling shareholder contemplating a diversion would know that if it were to go ahead, it either would need to comply with the disclosure rules intended to reveal such a diversion or face the threat of legal sanctions for non-compliance with these rules.

The Rise of Foreign Ownership and Corporate Governance

Second, whether a firm does a public offering in the United States or just cross-lists there, it is the periodic-disclosure obligation that does the main bonding work. The initial Securities Act or Exchange Act filing may help disclose the existence of past diversions and hence, by revealing the character of the control shareholders, help investors predict the level of future diversions. However, it does nothing to deter future diversions other than to provide baseline information that makes the subsequent periodic disclosures more meaningful.

Third, a US public offering or cross-listing is only effective as a bonding device to the extent that the control shareholders reasonably expect to be hurt if they violate their disclosure obligations. For a number of reasons, most foreign issuers and their managers and control shareholders have considerably less to fear from a violation than do their US counterparts. Many foreign issuers and their managers and control shareholders have little or no presence in the United States and hence, relative to their US counterparts, face much less exposure to the criminal, and even the civil, sanctions arising from a violation of their US disclosure obligations. In addition, there is some evidence that the SEC is unwilling to devote as much in resources to prosecuting cases involving foreign issuers.⁶⁷ Moreover, even the control shareholders of foreign issuers that fully comply with their SEC mandates have less to fear from these mandates because they are not required to disclose as much, or as frequently, as their US counterparts.⁶⁸

Finally, the SEC and the US Supreme Court have each taken actions in recent years to reduce the effectiveness of foreign-issuer bonding. In 2007, the SEC promulgated Rule 12h-6, whereby the SEC has provided a means of exiting the periodic disclosure obligations for any foreign issuer whose average trading volume in the United States was less than 5% of its worldwide trading (p. 812) volume.⁶⁹ A large portion of the world's publicly traded issuers would not have this large a US trading volume if they did a US public offering or cross-listed on a US exchange, in which case neither of these acts would constitute any real kind of bond since exit would be easily available soon thereafter. Even where the US trading volume would be greater than 5% immediately after the offering or cross-listing, investors in many cases could not be confident that they would not fall below 5% in the future.

In 2010, in *Morrison v. Nat'l Austl. Bank*,⁷⁰ the Supreme Court concluded that §10(b) reached only situations where the securities were listed on a US exchange or where their purchase or sale was effected in the United States.⁷¹ As discussed, this ruling had a major impact on fraud-on-the-market class actions against foreign issuers.⁷² Under *Morrison*, at least for foreign issuers that do their US equity listing in the form of American Depositary Receipts (ADRs), which is the predominant approach, any damages or settlement payments arising from such an action are confined to only the portion of the foreign firm's equity that is purchased in US trading, often only a small fraction of the total, whereas previous lower-court decisions suggested that a firm could sometimes be liable to all purchasers worldwide.⁷³ US issuers, in comparison, continue to be liable to all purchasers who suffer these losses from their purchases. Thus, for the typical foreign firm

The Rise of Foreign Ownership and Corporate Governance

listed on a US exchange, this civil damages cause of action has a smaller, often much smaller, capacity to deter misstatements.

4.2.5.2 Empirical Evidence that a US Offering or Cross-Listing Constitutes an Effective Bond

A number of studies document that when a foreign firm cross-lists in the United States, its stock price experiences a jump up in price.⁷⁴ Moreover, the weaker the disclosure regime of the firm's home country, the bigger the jump.⁷⁵

What, though, causes this price jump? Theory suggests three possibilities, none mutually exclusive. First, cross-listing may lower the rate at which the market discounts the future cash flows expected to be received by shareholders. The discount rate decreases in part because the cross-listing reduces the segmentation between the market of the firm's home country and the US market, enlarging the number of investors that can conveniently trade (p. 813) in its shares with the portfolio risk reduction that transnational investing allows. It also decreases in part because the improved disclosure resulting from the imposition of the US disclosure regime increases the stock's liquidity by reducing market maker's adverse selection concerns. Discounting expected future cash flows at a lower rate increases the present value of the right to receive these cash flows and hence the stock will trade today at a higher price. This is so even if the cross-listing is not expected to change the future behavior of the firm and its control shareholders and hence not expected to increase future cash flows received by the portfolio shareholders.

Second, the price jump may occur because the cross-listing leads the market to expect that the future cash flows received by the firm's portfolio holders will be greater than previously expected because the cross-listing shows the firm's willingness to submit to greater scrutiny its claims of a bright future. In other words, the decision of the control shareholders to cross-list is a signal that makes these claims more credible and hence leads to an increase in the outside market's perception of the expected level of the firm's future cash flows to portfolio holders. Thus, again, the price would increase even if those who are most knowledgeable do not expect the cross-listing to change the future behavior of the firm and its control shareholders, and hence do not expect an increase in actual cash flows to the portfolio shareholders.

A third possible reason for the price jump is the focus of the larger discussion here, i.e., bonding. This would be the idea that the greater scrutiny of the firm permitted by improved disclosure is expected by the market to change firm and control shareholder behavior in a way that will increase actual future cash flows to the firm's portfolio shareholders.

We can label these three potential explanations, respectively, the discount rate, signaling, and bonding explanations. The prospect of a price jump, whatever the explanation, is presumably an important motivation for a firm to cross-list. Determining, however, whether bonding is playing a significant role in this price jump is tricky because each of three explanations shares with the others either the same driving factors or ones that are at least

The Rise of Foreign Ownership and Corporate Governance

highly correlated with each other. Disclosure improvement is the driving factor behind both the bonding and signaling explanations as well as behind the liquidity improvement part of the discount-rate explanation. The weaker the home country's disclosure regime, the greater will be the disclosure improvement from cross-listing. The driving factor behind the other part of the discount rate explanation is that the access to the US capital market helps make up for shortcomings in the size and functional quality of the home country's capital market and its lack of integration into the larger global capital market. The greater these home country shortcomings, the more cross-listing can help. The extent to which cross-listing can help in this way is likely highly correlated with the extent to which it improves disclosure. This is because home countries with smaller, more poorly functioning domestic capital markets that are more distinctly separate from the larger global capital market tend also to have weaker disclosure regimes. Thus the driver of this second part of the discount-rate explanation, though not the same as the driver of the other explanations, is highly correlated with it.

Some studies suggest that there is at least more at work in the price jump than the capital market improvement part of the discount-rate explanation. Reese and Weisbach, for example, find that firms from weak diversion-constraint countries are more likely to engage in equity offerings after cross-listing in the United States than firms from stronger (p. 814) diversion-constraint countries, yet the offerings tend to occur outside the United States.⁷⁶ This suggests that the price gain from the cross-listing carries over to these offerings in markets without the size and functional quality of those in the United States. Hail and Leuz use changes in analysts' predictions of future cash flows to isolate the typical foreign issuer's US cross-listing's effect on the discount rate from the market's expectations of the firm's future cash flows (which could be the result of the signaling effect, the bonding effect, or both). They find that on average a change in cash flow expectations explains about half the price jump.⁷⁷

While these studies show that there is some effect from the bonding or the signaling effect, they do not allow us to distinguish between the two effects in order to see if the bonding effect in fact plays a role. There is at least some indirect evidence that bonding does play a role, however. Studies by Doidge⁷⁸ and by Bris, Cantale, and Nishiotis⁷⁹ each focus on firms with two classes of stock, where both classes have the same cash flow rights per share, but one class has higher voting rights per share and, as a result, trades at a higher price. Each study finds that the price ratio of the high voting stock to the low voting stock decreases significantly after a US cross-listing.⁸⁰ In each study, the authors attribute the high voting stock's premium at least in part to the ability of the control to engage in diversions and interpret the decline in this premium to the cross-listing imposing new constraints on such diversions.⁸¹ It should be noted that the price for the high voting shares used in the study is of course the price at which the publicly held ones trade. The holders of these shares are not part of a control group that can steer diversions in their direction. However, if the current control group does not have a majority of the share votes, the publicly held high voting shares still have extra value that is related to the ability of control to extract diversions. This is because their holders can sell to someone who is trying to assemble a new control group or who is trying to reinforce the

power of an existing one. Lel and Miller focus on the effect of cross-listing on the likelihood that a CEO would be fired in the face of disappointing financial results.⁸² They find that cross-listing increases this likelihood more for firms from weak diversion-constraint countries than from strong ones, suggesting that cross-listing leads to better governance.⁸³

4.2.5.3 Effects of Cross-Listing Independent of its Bonding Effect

A US cross-listing, independent of its effectiveness as a bonding device, will tend to promote foreign ownership because it reduces the cost, inconvenience, and regulatory hurdles associated with the purchase by US investors in the cross-listed foreign issuer. As discussed earlier, the availability of US cross-listings could play a larger role in promoting foreign ownership if the United States gave the issuer the option of imposing on itself the Exchange Act's (p. 815) ongoing periodic disclosure obligations, but did not require the issuer to do so. This optional approach would continue to allow firms to use these obligations as a bonding device, but would reduce the cost of cross-listing for firms that do not wish to bond.

4.3 Greater Foreign Ownership Leading to More Effective Diversion Constraints

There is also considerable evidence that a larger portion of a firm's shares being held by foreigners leads to the firm being subject to more effective diversion constraints. This evidence suggests that the continued lessening of the non-corporate-governance impediments to global shareholding is acting as a catalyst in a second way that is resulting in both increasing foreign ownership and better governance around the world.

4.3.1 How Greater Foreign Ownership Could Lead to More Effective Diversion Constraints

As discussed above, it is unlikely that if a country's firms have a larger proportion of foreign owners, there will be pressure on its government to enact and enforce stricter corporate and securities disclosure laws.⁸⁴ The idea that foreign owners might lead individual firms to adopt more effective diversion constraints is much more plausible, however. So is the idea that the presence of foreign owners can be a diversion constraining force in and of itself.

4.3.1.1 The Extent of Foreign Ownership

It is worth noting at the start that many of the larger corporations from countries not having the most effective constraints on diversions have a considerable portion of their shares held by investors from countries that do. Even more than a decade ago, Anglo-Saxon institutions held an average of 35% of the shares of the largest 40 firms listed on the Paris Bourse and 41% of large Dutch companies.⁸⁵ Foreign investors more generally held over 30% of shares of companies listed on Mexico's stock markets.⁸⁶ However, even where foreign holders have smaller percentages than these, as would be the case with smaller firms in continental Europe and most firms in the developing countries, there are

The Rise of Foreign Ownership and Corporate Governance

still reasons, as discussed below, why they might have an influence on corporate governance.

4.3.1.2 The Special Role of Foreign Investors

Foreign shareholders and domestic non-control shareholders have the same interest in preventing diversions by a firm's control shareholders because, on per share basis, they each lose equally from such diversions. Foreign holders are more likely to act on this interest, however. To start, the foreign holders from strong corporate-governance countries may bring with them a greater familiarity and experience with the kinds of diversion constraints that (p. 816) firms can impose on themselves, and a greater sense that diversions by control shareholders are an improper way of doing business. They and their agents are also less likely than domestic shareholders and their agents to be enmeshed in direct or indirect relationships with a firm's control shareholders that dissuade them from acting to prevent diversions.

The concentration of a country's equity holdings in the hands of institutional investors, characteristic of such wealthy good-governance jurisdictions as the United States and the United Kingdom, also makes holders from these countries more prone to act. This is because larger holders get proportionally greater gains for their efforts, while small holders rationally tend to freeride.

There is evidence that foreign shareholders from strong corporate-governance countries do in fact attempt to cause the adoption of stronger diversion constraints by the foreign firms in which they invest that are from countries with weaker corporate-governance legal regimes and traditions. For example, the California Public Employees Retirement System ("CalPERS") adopted a variety of corporate-governance standards that it urges upon foreign issuers in which it has invested,⁸⁷ and Fidelity has been reported as more aggressive on governance issues in Europe than in the United States.⁸⁸ There is also significant evidence of interventions by hedge funds from the United States and the United Kingdom in the governance of firms from continental Europe.⁸⁹

4.3.1.3 Methods of Influence

Willingness to act and having influence are two different things. The range of available tools for influence depend on whether the control shareholders have over 50% of the share votes. If they do have more than 50%, it is impossible for foreign shareholders to affect the firm's corporate governance or behavior directly through the way they cast, or threaten to cast, their own votes. They can nevertheless still exercise influence through the threat that if the controlling shareholders fail to heed the foreign shareholders' desires, the foreign shareholders will sell their shares, with a resulting price drop. The reason that the control shareholders may respond to this threat goes back in part to the reasons that the control shareholders wanted the firm to have public shareholders in the first place. All else being equal, they prefer the firm's shares to trade at a higher than a lower price.⁹⁰ The sale of a significant number of shares, even as little as 5-10%, is likely to prompt a lower price, particularly if the market becomes aware that foreign institutional investors, who are likely to be particularly informed about the corporate-governance situ-

The Rise of Foreign Ownership and Corporate Governance

ation at the firm, have decided (p. 817) to get out. Indeed, because foreign institutional investors are particularly informed, just the public knowledge that control shareholders refused to make changes after one or more such institutions expressed dissatisfaction may result in a share-price drop.

The range of tools of influence expand if the control shareholders have less than 50% of the votes. Then the foreign shareholders have the possibility of providing, at least at the margin, the votes needed to force a change in governance or the elimination of the managers subservient to the control shareholders. Foreign institutional investors, by leading a movement that threatens such a vote, may be able to persuade the controlling shareholders to adopt stronger diversion constraints or simply to divert less without the necessity of a vote actually taking place.

If the control shareholders have less than 50% of the votes, there is also always the possibility of a hostile takeover. Again, the foreign shareholders can be, at the margin, the deciding factor in whether such a takeover occurs. Moreover a foreign institutional investor may be in a better position than any other shareholder credibly to communicate to a potential foreign acquirer the financial gain that could be attained from such a takeover in situations where the network of relationships in the firm's home country makes unlikely a domestic acquirer coming forward. In most situations, the chances are probably relatively small that a foreign institutional investor could help instigate a successful hostile takeover. A domestically instigated takeover attempt that succeeds because of the votes of foreign investors is probably also infrequent. Even so, the stakes for control shareholders in avoiding such a disaster are so high that they may well give some weight to the preferences of the foreign institutions and other foreign investors in order to avoid the risk.

4.3.2 Empirical Evidence

A number of studies provide empirical evidence that greater foreign ownership in fact leads a firm to being subject to more effective diversion constraints. Perhaps the most thorough is the 2011 study by Aggarwal, Erel, Ferreira and Matos ("AEFM").⁹¹ Their starting point is their finding of a strong positive relation between foreign institutional ownership and a measure of a firm's quality of governance.⁹² AEFM conclude that there is in fact a causal pathway leading from greater foreign institutional ownership to improvements in corporate governance.⁹³ They base this conclusion on the use of fixed effects regressions showing a statistically significant positive relationship between a change in foreign ownership and a subsequent change in measures of good corporate governance.⁹⁴ Use of these fixed-effects techniques also rules out the possibility that there is not some other characteristic of the sampled firms—one that correlates with both the extent of foreign ownership and the measure of firm corporate governance—that is the real driver of the observed relation between the two.⁹⁵

AEFM's conclusion that foreign institutional ownership leads to better governance is reinforced by a few of their other findings. To start with, the relationship between foreign institutional ownership and the good governance measure is more intense for firms whose

home (p. 818) countries do more poorly on a measure of a good corporate-governance legal regime.⁹⁶ This is exactly what one would expect to see if greater foreign institutional ownership does in fact affect governance: such ownership has more room to make a difference where other constraints on control shareholders are weaker. Two other of their findings relate to governance outcomes, as opposed to constraints. One is that where foreign ownership is greater, the firm is more likely to replace its CEO if it has recently experienced poor market-adjusted stock returns.⁹⁷ The other is their conclusion that there is a causal pathway leading from greater foreign institutional ownership in a firm to a higher Tobin's Q, i.e., the ratio of a firm's stock market valuation to the book value of its assets.⁹⁸ Tobin's Q is considered a measure of how much management has been able to accomplish for the benefit of portfolio shareholders given the resources that shareholders have provided management to work with. AEFM base this Tobin's Q conclusion on the results of fixed-effects regressions showing a statistically significant positive relationship between a change in foreign ownership and a subsequent change in Tobin's Q.⁹⁹

A number of other studies are, in one way or another, supportive of the idea that greater foreign ownership leads to better governance. Khanna and Palepu, for example, find that in 1994, following India's early-1990s removal of its very substantial barriers to foreign ownership, Tobin's Q had risen more for firms that had achieved higher foreign ownership than it had for firms that had only achieved low foreign ownership.¹⁰⁰ Liang, Lin, and Chin find that in Taiwan, greater foreign ownership is associated with greater voluntary disclosure as measured by frequency of management conference calls.¹⁰¹ They in turn find that these calls contained meaningful information, as measured by the increase in trading activity immediately after.¹⁰² Using an instrumental variable approach, they conclude that the direction of causation is from foreign ownership to more conference calls.¹⁰³ Ferreira, Massa, and Matos find that the greater the percentage of foreign institutional ownership, the more likely it is that the firm will be involved in a cross-border merger and that this effect is stronger when (p. 819) the firm's home country corporate-governance legal regime is weaker.¹⁰⁴ Using an instrumental variable approach, they conclude that the direction of causation runs from foreign institutional ownership to the propensity to be involved in a cross-border merger.¹⁰⁵ Thus, to the extent that the potential of being subject to a cross-border merger has a disciplining effect on the control shareholders (either as an incentive or as a threat), greater foreign ownership will lead to more such discipline by enlarging the likely pool of merger partners.¹⁰⁶ Finally, Iliev et al., in a study of the votes of US institutional investors in non-US firms, find that the larger the percentage of shares held by control shareholders, the more likely these institutions will be to vote against the recommendations of management.¹⁰⁷ Again, this effect is stronger when the firm's home country corporate-governance legal regime is weaker.¹⁰⁸

5 Conclusion

Foreign ownership of publicly traded corporations around the world has increased dramatically in the last few decades. In substantial part, this has been due to the technological and legal changes that have made acquiring and trading shares of issuers from

The Rise of Foreign Ownership and Corporate Governance

abroad much easier and less expensive. Even more important has been the reduction in the cost of obtaining information about the prospects of issuers abroad. Corporate governance has also been involved in this story with the reduction in impediments acting as a catalyst for both the process by which better corporate governance leads to more foreign ownership and the one by which more foreign ownership leads to better corporate governance.

There is considerable evidence that a firm that displays better corporate governance attracts more foreign investors, whether the better governance is the result of being subject to stronger, more effective corporate and disclosure laws imposed by its home country or the result of the firm's individual actions. This evidence suggests that as the pool of potential foreign investors grows with the reduction in the impediments to global share investing, countries with weak corporate and securities laws will have incentives to strengthen them and make them more effective. It also suggests that many firms whose home countries have weak corporate and securities laws will have incentives to undertake their own individual efforts to improve their own governance and disclosure. Thus the reduction in impediments acts as a catalyst that results in both better corporate governance and more foreign ownership. Countries and individual firms may also improve their corporate governance for reasons independent of the incentives created by the reduction in impediments, but the reduction (p. 820) in impediments still means that these improvements will lead to greater foreign ownership than would have been the case without impediments reduction.

There is also considerable evidence that greater foreign ownership in firms from weak corporate-governance jurisdictions leads to better corporate governance. Here too, the reduction in the impediments to a global market for equities appears to have played a catalytic role. Such a reduction leads to more foreign investors purchasing shares in issuers from countries with poor corporate governance even if at the time there has been no improvement in the firms' corporate governance. As the foreign investors acquire a larger portion of the outstanding shares of these issuers, they generate new pressure for governance improvement, both through their share votes and through the threat to sell.

An interesting next step in the study of the relationship between foreign ownership and corporate governance would be to consider what developments in the past few decades can tell us about the future. Even if there were no further advances in information technology, there is substantial room for more "learning by doing" in taking advantage of the recent large decline in the cost differences in acquiring information from abroad versus acquiring information domestically. Thus the trends of the past may indeed be prologue.

⁽¹³⁾ Id.

⁽¹⁴⁾ Real (as opposed to financial) investment is the use of resources such as skilled labor, machinery, bricks, and mortar to create new capacity in a nation’s economy to produce a particular good or service in the future. Financial investment is the acquisition of rights to receive future cash returns: for example, the purchase of a share or bond, the lending of money, or the deposit of money in an interest bearing savings account.

The Rise of Foreign Ownership and Corporate Governance

⁽¹⁵⁾ Theories of individual investment behavior assume that the purpose of saving and investment is to consume the results of the investments at the end of the investment period. Since funds are fungible, whatever the combination of gains and losses on the investments in individual securities that make up the total return, all that counts is the total. Portfolio choice theory tells the investor how to compose a portfolio at the beginning of the investment period that will maximize the expected utility he will derive from the end of period value of this invested wealth (the means of his consumption at that time). If we assume that an investor is a rational maximizer of his expected utility, we can also use the theory to predict his behavior.

⁽¹⁶⁾ Investors are typically assumed to be “risk averse,” i.e., they like expected return and dislike risk. Thus, for any given level of expected return, the lower a portfolio’s risk is, the better. The assumption of risk aversion is in turn derived from an assumption that the investor will derive declining marginal utility from consuming his end-of-period wealth, i.e., compared to the utility he gains from any given level of wealth, one dollar more adds less to his total utility than one dollar less subtracts from his total utility. This leads to risk aversion because, compared to the expected utility from a given level of end of period wealth known with certainty, the chance of one dollar over that level does not compensate for an equal chance of one dollar under that level. Thus, in a choice between two portfolios with differing risk, the investor will choose the riskier one only if it has a sufficiently higher expected return to compensate her for the disutility she associates with the greater risk.

⁽¹⁷⁾ See, William F. Sharpe, “A Simplified Model for Portfolio Analysis”, 9 Mgmt. Sci. 277 (1963).

⁽¹⁸⁾ The larger absolute amount of transnational investment by the investors of the nation with relatively greater savings will be counterbalanced by the smaller absolute amount of such investment by investors in the other nation. If there were a safe asset available and one country’s investor were less risk averse than the other, its investors would hold a larger absolute amount of transnational investment relative to if the investors in the two countries were equally risk averse, but again the proportions would be the same.

⁽¹⁹⁾ See note 8 *supra*.

⁽²⁰⁾ John R. Graham, Campbell R. Harvey, & Hai Huang, “Investor Competence, Trading Frequency, and Home Bias”, 55 Mgmt. Sci., INFORMS 1094 (2005) (investors tend to shy away from investing in foreign securities if their perceptions are that they lack an understanding in the attendant benefits and risks); French & Poterba, *supra* note 1, at 225 (investors, due to lack of knowledge about foreign markets, institutions, and firms, regard investments in foreign stocks as “unfamiliar gambles” and, even when they assign to a foreign and domestic stock identical probability distributions, impute to the foreign stock a special kind of extra (apparently undiversifiable) “risk,” behavior explainable by certain theories of behavioral economics).

The Rise of Foreign Ownership and Corporate Governance

(²¹) This use of the term “speculator” thus covers both (1) persons who buy or sell for the short run on the basis of information (or evidence of the existence of information) that they believe will soon become more widely known, and (2) investors who purchase for the longer run on the basis of what they believe to be their superior analysis of the “fundamentals.”

(²²) This statement may appear inconsistent with the efficient market hypothesis (EMH). The EMH, most broadly stated, is that the market price of a security “fully reflects” all information publicly available at the time in question. See Richard Brealey, Stewart Meyers, & Franklin Allen, *Principles of Corporate Finance* 317–18 (10th ed. 2010) (the prices of established issuers trading in liquid markets reflect all publicly available information). While one of the implications of the EMH is that the ordinary investor is wasting her time trying to pick “winners” on the basis of information she gleans from public sources, a subset of all investors is the persons who initially obtain newly public information and whose trades cause the price to reflect it. Ronald Gilson & Reinier Kraakman, “The Mechanisms of Market Efficiency”, 70 *Va. L. Rev.* 549, 569–70 (1984). This subset may be responsible for a substantial percentage of all transactions and would as a result create a home bias in the pattern of holdings. There are sound theoretical reasons for thinking that speculative investors tend to invest in the securities about which they know the most. See, e.g., Robert C. Merton, “A Simple Model of Capital Market Equilibrium”, 42 *J. Fin.* 483 (1987) (formal model that shows how segmentation occurs when different groups of investors have different information sets, with each group preferring to trade in the securities about which they have the most information). Geographic proximity to the issuer has been shown empirically to be important even within the US market. Joshua D. Coval & Tobias J. Moskowitz, “Home Bias at Home: Local Equity Preference in Domestic Portfolios”, 54 *J. Fin.* 2045 (1999). Prominent financial economists have been suggesting for a long time that this “home country bias” is related at least in part to differences between the information investors possess concerning home country issuers and that concerning foreign issuers. See, e.g., Martin Feldstein & Charles Horioka, “Domestic Savings and International Capital Flows”, 90 *Econ. J.* 314, 316 (1980) (finding a high correlation between marginal increases in domestic savings and in domestic investment and attributing these in part to investors’ greater uncertainty concerning foreign issuers due to less information); Martin Feldstein, “Domestic Saving and International Capital Movements in the Long Run and the Short Run”, 21 *Eur. Econ. Rev.* 129, 130–31 and 148 (1983) (finding substantial imperfections in the international capital market and attributing them in part to investors having a higher subjective variance on foreign returns due to less information); Robert E. Lucas, Jr., “Interest Rates and Currency Prices in a Two-Country World”, 10 *J. Monetary Econ.* 335, 357 (1983) (explaining home bias as the result of the local nature of information, but noting the lack of models that even begin to give an understanding of the relationship); Ian Cooper & Evi Kaplanis, “Home Bias in Equity Portfolios, Inflation Hedging, and International Capital Market Equilibrium”, 7 *Rev. Fin. Stud.* 45 (1994) (taxes and extra costs of foreign investing cannot fully explain the extent of home bias and attributing a substantial portion of it to investor lack of knowledge concerning foreign issuers); Jung-Koo Kang & Rene M. Stulz, “Why is There a Home Bias? An Analysis of

The Rise of Foreign Ownership and Corporate Governance

Foreign Portfolio Equity Ownership in Japan”, 46 J. Fin. Econ. 3 (1997) (similar conclusion based on an examination of the Japanese firms in which foreign investors choose to invest).

(²³) The questions being addressed here apply to the information processing by a whole network of persons—the participants in the “finance process”—whose decisions ultimately determine which real investment projects are implemented. The role played by these different participants—project proponents, firm managers, financial intermediaries, investment advisers and individual investors—and the nature of the rules by which these participants process information is considered in more detail in Merritt B. Fox, *Finance and Industrial Performance in a Dynamic Economy: Theory, Practice and Policy* 92–232 (1987).

(²⁴) For an example in the legal literature of the use of this kind of “reputation theory,” see, e.g., Ronald J. Gilson & Robert H. Mnookin, “Coming of Age in a Corporate Law Firm: The Economics of Associate Career Patterns”, 41 Stan. L. Rev. 567, 578–79 (1989).

(²⁵) World Bank, Imports of Goods and Services (% of GDP), available at <http://data.worldbank.org/indicator/NE.IMP.GNFS.ZS>.

(²⁶) Exchange Act Section 12(a) prohibits any member, broker, or dealer from effecting on a national securities exchange any transaction in “any security” not registered on such an exchange in accordance with the provisions of the Act. Section 13 sets out the registration procedure and provides the statutory basis for the SEC’s system of ongoing periodic disclosure by issuers whose securities are registered under the Act.

(²⁷) Exchange Act Section 15(d). The overall structure of the reach of the US disclosure regime with respect to primary offerings and secondary trading involving the shares of foreign issuers is discussed in detail in Merritt B. Fox, “The Political Economy of Statutory Reach: US Disclosure Rules in a Globalizing Market for Securities”, 97 Mich. L. Rev. 696, 705–17 (1998).

(²⁸) *Morrison v. Nat’l Austl. Bank*, 130 S. Ct. 2869, 2828 (2010).

(²⁹) Merritt B. Fox, “Securities Class Actions Against Foreign Issuers”, 64 Stan. L. Rev. 1173, 1176 (2010).

(³⁰) One might think that an easy solution to this problem arises because, with modern technology, it is no more costly in resource use terms for US investor orders to be sent to a foreign exchange than to be sent to a US exchange. US investors can simply purchase their foreign issuer shares in foreign markets. See section 3.2.3 *infra*. The problem is more complicated than this, however. For reasons inherent in the way that even the most advanced exchanges currently work, most traders, whether individual or institutional, must place their orders through a broker-dealer who is a member of the exchange to which the order is sent. Under current US law, foreign broker-dealers, the ones that would be members of the foreign exchanges, face legal difficulties dealing with US investors located in the United States. US broker-dealer rules could be liberalized so that it

The Rise of Foreign Ownership and Corporate Governance

becomes easier for foreign broker-dealers to deal with US resident investors, but then US investors will not receive the consumer protection that the regulation of US broker-dealers and the regulation of US exchanges provide.

(³²) Fox, *supra* note 29, at 1191–1204; Fox, *supra* note 27, at 730–44.

(³³) Fox, *supra* note 27, at 706 n.21, 714.

(³⁴) Acceptance from Foreign Private Issuers, Securities Act Release No. 8879, Exchange Act Release No. 57,026, 73 FR 986 (Jan. 4, 2008); see especially 17 C.F.R. 230.701(e)(4) and Form 20-F(G)(h)(2) referenced in 17 C.F.R. 249.220f.

(³⁵) *Morrison v. Nat'l Austl. Bank*, 130 S. Ct. 2869 (2010).

(³⁶) *Id.* at 2888.

(³⁷) For a general discussion of fraud-on-the-market suits against foreign issuers and the impact of *Morrison*, see Fox, *supra* note 29, at 1199–1203, 1243–63.

(³⁸) The exception would be foreign issuers that in fact find it beneficial to impose on themselves, as a form of bonding, the strict US disclosure regime. See section 4.2.4. The attraction of a US listing to these issuers can be maintained, however, by making being subject to the US disclosure regime optional, rather than a required part of an offering or cross listing.

(³⁹) Where the number of shares sold to portfolio shareholders is sufficiently large that, after the sale, the shareholders who had control until then no longer possess enough shares to retain control, these former control shareholders are no longer capable of effecting diversions to themselves. This determinant of the value of the cash flows available to portfolio investors drops out. It is replaced, however, by the agency costs associated with the managers of a dispersed ownership corporation. As discussed in the seminal article by Jensen and Meckling, these agency costs consist of the sum of the costs of management decisions that diverge from what would be in the portfolio investors' best interests and the monitoring and bonding costs incurred to keep these divergences to a minimum. Michael C. Jensen & William H. Meckling, "Theory of the Firm: Managerial Behavior, Agency Costs and Ownership Structure", 3 J. Fin. Econ. 305, 308 (1976). Because firms outside of the United States and the United Kingdom predominantly have controlling shareholders, the discussion that follows in the rest of this chapter assumes, for the convenience of exposition, that the foreign issuers involved each have always had, and will continue to have, controlling shareholders. For firms where at some point this assumption is no longer correct, the focus of corporate-governance shifts from constraining controlling shareholder diversions to constraining agency costs, but, if the reader makes this substitution, most of the discussion is as applicable to management-controlled firms as ones with controlling shareholders.

The Rise of Foreign Ownership and Corporate Governance

(⁴⁰) See George A. Akerlof, “The Market for Lemons: Quality Uncertainty and the Market Mechanism”, 84 Q. J. Econ. 488 (1970). The classic article applying this kind of asymmetric information model to the issuance of securities is Stewart C. Myers & Nicholas S. Majluf, “Corporate Financing and Investment Decisions When Firms Have Information that Investors Do Not Have”, 13 J. Fin. Econ. 187 (1984).

(⁴¹) For a more extended discussion of these antidotes, see Merritt B. Fox, “Due Diligence with Residential Mortgage Backed Securities” (hereinafter Due Diligence) available at <http://ssrn.com/abstract=235679>.

(⁴²) These limitations are discussed in Fox, Due Diligence at note 41 *supra*.

(⁴³) The seminal articles in signaling theory are Michael Spence, “Job Market Signaling”, 87 Q. J. Econ. 355 (1973); Steven A. Ross, Disclosure Regulation in Financial Markets: Implications of Modern Finance Theory and Signaling Theory, in *Issues in Financial Regulation* (Franklin Edwards ed., 1979).

(⁴⁴) The theory that an intermediating merchant can serve this role can be traced back to Akerlof’s seminal article on asymmetric information. See Akerlof, *supra* note 40, at 496. The theory has been applied specifically to the use of the investment bank in the offering of securities. See James R. Booth & Richard L. Smith, II, “Capital Raising, Underwriting and the Certification Hypothesis”, 15 J. Fin. Econ. 261 (1986); Ann E. Sherman, “Underwriter Certification and the Effect of Shelf Registration on Due Diligence”, 28 Fin. Management J. 5 (1999).

(⁴⁵) See Linda D. DeAngelo, “Auditor Independence, ‘Low Balling,’ and Disclosure Regulation”, 3 J. Acc’ting and Econ. 113 (1981).

(⁴⁶) For a discussion of the superiority of a mandatory disclosure regime over a voluntary choice of a disclosure regime offered by a stock exchange or through a choice of jurisdiction, see Merritt B. Fox, “Retaining Mandatory Securities Disclosure: Why Issuer Choice is Not Investor Empowerment”, 85 Va. L. Rev. 1335 (1999).

(⁴⁷) Easterbrook and Fischel slightly refine this statement of basic norms in corporate law. Unequal divisions of gains from corporate activity will be tolerated, they suggest, provided that the transaction makes no shareholder worse off. Frank H. Easterbrook & Daniel R. Fischel, *The Economic Structure of Corporate Law* 143–44 (1991).

(⁴⁸) At least as importantly, disclosure can reveal failures by an issuer to follow the procedures, such as an informed independent director or shareholder vote, for approving transactions in which the controlling shareholders have an interest. These procedures are designed to prevent diversions. For an elaboration of this point, see Merritt B. Fox, “Civil Liability and Mandatory Disclosure”, 109 Colum. L. Rev. 237, 258–59 (2009).

(⁴⁹) See, e.g., OECD Principles of Corporate Governance (2004); Mark J. Roe, “Corporate Law’s Limits”, 31 J. Leg. Stud. 233 (2002) (corporate law is ineffective without transparency).

The Rise of Foreign Ownership and Corporate Governance

⁽⁵⁰⁾ The possibility of an IPO gives venture capitalists an option to exit successful start-ups in a way that allows the founders to retain control. In so doing, this possibility permits a kind of implicit contracting that allows promising innovative projects to move forward that otherwise would not move forward and adds to the incentives for engaging in entrepreneurial activity. See Bernard Black & Ronald Gilson, "Venture Capital and the Structure of Capital Markets: Banks versus Stock Markets", 47 J. Fin. Econ. 243 (1999).

⁽⁵¹⁾ Rafael La Porta, Florencio Lopez-De-Silanes, & Andrei Shleifer, "Corporate Ownership around the World", 54 J. Fin. 471 (1999); Stuart L. Gillan & Laura T. Starks, "Corporate Governance, Corporate Ownership and the Role of Institutional Investors: A Global Perspective" (John L. Weinberg Center for Corp. Gov., U. Del., Lerner College of Bus. & Econ., Working Paper No. 2003-01, 2003), at 28.

⁽⁵²⁾ A country, of course, is a collection of individuals and may not have collective decision making that maximizes the aggregate wealth of the individuals composing it. Improved corporate governance creates losers as well as winners and the losers may be able to block the change. See Mancur Olsen, *The Logic of Collective Action* (1971). Professors Rajan and Zingales hypothesize that the losers to the strengthening of corporate governance and disclosure have a good chance of succeeding unless an economy is open to both international capital flows and trade. They argue that this hypothesis explains the decline in financial development after World War I and its rise, even after controlling for the level of economic development, in recent decades. It also explains the substantial differences at any given time in the level of financial development across countries with the same level of economic development. Raghuram G. Rajan & Luigi Zingales, "The Great Reversals: The Politics of Financial Development in the Twentieth Century", 69 J. Fin. Econ. 5 (2003).

⁽⁵³⁾ Professors Hansmann and Kraakman, for example, suggest that there has been an ideological convergence around the world centering on a "shareholder-oriented" model of corporate law based on a belief that it has efficiency benefits that will increase the wealth of each jurisdiction that adopts it. Henry Hansmann & Reinier Kraakman, "The End of History for Corporate Law", 89 Geo. L.J. 439, 443-49 (2001). To the extent that this is the case, the growth of this ideology would be an independent driver of stronger corporate governance and mandatory disclosure regimes. It has also been suggested that because of the efficiency benefits of this model, firms that are not subject to it will be disadvantaged in competition with those that are. *Id.* at 449-52, Ronald J. Gilson, "Globalizing Corporate Governance: Convergence of Form or Function", 49 Am. J. Corp. L. 329, 336 (2001). The competitive pressures on the nonconforming firms would thus be another driver for such change, which is accentuated by the increase in international trade. Another independent driver is the growing number of portfolio shareholders in each country resulting from increased wealth and privately based pensions. Hansmann & Kraakman at 451-53. A final possible independent factor is the risk that corporate assets will be expropriated by the government. If this risk is high, concentrated ownership may seem a necessity in order to have sufficient political power to fend the government off. When the risk lowers, less concentrated ownership is safer from an expropriation. So there are more sit-

The Rise of Foreign Ownership and Corporate Governance

uations where greater portfolio ownership would be advantageous to both a firm's control shareholders and portfolio investors if the problem of expected diversions could be solved. See Rene M. Stulz, "The Limits of Financial Globalization", 60 J. Fin. 1595 (2005). This in turn could lead to domestic political pressures to improve a country's corporate governance and disclosure laws.

It should be noted that not everyone agrees that these independent drivers actually have much effect on the quality of corporate governance. Lucian Bebchuk & Mark J. Roe, "A Theory of Path Dependence in Corporate Ownership and Governance", 52 Stan. L. Rev. 127 (1999) (path dependence creates sharp resistance to these drivers); Tarun Khanna, Joe Kogan, & Krishna Palepu, "Globalization and Similarities in Corporate Governance: A Cross-Country Analysis", 44 Eur. Econ. Rev. 748 (2002) (using de facto measures of corporate governance, no evidence that countries that are more integrated in terms of product trade and labor mobility have more similar corporate governance than ones less integrated in these ways).

⁽⁵⁴⁾ See, e.g., Rafael La Porta, Florencio Lopez-De-Silanes, Andrei Shleifer, & Robert W. Vishny, "Legal Determinants of External Finance", 52 J. Fin. 1131 (1997).

⁽⁵⁵⁾ See European Corporate Governance Network (ECGN), *The Separation of Ownership and Control: A Survey of 7 European Countries Preliminary Report to the European Commission* (1997); Stijn Claessens, Simeon Djankov, & Larry Lang, "Expropriation of Minority Shareholders in East Asia", 57 J. Fin. 81 (2001); Charles P. Himmelberg, R. Glenn Hubbard, & Inessa Love, "Investor Protection, Ownership and Investment" (2000), available at <http://www.nber.org/china/ghubbard.pdf>.

⁽⁵⁶⁾ Reena Aggarwal, Leora Klapper, & Peter D. Wysocki, "Portfolio Preferences of Foreign Institutional Investors", 29 J. Banking & Fin. 2919 (2005) (finding that US mutual funds tend to invest more in countries with stronger shareholder rights and legal frameworks, even after controlling for the country's economic development). Khanna, Palepu, & Srinivasan find a positive relationship between a non-US firm's transparency measure and the equity owned by US investors in the firm's home country firms as a percentage of their total capitalization. While this result could be explained by US investors preferring investments in firms from countries with laws imposing more effective diversion constraints on its issuers, consistent with Aggarwal, Klapper, & Wysocki, it also could be explained by a higher percentage of firms willing to individually impose on themselves effective diversion constraints in some countries than others. Tarun Khanna, Krishna Palepu, & Suraj Srinivasan, "Disclosure Practices of Foreign Companies Interacting with US Markets", 42 J. Acct. Research 475, 499-500 (2004).

⁽⁵⁷⁾ It is true that the governments of some of the wealthiest countries, in particular the United States, advocate good governance, both directly and through their roles in the international financial institutions, and that wealthy countries are the source of most foreign investors in the firms of the countries of the rest of the world. The motivation for this kind of advocacy, however, appears to be to promote economic development in poorer countries and perhaps to expand a financial system in which some of the wealthy

The Rise of Foreign Ownership and Corporate Governance

country's citizens earn rents. It is unlikely that the intensity of this advocacy applied by any one wealthy country is strongly positively correlated with the percentage of shares already held by the wealthy country's investors in the firms of the particular country being lobbied. Such a strong positive correlation would be needed for advocacy by wealthy countries to drive a causal link running from greater foreign ownership to stronger, more effective governance laws.

⁽⁵⁸⁾ See section 4.1.3.

⁽⁵⁹⁾ Aggarwal, Klapper, & Wysocki, *supra* note 56 (positive correlation between firms that score well on good governance measures with extent of foreign ownership); Reena Aggarwal, Isil Erel, Miguel Ferreira, & Pedro Matos, "Does Governance Travel Around the World? Evidence from Institutional Investors", 100 J. Fin. Econ. 154, 161-164, 171-72 (2011) (same); Magnus Dahlquist & Goran Robertson, "Direct Foreign Ownership, Institutional Investors, and Firm Characteristics", 59 J. Fin. Econ. 413 (2001) (correlation between foreign ownership and low concentration of ownership); Christian Leuz, Karl Lins, & Francis Warnock, "Do Foreigners Invest Less in Poorly Governed Firms", 22 Rev. Fin. Stud. 3245 (2009) (US investors hold substantially smaller equity positions in non-US firms with poor scores on a transparency measure); Vicentiu M. Covrig, Mark L. Defond, & Mingyi Hung, "Home Bias, Foreign Mutual Fund Holdings, and the Voluntary Adoption of International Accounting Standards", 45 J. Acct. Research 41 (2007) (correlation between firms that voluntarily adopt international accounting standards and foreign ownership); Jia-Weng Liang, Mei-Feng Lin, & Chen-Lung Chin, "Does Foreign Institutional Ownership Motivate Firms in an Emerging Market to Increase Voluntary Disclosure", 39 Rev. Quant. Fin. Acct. 55 (2012) (positive relationship between percentage of foreign ownership of Taiwanese firms and voluntary disclosure as measured by conference calls, which are shown to be informative by the fact that they are followed by greater institutional ownership turnover); Miguel A. Ferreira & Pedro Matos, "The Color of Investors' Money: The Role of Institutional Investors around the World", 88 J. Fin. Econ. 499 (2008) (for non-US firms, correlation between the extent of US institutional ownership and higher market to book value (Tobin's Q), which arguably is an indicator of better governance); Kimberly A. Webb, Steven F. Cahan, & Jerry Sun, "The Effect of Globalization and Legal Environment on Voluntary Disclosure", 43 Int'l. J. Accounting 219 (2008) (correlation between a measure of a firm's voluntary disclosure and a measure of its country's integration into the global economy including global capital markets, with the effect being stronger for firms from countries with weaker legal environments).

⁽⁶⁰⁾ See section 4.3.1.

⁽⁶¹⁾ See section 4.1; Hansmann & Kraakman, *supra* note 53, at 451 (participants in international equity markets "understandably prefer shareholder-oriented governance"). As discussed further in section 4.3.1, Aggarwal et al. using fixed effects regressions, find a statistically significant positive relationship between a change in foreign ownership and a subsequent change in measures of good corporate governance, which suggests that foreign ownership leads to better corporate governance. In contrast, interestingly, they find

The Rise of Foreign Ownership and Corporate Governance

no statistically significant relationship between a change in measures of good corporate governance and a later change in foreign ownership. Aggarwal, Erel, Ferreira, & Matos, *supra* note 59, at 167–70. This latter result, of course, is not an affirmative finding that good governance does not lead to more foreign ownership. The test may simply have not been powerful enough to pick up evidence of such a causal relationship. One possibility is that such a causal relationship does exist, but that the lag structure between a governance change and any changes in foreign ownership may be more complicated than the lag structure going the other way and that this makes the relationship harder to test for.

(⁹⁷) *Id.* at 172 (table 9) (showing a statistically significant mean interaction effect between foreign institutional ownership and the previous period's market-adjusted return).

(⁹⁸) *Id.* at 173.

(⁹⁹) *Id.* A caveat is necessary with respect to these two governance-outcome-related reinforcing findings. AEFM have similar findings with respect to the effect of domestic institutional holdings on the sensitivity of CEO turnover to poor stock returns and the effect of changes in domestic institutional holdings on subsequent periods' Tobin's Q. Thus, to the extent that foreign and domestic institutional ownership, or changes in each, is correlated, it may not be the foreignness of the holdings that matters, but their institutional nature. This concern is significantly alleviated, however, by a study by Ferreira and Matos ("FM"). FM find a strong statistically significant positive relation between foreign institutional ownership and non-US firms' Tobin's Qs, and between "independent" institutional ownership (mutual funds, both foreign and domestic) and non-US firms' Tobin's Qs, but not between "grey" institutions (bank trusts and insurance companies) and non-US firms' Tobin's Qs, nor between domestic institutional ownership and non-US firms' Tobin's Qs. Miguel A. Ferreira & Pedro Matos, "The Color of Investors' Money: The role of Institutional Investors Around the World", 88 J. Fin. Econ. 499, 500–01, 517 (2008) Using an instru-

The Rise of Foreign Ownership and Corporate Governance

mental variable technique, they find the direction of causation is from the ownership factor to Tobin's Q, not the other way around. *Id.* at 517.

Governance by Institutional Investors in a Stakeholder World

Gerard Hertig

The Oxford Handbook of Corporate Law and Governance

Edited by Jeffrey N. Gordon and Wolf-Georg Ringe

Print Publication Date: May 2018 Subject: Law, Company and Commercial Law

Online Publication Date: Jul 2015 DOI: 10.1093/oxfordhb/9780198743682.013.35

Abstract and Keywords

This chapter examines the increased attention paid to stakeholder interests and its economic or, at least, societal impact, and whether giving a new or stronger voice to stakeholders is justified. It first provides an overview of recent stakeholder-oriented reforms and their impact before assessing the merits of giving stakeholders a new or reinforced voice in terms of corporate governance. It then turns to the hypothesis of having institutional investors act as stakeholder representatives as well as the extent to which their ultimate beneficiaries can contribute to institutional investor governance. It also explores whether the ultimate beneficiaries of pension funds can have the option to choose between shareholder and stakeholder-oriented investment strategies.

Keywords: stakeholder interests, stakeholders, reforms, institutional investors, beneficiaries, corporate governance, pension funds, investment

1 Introduction

¹FOR institutional investors, one thing is apparently clear: from a *long-term* perspective, the corporate objective must be the generation of sustainable shareholder value.² To the extent that this means the pursuit of overall social efficiency, one can expect little or no objection from most economists, lawyers, or even politicians.³ In the same vein, it is generally accepted that no important constituency should be mistreated if a firm aims at maximizing its value in the long term.⁴

Controversies start when it comes to defining the *shorter-term* policies that facilitate the realization of the long-term sustainability objective. In the US, lawyers were already debating in the 1930s whether non-shareholders could also be the beneficiaries of corporate transactions. Adolf Berle reasoned that only shareholders had a claim over residual corporate income, whereas Merrick Dodd argued that changes in the attitude of courts and public opinion allowed for the taking into account of stakeholder interests.⁵ Economists then joined the fray. Milton Friedman famously stated that the only social re-

sponsibility of corporations (p. 822) is to make money and Edward Freeman responded that profits are only an outcome, the purpose of a corporation being to be well managed.⁶

Clearly, these debates are not merely about the law, economic theory, or business practices: they also reflect diverging political or philosophical opinions. This is a context where one can get lost unless one focuses on what is really at stake. For example, the rather rich Berle-Dood debate becomes easy to understand when one realizes it is essentially about the respective lawmakers' and courts' powers to take stakeholder interests into account. Similarly, the Friedman-Freeman discussion gains in clarity once established that it is about whether we should look at markets or at individuals when trying to understand how firms work.⁷

In the same vein, it is also useful to clarify what the terms "stakeholder" and "corporate social responsibility" generally mean. When mentioning stakeholders, one normally refers to a firm's employees, suppliers, and customers as well as to third parties effectively or potentially affected by the firm's activities.⁸ For this contribution, the stakeholder category will comprise creditors at large, i.e., any contractual counterparty or person having a claim against the firm under torts or other externality-related legislation. In other words, the discussion will not be limited to persons owed fiduciary duties under corporate law, as is often the case in the US corporate governance literature. On the other hand, the discussion will not encompass persons who merely have an economic, reputational, social, or political relationship with the firm.

When one talks about "corporate social responsibility" (CSR) it is commonly recognized that he or she refers to a firm's responsibility to avoid harming stakeholders and to contribute to social welfare. What a firm is precisely expected to do or not to do varies over time and across countries.⁹ Nowadays, however, demands for corporate social responsibility can largely be understood as demands for an alternative response to market and (state-led) redistribution failures.¹⁰

While focusing on what is at stake and referring to generally accepted terminology has analytical value, it can prove difficult to identify whether a given firm is of the *shareholder value* type or of the *stakeholder interest* type. Let's start with the big picture. While CSR efforts are not limited to improving the situation of stakeholders as defined above, we would expect the "stakeholder"-type group to comprise all firms that favor CSR and other investments also benefiting creditors at large and the "shareholder"-type group to include all high equity performance firms. Yet, there is evidence of (1) firms that undertake "social" investments also improving their financial performance and (2) firm performance also attracting socially (p. 823) oriented investors.¹¹ Similar results can be observed when looking more specifically at employee satisfaction. The classical prediction is that it comes at the price of shareholder value, but here too there is evidence of employee satisfaction being positively correlated with shareholder returns.¹²

This definitely does not imply that stakeholder-oriented firms are necessarily more valuable than their shareholder-oriented brethren. However, it has become clear that this can be the case in various circumstances.¹³ As a result, the pro-shareholder versus pro-stake-

holder debate has become less polarized.¹⁴ For example, the suggestion made by stakeholder value advocates¹⁵ to reduce the focus on short-term results by amending disclosure requirements and getting board members elected for longer terms is not radically different from what a shareholder value advocate may propose. More generally, the claim that pursuing stakeholder value will result in managers behaving opportunistically has become less persuasive in the face of mounting evidence of opportunistic behavior also occurring in shareholder value environments.¹⁶ In addition, recent research finds no evidence of socially responsible activities being driven by managerial opportunism.¹⁷

Ongoing legislative developments are in line with this evolution, with corporate lawmakers paying increasing attention to stakeholder interests. Interestingly, this evolution is not only perceptible in jurisdictions like Germany, where corporate law has traditionally taken into account stakeholder interests. Even more shareholder-centric jurisdictions, such as the UK, are fostering strategies that focus on the interests of the “ultimate” beneficiaries of capital market investments.

In this new environment, corporate governance reformers have paid special attention to institutional investors. One reason for singling them out is that they are the prototypical stakeholder. On the asset side, they often hold equity as well as debt instruments, whereas on the debt side their counterparts have variable as well as fixed income claims. In other words, their corporate governance interventions should be more *balanced* than interventions by shareholders, employees, trade creditors or customers. Another reason is that institutional investors are perceived as having insufficiently monitored their investments during the period leading up to the credit crisis. In other words, institutional investors have allegedly *failed* to discharge their combined equity and debt holder responsibilities. Finally, and most importantly, shareholders as well as stakeholders increasingly depend upon institutional investors for their post-retirement income as private firms and governments gradually outsource their pension obligations.

(p. 824) In this context, corporate governance reformers have nudged institutional investors toward assuming bigger so-called “stewardship” responsibilities. The basic idea is relatively simple: it boils down to getting institutional investors to adopt policies that are more stakeholder or “socially” oriented. For implementation purposes, reformers have relied upon a transparency plus voice approach. On the one hand, they are encouraging industrial corporations and financial intermediaries to provide information on their self-proclaimed ‘CSR’ approach whereas institutional investors are expected to disclose how they intend to discharge the stewardship responsibilities they owe to their ultimate beneficiaries. On the other hand, reformers have signaled to institutional investors that they should take a more active corporate governance role, in particular by effectively using their voice options.

Markets have not been taken by surprise. Industrial firms that adopted CSR policies over the past decades have generally informed market participants accordingly. Institutional investors, for their part, are increasingly considering the adoption of socially responsible investment (CSI) principles as a (positive) future performance indicator. There is also evi-

dence of institutional investors going a step further and actively encouraging firms to adopt stakeholder-oriented policies in addition to their traditional financial result driven policies. To be sure, one can still observe significant differences in ownership engagement levels¹⁸; overall, however, institutional investors have become more active over the past decade.¹⁹

These developments raise two fundamental questions. One is whether the increased (but not new) attention paid to stakeholders issues has had a positive economic or, at least, societal impact. The other issue is whether institutional investors are acting in the interest of their “ultimate” beneficiaries (defined here as the individuals who personally consume the investment returns) to the extent they foster the interests of stakeholders or society at large. This chapter will address these issues from two angles. First, it will assess the attention currently paid to stakeholder interests and the extent to which it justifies giving a new or stronger voice to stakeholders. Second, it will evaluate whether institutional investors are well placed to represent stakeholder interests and, if so, the extent to which their ultimate beneficiaries can contribute to institutional investor governance.

The remainder of this contribution is organized as follows. Section 2 describes recent stakeholder-oriented reforms and assess their impact. This allows for a preliminary assessment on the merits of giving stakeholders a new or reinforced governance voice.

Section 3 builds upon this assessment by discussing the hypothesis of having institutional investors act as stakeholder representatives. It shows that various institutional investors, in particular religious organizations, union managed pension funds, and ethical mutual funds already play such a role. But it also provides evidence of these interventions being biased toward special interests or having a limited impact. Therefore, section 3 also explores whether the ultimate beneficiaries of pension funds can be given the option to choose between shareholder and stakeholder-oriented investment strategies.

(p. 825) 2 Focusing on Stakeholder Interests

Institutional investor activism has had an impact on the inter-shareholder agency problem. Conflicts of interests between smaller and controlling shareholders used to be pervasive in larger continental European and East Asian corporations.²⁰ In recent decades, however, direct household share ownership has decreased by 20% to 50% in Canada, France, Germany, Japan, and Sweden due to portfolio diversification and tax optimization prompting households to favor mutual funds and retirement plans.²¹ As a result, smaller owners have largely been substituted by pension funds, investment funds, and insurance companies. While one cannot expect these new owners to necessarily favor voice over exit,²² their presence makes it more difficult for controlling owners to act opportunistically and to the detriment of minority shareholders.

In this context, increased attention is paid to the shareholder-creditor/stakeholder conflict of interests.²³ From a theoretical perspective, this novel environment is potentially detrimental to employees, suppliers and customers, and other creditor interests, especial-

ly when equity-based compensation incentivizes managers to undertake risky projects.²⁴ Real-world creditors see it the same way, with bond prices falling when executive stock option plans are adopted.²⁵

To be sure, shareholders do not necessarily benefit from the new equilibrium as it may lead to risk-taking levels that are (directly or indirectly) detrimental to both creditors and shareholders.²⁶ This is especially likely to happen when shareholder demand for higher returns is not accompanied by an increase in creditor monitoring or creditor protection. Here too, real-world reactions confirm the theoretical prediction. In recent years, jurisdictions with weaker creditor protection regimes experienced higher declines in stock market index than jurisdictions with stronger creditor protection regimes.²⁷

(p. 826) 2.1 Recent Stakeholder-Oriented Reforms

This evolution and the emergence of related creditor protection concerns have gone hand in hand with the adoption of a number of stakeholder-oriented corporate governance initiatives. Various international organizations have taken steps to make managerial compensation less dependent upon shareholder value, to improve risk-taking disclosure and to generally reinforce creditor protection.²⁸ At the national level, industrial corporations and financial intermediaries are encouraged to provide information on their CSR policies whereas institutional investors are expected to take a more active corporate governance role. German and UK code-makers, in particular, have emphasized the importance of long-term sustainability as well as focused on stakeholder involvement or representation.

In its original version, the German Corporate Governance Code stated in its foreword that its aim was to clarify “the needs of shareholders, who provide the company with the required equity capital and who carry the entrepreneurial risk.” The foreword was amended in 2009 and now underlines the obligation of the board “to ensure the continued existence of the enterprise and its *sustainable creation* of value in conformity with the principle of the social market economy (*interest of the enterprise*).” This evolution is back in line with the German corporate law tradition of taking into account stakeholder interests, most famously by imposing employee representation in boards of large companies (so-called codetermination).²⁹

In the UK, the 2009 Walker Review emphasized that governance failures had led to excessive risk taking and underlined the responsibility of institutional investors to encourage *long-term* improvements in performance.³⁰ Accordingly, the 2012 UK Stewardship Code has subjected UK pension funds, insurance companies, investment trusts, and other collective investment vehicles to explicit stewardship responsibilities.³¹ According to the Financial Reporting Council,³² the Code’s aim is to enhance the quality of engagement between asset managers and companies and the value that accrues to *ultimate beneficiaries*. The UK’s stewardship efforts are in line with theoretical work devoted to revamping the relationship between owners and managers,³³ in particular by getting institutional investors to focus on managers’ intrinsic rather than extrinsic motivation.³⁴

The German Code appears to be more stakeholder-oriented than the UK Code and its scope could be broader.³⁵ However, both codes aim at going beyond immediate shareholder (p. 827) value so as to protect the interest of the firms' ultimate beneficiaries. From this perspective, one can expect institutional investors to adopt similar strategies in both jurisdictions.³⁶

2.2 Assessing Regulatory Reforms

As already mentioned, the hard (and controversial) task is to identify the *shorter-term* policies that facilitate the realization of the long-term sustainability objective.

Lawyers have continued to this day the theoretical shareholder/non-shareholder orientation debate started by Berle and Dodd.³⁷ The original Friedman–Freeman controversy is also still alive. Financial economists have generally made theirs the claim that, in the long run, what is good for shareholders in the short term is also good for stakeholders in the long term.³⁸ Business management and industrial organization scholars, for their part, seem to favor a more stakeholder-oriented approach. Some justify it in terms of economic value creation.³⁹ Others broaden the approach by proposing to let stakeholders appropriate a bigger share of value creation.⁴⁰ Last but not least, some scholars favor psychological and sociological over *homo economicus* approaches.⁴¹ In other words, human beings operating in or interacting with the firm are not merely self-interested actors; one has to take into account that they often bond with the firm and behave like its psychological owners.

In practice, there is evidence of firms trying to optimize their relations with *all* stakeholders. Empirical investigations show that board members often consider themselves accountable to stakeholders, with some directors having preferences that favor shareholder primacy and others being inclined to adopt a more balanced attitude.⁴² More generally, CSR approaches have become increasingly relevant within the business community.⁴³

This could be related to CSR being profitable by itself. Social investments may generate innovations and CSR-oriented managers can contribute to firm performance when their approach increases employee motivation.⁴⁴ In fact, there is empirical evidence of superior CSR performance going hand in hand with better access to finance.⁴⁵ Similarly, (p. 828) there is increasing evidence of CSR investments being associated with financial performance improvements⁴⁶ and contributing to merger performance.⁴⁷ More generally, CSR investments can have positive reputation effects, which in turns may permit to increase output or charge higher prices.⁴⁸

At the same time, CSR developments may essentially reflect institutional, political, or ethical factors.⁴⁹ In particular, there is empirical evidence of firms governed by Scandinavian law scoring the highest CSR scores and of firms governed by English common law scoring the lowest CSR scores—firms governed by German and French law being in the mid-

dle.⁵⁰ Similarly, it has been shown that companies that generate higher social costs or are subject to greater public attention also carry out higher social investments.⁵¹

Overall, it remains unclear why we observe a corporate social responsibility trend. CSR policies may contribute to the firm's bottom line even though the social responsibility debate is often fueled by public goods considerations. Alternatively, managers may invest in CSR projects simply because they are philanthropy-oriented managers⁵² or are financially unconstrained.⁵³ In short, the value of CSR activities may be circumstance-dependent, for example contingent upon CSR activities having a real impact on stakeholder behavior.⁵⁴

(p. 829) 2.3 Giving Stakeholders a New Voice

Clearly, more research is needed to assess the extent to which CSR policies benefit shareholders, creditors, and/or society in general. However, the available evidence allows for a preliminary assessment of recent, more stakeholder-oriented corporate governance reforms. They can rely on (some) theoretical support, they are in line with recent business practices, and they cannot be considered per se detrimental to either shareholders or stakeholders. This rather lukewarm assessment may be due to lawmakers having essentially relied upon boards and information flows to foster stakeholder interests.

Germany's codetermination approach exemplifies the difficulties one faces when trying to get *boards* more responsive to stakeholder interests: after decades of experimentations, the debate about the costs and benefits of mandatory employee board participation has yet to be settled.⁵⁵ To be sure, there is increasing evidence of boards around the world becoming more directly involved in social issues.⁵⁶ However, we do not know whether this development has anything to do with either board structure or board composition. For example, appointing a CSR director does not seem to make a difference.⁵⁷ The same is true when it comes to having employee representative directors, as they generally seem to take a shareholder view when there is a shareholder-stakeholder dilemma.⁵⁸

On paper, improving corporate *transparency* seems a better approach toward fostering stakeholder interests. Better information flows could result in more socially balanced external interventions while letting managers keep the discretion necessary for the efficient conduct of corporate affairs. In practice, however, the presence of presentation effects continues to cast doubt on the utility of CSR reports.⁵⁹ More importantly, the empirical evidence remains sketchy when it comes to accounting standards' contribution to the assessment of a firm's social investments.⁶⁰ On the one hand, financial accounting valuation usefulness seems negatively related to a firm's stewardship orientation.⁶¹ On the other hand, it has been shown that socially responsible firms tend to produce higher-quality financial reports.⁶² More generally, there is an ongoing debate about the compatibility of valuation (p. 830) and stewardship accounting.⁶³ This probably explains why securities regulators still focus on valuation issues, whereas accounting standard setters have yet to agree on how to approach stewardship.⁶⁴

Going forward, the question is whether more could be done to foster stakeholder interests. This is not, as often in the past, a primarily continental European reflection. The adoption of the UK Stewardship Code and recent contributions by US academics show that the debate has reached the Anglo-Saxon world.⁶⁵ Many reformers still follow a “more of the same” approach and continue to focus on boards and corporate disclosure requirements. Nevertheless, as shown by the UK example, increasing attention is given to institutional investor activism.

From the latter perspective, it is worth noting that institutional investors have been filing an increasing number of “social” resolutions over the past decade.⁶⁶ The practice may or may not be in the interests of their ultimate beneficiaries, in particular when it comes to their stakeholder interests. It is therefore justified to investigate in more depth whether institutional investors are acting or should be required to act like stakeholder representatives.

3 Institutional Investors as Stakeholder Representatives

Stakeholder issues have originally been put on the corporate governance agenda by societally oriented institutional investors such as mutual funds catering to clients who favored investments made according to ethical criteria, union-managed pension funds, and, especially, religious organizations.⁶⁷ However, this does not mean that societally-oriented institutional investors have necessarily aligned their corporate governance interventions with stakeholders’ interests—nor, a fortiori, that other institutional investors have given priority to the societal or long-term interests of their ultimate beneficiaries.

For example, mutual fund managers understand that while some of their clients are prepared to pay a significant price for high ethical performance, other clients are less willing to sacrifice financial returns.⁶⁸ As a result, their corporate governance interventions may also reflect (short term) shareholder-oriented considerations. Similarly, labor unions that manage public pension funds are known for having their corporate governance (p. 831) interventions reflect union of member interests rather than the interests of pension funds’ ultimate beneficiaries. Hence, there is evidence of union-managed pension funds focusing upon occupational health and safety, fair wages, or equal opportunity issues.⁶⁹ Likewise, religious organizations often target what they consider “unjust” corporate policies or try to promote peace and economic justice, which does not necessarily reflect the stakeholder interests of their constituencies.

Moreover, societally-oriented activism has not necessarily translated into corporations adopting societally-oriented policies. In particular, the available evidence points toward very limited success in terms of activists getting a majority of fellow investors voting in favor of stakeholder-oriented resolutions. That being said, it has not been uncommon for targeted firms to amend their policies on the basis of informal discussions or in view of a resolution getting a significant number of (minority) votes. This may actually have been

Governance by Institutional Investors in a Stakeholder World

activist investors' original intent, as there is often a difference between what they ask and what they want.

Regardless of how one assesses the results of these stakeholder-oriented governance efforts, the fact is that they have become more significant in recent years, with mutual funds and non-union pension funds joining the activist fray. In particular, there is evidence of US public pension funds promoting social diversity not only via conventional proxy voting efforts but also by favoring the use of asset managers owned or operated by women and minorities.⁷⁰ Overall, pension fund activism currently seems more stakeholder-oriented than mutual fund activism. Differences in investment strategies and client bases are likely to explain this result.

Firms targeted by mutual funds are very diverse and mutual fund beneficiaries have divergent expectations. Consequently, mutual funds have incentives to adopt a cautious and diversified approach to social issues and stakeholder interests. To be sure, we have seen that the ethical mutual fund industry has an established stakeholder activism record. But this is not necessarily the case for the mutual fund industry at large (partly because of regulatory constraints)⁷¹ or for all ethical mutual funds (due to heterogeneous client preferences).

By contrast, pension funds tend to have more homogeneous investment strategies and client bases. In particular, they must take into account their ultimate beneficiaries' common expectations regarding the adoption of prudent investment strategies that secure their future financial security.⁷² This environment obviously favors the adoptions of long-term oriented investment strategies. Clearly, this does not automatically mean that pension fund originated governance interventions reflect social concerns rather than mere long term financial value considerations.⁷³ Nevertheless, pension funds are generally considered active social issues advocates.⁷⁴ Two factors may explain this perception.

(p. 832) One is the increase in life expectancy and related changes in retiree expectations, which have put the limelight onto pension funds "trustee" responsibilities. Pension funds are nowadays expected to behave like good "stewards," i.e., to understand and take into account the *overall* interests of their ultimate beneficiaries.⁷⁵ To be sure, the latter are not necessarily interested in corporate social responsibility. However, the increase in life expectancy makes it likely that pension fund beneficiaries will have to work longer and bear a higher risk of suffering from the consequences of ongoing environmental and social changes. One can expect younger beneficiaries to be aware of these risks and support pension fund CSR activism as one way to protect their future retiree interests.

The other factor is related to concerns about the externalities that go hand in hand with a disproportionate focus on short-term profits. The 2008 credit crisis and related bank bailouts have made the beneficiaries of public pension funds aware of the relationship between immediate profit strategies and their taxpayer exposure. Bank bailouts have also (or possibly therefore) prompted policy makers to adopt corporate governance reforms aiming at constraining risk taking by getting asset managers to better take into account sustainable performance. We have seen that the 2012 UK Stewardship Code is nudging

institutional investors toward adopting a longer-term stewardship approach.⁷⁶ Asset managers in Canada, France, and the Netherlands have similarly been encouraged to act like stewards.⁷⁷ The basic idea is to foster the longer-term interests of ultimate beneficiaries, in particular by having pension funds pay more attention to societal issues.

Reformers have, until now, refrained from prescribing ways to do so. As already mentioned, state intervention is generally limited to getting pension funds to disclose their governance policies and interventions, so as to make stewardship more transparent and to encourage more effective investor engagement. This regulatory approach has been considered futile by some commentators, the argument being that it fails to provide a clear and constraining legal framework.⁷⁸

Clearly, it would be a mistake to assume that market forces automatically provide optimal stewardship levels. “Natural” stakeholder activism is not only likely to vary across institutional investor types, but also among those institutional investors generally considered stakeholder-oriented, such as pension funds.⁷⁹ Conversely, it would also be erroneous to require all institutional investors to engage in stakeholder activism. Activism capability or adequacy is similarly likely to vary across or among institutional investor types. What must be clarified here is whether some institutional investors are (1) better placed to pursue a stakeholder-oriented agenda that is in line with their ultimate beneficiaries’ interests and, (p. 833) if so, (2) to identify the governance mechanism that ensures the effectiveness, efficiency, and representativeness of their intervention.

3.1 Best-Placed Stakeholder Representatives

Whether an institutional investor can adequately represent stakeholders ultimately depends upon the respective interests of its managers and ultimate beneficiaries.

Let us start with business angels and venture capitalists. These are institutional investors with rather short-term objectives, i.e., they take stakes in *early-stage* firms with the objective of getting them to mature as rapidly as possible. Once this occurs, the firm type changes and becomes attractive for outside investors or suitable for public listing. Business angels and venture capitalists, respectively their funders, can then cash in and reinvest in another early stage firm. Stakeholder interests are not irrelevant in this context, but they are only taken into account if doing so contributes to increasing shareholder value. One could, of course, require (or incentivize) business angels and venture capitalists to foster stakeholder value as such. However, this is likely to be inefficient as it probably would constrain entrepreneurship at a critical firm development stage. More importantly, regulatory interference would also adversely affect the beneficiaries of pension funds and other funders of business angels and venture capitalists, which would be odd considering the importance stakeholder advocates give to the interest of ultimate beneficiaries.⁸⁰

Private equity firms resemble business angels and venture capitalists in various respects. They have similar financial backers, as they are prototypically funded by investment banks, insurance companies, pension funds, and wealthy individuals.⁸¹ They also take an active part in the management of the targeted firms and their main objective is to cash in

on exit values. On the other hand, private equity firms usually target *mature* firms they consider to be underperforming, not emerging firms or firms that need to access capital markets to complete their development.

Stakeholder interests may prove more important for private equity firms than for business angels and venture capitalists for two reasons. First, as just mentioned, they generally invest in larger and often publicly traded firms. Second, private equity firms may themselves be publicly traded.⁸² Overall, however, it is also likely to be contrary to the interests of ultimate beneficiaries to contrive private equity firms into taking stakeholder interests into account. In particular, getting an underperforming firm back into shape often requires the adoption of restructuring measures that can be disadvantageous for employees and suppliers. Such measures, which are controversial even in an ideal business environment, would be much harder to implement if private equity firms were forced to specifically consider their impact upon stakeholder interests.

(p. 834) That leaves us with mutual funds, hedge funds, and pension funds. Mutual funds provide diversification advantages and, therefore, count not only institutional investors but also a significant number of households among their immediate funders.⁸³ Possibly but not necessarily for this reason, the mutual fund industry has paid increasing attention to socially responsible investments in recent years, both in terms of investment volume and investment value.⁸⁴ On the other hand, there is evidence of so-called social funds being more likely to support shareholder proposals than other funds.⁸⁵

The implications in terms of performance are not easy to assess. As already indicated, mutual fund managers understand that while some of their clients are prepared to pay a significant price for high ethical performance, other clients are less willing to sacrifice financial returns. This may explain why various studies have found no significant difference in performance between conventional mutual funds and socially responsible funds.⁸⁶ At the same time, one cannot exclude that pursuing socially responsible investments may constrain portfolio diversification and, therefore, affect fund performance.⁸⁷ This theoretical prediction is supported by recent real-world evidence showing that socially responsible mutual funds have inferior reward-to-risk performance.⁸⁸

It follows that there is no compelling reason to adopt measures prompting mutual funds to take into account stakeholder interests. Stakeholder-oriented investors can invest in social funds if they wish to do so. However, this can prove costly in terms of risk-adjusted returns and incentivizing mutual funds to increase socially responsible investments is likely to make things worse for their beneficiaries without obvious benefits for stakeholders as a class.

Turning to hedge funds, it is well known that they are normally open only to a limited number of institutional or wealthy investors. This does not prevent future retirees to be their ultimate beneficiaries: of the \$3 trillion managed by hedge funds across the world, more than a third is provided by retirement funds.⁸⁹ Moreover, hedge funds often invest in industrial and financial firms. It could thus make sense to require (or incentivize) them to take into account stakeholder interests. However, when hedge funds undertake corpo-

Governance by Institutional Investors in a Stakeholder World

rate investments, they essentially target badly managed firms—in particular those with free cash or excessive costs.⁹⁰ To make the most of the business opportunities these deficiencies provide, hedge fund managers actively use their shareholder powers. In particular, they regularly use their voting rights to create shareholder value by forcing the targeted firm into a (p. 835) merger or to otherwise restructure.⁹¹ Here again, this strategy can prove disadvantageous for the firm's employees and suppliers and would become much harder to implement (and less advantageous for ultimate beneficiaries) if the hedge fund had to specifically consider their impact upon stakeholder interests.

This leaves us with pension funds. They prototypically have individuals as beneficiaries. Private pension funds generally operate under a contribution-defined retirement scheme. Public pension funds traditionally operated under a defined benefits retirement scheme, but public finance constraints have recently resulted in an overall trend toward contribution-defined approaches.

As indicated, there is evidence of union-managed pension funds favoring union or union member interests over the interests of other stakeholders. However, it remains unclear whether labor union activism has any specific wealth impact, in particular on long-run beneficiary wealth.⁹²

Non-union-managed pension funds are less likely to favor some beneficiaries over others, but they may nevertheless be conflicted. Private pension funds may not want to rock the boat when investing in firms that do business with their corporate sponsor.⁹³ More generally and importantly, their managers are likely to favor the immediate accumulation of pension assets over the longer-term interests of their beneficiaries.⁹⁴ Public pension funds, for their part, may have managers whose activism is tainted by political ambitions⁹⁵ or influenced by public debt financing considerations. When public pension funds operate under a benefit-defined scheme, self-interested managerial activism is unlikely to affect beneficiaries as any resulting asset shortfall will be funded by taxpayers. On the other hand, when public pension funds operate contribution-defined schemes or are not backed by taxpayers, beneficiaries are likely to bear the costs of misguided managerial activism.

It thus appears that pension fund beneficiaries face two specific longer-term risks. One is the so-called pension risk, i.e., the risk of not getting adequate retirement income. The other is what can be called the stakeholder risk, i.e., the risk of retiring in a world where asset misallocations have caused significant social costs. From this perspective, it is definitely worth analyzing more in depth if and how pension funds could be required or incentivized to take stakeholder interests into account. Our analysis will focus on defined-contribution pension plans, to avoid the insurance-related moral hazard issues that may affect benefit-defined pension plans.

Summing-up, business angels, venture capitalists, private equity, or hedge funds are not well-placed to act as stakeholder representatives due to their business plans often requiring (p. 836) them to take actions that are contrary to the (short-term) interests of major stakeholder constituencies. Mutual funds, for their part, are paying increasing attention

to stakeholder value, but there is evidence of their socially responsible investments being costly for their beneficiaries without matching benefits for stakeholders at large.

Things look more promising when it comes to pension funds. The trend toward contribution-defined schemes and the longer-term risks associated with this evolution have generated a convergence of pension fund beneficiary and stakeholder interests. The remaining issue is to determine how pension funds managers, and more specifically managers of pension funds with *contribution-defined* schemes,⁹⁶ can be required or incentivized to better take these interests into account.

3.2 Investor Voice and Stakeholder Interests

Pension fund reforms are highly political exercises.⁹⁷ No proposal aiming at getting pension fund managers to take into account stakeholder interests is viable if it significantly affects the institutional status quo or can be perceived as jeopardizing “adequate” retirement income.

Two basic regulatory strategies, disclosure and voice, are best suited to such an environment. More specifically, pension funds could be asked to gather and disclose more information about the stakeholder value of their investments. On the voice side, pension fund beneficiaries could be given the possibility to individually choose among several investment plans, some being more stakeholder-oriented than others. In other words, the currently prevalent *collective* decision-making and investment mandates would be supplemented by *individual* decision-making and investment options.

Like other institutional investors, pension funds are increasingly gathering and disclosing information about the social value of their investments. However, the information provided to beneficiaries is often not very explicit, which obviously makes it more difficult to assess the market value of pension fund investments. More surprisingly, this lack of transparency could also prompt affective reactions and lead pension fund beneficiaries to over or underestimate the social value of their investment.⁹⁸

Improving transparency is always a risky exercise. Simply requiring more or better disclosure may prove insufficient or even counterproductive. In particular, getting more information may overwhelm rather than help investors, especially if the goal is to improve individual decision making by pension fund beneficiaries. In the latter context, improving information quality is likely to be a better strategy. For example, pension funds could be required to (p. 837) provide information on the comparative shareholder and stakeholder values of a diverse set of portfolios.

More specifically, pension fund beneficiaries could be provided with tables comparing the value of three portfolios: (1) a portfolio mimicking the portfolio currently managed by the pension fund on a discretionary basis; (2) a portfolio mimicking the “managerial” portfolio for 80% of its value, but with the remaining 20% being invested in socially responsible

Governance by Institutional Investors in a Stakeholder World

investments; (3) a portfolio mimicking the “managerial” portfolio for 80% of its value, but with the remaining 20% being invested in shareholder value maximization.

In theory, this approach has four advantages: it reduces the impact of cognitive biases; it makes it easier to grasp the pension risk impact of undertaking of socially responsible investments; it facilitates a comparison between the stakeholder value allocation preferences of the pension fund beneficiary and the pension fund’s effective stakeholder value allocation; it permits evaluation of the financial implications of an increase or decrease in stakeholder risk.

To be sure, the suggested approach requires the use of standardized shareholder and stakeholder value assessments. This could prove difficult, especially if one also aims at getting standardized shareholder and stakeholder value assessments that are comparable. However, given that shareholder value and stakeholder value are already commonly used to assess investment allocation and returns, these difficulties cannot justify the rejection of the proposed transparency improvement: they simply reflect the imperfect nature of current (and presumably future) disclosure practices.

Moreover, getting pension funds to compare three sets of asset allocations is not an end by itself. The aim is to give pension fund beneficiaries a choice when it comes to their respective pension and stakeholder risks. Up to now, pension fund beneficiaries often had limited or non-existent powers when it comes to influencing investment strategies. This not only provides pension fund managers with room to engage in opportunistic activism.⁹⁹ It also prevents the (many) pension fund beneficiaries whose main financial asset is a claim against their pension fund from effectively expressing their stakeholder preferences.

The standard way to address this governance issue would be to provide beneficiaries with monitoring and election rights. One could deem it naïve to expect beneficiaries to actively exercise such rights. Yet there is recent evidence of underperformance by unionized multi-employer plans disappearing when the pension is controlled by individual employers.¹⁰⁰ From that perspective, it seems conceivable to give pension fund beneficiaries an effective voice without having to rely on third-party activists that may have their own agenda (or whose interventions make good fund managers reluctant to work for pension funds).

Nevertheless, getting pension funds to change their overall investment strategy to reflect their beneficiaries’ stakeholder preference is likely to prove very difficult. First, pension fund beneficiaries are unlikely to have identical stakeholder value preferences. Some may want the pension fund to be more “social” than it currently is, and others may want it to be less “social.” Second, getting pension fund beneficiaries to demand and engage into collective decision making is likely to prove very difficult, especially because it will be unclear whether the final result will improve or worsen the status quo. Third, pension fund beneficiaries may (p. 838) have stakeholder value preferences that are strong enough to make them favor an asset allocation that results in excessive pension risks.

These difficulties can be addressed by limiting beneficiary choice to a set of diverse but still comparable investment plans. More specifically, beneficiaries could be allowed to voice their preferences by opting for a diversified plan, a targeted shareholder value plan or a targeted stakeholder value plan. These plans could provide significant stakeholder choice without having radically different performance objectives. Indeed, the empirical evidence shows that shareholder value and stakeholder value approaches often result in relatively similar performances. Moreover, the risk of excessive performance difference could be minimized by constraining beneficiary choice in two ways. One would be to have beneficiary choice limited to a fraction of managed assets—for example the 20% mentioned for transparency purposes. The second way would be to require any given choice to be made for at least five years, so as to insure for any change of mind to be based on an effective track record rather than on emotional responses to short term performance or recent economic or social events.

This restriction is related to the more general issue of whether beneficiaries could be allowed to switch from one investment plan to another as they get older. To the extent beneficiaries are allowed to exit their firm's pension plan when to leave to work for another firm or to operate as independent contractors, there is no reason to forbid moving from one investment plan to another. Here again, it may prove necessary to impose a waiting period so as to avoid liquidity issues or significant investment losses. However, mutual funds regularly deal with such issues and there is no reason to believe that pension fund managers will not prove capable of managing them.

4 Conclusion

While changes in investor activism and compensation policies have reduced the shareholder-manager conflict of interests, the benefits of shareholder profit maximization strategies have been increasingly questioned over the past decade. This debate has generated a number of stakeholder-oriented corporate governance initiatives and put institutional investors under pressure to better take into account the overall interests of their constituencies.

As a result, institutional investors have gathered and disclosed more information about the social value of their investments. This has been criticized as too small a departure from the shareholder profit maximization approach. The point is well taken, but does not sufficiently take into account institutional investor diversity. It is not obvious why business angels, venture capitalists, private equity firms, or mutual funds should be required to take into account stakeholder interests. By contrast, it can make sense to give pension fund beneficiaries a voice regarding stakeholder investments by providing them with a choice among investment options.

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

Erik P.M. Vermeulen

The Oxford Handbook of Corporate Law and Governance

Edited by Jeffrey N. Gordon and Wolf-Georg Ringe

Print Publication Date: May 2018 Subject: Law, Company and Commercial Law

Online Publication Date: Sep 2015 DOI: 10.1093/oxfordhb/9780198743682.013.36

Abstract and Keywords

This chapter examines initial public offerings (IPOs) as funding rounds for high-tech companies and exit mechanisms for investors, as well as the stringent corporate governance requirements that apply to newly listed companies in the growth stages of their development. Current investment trends seem to indicate that the IPO market is aging: More and more high-tech companies decide to remain private longer. Moreover, public market investors, such as hedge funds and mutual funds, increasingly invest in non-listed high-tech companies, making “IPO-like” investment rounds at massive valuations a normal phenomenon in the private market. These developments have led to the belief that we are in the next tech bubble. Fortunately, however, a new “establishment” amongst investors is emerging. They realize that in order to prevent the bursting of the bubble, they must collaborate with management and actively contribute to a company’s medium-term and long-term performance.

Keywords: initial public offerings, listed companies, alternative stock markets, high-growth companies, private secondary markets, JOBS Act, collaborative corporate governance, management, board of directors, investors

1 Introduction

SEVERAL questions are currently being debated by policy makers and regulators in an increasingly integrated and globalized capital market,¹ regarding the listings and governance structures of high-tech companies. Should policy makers and regulators stimulate initial public offerings (IPOs) of high-tech companies? Is the IPO market dying? If fast-growing companies are subject to less stringent listing and governance requirements, would this result in more listings and an increase in high-tech companies? If the number of IPOs increases, will it lead us towards another bubble?

There is a general consensus that over-regulatory approaches have led to an IPO crisis around the world, and there is evidence to support this.² Not only do we observe a number of high-tech companies rethinking their intentions to pursue an IPO, but we also wit-

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

ness more and more listed companies considering delisting. Countries that maintain strict rules, or have recently introduced more stringent listing or governance requirements in order to boost market liquidity, are currently experiencing a decrease in IPO activity and an increase in back-door listings.³ Marc Andreessen, the reputed venture capitalist and cofounder of (p. 840) Netscape, went so far as to say that the IPO market is dying,⁴ and that he largely blames overregulation for this.⁵

In response to the overregulatory trends, new stock markets or stock market segments have been launched. These new listing venues are an attempt to bridge the funding gap that emerged after a number of uncoordinated, corporate governance reforms introduced numerous mandatory and stringent legal requirements which significantly increased the costs of being a public company on various main markets around the world. Another regulatory answer to stimulate IPO activity has been the introduction of more flexible governance rules and regulations for growth companies. An example of this took place in the US on April 5, 2012 when the Jumpstart Our Business Startups Act (JOBS Act) introduced “Emerging Growth Company” (EGC) status.⁶ Companies that avail themselves of EGC status are offered a transition, or on-ramp, period during which they are exempt from a number of regulatory requirements associated with both going and being public.

Inspired by the JOBS Act, similar initiatives are being introduced in Europe actively to promote the listing of high-tech companies and other small and medium-sized enterprises (SMEs). For example, in February 2015 the European Commission started a consultation process expected to evolve into an EU-wide Capital Markets Union.⁷ The idea is that a small company’s access to financing would be significantly improved in a more harmonized capital market.⁸ This initiative is in line with the NYSE Euronext’s establishment of EnterNext—the new pan-European marketplace designed to encourage SMEs to go public, to raise growth capital, and offer liquidity to their shareholders.⁹ Policy makers in the UK see the relaxation of listing rules, particularly lower free float requirements, as the key to reversing the trend of high-tech companies being reluctant to enter the bureaucratic and overregulated world of listed companies.

This renewed focus on listings of high-tech companies is not limited to the US and Europe. In 2013 South Korea launched a third stock exchange with the aim of helping promising startup companies to raise money from institutional investors and wealthy individuals. The exchange—dubbed “Korea New Exchange” or KONEX—is considered a stepping-stone to either the more regulated main board, KOSPI, or Korea’s venue for high-tech companies, KOSDAQ.¹⁰ KONEX is Korea’s response to the JOBS Act, with any companies that want to list on KONEX facing less stringent listing requirements and more flexible corporate governance rules.¹¹

But is the introduction of new alternative listing venues and deregulatory measures all that is needed to reverse the decline in the number of listed companies, and thereby boost long-term economic and employment growth? Proponents of this argue that the dream of (p. 841) a successful IPO is still one of the most important drivers for innovative entrepreneurs.¹² A strong and accessible IPO market is important as it attracts venture

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

capital and other startup and growth capital investors, who provide early-stage investors with the opportunity to exit their ventures and realize strong positive returns. IPOs are thus considered essential to sustaining a robust venture capital industry, which is necessary to accelerate innovation and entrepreneurship.

However, there is another side to the story which argues that regulatory complexity and cost alone do not explain the decline in IPOs.¹³ Modifying legal and institutional measures to encourage technology companies to float is not a new phenomenon. Over the past two decades, several alternative market venues have been introduced to support the fundraising of fast-growing companies. Unfortunately, most of these have failed to deliver the success they were designed to facilitate. Furthermore, of those venues still in existence, they have been experiencing a steep and slippery downward slope with respect to the number of listed companies, their quality, or both.

Further, recent trends and developments in the venture capital industry have called into question the primacy of the IPO as an exit strategy. It has been found that in a sluggish IPO market, venture capitalists and entrepreneurs are able successfully to employ other exit routes, most notably through a lucrative trade sale to a strategic party.¹⁴ These trade sales (as well as secondary sales) have even become the preferred exit option for many investors in growth companies. In contrast to an IPO exit, a trade sale offers immediate liquidity without onerous lockup periods, disclosure requirements, and obligations for venture capitalists to maintain board seats.

Perhaps the most important factor in the decline of IPOs is that an increasing number of technology companies believe that it is in their best interest to remain private as long as possible. It is no longer necessary to go public to get access to large investments, high profiles, and liquidity. For example, Uber, the Internet/app-based transportation/taxi network, was able to close a financing round of \$1.2 billion at a \$17 billion pre-money valuation in June 2014. Amongst its investors are not only reputable venture capitalists and private equity funds, but also institutional investors (such as mutual funds and hedge funds) that usually limit their investment scope to public companies.¹⁵ These privately held technology companies, such as Uber, usually provide liquidity to shareholders (employees and early investors) by offering regular access to buyback/liquidity programs. However, it should be noted here that these programs are typically viewed as a second-best “liquidity” solution due to nontransparent valuation practices.¹⁶

(p. 842) There is a more critical issue with the increasing VC investments in high-growth private companies. Companies that attract enormous investments tend to have more excessive spending behavior. This trend has led prominent investors to believe that we are heading towards yet another tech bubble, worse than the dot.com bubble of the late 1990s.¹⁷ One interesting and possible solution to this is to make IPO markets more accessible to growth companies by implementing flexible listing and governance rules. However, besides the question of whether more flexibility will eventually show the desired results, corporate governance experts argue that introducing more flexible rules is a “cor-

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

porate governance” scandal waiting to happen. Although it is difficult to predict the timing of the bubble, the first signs may already be visible in the biotech market.

How can we solve this vicious circle? With the recent globalization trends in the financing and organization of high-growth (including high-tech) companies, now is a good time to take stock of the inner workings of IPOs as funding rounds and exit strategies, as well as the rules and regulations that apply to listed companies that are in the growth stages of their development. This chapter addresses these issues by offering a glimpse into the past, present, and future listings of high-growth companies. It shows that although the first empirical results indicated that the special IPO rules and regulations were not persuasive enough to lure a large number of high-tech companies to the stock market, as occurred in the late 1990s, prior to the burst of the dot.com bubble in 1999 to 2001, the policy makers’ efforts were not completely in vain.

The deregulatory efforts have not only made the public market more accessible to high-tech companies, they can also be viewed as a first step towards redirecting corporate governance discussions away from merely focussing on increasing shareholders’ short-term value to a more collaborative focus on stimulating “long-term” entrepreneurship, innovation, and value creation inside both nonlisted and listed companies. This view is supported by the emergence of a new establishment of active investors, such as venture capitalists, private equity funds, or hedge funds that see themselves as allies of corporate management and executives. They have an increasing willingness to downplay stringent corporate governance norms and practices that have only created an apparently “unbridgeable divide” between shareholders and management.¹⁸ They believe that the future of corporate governance is about sharing nonfinancial and financial information and having open discussions with the companies’ stakeholders. We call this trend: collaborative corporate governance.

2 The Past: The Emergence of Alternative Stock Markets

Discussions about the design of stock markets that are ideally suited to high-tech growth companies are not new. Under substantial pressure to create a robust entrepreneurial climate, policy makers and regulators put a significant focus on increasing the financing opportunities for these companies while at the same time offering liquidity to investors. This has led to a (p. 843) global increase in market venues designed to facilitate and stimulate venture-capital-backed IPOs over the past two decades. These markets initially sought to attract high-tech firms in their jurisdictions by mimicking the success of the NASDAQ model in the US. In an attempt to replicate NASDAQ’s success, several stock exchanges in Europe launched high-tech market segments during the 1990s. EASDAQ, initially established as a pan-European stock market in 1996, was among one of the first venues to emerge in Europe. The NASDAQ model also inspired a number of national initiatives,

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

such as the Neuer Markt sponsored by the Deutsche Börse, the Paris Stock Exchange's Nouveau Marché, the Italian Nuovo Mercato, and the Euro NM Brussels.

These "NASDAQ clones" proved not to be sustainable and were only able temporarily to support European high-tech companies. There were a few reasons for this. First, since these "new" markets mainly focused on Internet companies, the burst of the dot.com bubble logically ushered in their demise. Second, with a lack of institutional investments these markets were extremely vulnerable to economic downturns. There was one exception: the Alternative Investment Market (AIM), a listing segment operated by the London Stock Exchange in the UK.¹⁹ The survival of AIM can be attributed to a series of factors that range from London's prominence as a financial center to changes in the IPO market in the US.

The most important factor behind AIM's good fortune is perhaps its regulatory model, which strikes a balance between the level of protection afforded to investors and the costs borne by the listed high-tech companies. Companies that trade their shares on AIM benefit from flexible rules that set low hurdles for listings and fewer ongoing principle-based obligations compared to other stock exchanges. In the absence of mandatory and stringent requirements, AIM introduced the Nominated Advisers (NOMADs), typically registered investment banks, assisting companies with the listing process and performing the role of "regulators," overseeing the admission process. This principle-based scheme contributed largely to the venue's reputation and continued success in the years leading up to the most recent financial crisis (Figure 31.1).

Unsurprisingly, US high-tech companies also started to use AIM to offer an exit mechanism for their investors. The migration of US firms gained momentum after the promulgation of strict and stringent corporate governance regulations and mandates, such as the Sarbanes-Oxley Act (SOX) in 2002, which imposed stiff legal requirements on listed companies, particularly with regard to their auditing and internal control processes. A study published in 2008 included compelling evidence showing that SOX had disproportionately affected small US publicly held firms.²⁰ Because, as already mentioned, significant costs were imposed on companies that intended to float their shares on NASDAQ, AIM quickly became an attractive IPO alternative. With US firms increasingly getting quoted on AIM, the reputation of the venue enhanced rapidly and it wasn't long before policy makers around the world started to adopt the AIM model.²¹ Tokyo AIM (currently a Tokyo Pro Market), AIM (p. 844) Italia, First North in Scandinavia, NYSE-Alternext in Belgium, France, the Netherlands, and Portugal, and Entry Standard in Germany are all examples of this.

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

Figure 31.1 Listed Companies at NASDAQ (US) and AIM (UK) 1995–2013.

Source: NASDAQ, London Stock Exchange.

So far, the performance of the AIM-type stock markets has fallen short of expectations, which is hardly surprising in light of the financial crisis that hit the global economy at the end of the previous decade. However, a closer look at the empirical evidence of the AIM-type stock market initiatives raises questions as to whether the mere introduction of flexible and accessible listing venues is sufficient to stimulate IPO activity. Looking at venture-backed listings in Europe, from 2009 to 2014, we can see that some countries attract far more venture capital-backed IPOs than other countries even though they offer similar regulatory regimes. Why is that? One credible explanation is that specific stock markets attract more companies because special “IPO ecosystems” (i.e., networks of underwriters, lawyers, and other advisors) have evolved around them. For instance, NYSE Alternext, an alternative stock market for high-tech companies in Europe, has venues in Amsterdam, Brussels, Lisbon, and Paris. NYSE Alternext is able to attract and retain issuers, with admissions outweighing de-listings year on year. In October 2014 alone, 205 companies were listed on NYSE Alternext. The differences in IPO ecosystems explain why 94% of the firms that enter NYSE Alternext are listed in Paris, with only 5% in Brussels and 1% in Amsterdam and Lisbon.

Clearly, regulatory and network advantages do not offer a guarantee for continuing success. The AIM market recently witnessed an exodus of companies. From its peak of 1694 companies in 2007, AIM has shrunk to 1087 companies in December 2013. There are several reasons for this. First, since it is generally paramount for companies that recently floated their shares to generate trading volume, it is not surprising that high-tech companies increasingly prefer to list on a main market (instead of AIM-type markets) (see Figure 31.2). (p. 845) These companies usually lack a track record; they trade less often and in smaller volume.²² This entails that their stock price is particularly responsive to buying and selling pressures, which, in turn, increases the cost of capital. Low trading volume is often the explanation for a depressed stock price and negative IPO performance. Thus, there are strong incentives for “young” IPO companies to list on the main board of a capi-

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

tal market, which increases the chances of generating trading volume and attracting the interest of equity research analysts.

Figure 31.2 Venture Capital Backed IPOs on Alternative versus Main Markets in Europe (2009–2014).

Source: PitchBook.

The second reason for shrinking markets is that the best performing high-tech companies prefer to extend their “private company” status for as long as possible before making the “irreversible” decision to go public. The staying private trend is apparent in both the US and Europe. Figure 31.3 shows that the time that elapses between the inception of a firm, the first involvement of venture capital funds, and their eventual exit has significantly increased in recent years in the US. The median time between the initial equity funding and the IPO in 2000 was approximately three years, compared with the seven years for companies pursuing an IPO in 2014.

3 The Present: The Aging IPO Market

We ended the previous section with the observation that investors and entrepreneurs generally believe that IPOs are not in their best interest. In 2012, the Economist even proclaimed (p. 846) that since high-tech companies remain private as long as possible, “going public” has lost its glamour, resulting in the public corporation becoming an endangered species.²³ The article refers to Michael Jensen’s study of 1989, “The Eclipse of the Public Corporation,” which supports the view that privately owned companies actually outperform their publicly listed counterparts.²⁴ However, in the same issue of the Economist, Schumpeter’s column recognized that there is a symbiotic relationship between “being private” and “going public,” suggesting that public companies will not be extinct in the near future. The argument is simple and straightforward: An IPO enables the entrepreneurs and investors to realize the gains in market value related to the growth that the best performing companies have realized in their “private” phase.

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

Figure 31.3 Median Time from Initial Equity Funding to IPO in the US (2000–2014).

Source: Dow Jones VentureSource.

We have already mentioned that it is widely believed that entrepreneurs would not put so much effort into the establishment and development of their startups if they did not dream of a successful IPO. The IPO is allegedly also crucial for venture capitalists that invest in these entrepreneurs. To see this, it is important to understand the traditional venture capital model.²⁵ It typically starts with the creation of funds that raise capital from both institutional and private investors that are interested in backing innovative, often high-tech, companies. The venture capital funds select promising startups, which they nurture and support by (p. 847) contributing money and services that these companies need to reach the next stage in their development. Ideally, this continues until the moment that the venture capital investors decide to exit their portfolio companies and reap the fruits of their investments. A significant part of the returns are then distributed back to the initial investors.

It is here that entrepreneurs and investors encounter some serious implications in the current IPO markets. When the best performing companies “finally” decide to pursue an IPO to find capital that is needed successfully to grow the company, most of the gains in the companies’ market value have already been allocated to pre-IPO investors.²⁶ Consider the mere 0.6% first-day “pop” (or first-day increase in stock price) that Facebook realized during its IPO. Clearly, investors expected a “healthy” pop in the range of 20–30%,²⁷ which would have been in line with the average first-day increase of 27.9% (based on an empirical analysis of 2634 venture-capital-backed IPOs from 1980 to 2010).²⁸ The significant decrease in the first-day pop could largely be attributed to high-tech companies’ decisions to remain private longer, allowing pre-IPO investors to appropriate most of the gains from the increase in the value of the company. This is of course different when a company’s IPO is intentionally priced under market value, as was allegedly the case in the Alibaba IPO in 2014.²⁹ This strategy resulted in a 38% gain after the first day of trading.

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

When discussing this issue with investors, it is increasingly emphasized that much bigger cash on cash and IRR return can be realized while investing in early-stage and later-stage private opportunities than in the public markets. Investors mention several reasons for this. For instance, the supply-demand dynamics are much better for investors in private companies. That is to say, in public markets investors often have the feeling that the entire globe is their competitor when it comes to investing in a good deal. Private investors practically have a “monopoly,” allowing them to select and invest in the best opportunities. Andrew Romans of Rubicon Ventures and author of the *Entrepreneurial Bible to Venture Capital* made an interesting observation:

At a high level consider this. Most publicly traded companies have many bulge bracket investment banking analyst teams tracking them. Information is disseminated in real time via Bloomberg terminals, the Internet and mobile phones. By the time I meet a CEO and learn some new information that same information is available to the global market of traders and any arbitrage opportunity exists for less than a second.

Investors in the pre-IPO market can thus capitalize on “inside information”.

Perhaps more importantly, making “hands-on” investments in private companies gives the investors more control over their own destiny. Simply put, they usually track approximately 1000 deals in their deal flow funnel each month, but invest in for instance “only” 10 new companies per year. This allows them to divert their time and resources to the very best ones. First, they use their proprietary networks for due diligence and (p. 848) separating the good investments from the bad. They then mobilize their proprietary network to add value to their portfolio companies. The deal selection process based on private information together with the personal “magic” touch and “value add” explains why the better investors are able to achieve growth in private companies that can never be realized in publicly traded equities (where they cannot wave their magic wand over the deal).³⁰

Figure 31.4 Venture-Capital-Backed Exits in the US and Europe.

Source: PitchBook.

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

The changing nature of the IPO market has also changed the way high-tech companies, and their founders and investors, deal with funding and liquidity strategies. For instance, even though Figure 31.4 shows a revival of the global IPO market starting in 2010, it seems hard to believe that “going public” will recover its traditional allure. Figure 31.4 also shows that venture capitalists tend to induce entrepreneurs to sell their companies to strategic investors.³¹ They have good reasons to do this. In order to increase the track record of their funds and attract the interest of institutional and other investors, venture capitalists realized that a focus on an acquisition by a strategic corporate investor would significantly increase the probability of a successful exit. It is thus not surprising that the ratio of IPOs to trade sales increased from approximately 1:1 in 1997 to 1:7 in 2013 in the US. In Europe, this ratio was 1:10 in 2013.

There are other advantages to pursuing a trade sale. The median time to liquidity is shorter in the event of a trade sale (compared to an IPO), which took six years in 2014 (compared to seven years in the event of an IPO). The timing advantage may be significant for well-established venture capitalists and perhaps even the founders of startup companies. Employees (who are usually awarded with restricted shares and stock options) and early-stage investors (particularly family, friends, and other early-stage risk capital providers) may have short-term views when it comes to liquidity issues. For them, the extended exit—and its delayed cash-out event—arguably creates a liquidity gap that could potentially discourage them to work for and with high-tech startup companies. The availability of an exit strategy is of such importance that it can make or break the commitment of prospective employees to contribute human capital resources to a fledgling enterprise. In 2008 when there was such a lack of liquidity options for holders of private shares, a former Facebook employee approached SecondMarket, a company that offered a marketplace for classes of stock in private companies and assets of defunct companies that could not be sold on the public market, to assist him in selling his stock options.³² (p. 849)

There is, of course, little doubt that the best performing and most promising companies, as well as companies in highly capital-intensive sectors, will eventually pursue an IPO to find the capital needed to achieve stellar growth and success. What is remarkable, however, is that even if venture capitalists and high-tech entrepreneurs decide to float the company's shares on a stock exchange, the IPO can be completed with a relatively low median free float of 23% in the US and 27% in Europe, indicating that they can gradually give up their “private company” status (this is also due to onerous lock-up provisions which prevent venture capitalists from pursuing an immediate exit).³³ More generally, the pace with which the companies are willing to give up this status depends on the hype surrounding the IPO. If the IPO has attracted significant media and (retail) investors' attention, the technology entrepreneurs/founders in consultation with their lead venture capitalists tend to structure their future listed companies in such a way that investors and board members are not able to unseat them (see Figure 31.5).³⁴

One example is LinkedIn, which went public on May 18, 2011 in the US. Similar to other social media companies, LinkedIn introduced dual class shares. Following its IPO, co-founder Reid Hoffman, together with the key venture capital investors, held Class B

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

shares, which gave them 10 votes per share. Class A shares, with one vote a piece, were offered to the public. The outcome of this was that Hoffman, who is also the chairman of LinkedIn's board (and part-time partner in a venture capital firm in Silicon Valley), held (directly or indirectly) a minority stake of approximately 16.3% of the outstanding Class A and Class B shares, but controlled approximately 61.5% of the voting power on December 31, 2012. Indeed, Reid Hoffman's Class B shares, which gave him controlling voting power in excess of the cashflow rights attached to the minority stake, allowed him to resist immediate pressures from public market investors to produce short-term results and forgo investments in new products and services. (p. 850)

3.1 The Emergence of Robust pre-IPO (Private Secondary) Markets

It did not take long for clever entrepreneurs in the US to create and further develop on-line platforms to better facilitate pre-IPO trading in the shares of nonlisted venture-capital-backed firms. They were able to avoid compliance with strict securities rules and regulations by limiting access to trading to “accredited investors” or those deemed sufficiently wealthy. Unsurprisingly, these trading platforms fast became a critical component of the venture capital ecosystem, as they helped bridge the liquidity gap in the venture capital model. Perhaps the most well known online platform for shares in private firms was the New York-based SecondMarket, which rose to prominence after becoming the main platform for “trading” shares in Facebook. The sellers of shares traded through SecondMarket were mainly the former and current employees of firms, with founders also unloading their stock from time to time. The main competitor of SecondMarket was California-based SharesPost. In close resemblance to SecondMarket, SharesPost started op-

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

erations in 2009 with the specific aim of dealing with “the lack of market liquidity for private company shares.”³⁵

The online platforms as an outlet for trading shares in private companies have never been free from controversy.³⁶ Concerns have been raised about the lack of sufficient (p. 851) information regarding the companies whose stock “traded” through these platforms. As private firms have generally no obligation to make public disclosures, there has always been some doubt about the accuracy of the valuations used to determine the price of transactions in SecondMarket and SharesPost. Looking again at Facebook, in January 2010 their shares initially traded on SecondMarket at an implied valuation of \$14.70 billion (and a share price of \$6.39). By December 2010, following transactions carried out on SharesPost, Facebook’s value reached \$56 billion. SecondMarket transactions, executed just prior to the IPO, implied a valuation of \$90.13 billion (and a share price of \$36.05) in March 2012, an increase of more than six times in a little more than two years.

The IPO was priced at \$38 per share, at which price Facebook raised an amount of \$16 billion. The disappointing first-day pop and deteriorating “IPO performances” (Facebook’s 30-day, 60-day, and six-month IPO performances were 21%, 26%, and 38%, respectively) fueled the general perception that Facebook was overvalued at the time of its decision to go public. The fact that the trading community was growing and started to include more and more investors (such as the “DLD”—doctors, lawyers, and dentists investors) without the necessary knowledge and expertise correctly to interpret the available information about the valuation of fast-growing startup companies has arguably created upward price pressures that significantly inflated the valuations of the private companies “listed” on these platforms.³⁷

Naturally, the post-IPO fall in the price of Facebook shares quickly dampened the excitement for the private startup stock platforms. That is not to say that we have witnessed the end of these platforms, as was predicted in the wake of the Facebook IPO.³⁸ In fact, online platforms, such as SecondMarket and SharesPost, continue to play an important role in offering employees and investors a possibility to cash out of their “illiquid” positions in VC-backed companies that could still be years away from a trade sale or exit—but the model has changed. Prior to Facebook’s IPO, the shareholders auctioned their securities directly to any buyer, under terms that were acceptable to both parties, and sometimes without the company’s involvement and/or approval. The difference with the current post-Facebook IPO model is that the companies themselves employ SecondMarket-type platforms to give existing shareholders the possibility of exit. The companies are thus largely in control of the transactions—they select the buyers and set the price of the securities.

Over the years, trading in stock of private companies has grown rapidly and is currently doubling the volume of trades that took place in the pre-Facebook IPO period of 2011/2012, according to private equity research firm NYPPEX.³⁹ This shouldn’t be all that unexpected for those attuned to the venture capital industry. Hedge funds, mutual funds, and other institutional investors are increasingly pushed to make later stage investments

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

in the venture capital asset class since, as we have seen, the timing of the “IPO pop” has slowly but surely shifted to before the IPO, leaving less capital on the table for the investors in public markets.⁴⁰ Thus it makes sense for these institutional investors to buy into high-tech companies by acquiring (p. 852) shares held by founders, early investors, and employees on the pre-IPO (secondary) market.⁴¹

With hedge funds and mutual funds gaining steam in the industry, there is however, sufficient evidence to suggest that venture capitalists do not plan on ignoring the new investors. Venture capitalists have more capital reserved for their pro-rata investment opportunities in the later financing rounds. The additional capital creates the opportunity to continue financing winners into later rounds (without running the risk of being significantly diluted when hedge funds and mutual funds bring out the big guns). We see “early-stage” or “life-cycle” venture capitalists setting up separate later-stage funds to “capture the pro-rata,” as it was so clearly dubbed by Mark Susters of venture capital firm Upfront Ventures. The \$225 million Foundry Group Select Fund and the \$200 million Greycroft Growth fund are recent examples of special later stage funds.⁴²

As public market investors are entering the private market and venture capitalists are being pushed to later rounds of financing, high-tech companies have even more reason to stay private longer. The result is larger investments in bigger and more mature companies with higher valuations. Indeed, the Wall Street Journal, in collaboration with data provider Dow Jones VentureSource, found that more and more venture-capital-backed companies with a valuation of \$1 billion or more decide to remain private. This trend is not only happening in the US, but also in other parts of the world. As reflected in Figure 31.6, at least 73 private companies were valued at \$1 billion or more in February 2015. In January 2014, this number was 41. The number of “exceptional” startup companies that were still private in 2013 was 28. During the dot.com boom in 2000, “only” 10 companies with a valuation of \$1 billion or more had the status of being “privately-owned,” the record number before the 2007–2008 financial crises.⁴³

Dow Jones VentureSource data also reveal that the median amount that was raised prior to going public increased from \$57.3 million in 2006 to \$89.6 million in 2014. Another data provider, PitchBook, shows that the median late stage (series D) valuations jumped from \$67.9 in 2005 to \$190.6 in the first 6 months of 2014. What is even more remarkable is that the 10 largest amounts of venture capital in high-tech companies in 2014 are higher than the capital raised in the 10 largest IPOs in the US (see Figure 31.7). This will become more imminent as US venture capital investors are taking a more global view as they seek to benefit from global investment opportunities.⁴⁴ So what is the impact of these venture capital mega rounds and valuations on the IPO market? There are two possible answers: (1) Mega rounds will eventually make the IPO market irrelevant or (2) mega rounds still need an active IPO market in order to enable later-stage investors to realize the required liquidity multiples (and provide companies with a realistic option to go public). The latter answer appears to be correct (as was previously stated by the Economist in 2012),⁴⁵ which brings us to the introduction of the JOBS Act in the US. (p. 853)

(p. 854)

3.2 The JOBS Act

The JOBS Act, viewed by some as a mishmash of several different initiatives,⁴⁶ illustrates the potential of a combined focus on both pre-IPO and IPO markets in successfully accommodating high-tech companies at different stages of their respective life cycles. The JOBS Act offers several benefits to high-tech companies in the pre-IPO and post-IPO periods. Before the JOBS Act was enacted, once a private company in the US had surpassed a threshold of \$10 million assets and 500 shareholders of record, it had to register with the

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

SEC and produce periodic disclosure reports under the US Securities Regulations. Although companies that had reached that threshold were not required to go public, the costs of disseminating private information about their activities were presumed to be significant. Preparing quarterly and annual reports requires the assistance of accountants, external auditors, and other professionals, whose service fees will have to be borne by the company. Perhaps more importantly, revealing strategic information about the firm's activities might also benefit competitors or increase transaction costs in the context of the company's relations with third parties. The JOBS Act has expanded the number of shareholders a private company may have from 500 to 2000, making it easier (and cheaper) for them to remain private, and thus extend the pre-IPO stage, as most of them currently prefer.

The JOBS Act also offers the possibility of a company to qualify as an “emerging growth company” (EGC) if its total annual gross revenues are less than \$1 billion for the most recently ended fiscal year. The EGC label offers several benefits to high-growth companies in the pre-IPO and post-IPO stages. In the pre-IPO stage, an EGC will only be required to include two years—instead of the usually required three years—of audited statements in its IPO registration. An EGC can also elect to provide the market with reduced executive compensation disclosures (i.e., EGCs are allowed to disclose compensation statements for only the Chief Executive Officer and the two other highest-paid executives, while non-EGCs must provide five executive compensation disclosures). More importantly, the JOBS Act provides these companies with the possibility to confidentially submit a draft of its IPO registration statement for review to the SEC. The special status thus introduces “testing-the-waters” provisions, which also allow EGCs to communicate with professional investors (qualified institutional buyers or institutional accredited investors) to determine investors' interest in the company prior to or following the date of the IPO registration statement.⁴⁷

The JOBS Act's “on-ramp” provisions grant temporary (five years or less if certain growth conditions are met) but important reliefs in the post-IPO period. For example, EGCs are exempted from the obligations under SOX Section 404(b) to provide an auditor attestation of internal control. Furthermore, the Act excludes EGCs from (1) complying with the full range of executive compensation disclosures and (2) say-on-pay votes (p. 855) on executive compensation. Finally, EGCs need not comply with any new or revised accounting standards until the date on which private companies are required to apply these standards to their organization.

The JOBS Act is working. As we discussed in the previous section, venture-capital-backed companies do prefer to stay private longer, but the JOBS Act has contributed to a surge in IPOs within the US.⁴⁸ In 2014, 118 venture-capital-backed companies floated their shares, compared to 84 companies in 2013. In particular, a number of companies active in either the biotechnology or the medical sector completed their IPOs as an “emerging growth company.”⁴⁹ This trend is reflected in Figure 31.8. The JOBS Act is also (at least partly)

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

responsible for the increase in foreign companies “going public” on a stock exchange in the US.⁵⁰

To see the success of the JOBS Act, consider the significant increase in the number of EGCs that have pursued a listing after having used the option confidentially to file their registration statements. It has already been argued that confidential filings have become the new normal for companies that consider going public.⁵¹ According to data provider Renaissance Capital, approximately 70-80% of the 131 IPO companies (including non-venture-capital-backed companies) in 2013 availed themselves of the JOBS Act’s confidential filing provision. Accounting firm Ernst & Young estimates that approximately 85% of the EGCs that have filed IPO registration statements in the period April 2012 to June 2014 submitted the statements confidentially.⁵²

These observations are not surprising since high-tech companies value having control over the timing of the IPO (provided by a confidential filing) more than a possible discount in the stock price due to the reduced disclosure and reporting requirements of EGCs.⁵³ Corporate governance experts, however, have a different view. They acknowledge that the drawbacks may not be immediately apparent, but when something goes wrong (and they argue that it always does in business)⁵⁴ “then the investors are going to complain that the regulators screwed it up.”⁵⁵ So who is right? (p. 856)

Figure 31.8 Impact of the JOBS Act in the US.

4 The Future: Collaborative Corporate Governance

4.1 Another Bubble?

The National Venture Capital Association, the Biotechnology Industry Organization, the New York Stock Exchange, NASDAQ, and the US Chamber of Commerce all welcomed the JOBS Act.⁵⁶ However, not everyone was convinced of the potential benefits of the Act.⁵⁷ When the JOBS act was introduced in 2012, 55% of the investment bank executives who participated in a survey conducted by accounting and consulting firm BDO USA LLP believed that the JOBS Act was likely to produce accounting scandals, market manipulation, and fraud.⁵⁸ In particular, the relaxed accounting standards under the JOBS Act raised concerns among academics and practitioners.⁵⁹

(p. 857) In the two years since the enactment of the JOBS Act, concerns have changed. The benefits of the Act for the “lower valued” companies (those that had no or relatively little media attention before their IPOs) are now widely accepted. Current concerns focus on the billion-dollar companies that are also allowed to use the reduced disclosure requirements for EGCs for when they, eventually, decide to go public. In the media, Twitter’s high-profile IPO is an example of the cost and problems of allowing prominent companies to test the water, buy time, and, most worrisomely, show less paperwork before they float their shares to the public.⁶⁰ Twitter’s exceptional first-day pop of 73% (trading at \$44.90 per share from its \$26 IPO price) was among the 20 highest of any listing in the US in 2013.⁶¹ The share price gradually increased 92% during the first three months of trading, but then tumbled to \$50.05 per share (dropping 24%) after their first earnings report was disclosed.⁶²

Twitter’s sharp fall in the stock exchange worked exactly as the critics of the JOBS Act had predicted.⁶³ They argue that less disclosure and less transparency had the perverse effect of increasing speculation about Twitter’s performance. They allocated most of the blame for the drop in share price following the disclosure of the earnings report on the JOBS Act.⁶⁴ High valuations of late-stage private companies involving public market investors and the subsequent hype building up to the eventual IPO arguably contributed to Twitter’s stock price decline. Certainly, there is anecdotal evidence that suggests that the increase in IPOs, the massive valuations (compared to the revenues) of pre-IPO-stage high-tech companies and the confidential filing process under the JOBS Act (which allegedly explains some of the Twitter-like first-day IPO pops) would eventually lead to a bubble and a subsequent burst, similar to the dot.com bubble of the late 1990s.⁶⁵

It is questionable whether or not full compliance with non-EGC disclosure standards and requirements would have completely avoided Twitter’s shaky stock price. The giant sums of capital that private companies are able to raise, however, are a concern that both the opponents and proponents of the JOBS Act appear to share. As we have seen, approximately \$4.2 billion was raised in the 10 biggest “venture capital” rounds in the first half

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

of 2014, compared to \$2 billion in 2013 and \$1.4 billion in 2012.⁶⁶ The issue with the increasing venture capital investments is that there is usually some sort of correlation between the amounts raised and the burn rate (defined as the amount of money spent by a company in excess of its revenues per month).⁶⁷ Human capital-based high-tech companies that have raised huge piles of cash, usually increase (p. 858) their monthly burn, according to several reputable venture capitalists that started to voice their worries about the increasing burn rates.⁶⁸

Their worries appear to be supported by empirical research: the high-tech startup's average burn rate is at an all-time high since the burst of the Internet bubble. Data provider PitchBook calculated the burn rate at venture-capital-backed software companies in the US by dividing the capital raised by the time between the financing rounds. Their research also confirms that burn rates at later-stage companies are rising.⁶⁹ Danielle Morrill, founder CEO of business intelligence company Mattermark, analyzed the percentage of expenses covered by revenues at high-tech companies at the time of their IPOs.⁷⁰ Her data, which is included in Figure 31.9, shows that profitable IPOs made up a smaller portion of the IPOs in the first quarter of 2014 than they did before. It is however nearly impossible to predict the timing of a bubble based on the available data.

Since unprofitable IPOs are nowhere near to the numbers we saw before the Internet bubble burst, it could be argued that another bubble is not likely to happen in the IPO market in the near future. Unfortunately, this cannot be said about the pre-IPO private market. Bill Gurley, a partner at the Silicon Valley venture capital firm Benchmark, refers to the example of Fab.com, a private online retail company that sells designer-influenced products, including clothing, accessories, furniture, food, and pet products.⁷¹ He argues that the later-stage investors that poured \$150 million into the company at a \$1 billion valuation should have been more wary about investing in a company that would most likely not have passed the immense scrutiny that is part of the IPO process. Companies that did not pursue an IPO in 2014 stayed private for a reason.

If we accept this line of reasoning, the Fab.com case suggests that there still remains a dilemma for the companies and their investors and a conundrum for policy makers and regulators. Arguably, the review of financial statements by auditors, bankers, lawyers, and the Securities and Exchange Commission is needed to reduce the information asymmetries between the investors and a company's executives during the IPO.⁷² However, it is far from clear whether the disclosure of financial figures is truly material to any evaluation of a company's prospects for sustainable growth and value creation. Mindful of this, an analysis of Fab.com suggests that new metrics should be developed in order to measure the future performance of both private and public high-tech companies.⁷³ The focus of the remainder (p. 859) of this chapter is on long-term metrics and the processes that we have already observed in practice.

4.2 The Emergence of a New Normal in Corporate Governance

There is something odd about the fear of another bubble in the venture capital industry. Surely, the most prominent and reputable venture capitalists acknowledge that the burn rate and spending plans of their own portfolio companies have increasingly made them grumpy.⁷⁴ It could be argued, however, that the ones who are able to prevent the next bubble are none other than the venture capitalists themselves.⁷⁵ When venture capitalists invest, they tend to hold preferred stock instead of common stock.⁷⁶ The precise scope of the provisions and restrictions attached to the preferred stock is established by the terms of the contractual arrangements. These typically protect the venture capitalists extensively against shirking, opportunism, and incompetence and, obviously, limit information asymmetries and agency issues which characterize the relationship between venture capitalists and the founders of high-tech companies. The provisions usually attached to the preferred stock are: preference on dividends, the proceeds of a liquidation event (including a sale of the company), and pre-emptive rights. The preferred shareholders are also entitled to elect a set (p. 860) number of representatives on the board of directors. Moreover (and most importantly in the current climate), they usually have the opportunity to replace the CEO, even if he or she is the founder, in the event of burn rates being excessive and irresponsible.

This was probably true under the traditional model of venture capital that has widely been discussed in the academic literature.⁷⁷ Lawyers tend to introduce more and more stringent agency-based contractual provisions, such as senior liquidation preferences, participating preferred shares, high liquidation preference multipliers, and anti-dilution provisions to ensure that self-interested managers will not act in ways that conflict with shareholder value creation or to offer downside-protection when venture capitalists were about to lose money. This all sounds great in theory; however, people nowadays are increasingly debating how well these provisions truly protect the venture capitalists and

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

other risk capital providers.⁷⁸ Speaking from personal experience, when you are on the ground working with venture-capital-backed companies, you immediately recognize that there are other overriding considerations that should take precedence. Fred Wilson, co-founder of Union Square Ventures and notable blogger, puts it as follows:⁷⁹

One thing I know for sure is that those who advise and invest in startups cannot and should not meddle in the day to day decision making. It's harmful and hurtful to the startup and those that lead it. So operating at a higher level, helping to set the framework for decision making and then sitting down and watching the game being played, is certainly the way to go.

There is more and more evidence that venture capitalists are returning to the venture capital model in its most traditional form as risk takers and most importantly as real partners to the founders of high-tech companies. Mark Susters of Upfront Ventures summed it up perfectly:⁸⁰ "In my view the best VCs are merely your guides. They are your sparring partners. They are there to help you correct your course when you want to make decisions that their history and wisdom tells them might lead you into a dark alley." He continues as follows:

That's not to say that we as VCs are without strong opinions. I'm no wallflower. And I cherish my role of being difficult to persuade about strategic moves without strong data or logic or conviction on your part. It's my job to help you find your True North. To know that while acquiring a business in China will help you globalize faster it most certainly will take you off of your most immediate problems at home and that dominating your national opportunity first is far better than being spread thinly across two complex opportunities. You want to do that early in your company's existing? Bring it on. You're going to have to run over me like a Mack Truck to get that decision approved. But I would never say "no" 100%.

The best venture capitalists are in essence bringing retro back to the forefront, where it was once fashionable to be bold, but with a modern twist that takes advantage of new-age (social media) platforms and creative as well as disruptive mechanisms to differentiate themselves from the herd. For instance, Fred Wilson, whom we mentioned earlier, shares the (p. 861) three "must-have" terms (board representation, liquidation preferences, and pro-rata rights) to cover in a term sheet on his blog back in 2009.⁸¹ These types of posts have positively impacted the industry on a variety of matters including terms negotiated.⁸² In fact, we see that investor-favorable terms are being exchanged for more founder favorable clauses in term sheets. The very people that deal with this the most at Wilson Sonsini Goodrich & Rosati, Cooley, and Fenwick & West indicate in their quarterly reports on the industry that agency-based provisions continue to decline at a steady rate.

Consider the example of the liquidation preference, which traditionally entitles venture capitalists to get their money out first when an exit opportunity emerges and the company's valuation has gone down (also known as a down round). Liquidation preferences, however, are currently viewed less as stringent "down round risk protection" and more as a necessary provision to align the interests of the investors and the founders. To

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

see this, contemplate a venture capitalist who decides to invest without any liquidation preference protection. He or she would receive their “ownership percentage” from the proceeds of the exit, but this may be significantly lower than their initial investment. Clearly, this could disadvantage the venture capitalist, as the founder may disproportionately monetize his stake in the company at the venture capitalist’s expense. This different perception of the liquidation preference explains why the investor-favorable senior liquidation preference is used less often (see Figure 31.10), and additional participation in the remaining proceeds was infrequently used in 2013 (see Figure 31.11).

This is certainly not a call to remove all protections and agency-based provisions, but more to do with removing those that are purely unnecessary and uncalled for and can only destroy the founders’ incentives to be prepared to go at any lengths to make their startup companies a long-term success. In this light, it is not surprising that not everyone in the venture capital industry is excited by the involvement of hedge funds and mutual funds in startup companies.⁸³ Venture capitalists generally believe that the typical characteristics of these investors do not match well with the objectives of venture capital to make patient medium- to long-term equity investments in early-stage companies. The companies’ founders, however, are usually more positive about the new breeds of private investors.⁸⁴ In their view, institutional investors, particularly hedge funds, are able to add exceptional and unique value to later-stage companies (besides loads of cash). For instance, their knowledge and expertise with listed companies are invaluable for companies that are eventually considering an IPO. Startups that are looking for ways to expand to foreign markets also benefit more and more from hedge funds’ broad international networks and experiences.

The founders are right. A new establishment of hedge funds (similar to the modern venture capitalists mentioned above) is emerging, with the hedge funds realizing that when they conceptualize the relationship between managers and investors as one of hierarchy, they create a short-term mentality within the company that usually leads to corporate (p. 862) (p. 863) reorganizations, and demands for increased dividends and stock buybacks. This makes it extremely difficult for companies to recapture the focus on innovation, growth, and wealth⁸⁵ Consider Nokia and Blackberry, once viewed as tech champions until they became share buyback heavyweights.⁸⁶ It is this disconnect that is slowly but surely causing a shift in corporate governance thinking amongst activist investors. They appear to be more interested in the question of what it is that causes companies to thrive and stay ahead of their competitors. As they ask themselves how to structure and design their private and public “portfolio” companies, they focus on certain common themes, such as board representation, M&A transactions, and business/growth strategy issues (see Figure 31.12). Consider ValueAct Capital’s board seat at Microsoft. Undoubtedly, ValueAct was behind Satya Nadella’s appointment as the new CEO of Microsoft on February 4, 2014.

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

It is exciting to see that the focus on helping business executives is starting to become the norm of what is expected of venture capitalists and active investors in both private and public companies. It is up to the founder/CEO and the board of directors, however, to make the investors work for the company (independently of the stage in the life cycle of a company).⁸⁷ The best way to engage the investors is frequently to share information and communicate with them.⁸⁸ This is also true for companies with a relatively small investor base, such as an early-stage startup.⁸⁹ Clearly, the information is not so much about quarterly financial statements that focus on the past. As we all know, past performance is not always indicative of future success. It is more effective to use metrics that are forward looking and complement some of the more historical data that is available in the market. Attributes that are critical for future performance are customer satisfaction, employee en-

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

gement, and community connections, collaborations, and co-creation activities, but also the introduction of new products, product innovations, and/or entering new markets.

As mentioned, it is not just the mere sharing of information, but the interactive discussion between executive management, investors, and also the board of directors that may prove to have a significant effect on the future performance of companies. There are generally three potential benefits for companies. First, the most important aspect of engagement may be in connecting with other leading investors across the globe to explain and discuss growth strategies (and invite input). These discussions assist the founder/CEO in making better decisions and avoiding tunnel vision. Second, a similar focus is on identifying opportunities and getting a better sense of their peers and competitors that often attract the same investors. Third, (pro-)active engagement helps the founders/CEOs in identifying expertise gaps on the board of directors and executive teams. It is in this collaborative context that investors may have the most impact on the spending plans of the CEOs of their portfolio companies. (p. 864)

5 What's Next? The Blurring Line between Private and Public Companies

This chapter started with the observation that policy makers and regulators are convinced that an active IPO market is an indispensable component in an environment that fosters long-term economic growth and job creation.⁹⁰ Their efforts have mainly focused on nurturing alternative stock markets with low entry barriers and few ongoing requirements for listed firms. The discussion in this chapter, however, suggests that govern-

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

ments and policy makers may have to reconsider some of the policies designed to foster the growth and development of high-tech companies. For instance, the Korean KONEX was able to attract a “disappointing” 35 companies within its first year. Choi Kyung-soo, Chairman of Korea Stock Exchange, acknowledged that further steps are needed to deal with KONEX’s low brand image and low trading volumes.⁹¹

(p. 865) We can draw several lessons from the developments in the aging IPO market as discussed in the previous sections of this chapter. A first lesson is that there is a growing need to develop a pre-IPO market for high-tech companies. Pre-IPO platforms (such as SecondMarket) have emerged to satisfy the liquidity needs of founders, early-stage investors, and employees. The list of “new” players in the pre-IPO phase of venture-capital-backed-companies also includes public market investors such as hedge funds and mutual funds. Indeed, participating in later stage (pre-IPO) financing rounds of venture capital-backed companies (that offer unique investment opportunities and quick turnarounds) becomes more and more a must for institutional investors in order to maintain performance standards.⁹²

It is thus important for policy makers and regulators to remove the regulatory uncertainty that creates barriers to the emergence of pre-IPO trading platforms and the involvement of institutional investors in the venture capital industry.⁹³ For instance, it is only waiting for stock exchanges to integrate platforms for pre-IPO (secondary) trading in shares of nonlisted companies into their existing venues in order to gain an edge in the increasingly fierce competition to dominate the market for IPOs of high-growth firms. A segmented venue of this nature would allow stock exchanges to create bonds with these firms early on in their life cycles. This may make it more likely for firms with high growth potential to undergo their IPOs in the same venue that supplied their investors with pre-IPO liquidity, rather than in competing exchanges. The launch of NASDAQ Private Market, which evolved from the joint venture with SharesPost, is one of the first examples of a stock exchange offering a ‘pre-IPO’ segment.⁹⁴

In this context, the introduction of the JOBS Act makes perfect sense. It allows high-growth companies to stay private longer. But there is more. The JOBS Act also offers high-growth companies a legitimate basis to deviate from the “one-size-fits-all” agency-based rules and regulations that usually apply as soon as they decide to go public. Under the JOBS Act the focus on financial statements and past performance has become less important. This should be heralded as a first breakthrough in corporate governance thinking. As we have seen in section 4, it is preferable if both the companies and their investors focus on metrics and information that are material to their growth potential and competitive position. It is therefore only to be expected that connections, collaborations, and co-creation activities will emerge as leading-edge items on the agenda of the investor-management meetings and conversations.

Lastly, I would like to conclude with what I call “collaborative corporate governance”. It is the process of developing new strategies with the aim of contributing to a culture that fosters valuable communications and conversations between a company’s management,

New Metrics for Corporate Governance: Shifting Strategies in an Aging IPO Market

board of directors, and its investors that is likely to have real effects. A collaborative view on this considers corporate governance as the interface between what a company is today and (p. 866) what it attempts to achieve in the medium-term or long-term future rather than focusing upon the conflict between investors and managers. Fortunately, more and more founders, CEOs, and investors have already successfully applied this collaborative corporate governance approach to maximize efficiency, performance, value creation, and innovation within the company.

Corporate Law and Self-Regulation

David Kershaw

The Oxford Handbook of Corporate Law and Governance

Edited by Jeffrey N. Gordon and Wolf-Georg Ringe

Print Publication Date: May 2018 Subject: Law, Company and Commercial Law

Online Publication Date: Oct 2015 DOI: 10.1093/oxfordhb/9780198743682.013.37

Abstract and Keywords

This chapter explores the different ways in which market actors are “co-opted” as corporate law regulators. It considers the preconditions for generating “endogenous self-regulation” through the lens of the formation and operation of the UK Takeover Code and Panel. From endogenous self-regulation, the chapter moves onto consider “market-controlled” regulation where the state directly co-opts market actors as regulators. The chapter shows that the regulatory biases generated by self-regulation are more multi-faceted than, and often inconsistent with, the standard account that self-regulation is likely to generate rules that favour the regulated.

Keywords: corporate law, self-regulation, endogenous self-regulation, contracting zone, market-controlled regulation, UK Takeover Code, UK Takeover Panel, comply or explain approach, state, market

1 Introduction

¹TYPICALLY when we think about the regulation of corporate and business life we ask two questions: why should we regulate, and how should we regulate? The first question invokes justifications for interfering with the free contracting process amongst corporate actors, both within and outside of the corporation. The second question explores whether we should insist on corporations following a particular form of behavior through mandatory rules, or merely provide weighted guidance on rule choice through default rules that can be opted-out of. A third question relating to corporate regulation is less prominent and is the subject of this chapter: *who* should do the regulating? Traditionally, we have thought about this question through the dichotomy of state versus market. Not “the market” as a mechanism which generates regulatory benefits, but the market as a collection of actors capable of coordinating to produce and enforce rules regulating their activities. Through this lens we ask: in what, if any, circumstances should market actors regulate corporate activity themselves by endogenously generating and enforcing regulation without *overt* state involvement; and in what, if any, circumstances is such endogenous self-regulation likely to occur in practice?

Of course the rigid dichotomy of the state as regulator versus the market as self-regulator does not do justice to the different ways in which the state and the market interact to produce corporate law and regulation. In some sense both the state and the market are always involved in the production of regulation: the state's deference to self-regulation is inimical to its formation; the market forms state regulation through consultation processes, repeat player activity, and lobbying. However, in this chapter we are interested not in the ways in which the market molds and influences regulation but the circumstances in which it actually controls the production and enforcement of that regulation. Endogenous self-regulation (p. 870) is the ideal type of such regulation, but it is not the only one.

Where there are regulatory benefits for the state to defer to the market to generate and enforce rules, the state, cognizant of these benefits, may command the market, collectively or individually, to generate regulation or to engage in practices that lead to targeted norm formation. We might view this type of regulation as *forced* self-regulation. We refer to this form of regulation in the chapter as *market-controlled* regulation and distinguish it from *self-regulation*, which the chapter will view as the (quasi-)endogenous production of regulation in the absence of legal instruction.

The purpose of this Chapter is first to explore the conditions in which self- and market controlled regulation arise in the field of corporate law. To do so, the chapter analyzes the dominant real-world examples of self- and market-controlled regulation in the field of corporate law; examples which are often lauded by regulators and commentators alike as model examples of these forms of regulation. They are: the UK Takeover Code and the Takeover Panel created in 1968; and the 'comply or explain' approach to the regulation of board structure and composition, pioneered in the UK in the early 1990s. However, the chapter is not only concerned with the pre-conditions to the creation of these regulatory forms. The chapter also explores the distinctive regulatory biases generated by these different modes of self-regulation and shows that they are more multi-faceted than, and often inconsistent with, the standard account that self-regulation is likely to generate rules that favour the regulated.

2 Forms and Pre-conditions

2.1 Endogenous Self-Regulation of Corporate Activity?

Self-regulation as an ideal theoretical type is said to generate several benefits. Self-regulation is cheap and imposes no direct cost on the state treasury: the marketplace pays for its own regulation.² In addition to such direct cost benefits, self-regulation has clear *potential* regulatory benefits. First and foremost, it is a means of addressing often acute knowledge and information asymmetries afflicting the relationship between the regulator and the regulated constituency. Market actors live the regulated activity and, accordingly, both understand the problems and issues that are generated by such activity and understand the means for most efficiently counteracting such problems through regulation. In contrast, state regulators, even ones with revolving doors from and back into practice, have partial vision and understanding of such activity and are more likely therefore to

craft suboptimal regulation that neither deals with the actual problems and, worse, imposes unnecessary costs on such activity. This is compounded by the *them against us* lens generated by state regulation which disincentivizes information sharing as a result, inter alia, of the unpredictability of how a state regulator might respond to shared information about market practices. In contrast, the market's "ownership" of the regulatory space both promotes information sharing with the self-regulator and, in theory, promotes behavioral norms which foster compliance. The (p. 871) second, well traversed,³ benefit of self-regulation is that it is able to respond more quickly to new forms of activity that require regulation. Not only, for the reasons set forth above, is the self-regulator likely to be aware of the problem earlier, it is also not constrained by the procedures, checks, and balances associated with state action through primary or secondary legislation or through an authorized regulator.

Clearly, however, one needs to be wary of such broad-brush claims about the benefits of self-regulation. State regulatory forms, particularly regulatory bodies with rulemaking authority have the capacity to move relatively quickly. Self-regulatory bodies also typically provide for time-consuming procedures to effect rule changes. This is because public expectations of due process and consultation typically inform nonstate as well as state bodies. And not all forms of corporate activity generate acute information asymmetries between the regulator and the regulated. Corporate and audit scandals in the last two decades, as well as the global financial crisis, have illuminated areas of corporate activity where such asymmetries clearly exist, such as the accounting for off-balance sheet transactions or complex derivative instruments such as collateralized debt obligations. However, in many areas of corporate life, although we find market innovation and smart structuring, the conflict surrounding such activity typically renders it visible and comprehensible. For example, innovative activity in the market for corporate control has typically been transparent because of the conflict it has generated. Consider, for example, takeover defenses in the 1960s, 1970s, and 1980s or the conflicts over the use of equity swaps in the 2000s. In these areas claims that self-regulation addresses asymmetries of knowledge and information are overstated because the asymmetries are insignificant.

As with the benefits of self-regulation, its potential costs have been thoroughly explored. Most important in this regard is the concern that the self-regulator will abuse its position and its knowledge and information advantage to craft rules that enhance its welfare position at the expense of other affected parties that have no control or influence over the rulemaking and enforcement process. State regulators are, of course, not immune from rent seeking but are thought—certainly in the eyes of the state regulators themselves!—more able to resist pressures from market constituents and more likely to be able to craft rules that are not biased in favor of any particular constituency. The extent to which a self-regulator is able to bias the rules in favor of market actors is a function of several factors. First, whether or not other non-participating parties are thought to be affected by the activity in question. Where the activity is thought only to affect the direct parties involved (or where such third-party effects although real are very opaque) then the independence concern will be (or will be seen to be) less pressing so long as all affected market participants have a voice in such self-regulation. It is in such areas in particular that

the welfare case for self-regulation is a strong one. Second, the extent to which bias is a concern is dependent on the alignment, or lack thereof, of the interests of the self-regulatory rulemaker and the perceived interests of society. If, for example, institutional shareholder groups exercise self-regulatory authority and the prevailing political and social norms view the advancement of shareholder interests as congruent with social welfare, then any such rule bias is unproblematic. Third, the extent of this bias problem is, paradoxically, connected to one of the purported key benefits of (p. 872) self-regulation: the knowledge and information asymmetries of market actors. Where such asymmetries are significant, self-regulatory actors have more room to deploy self-interest, as the ability of the state and other nonstate actors, such as the financial press, to assess and monitor whether the rules are biased is much diminished. This means that where we think about the welfare implications of self- versus state-regulation we find that both the benefits and the costs are higher where knowledge and information asymmetries are high.

The second consensus drawback with self-regulation is the concern that the self-regulator is unlikely to enforce the rules against its own. There are two reasons given for this: the absence of the enforcement apparatus of the state and the lack of distance between the regulator and the regulated which undermines the willingness of the regulator to impose available sanctions for breach. Of course, these enforcement problems may be counter-balanced to some degree by both the positive compliance effects, mentioned above, of “owning” the regulatory space as well as the precarious nature of self-regulation—if rules are too pro market actor and are not enforced, the likelihood increases that the market will lose the regulatory franchise.

2.2 Theorizing the Preconditions for Self-Regulation

We might think about the probability that the market will elect to regulate itself through the lens of the costs (or lost benefits) of failing to do so. Clearly for many market actors there are significant benefits of remaining unregulated. However, market actors will collectively realize that where their actions are generating public and political disquiet there is a distinct likelihood of state regulatory intervention. Self-regulation in such a context may impose costs on market actors but will be viewed as the lesser of two evils and as way of deflecting political pressures to introduce more costly state regulation. Where $C_{SR} < C_S$ then the market actors will enter the “contracting zone”⁴ to produce self-regulation, where *compared to a state of the world without regulation* C_{SR} equals the costs⁵ for market participants of a self-regulatory regime which they control and enforce plus the transaction costs—the costs of coordination—of agreeing on and maintaining the terms of self-regulation; where C_S is the costs of state regulation to the market actors; and where C_S is discounted for the probability of state intervention. The costs of coordination will vary as a function of the homogeneity and proximity of the actors in question. Such homogeneity and proximity are also likely to foster coordination cost reducing norms, such as a sense of responsibility for the space within which the activity takes place.

Corporate Law and Self-Regulation

C_{SR} and C_S are individual variables for each player—or category of player—in the marketplace. Where there are multiple categories of player it is possible that whereas $C_{SR} < C_S$ for some categories, $C_{SR} > C_S$ for others. In such circumstances all parties will not be brought into the “contracting zone” in the absence of either some differential power weighting for key actors for whom $C_{SR} < C_S$ or a coordinating mechanism that ensures a response where in aggregate $C_{SR} < C_S$. A similar calculus operates where market actors’ concern is not the cost implications of state regulation but the cost implications of the failure to regulate due to, for example, the political failures of the executive or legislative authorities that are deadlocked or for other reasons incapable of acting. Here participants will optimally enter the contracting zone where the aggregate benefits of self-regulation, B_{SR} , exceed the transaction costs of coordination. Again, however, individual variation in B_{SR} may impede parties entering the contracting zone (Figures 32.1 and 32.2).⁶

Figure 32.1. Contracting Zone Open.

Figure 32.2 Contracting Zone Closed.

Corporate Law and Self-Regulation

It is plausible that such a cost calculus is an important component of the drivers of the real-world examples of self-regulation. However, it is most certainly a secondary driver. Whether actors can enter the contracting zone is a function of whether the state will countenance self-regulation. In an idealized world if the state acts as a rational actor, whether it would permit self-regulation would be a function of the costs and benefits of self- and state-regulation, discussed above, as applied to the particular regulatory context. Where the social welfare benefits of self-regulation exceed those of state regulation one would expect a rational state to permit or to facilitate self-regulation and where they do not to preempt self-regulatory contracting (Figures 32.3 and 32.4).

Figure 32.3 Contracting Zone Open.

(p. 874)

Figure 32.4 Contracting Zone Closed.

Clearly, however, the willingness of the state to open the contracting zone is a function of more than such a calculus. Of central importance in this regard is the regulatory conception of state and whether such a conception countenances or encourages self-regulation. By regulatory conception of the state I mean the shared understanding—amongst politi-

cians, market actors and citizens more broadly—about the extent to which it is legitimate or illegitimate for the state to exercise power to identify and address problems generated by interactions within civil society; or, put differently, the extent to which it is legitimate or illegitimate for nonstate actors to perform regulatory, state-like functions. Where this regulatory conception of the state does not countenance self-regulation, even where Figures 32.1 and 32.3 apply, there is no scope for the marketplace to legitimately occupy the regulatory space policed by the state and therefore no scope for there to be a “contracting zone” within which the market actors’ cost calculus could operate. In such a context market actors are left to try and coordinate improved behavior in the hope of dampening (p. 875) political concern, or, where the problem is the failure of the state to act, to lobby for state action. Where the conception of the state is open to, or favorable to, market-based action the contracting zone comes into play. For this reason it is unsurprising that we find that many of the examples of corporate self-regulation—some of which are discussed in this chapter—are produced in the UK, a jurisdiction that for several centuries following the Enlightenment actively promoted local and market-based solutions to identified problems—an approach that resulted from a longstanding and deeply held “wariness towards the central state apparatus.”⁷

There is a significant body of scholarship on the passive conception of the UK state which we can only touch on here. Jenks, for example, contrasts the prevailing political style in nineteenth- and twentieth-century Britain with the “imaginative conception of politics” associated with the utilitarianism of Bentham and John Stuart Mill.⁸ For Jenks, this utilitarian conception of politics involved an active form of government: “a conception of problem solving and exploration of opportunities for innovation as the very stuff of politics.” The British political style and the conception of the state that underpinned it was the antithesis of such an active and interventionist style. For Jenks, the British approach is characterized by sobriety, neutrality, and a resistance to problem solving, almost a willed passivity in the face of identified problems until there is no alternative but to act. In his seminal work on the history of industrial relations in the UK Alan Fox observes that as “it was not part of the state’s duty to anticipate and meet needs which seemed likely to grow”; the problem would have to grow “to a major size before the government decided to step in.” But as the great labour lawyer Otto Kahn-Freund observed, the resistance to proactive intervention and directed control clearly should not be mistaken for the absence of any form of intervention or role for law. For Kahn-Freund, in the UK there was widespread support for the “social institution” of “organized persuasion” where the state’s, and law’s, role was to facilitate parties in creating order, reaching agreement, and resolving conflict.⁹ At most, the government’s role was to take steps—from cajoling actors to respond, to the creation of institutional structures—that would facilitate actors in addressing the problem themselves. The bedfellow of this political outlook was an expectation, and a sense of entitlement, that market actors themselves should be given an opportunity to address identified problems. For politicians, an electoral minefield awaited those who proactively disturbed those expectations, and accordingly “crisis dimensions” were required to drive government to (directly) intervene.¹⁰

For this reason until the latter part of the twentieth century in the UK there was no form of what today we would recognize as capital market or banking regulation, responsibility for which was left to the City of London and the City's "Pope,"¹¹ the Governor of the Bank (p. 876) of England, a non-state body itself until 1947. This approach led Louis Loss in his treatise on US Securities Regulation to observe that it was paradoxical that the US "the arch apostles of private enterprise should have resorted to public control while socialist Britain . . . should have left so wide a field free from state control."¹² For this same reason, the UK did not have a developed system of industrial relations or labor law until well into the 1970s—a regulatory lacuna that was viewed as a mark of success not state failure. Alan Fox observes in this regard that as late as the early 1960s: "The industrial relations systems of less 'mature' capitalisms such as the United States and Germany were thought to reveal their immaturity by their heavy dependence on legal definitions and sanctions and on their being more consciously and deliberately designed by the state."¹³

Whilst one can chart a retreat from, or the disintegration of, this conception during the post-World War II period and in a more pronounced way in the past 40 years, many of the classic examples of corporate and non-corporate self-regulation in the UK are in large part a product of this conception and, as we shall see below, its mark is still impressed on contemporary self- and market-controlled UK approaches to the regulation of the corporation. In other jurisdictions, including twentieth-century US and other European jurisdictions, where the conception of the regulatory state more closely approximates Jenk's utilitarian conception of politics,¹⁴ the scope for market players to take control of the regulatory space and enter the contracting zone has been much more attenuated. Unsurprisingly, in such jurisdictions examples of self-regulation are much less prevalent.

Where the conception of the state does enable self-regulation, the activity that takes place within the "contracting zone" must be framed through a continuing relationship of the state to the contracting market actors. We have already noted the role of possible state intervention in incentivizing actors to enter the contracting zone—the threat to act if the market fails to do so. Moreover, the long-term success and stability of any self-regulatory response is dependent upon it maintaining its (democratic) legitimacy in the eyes of the public and the state. In particular, as the self-regulator usurps the regulatory function of the state it must be seen to do so in an unbiased and even-handed way. Arguably, this need to maintain legitimacy renders self-regulation unstable, if not unworkable, in the long run in contexts where due to knowledge and information asymmetries it is difficult for the state to assess whether or not the self-regulator is acting in a neutral or unbiased fashion. Visible failures in that marketplace are likely to lead to the inference of self-regulatory failure. Even if such an inference is inaccurate, the knowledge and information asymmetries make it very difficult to explain to the regulator, or the public, why it is inaccurate. In these contexts, such failures may themselves irretrievably delegitimize the self-regulator regardless of any failing or fault on its part. By way of contrast, where asymmetries of information and knowledge are limited, (p. 877) a self-regulator can more easily explain its rules and actions and thereby maintain its legitimacy in the eyes of the state and the public.

2.3 Market-Controlled Regulation

Everyone wants the best of both worlds. But invariably the real world consists of second-best solutions that make inevitable trade-offs between the “bests” of each world. The above analysis of endogenous self-regulation has identified several advantages of this mode of regulation but also several bias, availability, and stability problems. Would it be possible to devise a system of corporate regulation that gets the knowledge and flexibility benefits of self-regulation but minimizes the downside rule and enforcement biases and stability problems; a system of regulation that guarantees a market response to the regulatory problem without having to rely on a panglossian alignment of private and public economic interests as well as the availability of co-ordination mechanisms?

In such a system of regulation the state would demarcate the contours of regulation and then command the market to fill in the substantive content of that regulation. We might describe this approach to corporate regulation as forced self-regulation or “market-controlled regulation.” This typically takes place through a legal or regulatory requirement to comply with or to take account of rules produced by market actors. Corporate governance codes provide perhaps the best example of this approach, where legislation or regulation in several jurisdictions provides that publicly traded companies must comply or explain their failure to comply with the rules produced by a designated governance body or commission.¹⁵ Typically this body is a hybrid state/market regulator staffed by market participants but with some formal connections to the state. We explore this form of market-controlled regulation together with the enforcement effects and regulatory biases that it generates in section 4 of this chapter.

3 “Endogenous” Self-Regulation: A Takeover Case Study in the UK and Brazil

Examples of successful self-regulatory regimes that regulate significant parts of corporate activity and that have no formal connection to the state are rare. The most notable (p. 878) example is the UK’s Takeover Code and the Takeover Panel that enforces and maintains the Code. The Code provides a comprehensive body of rules regulating all aspects of the takeover process for publicly traded companies. The Takeover Panel is globally recognized as one of the most powerful and effective command and control regulators. Yet between 1968 and 2005—when it became a state regulator as a result of the implementation of the EU’s Takeover Directive¹⁶—this was achieved without direct instruction from, or empowerment by, the state.

The first attempt to regulate the UK takeover market followed political and media disquiet which arose in the 1950s as a result of target companies using early takeover defenses, including a crown jewel defense in the battle for the Savoy Hotel and a white squire share issue defense in the battle for British Aluminium.¹⁷ These actions generated multifaceted political and public concerns from which one would be hard pressed to identify a dominant concern.¹⁸ The concerns included: disapproval of hostile bids as an inappropriate

ate interference in the “corporate bastion”;¹⁹ concern about the ethics of the takeover marketplace;²⁰ anxiety about the effects of hostile activity on economic policy commitments to restrict income inflation;²¹ and concerns about illegitimate board interference in shareholder sovereignty.²² In July 1959 this led the Bank of England, which at the time was solely responsible for “regulating”²³ banking and capital markets in the UK, to form a working group consisting of participants in the UK capital markets in order to produce a Code of Conduct to regulate hostile and competitive bids. Importantly, UK merchant (investment) banks—through their trade association the Issuing Houses Association—took control of the production of this Code of Conduct. They produced their own working party which was tasked with producing an initial draft code.²⁴ Other market constituencies clearly had input into this process although it was reported that there was “general agreement about the principles involved.”²⁵ The resulting Code of Conduct, which came into force in 1959, was (p. 879) clumsily named the “Notes on the Amalgamation of British Business.” However, the Code was wholly unsuccessful and did not generate behavioral constraint in the UK takeover market. From the moment it was published it was clear that it would not constrain behavior when an actor’s interest diverged from the rules. There was no body responsible for updating and enforcing the Notes and although the Notes contained the structural and substantive seeds of modern takeover regulation, in many instances they were comically ambiguous: “Every effort” should be made to avoid market disturbance; shareholders should be given “adequate time (say three weeks) for accepting” the offer; and it was “desirable that the offer is for the whole share capital.” It was, therefore, unsurprising that the marketplace ignored the Notes in multiple ways,²⁶ including the replication of the very events that led to the Notes on the Amalgamation of Business. For example, in the 1967 battle for Cook & Watts Ltd. the target board locked up a deal with its preferred bidder by agreeing to issue a majority of the company’s ordinary shares in exchange for the sale of one of the preferred bidder’s subsidiaries.²⁷ Similarly, later in the same year in relation to a hostile bid for Metal Industries, the target again agreed to issue a block of shares in exchange for the sale of the preferred bidder’s subsidiary.²⁸ These events generated renewed political and media clamor for regulatory intervention and again resulted in the Bank of England bringing market participants together to put their own house in order.²⁹ For the first time the group included representatives of management. Again the merchant banks through the Issuing Houses Association took the lead in revising the Code. A sub-committee was created to revise the Notes, which “did most of the work and the drafting of the code” and consisted only of Issuing House Association representatives from four merchant banks, one of whom, Robert Clark, had previously been a partner at Slaughter and May, the leading City law firm.³⁰ The result was the newly named Takeover Code which, building on the Notes, provided a pro-shareholder code that directly responded to the problematic events that generated pressure for action and, of some contextual importance, was wholly in keeping with the pro-shareholder orientation of UK company law. Furthermore, the City provided for a self-regulatory body, staffed by representatives of market participants to administer the Code.

Today’s Takeover Code provides for a set of extremely demanding rules as well as a feared and uncompromisingly independent regulator. Compared to the Takeover Code—

which today amounts to 300 pages of rules and rule guidance—other jurisdictions’ takeover rules, (p. 880) for example the US’s Williams Act, appear rather insubstantial, perhaps incomplete,³¹ and are much more deferential to the parties’ freedom to contract. In addition to the well-known non-frustration rule preventing any target board frustrating action,³² and the mandatory bid rules triggered when crossing the 30% threshold or further purchases within the 30–50% ownership range,³³ the Code provides many other highly interventionist and controlling rules. For example, the Code requires announcements of possible offers when there is any untoward movement in the share price³⁴—what amounts to untoward is determined by the Panel. In contrast to the Williams Act³⁵ in the United States—which provides for an all-holders-best-price rule in relation to one class of shares and in relation to purchases during the offer period—the Takeover Code requires bids for all share classes and convertibles³⁶ and provides for an equal pricing rule both during the bid and between three to 12 months prior to the bid.³⁷ The Code provides for what is known as a “put up or shut up” rule requiring the bidder to make an announcement of a firm offer 28 days following an announcement of a *possible* offer.³⁸ An announcement of a firm offer as well as the offer itself may only be subject to limited conditionality which is controlled by the Panel.³⁹ It is the Panel, not the parties or a court, that, for example, determines whether a material adverse change clause can be called pursuant to the contractual agreement. Finally, and perhaps most surprising for a US audience, the Code has long placed significant constraints on the use of deal protections including break fees. Until 2011 a break fee could not exceed 1% of deal value. After 2011, save in limited circumstances, they are prohibited altogether.⁴⁰

The Takeover Panel today is a state body. Pursuant to the Companies Act 2006, which implemented the European Takeover Directive, the Panel is a “recognised supervisory authority.”⁴¹ As a state body the Takeover Panel now has clear access to the power of the state to sanction Code transgressions.⁴² It is noteworthy, however, that from the 1980s the Takeover Panel had theoretical access to the enforcement powers of the UK capital market regulators. And from its inception it had access to licensing sanctions in relation to certain market participants that were regulated by the Board of Trade, a government department. But these trappings of state power are of no relevance to the success of this endogenous self-regulatory body. They have never been and are highly unlikely ever to be used. If the probability of Code compliance were a function of the probability of the use of some form of state power to enforce the Code, then there would be no compliance with the Code because the probability of the use of state power is zero. Yet there is close to total compliance with the Code; and incontrovertible deference to the views and instructions of the Panel. What then explains the success of this self-regulatory mechanism and what are the preconditions to replicating its success? These are important questions of contemporary relevance both generally to the question of in what circumstances, if any, self-regulation can be effectively deployed within corporate law, but also of specific importance to takeover regulation in other jurisdictions, (p. 881) such as for example Brazil, who are currently experimenting with similar forms of self-regulation often because vested interests or governance failures are thought to prevent the state from regulating directly and effectively.⁴³

Based on the experience of the Takeover Panel and Code, below I suggest five key drivers to the successful self-regulation of the market for corporate control. This set of drivers suggests that the Takeover Panel's existence and success is *sui generis* and that successful replication in other jurisdictions is improbable.

3.1 The Deferential State

The Takeover Code and the Takeover Panel are the product of the mid-twentieth-century conception of the British state which, as detailed in section 1, contained an inbuilt assumption of state passivity. This lens generated a regulatory logic which viewed the UK state's role as one of facilitating and organizing self-regulatory solutions. This conception did not merely generate space for the "contracting zone," it actively encouraged entry by market participants. Consider, for example, the UK government's sense of powerlessness in relation to the Battle for British Aluminium. Kynaston notes in this regard that the prime minister's (Harold Macmillan's) view was that "it would be a grave political error to interfere now . . . Let the rival forces fight it out . . . It's the only safe course."⁴⁴

Self-regulation of the takeover market in the UK is often presented as political disarmament: the powerful state threatens to act which leads market actors to self-regulate their activity in order to deflect intervention. This is invariably a key factor in driving what appear to be self-regulatory solutions. And this lens certainly animated many actors and commentators around the time of the formation of the Code and the Panel.⁴⁵ But this lens must be placed within the context of this then prevailing conception of the British state which created a presumption and an expectation—firmly held within government, the City of London, and the Bank of England—that market participants should address and resolve the problems of their own making. State intervention in the market for corporate control in the UK at the end of the 1950s and 1960s would have represented a regulatory paradigm fissure. Publicly stated fears and threats of intervention must accordingly be discounted to take cognizance of this conception. Consider in this regard the Financial Times's (FT) LEX column of July 1967 that called both for more precise rules and a means of enforcement in light of the multiple high-profile takeover "scandals" of that year. It noted the concern that if the issues were not addressed by the City then government would be forced to step in.⁴⁶ This concern was repeated in the press and crystalized around the idea of the threat of a British Securities and Exchange Commission (SEC).⁴⁷ In spite of this perceived looming "threat," in fact consistent with the longstanding British regulatory style, the government, the media, and the City were all of the view that the takeover problem was presumptively a problem for the City to solve. Less than a week later in his Mansion House speech Prime Minister Harold Wilson echoed the FT's sentiments but observed that "it is for the City to ensure that these processes are and are seen to be, carried through in accordance with clearly formulated rules." Of course, if the City failed to act there remained a threat of government intervention, and certainly by the late 1960s this threat was increasing as more commentators called for a break with tradition and greater state involvement in the regulation of business.⁴⁸ However, given the continuing weight of presumption associated with the British approach to governance, the probability of intervention at this point was still extremely low. Historically situated, govern-

mental concerns and media attention were communicative triggers to tell the City to organize itself to address the concerns that had arisen in relation to takeovers.

The centrality of this conception of the state to the UK takeover regulation story suggests that this form of corporate self-regulation is *sui generis*. In the absence of a similar conception, the contracting zone may be locked as self-regulation is viewed as an illegitimate intrusion into the role of the state; an anti-democratic grab for state authority. Moreover, this sense of illegitimate intrusion is likely to be compounded in more modern regulatory settings for capital markets, which typically already provide for a capital markets regulator who would be viewed as the natural regulator for such a new regulatory venture and who is likely to make a territorial claim thereover. In the United States context, for example, at the time of the introduction of the Williams Act the preexistence of the SEC generated a path-dependent preference to address takeovers through an expanded SEC jurisdiction.⁴⁹ This factor is of particular concern in relation to modern attempts to replicate the Takeover Code's self-regulatory success. Brazil has been much lauded for its regulatory dualism which involves the introduction of alternative regulatory regimes designed to offer companies and shareholders, at their election, protections that the state has failed to offer.⁵⁰ In this vein of regulatory dualism, a body of market constituents has come together in Brazil to produce a self-designated Committee on Mergers and Acquisitions (CAF).⁵¹ The CAF Code describes the body as "a non-statutory independent body created by representatives from the main Brazilian capital market players to operate on the basis of a voluntary self-regulation model."⁵² It provides takeover regulation to companies that *elect* to be bound by (p. 883) its rules.⁵³ Although this author is in no position to provide any account of the contemporary conception of the Brazilian state, and whether or not it is similarly open to endogenous self-regulatory initiatives, it is clear that attempts to generate space for this regulatory solution have generated difficulties in traversing the territorial authority of the existing Brazilian Capital Markets regulator, CVM. In this regard, it is noteworthy that the Code itself observes that it "should not be regarded as a substitute" for either law or CVM.⁵⁴ That is, there is a preexisting occupant of this regulatory space, even if—to carry the occupation metaphor further—they have been neglecting their property.

3.2 All for One and One for All: Rules, Trade-Offs, and Coordinating Mechanisms

Provided the contracting zone is open, it is necessary to get the affected market actors to the contracting table. The first UK Takeover Code acknowledged the importance of buy-in from all parties. In a statement issued shortly after its formation the Panel referred to the importance that the "voluntary system should function effectively and command the respect of all."⁵⁵ If key players opt out, there can be no self-regulatory solution. As noted above, the cost calculus for market actors will vary for different parties with both $C_{SR} < \text{and} > C_S$ and $B_{SR} < \text{and} > 0$ for different participants. There are two key considerations for successfully getting parties into the contracting zone. First, as B_{SR} and C_{SR} will be, *inter alia*, a function of the selected self-regulatory rule choices, compromises will have to be made to ensure that rule choices are not made that render $B_{SR} < 0$ or $C_{SR} > C_S$ for key

players. In addition, but also as a substitute for such rule trade-offs, contracting is more likely to take place where there are coordinating mechanisms in place that either force contracting or reduce the coordination costs of contracting.

Let us consider first the relationship between rule choice and variation in relation B_{SR} . If the rulemakers reject the basic economic logic that key players will not contract if $B_{SR} < 0$, the self-regulatory venture is likely to fail. This logic and lesson does not bode well for Brazil's attempt to generate self-regulatory dualism in the takeover field. CAF has the support of several constituents of the Brazilian Capital Market including: the Brazilian Securities Exchange (BM&FBOVESPA S.A.—Bolsa de Valores, Mercadorias e Futuros, “BVMF”); the Association of Capital Markets Investors (Associação de Investidores no Mercado de Capitais; “AMEC”); the Brazilian Association of Entities of the Financial and Capital Markets (Associação Brasileira das Entidades dos Mercados Financeiro e de Capitais, “ANBIMA”); and the Brazilian Institute of Corporate Governance (Instituto Brasileiro de Governança Corporativa, “IBGC”). However, the Brazilian Association of Publicly Held Corporations (Associação Brasileira das Companhias Abertas, “ABRASCA”) did not join the group after a long period of negotiation. The reason for their opt-out is thought to be the mandatory bid pricing rule contained in the Code.⁵⁶ A mandatory bid is triggered by (p. 884) a purchase of between 20–30% of the target's shares (the precise percentage determined by the applicable company's bylaws).⁵⁷ The mandatory bidder must offer to all shareholders the highest price paid for the shares in the previous 12 months.⁵⁸ The rule is understood to further the key takeover regulatory goal of equality of treatment of shareholders.⁵⁹ However, for many large Brazilian companies which are subject to blockholder control, such a rule would prevent a controller from receiving any payment for its private benefits of control as any premium paid to the blockholder within a 12-month look-back period must be offered to all shareholders. It is a forced sharing rule which, given the consensual nature of Code application, means that blockholder-owned public companies are unlikely to sign up, and the same goes for their trade association, ABRASCA. Alternative rules would have enabled sign-up by this key constituency: for example, no or a short look-back period would enable premium block purchases which would not be subject to the highest price rule; or a weighted pricing rule taking a percentage of the highest price paid. Of course even in the absence of widespread sign-up by public companies, from a regulatory dualism perspective the Code still offers benefits to existing widely held companies—as well as companies that intend to effect an IPO where there will be no post-IPO controller—allowing them to elect to lock in⁶⁰ the sharing rule. Nevertheless, rule integrity here appears to jeopardize generating momentum for the project. What is driving this counterproductive rule choice is difficult to parse. But it seems plausible that a possible driver is a classic translation problem: the desire of cosmopolitan legal elites to replicate, and to find authority for legal change in, foreign “best practice” regulation⁶¹—here in relation to the perceived importance of the equality of treatment of shareholders—at the expense of pragmatic adaptation to the conditions of the local marketplace. It is noteworthy in this regard that by the time the UK adopted a 12-month sharing rule for the mandatory bid rule in the mid-1970s there had been a significant reduction in the

number of controlling shareholders in publicly traded companies and a concomitant increase in institutional holdings.⁶²

Where parties refuse to enter or reach agreement within the contracting zone, optimal welfare-enhancing solutions—for the state and aggregate market actors—may be left on the table. In such circumstances coordination mechanisms are required to enable self-regulation. The story of the Takeover Code in this regard directs us to the importance of the financial incentives of pivotal players for coordinating self-regulatory contracting. Most important in this regard were the financial incentives of merchant (investment) banks. Prior to the Battle for British Aluminium, UK merchants banks were almost exclusively pro-management.⁶³ The seismic cultural shock which resulted from the failure of the target to succeed in this case led bankers to realize that their business model had to adapt to take account of the fact that there was money to be made in hostile activity. “Overnight,” Roberts observes, City attitudes to takeovers changed and “financial advisors added hostile bids to (p. 885) their repertoire of merger and acquisition techniques.”⁶⁴ Bankers came to realize that there was money to be made in an active takeover market and in regulation that wedded takeover activity to the financial advisory role. These investment bankers were at the center of a network of advisory services, many of which were essential components in making a takeover bid. Accordingly, once the marketplace incentivized bankers to come into the contracting zone many others had no choice but to follow.

Plausibly, such an investment-banker-driven coordinating mechanism could act as a substitute for the absence of state or quasi-state drivers, as is the case in Brazil. However, for two reasons such replication is improbable. First, such an option is only available where hostile activity levels are sufficient to encourage bankers to take a more neutral stance between targets and acquirers. Where controlling ownership structures block a significant increase in such activity levels, as they do in Brazil, investment banker buy-in is likely to be difficult. Second, although investment bankers coordinated self-regulation in the UK, it was not an endogenous market response. Though coordinated action was in the bankers’ interests and coordination costs for bankers were low—given pre-existing structures for collective action⁶⁵ and the close, geographically proximate and relatively homogeneous environment which was the Squire Mile of the City of London at this point in time⁶⁶—bankers faced a prisoner’s dilemma coordination problem between 1959—the introduction of the Notes—and the creation of the Code and Panel. Although it was in the long term financial interests of bankers (individually and collectively) to control a regulatory system that put them at the heart of the process, in the immediate term, in the absence of such a system, it was in the individual bankers’ interests to serve their client’s needs by facilitating creative (non-)compliance with the Notes. This they did in multiple high-profile events.⁶⁷ What was required—and what was in the bankers’ individual and collective long-term interests—was forced coordination, which arose indirectly from state expectation in response to these events and directly from the Bank of England, who during this period remained the self-styled “Pope”⁶⁸ of the City.⁶⁹ In other jurisdictions, in the absence of such direct or indirect state pressure—which is necessarily the case where

self-regulation responds to state governance failures—this financial advisor coordinating mechanism is unlikely to be triggered.⁷⁰

Of course other market actors could also be incentivized to perform the coordinating role, even if no other constituency is as central to the deal process as the financial advisor. In an important article addressing the UK takeover context, Professors Armour and Skeel (p. 886) identify institutional shareholders as a coordinating mechanism. For Armour and Skeel, the increasing presence of institutional shareholders in the UK marketplace in the 1950s and 1960s⁷¹ meant that it was in their interests to coordinate the market's response in order to exert influence over rule choice even where it may not have been in individual institutions' interests to coordinate to monitor individual companies.⁷² In theory, with their increasing presence and power it seems very plausible that institutions could perform the role of self-regulatory coordinator in order to generate rules that favor their long-term interests. It would follow that the increasing institutionalization of corporate ownership in a jurisdiction may lead to an increase in the probability that self-regulatory solutions to corporate problems will arise, at least where the regulatory space has not already been occupied by the state. In this regard, Armour and Skeel suggest that: "It is not surprising that the emergence of a pro-shareholder approach to takeover regulation coincided with the emergence of institutional investors as a significant force in British share ownership."

With regard to the UK, Armour and Skeel are clearly correct that the "emergence of institutional investors" played a key role in creating the conditions within which the self-regulation of takeovers could arise. However, in my view this is not because the institutions themselves coordinated to claim the regulatory space. In the rule production process their role is better characterized as the interested observer rather than the coordinator. Several considerations point in this direction. First, it is not clear that either at the end of the 1950s or 1960s intra-institution coordinating mechanisms were in place.⁷³ Second, while it is correct that institutions expressed dissatisfaction at some pre-Takeover-Code events,⁷⁴ in relation to several others they were the beneficiaries of practices—at the expense of retail investors—that appeared to be in breach of the Notes.⁷⁵ Although, as is the case with merchant bankers, one could make a case that regulation was in the long-term interests of institutions even if they were tempted to take the low-hanging value fruit associated with preferential non-compliance. Third, and most importantly, it seems clear from the historical record that merchant banks controlled the drafting of both the Notes and the Code⁷⁶ through the Issuing Houses Association, producing a Code that responded to the high-profile takeover events (p. 887) that led to the Code whilst bonding the takeover process to a financial advisory role.⁷⁷ It is submitted that the more significant contribution of the institutionalization of share ownership to takeover regulation in the UK was then an indirect one: its demand-side contribution to the diffusion of share ownership created the conditions for the proliferation of hostile activity which, as observed above, altered the business model for investment bankers and generated strong incentives for them to take control of the regulatory process when action was coordinated by the Bank of England.

3.3 Enforcement

In the UK, unanimous constituency sign-up for the project was not only necessary for the project's momentum, it was central to its mode of enforcement. During the lifetime of the Code the Takeover Panel has acquired several state enforcement supports through the capital markets regulator prior to 2005 and after 2005, when the Takeover Panel became a state supervisory authority, through the courts.⁷⁸ But it has never, and is unlikely ever, to use them. It continues to rely on the enforcement tools introduced at its inception which involve neither injunctions nor fines but the corporate law equivalent of the naughty step and being sent to your bedroom.

There are three tiers of Panel sanction that ensure compliance with the Code and the Panel's instructions. Such instructions could include a direction to comply with the Code or, much more rarely, to compensate parties who are injured as a result of non-compliance. The sanction regime provides for a pyramid of increasingly onerous sanctions which fall clearly within the responsive regulation umbrella:⁷⁹ failing to comply with the Code could result in a private censure, a public censure, or a "cold shoulder." The censures are really precursors/warning signs for cold shouldering and involve either a private or public dressing down. If parties continue to offend or the first offense is an egregious one then the Panel may issue a cold shoulder statement. The effect of a cold-shoulder statement is to inform all market participants that they cannot work with this person for the specified period of time in relation to a UK takeover. In the early years following the Panel's formation, all the trade associations, together with the Board of Trade in relation to licensed dealers, agreed that any of their members who dealt with such a cold shouldered person would be subject to trade association sanctions which could result, in theory, in an effective loss of license for many of these participants. Today, the cold shoulder statement benefits directly from state support through the Financial Conduct Authority's Market Conduct Rules that provide that any person authorized to provide financial services business by the FCA must cease to work with the specified person in relation to takeovers and if they fail to do so may be sanctioned by the FCA, which again risks loss of license.⁸⁰ However, given the widespread compliance with the Code prior to this state support, it appears that the sanction worked effectively without it.

It is noteworthy that although this enforcement approach is widely considered to be highly effective, there are few public examples of sanctions being deployed. Although public censures do occur, they are relatively rare. There has only been one in the past five years.⁸¹ (p. 888) And cold shouldering orders are extremely rare. In the history of the Panel there have only been two. The last one was issued in 2010⁸² but this was the first one for almost 20 years.⁸³ It is common, and sensible, in corporate governance scholarship to draw conclusions about the probability of enforcement from evidence about the number of enforcement actions brought against market participants. Through the lens of the regularity of enforcement action by the Panel one might conclude that the probability of Code enforcement is low. This would be a serious error of judgment for any market participant. However, it is only a mistake that an outsider would make. The Panel signals a high probability of enforcement for breach through its close engagement with the bid. For

every deal the Panel appoints a case officer who is, purportedly, available in real time 24/7. This provides an unrivalled level of interaction with, and oversight and control of, each deal.⁸⁴ The Panel's approach is not unfairly characterized as a surveillance culture, with deal participants aware of the Panel's presence and oversight throughout the deal.

Empirical evidence to support this account of such a surveillance culture is not available. However, a recent case provides some more than anecdotal support for this position. *Re Expro International Group Plc*⁸⁵ involved an idiosyncratic UK deal structure known as a scheme of arrangement.⁸⁶ A scheme is a court-controlled deal structure that can be used to effect a merger or the functional equivalent of a tender offer.⁸⁷ To effect a scheme the parties must obtain the required approvals from shareholders, but also court approval that the scheme is fair and reasonable. This case involved a deal between Expro and a bidder called Umbrellastream. The parties agreed terms and obtained the scheme approvals. However, at the same time there was what UK M&A lawyers would call a virtual bid. In the shadows, Halliburton was lurking indicating that it might make an offer but never quite doing so. In such circumstances, the UK Takeover Code provides for a "put up or shut up" rule that requires such virtual bidders to either make a bid (put up) or announce that it will not make one (shut up).⁸⁸ If the bidder elects not to make a bid it cannot make an offer for the company in the following six months.⁸⁹ However, when a bidder elects to "shut up" it can condition its election on certain events which if they occur will allow it to re-enter the fray.⁹⁰ In this case Halliburton elected to "shut up" subject to the condition that if the court did not approve of the Umbrellastream scheme it would be able to make a bid. The possibility of a bidding war for the target incentivized several hedge funds to oppose the application for the court's approval of the scheme. Halliburton instructed counsel to attend the scheme hearing. More interestingly, for our purposes, so did the Takeover Panel. What the Panel was doing at the (p. 889) hearing is at first blush rather unclear. Although the Takeover Code applies to schemes of arrangement, it had no role in the court's determination of whether or not to approve the scheme. The Code was not relevant to the outcome of the scheme. Nor was there any scope for the court to opine on Code rules; and its judgment would not affect the application of the Code to the scheme. What then was the Panel doing instructing expensive counsel to attend the meeting? It was there to make Halliburton aware that it was there. To ensure that Halliburton did not say anything at all that could be in breach of its shut-up election. Any indication of a particular price or encouragement to create space for a bid would have been, in the Panel's view, a breach of the Code. The Panel's presence was designed to ensure that Halliburton was aware of this.

The nature of this command and control compliance culture is difficult to describe and, as noted, has not been empirically documented. The above example merely provides a flavor of it. Moreover, how the culture came into being is also undocumented and illusive. It clearly cannot be accounted for by the mere existence of a powerful self-regulatory enforcement tool that has rarely been used. For a body attempting to replicate the Panel's success, such self-regulatory enforcement arrangements would, and should, appear hopelessly utopian. The Brazilian self-regulatory takeover code does not attempt any such replication. Indeed, it falls far short in this regard with no enforcement mechanism of any

note.⁹¹ Yet in close attention to the Panel's success there is a key replication lesson, although not one that will necessarily be available in the Brazilian context. The lesson is that a significant compliance dividend can be obtained, and a culture of self-regulatory compliance generated, if key (and coordinating) market actors can be given a financial stake in the rules and their enforcement. Put differently, and discussed in detail below, the key to self-regulatory enforcement success is, *through the rules and process*, to bribe the quarter-back.

3.4 Bribing the Quarterback: Creating Significant Financial Stakes in Compliance

For lawyers who encounter the Takeover Code in action for the first time it often involves a sense of surprise, if not disappointment. The reason for this is that the lawyers are not in charge of what is a very law-like and detailed rules-based⁹² document. As the Code makes clear, it is the company's financial advisors that bear "a particular responsibility" for ensuring that their clients comply with the Code.⁹³ As a consequence of this, it is financial advisors (as well as lawyers) that perform a legal function for their clients. In meetings to discuss deal structure and compliance with the Code clients more often than not turn to their bankers to understand how the Code works and to understand the Panel's likely response to any requests that are made. Of course, given the central role that bankers played in the drafting of the Code and the creation of the Panel, this is unsurprising.

(p. 890) Accordingly, UK investment bankers have valuable human capital wrapped up in their ability to interpret the Code and to predict Panel judgments. Such individual and firm investments are enhanced by the secondee case officer system that the Panel deploys. According to this system, the Panel staffs itself, in addition to its limited full-time staff, with secondees from financial advisors (including investment banks and financial consulting firms) and other members of the City establishment (including lawyers). In addition, at several junctures in the Code the role of financial advisor is hardwired into the takeover process. For example, a bidder cannot announce his intention to make a firm offer that will include a cash component without a "cash confirmation statement" from the financial advisor confirming that the cash resources needed to close the deal are available to the bidder.⁹⁴ Other, of the many, examples in which the Code builds in a role for the financial advisor include: the determination of whether or not to make a "possible offer announcement";⁹⁵ the requirement for certifications from financial advisors in relation to profit forecasts;⁹⁶ and target management's post-bid remuneration.⁹⁷ As each of these roles and functions generates fee income, the Code becomes a source of revenue.

As compliance with the Code is very clearly in the significant financial interests of financial advisors it is in the financial interests of the brokers, accountants, the lawyers whom they instruct and the companies, private equity houses, hedge funds that rely on their services. The lesson for effective enforcement of self-regulation from the Takeover Code is not only the hands-on involvement of the Panel and the innovative informal sanction of the cold-shoulder mechanism, but also a more straightforward incentive story: self-regu-

lation will work if you make sure that strict compliance is in the financial interests of the most important player in the marketplace.

By providing one market player with such a key role in the regulatory space we might have legitimate public choice concerns that the rules will quickly become skewed toward the interests of the advisors and of their clients. A strong case can be made that multiple specific examples of such bias, referred to above, can be found, as well as a case that the exponential proliferation in the rule book is connected to financial advisor interests as it increases the scope for advice on Code interpretation and thereby solidifies a central role in the takeover process for bankers. However, with regard to the core of the Code that regulates bidder and target behavior it seems unlikely that any particular interests would be more forcefully transmitted to the Panel than others. Advisors typically work with bidders and targets and, therefore, see the advantages and disadvantages of the rules from both sides on a regular basis. The investment bank is therefore unlikely to become an effective conduit for the interests of a particular constituency in any regulatory reform or enforcement process. Of course, if advisors specialize in working for particular repeat-player clients such as private equity firms then their views may become weighted towards their client's regulatory preferences. But from the Panel's perspective, for every advisor putting forward a pro-bidder (p. 891) view there is an advisor putting forward the target's perspective. Accordingly, this problem is of limited concern.

This is different, of course, than saying that the Takeover Code provides a neutral system of rules as between shareholders and managers. It does not. It clearly provides a pro-shareholder rule book. But this rule book is not the product of shareholder control over or bias in the rulemaking process; rather the product of the deeper shareholder rights bias in British business culture and company law. A bias that generated the different strands of public and political outrage from the takeover events in the 1960s, relating to both shareholder sovereignty and equality of treatment, to which the original banker drafters of the Code directly responded.⁹⁸

3.5 Demarcating the Regulatory Space

To operate effectively and ensure compliance with its rules, a self-regulator must "own" the regulatory space within which it operates. If it does not do so, market participants may attempt to subvert its rules by attempting to leverage the role of other lawmakers that may lay claim to the regulatory space. A self-regulator therefore requires either a regulatory space in which there is no other regulator or deference from such regulator. As detailed above, the Takeover Panel when it came into being benefited from both.⁹⁹ The Takeover Code also teaches us that the ability of an effective self-regulator to control the regulatory space is not only a function of the absence or deference of other regulators and adjudicators, but also a function of certain "keystone" rules that carve out that regulatory space. In the case of the Takeover Code there are two such rules: the non-frustration rule and the mandatory bid rule. The non-frustration rule is a rule that provides that where a bid has commenced or is imminent, target management cannot take any action that could prevent the shareholders from deciding on the merits of the bid without share-

holder approval. This applies regardless of whether or not the board has any defensive motivation vis-à-vis the intended corporate action. As I have argued elsewhere,¹⁰⁰ the actual substantive effect of the non-frustration rule is overstated as the existing UK corporate law requires similar, although not identical, protection through the proper purpose doctrine.¹⁰¹ However, the non-frustration rule's (p. 892) limited substantive impact should not be mistaken for its lack of importance to the Takeover Panel. In its absence, the question of the availability of defenses and the effects they could have on bid timing and process would not be in the hands of the Takeover Panel but in the hands of the courts interpreting the scope of application of the proper purpose doctrine. The Takeover Panel would often be forced to play second fiddle to the courts, undermining both its autonomy and the perception that it controls the rules of the game in the UK takeover market.

The second “keystone rule” is the mandatory bid rule. There is of course no such thing as a mandatory bid. All mandatory bids under the Takeover Code are voluntary bids because the bidder decides voluntarily to cross the mandatory bid threshold. It might do so to enhance its ownership position in the target prior to the offer if the bidder expects resistance from the target. The rules that apply to mandatory bids are more onerous than those that apply to voluntary bids. For example, the pricing look-back period for a mandatory bid is 12 months rather than three months,¹⁰² and there is virtually no scope for any conditionality beyond a simple majority acceptance threshold.¹⁰³ Accordingly, most bidders opt for voluntary bids. However, without the mandatory bid rule the Panel would not be able to maintain its stringent regulation of voluntary bids as the costs of the incremental acquisition of control of the target over time would in many cases be lower than a Code-controlled voluntary bid. This would force the Panel to reduce the costs of voluntary bids by relaxing many of the rules.

Although both of these rules are contentious there are many valid arguments in their favor.¹⁰⁴ However, aside from the arguments for and against the rules, it is interesting to observe that the centrality of these rules to the creation and operation of self-regulation of the market for corporate control gives the regulator a distinct vested interest in those rules that may not be aligned with the interests of the companies it regulates or the economy in which those companies operate. Accordingly, in relation to such keystone rules the technique of self-regulation may bias substantive outcomes in an unexpected way, independently of the rule bias sought by constituency interests. It follows that where events problematize such keystone rules we cannot rely on the self-regulator—even one that is truly independent of constituency interests—to be a neutral arbiter of their suitability and efficiency.

Recent events in the UK lend support to this view. The high-profile, initially hostile, takeover of Cadbury Plc. by the US corporation Kraft Inc. raised the question in political, business, and media circles as to whether UK companies were too exposed to hostile deals and too easily taken over. At a speech at the Said Business School the outgoing Chairman of Cadbury, Roger Carr, asked whether the prevailing takeover rules “were fair and helpful to the long-term success of Britain’s future.”¹⁰⁵ As possible reform responses Mr Carr considered both the disenfranchisement of short-term shareholders in hostile bid

contexts and an increase in the minimum acceptance condition from a simple to a super majority. We cannot explore the merits of these proposals here, but what should be noted is that both ideas explored ways in which boards could be directly or indirectly empowered and supported over the long term. An alternative means of altering the balance of power would be to provide boards with greater defensive capability which, *inter alia*, would involve reform to the (p. 893) non-frustration rule. Following Carr's comments, political and media attention on the role of the Code's rules was heightened and the Takeover Panel responded with a consultation process and rule changes that, at the margin, may have dampened takeover activity.¹⁰⁶ For our purposes, what matters here is not whether Carr was right or wrong; what matters is that there was no serious engagement in the consultation process regarding the merits of the non-frustration rule,¹⁰⁷ and no attempt to gather empirical evidence on the effects that this rule may have had on UK companies and the UK economy. This key issue was not placed in play at all, and the debate was ultimately channeled into marginal, if useful, reforms. The keystone rule remained untouched.

4 Market Controlled Regulation: Comply or Explain

It is clear that there are regulatory benefits of a regulator being able to access market knowledge and information about market practices and how those practices are likely to interact with regulation. However, unsurprisingly the regulated may be less than forthcoming to the regulator with that knowledge. Endogenous self-regulation may be one means of accessing that knowledge, but as we have seen the probability of generating effective self-regulation is low. A close analysis of the Takeover Code and Panel reveals several *sui generis* factors upon which its success is built. This analysis suggests that a regulatory strategy built upon encouraging or supporting self-regulation will often involve a considerable pinch of wishful thinking. The need to find alternative ways of harnessing market knowledge within regulation points us to another "light" version of self-regulation, referred to in this chapter as "market controlled regulation". Through market-controlled regulation the state does not wait for or encourage the market to regulate itself; rather it commands its direct involvement in rule production. It seeks to achieve its regulatory objectives by co-opting the market actors to form and tailor the rules. In doing so it takes the risk that control of the rules may bias the rules in favor of market actors, in order to obtain the substantive benefits of informed and tailored business regulation and the compliance and norm-formation benefits that may flow from market ownership of the regulatory space.

The main example of such market controlled regulation in the corporate sphere is the introduction during the last 20 years of market-controlled corporate governance codes designed to guide companies towards best practice in the composition and structure of boards. These Codes invariably address the number of non-executive directors and their role and independence of management, and board committee structure and the staffing

of these (p. 894) committees. They may also cover separation of the roles of chairman and chief executive officer, remuneration guidance, and internal controls. These Codes are typically—although as the US experience shows not always¹⁰⁸—“comply or explain” codes. “Comply or explain” means that companies are required to comply with the recommendations set forth within the code or to explain to their shareholders why they do not comply. The underlying idea of such codes is to set forth guidance on governance best practice that one would expect most companies to follow but to leave companies the freedom to adapt governance rules and structures to their own conditions and circumstances: one size does not fit all, therefore one size is not imposed on all. However, departures from the code must be justified to shareholders who can assess and respond to the non-compliance explanation either through voice or exit. Although the code rules are typically produced by representatives of market actors who are the members of the code committee or commission who produce the rules, such commissions invariably have been formed by or are connected to the State, members are often appointed by the state or the state at least has a say in the broader membership, and typically the obligation to comply or explain is set forth in mandatory law.

4.1 Foundations

The first comply and explain corporate governance code was the UK’s Code of Best Practice issued in 1992, which formed the basis of what today is known as the UK Corporate Governance Code. The first iteration of this Code resulted from Sir Adrian Cadbury’s investigation into the “Financial Aspects of Corporate Governance.” The “Cadbury Committee” was—like the Takeover Code and Panel—the product of the combination of a deferential conception of the British State, pressure generated by public outrage in relation to several corporate and accounting scandals,¹⁰⁹ and the coordination and forced entry of market participants into the “contracting zone” by the London Stock Exchange and the quasi-state body, the Financial Reporting Council (FRC), who commissioned the Report.¹¹⁰ The FRC itself was then a recently formed response to the failed self-regulation of accounting standards.¹¹¹ After the Cadbury Committee’s recommendations were delivered, the FRC became responsible for the maintenance and revision of the Code. The FRC is a quasi state body with certain formally designated state functions¹¹² and its Chairman and CEO are appointed by the secretary of state for business. Nevertheless, this is a body controlled by market constituents, with a majority of FRC appointed board members from the business and accounting worlds, and with no delegated representatives from other regulators or government.¹¹³

(p. 895) From its inception the Code has been a “comply or explain” Code. However, for companies subject to the Code the requirement either to “comply or explain” is mandatory. Pursuant to the FCA’s listing rules, premium listed companies¹¹⁴ must provide a statement in their annual reports setting forth whether they comply with the Code’s provisions or explaining their failure to comply.¹¹⁵ The Code itself recommends that explanations provide background to, the rational for, and risks associated with the departure from the Code.¹¹⁶ However, there are no clear guidelines in the FCA’s rules on the level of detail that must be provided in company’s explanations of non-compliance. A statement provid-

ing that “the provision is unsuitable for our company” would appear to suffice for the purposes of compliance with the explain obligation. It is noteworthy that in this regard the FRC has no sanctioning powers, and that to date there has been no action by the FCA or its predecessor, the Financial Services Authority, in relation to companies’ failure either to explain or in relation to the quality and detail of the explanation.

Worldwide at the beginning of this century there was an exponential increase in the production of Corporate Governance Commissions and Codes following multiple high-profile corporate and audit failures, particularly in the US.¹¹⁷ Although the governance response in the US generated mandatory rules imposed through exchanges and trading platforms,¹¹⁸ most other jurisdictions elected for the less intrusive “comply or explain” approach. In Germany, for example, a Corporate Governance Commission was appointed by the federal government in 2001 and a Code introduced in 2002.¹¹⁹ Publicly traded companies are required either to comply or to explain non-compliance pursuant to section 161 of the German Stock Corporation Law. Although the German state provided for its formation, the Commission is staffed (by government appointment) with shareholder and management representatives as well as auditors and academics. The Austrian and Dutch Corporate Governance Codes adopt a similar approach of state authorized commissions and statutory “comply and explain” obligations coupled with Commissions staffed by market participants.¹²⁰

4.2 Compliance Levels

The typical expectation of students who encounter the “comply or explain” idea for the first time, is that compliance levels will be low. We tend to think of regulation, particularly (p. 896) regulation that represents a response to failings, as directing participants to take actions contrary to their preferences. It follows that if you give the regulated a choice about compliance they will elect not to comply. This concern was acknowledged by the Cadbury Committee, which warned market participants that if they did not take the recommendations seriously, “it is probable that legislation and external regulation will be sought to deal with some of the underlying problems.”¹²¹ Yet contrary to this expectation, compliance levels for “comply and explain” codes are high, and very high amongst large, publicly traded companies. In the UK, Arcot and Bruno¹²² report compliance levels of between 85% to 95% of companies in relation to a subset of key—arguably the most important—Code provisions.¹²³ Arcot and Bruno did note, however, that where there was non-compliance, the relevant explanation was often very brief and uninformative.¹²⁴ Over the course of the Code’s lifespan Arcot and Bruno’s results confirm that the UK Code is driving profound structural governance changes, even where those changes are contentious. Consider, for example, the recommendation to separate the roles of chairman and CEO,¹²⁵ an issue which continues to divide opinion both within the UK and across jurisdictions. Between 1991 and 1993 Conyon documents an increase in separation rates of 48%–64%.¹²⁶ Arcot and Bruno found that by 2003 the compliance rate had increased to 92%. Another example of how the Code appears to be driving change is in relation to the length of senior management’s service contracts. As of 2003 Arcot and Bruno found weak compliance levels in relation to the Code provision recommending maximum one-year ser-

vice contracts. Several years after their study, one would struggle today to find any companies that do not comply with this provision. In a later study, with a smaller sample but a broader assessment of compliance with all (at the time) 48 Code provisions, Seidl, Sanderson, and Roberts found that approximately 63% of the top 80 companies (by market capitalization) were fully compliant with the Code, whereas only 34% of the bottom companies were fully compliant.¹²⁷ The top 80 companies had an average of 0.96 deviations and the bottom 50 an average of 1.49 deviations. If one turns to continental European “comply or explain” Codes compliance levels are high, although again the quality of explanations where there is non-compliance is considered to be poorly informative.¹²⁸ The German Code makes a distinction between recommendation and suggestions. Compliance rates for DAX 30 companies in relation to recommendations are in the high 90s percentile and for suggestions in the high 80s.¹²⁹ This represents a notable increase on 2006

(p. 897) when only 40% of DAX companies were fully compliant and only 10% of MDAX (mid-cap) companies were in full compliance with the Code.¹³⁰ Dutch compliance rates are high 90s percentile for large caps, although compliance rates drop for mid and small caps (89%, 88%, respectively).¹³¹

Care needs to be taken, however, not to assume that the existence of a “comply or explain” governance code coupled with high rates of compliance necessarily represents a new and distinctive contribution to governance. Many corporate governance codes have extensive sections that merely replicate the existing legal position as set forth in the applicable Corporate Code. The Austrian Corporate Code, for example, explicitly acknowledges that the Code is based on Austrian corporate and securities law, as well as OECD Principles.¹³² The German Code contains many provisions that again merely replicate corporate law and practice. For example, the German Code contains provisions referring to the unavailability of multiple voting rights, which for most companies are unavailable under German law.¹³³ Its section on the management board (*Vorstand*) involves in large part a replication of existing mandatory corporate law.¹³⁴ Furthermore, many of the provisions in the Code would not be viewed by many corporate governance scholars as governance terms at all, but merely as good process guidelines. For example in Provision 2.2.4 of the Code there is a suggestion that the general meeting last for four to six hours. Provision 2.3.3 suggests that the general meeting should be followed by modern communication. Of course, these Codes do take important steps to alter certain existing practices. Most important in relation to the German Code is the recommendation to limit the longstanding practice of management board members retiring to the supervisory board¹³⁵ or the provision recommending that supervisory board members do not take more than three supervisory board directorships.¹³⁶ The Code provides both a recommended limit on the number of supervisory board members who are former management board members and for a cooling off period for managers of two years before they are eligible for supervisory board membership. As of 2013, these provisions attracted between low 70s and high 90s percentile compliance, with larger companies more likely to comply.¹³⁷ The point here is not that these Codes do not, or do not have the potential to, make a governance difference, but that we must parse often lengthy codes for provisions that are different from applicable corporate law or are of real governance significance. This in turn means that

we also need to be wary of overall compliance data which details partial compliance and percentage deviation from the Code provisions. There is a risk with this data that identified (p. 898) partial compliance merely represents compliance with existing mandatory law or non-governance provisions.¹³⁸

These caveats aside it remains clear that in relation to a substantial body of companies “comply or explain” governance codes alter the governance rules and practices of those companies even though there is no requirement to actually comply. In Germany, the UK, and the Netherlands, for example, high 80s and 90s percentile of the largest publicly traded companies comply fully with the Codes. Indeed, in some jurisdictions, for example the UK, excessive compliance is viewed as the primary enforcement problem. The FRC has become concerned that companies do not take seriously enough the idea that they can explain non-compliance. Recent amendments to the Code attempt to foreground this option to companies.¹³⁹ The UK’s post-crisis Walker Review into the Governance of Banks and Financial Institutions lamented the fact that many of the UK Corporate Governance Code’s rules may be inapt for banks, yet banks did not opt out and explain non-compliance.¹⁴⁰ Walker was particular concerned in this regard that the Code’s focus on the independence of non-executive directors resulted in boards of banks staffed with directors who did not understand modern banking and financial services.¹⁴¹ Whether or not this was the case across all UK banks is debatable,¹⁴² but Walker was surely correct that UK banks did not consider that they had space to explain non-compliance. This has led some commentators (unsuccessfully) to propose changing the terminology to “apply and explain.”¹⁴³ The idea being that companies need to distance themselves from a “compliance culture” and that using “apply” instead of “comply” will enable this.¹⁴⁴

4.3 Enforcement Drivers

These Codes make recommendations many of which are not in the senior managers’ interests. Separation of Chairman and CEO in the UK and management board cooling-off periods in Germany are good examples of such managerially unfriendly rules. Such rules are not enforced by regulators. There are no direct financial consequences of non-compliance. Yet the compliance levels are very high. What explains this? Where do we find the compliance pressures?

(p. 899) It seems clear that the compliance pressure arises through a combination of market/investor expectation about good governance as benchmarked by the applicable Code coupled with reputational capital concerns for managers but also, more importantly, for non-executive directors whose rents are a function of their ability to obtain other (parallel or subsequent) non-executive positions. This reputational capital is, inter alia, a function of directors’ association with companies that are known for good and not bad governance practices. The potential reputational downside of non-compliance for directors is a function of the likelihood that investors (fund managers) will reject the explanation and put their head above the parapet to complain about non-compliance and “bad governance.”

The question of importance here is: what factors determine an investor's response to explained non-compliance?

Ideally, such a response is a function of the arguments about the benefits and downsides of the provision itself and the provision's application to the company in question. It may be the case that compliance levels are high because attempts to explain non-compliance have met with careful consideration by institutional investors and their fund managers, but ultimately their rejection of the non-compliance and subsequent direct and indirect pressure to comply. However, there are several factors which may distort such an "ideal" shareholder assessment of non-compliance. First, consider the costs associated with that analysis for the fund manager. Although the economic benefits for the investor of the company complying or not complying with the provision are likely to be very uncertain, opaque, and distant, the opportunity costs of the governance conversation are clear and immediate. It may be cheaper in such circumstances to have a pro-compliance bias across all portfolio companies which resists detailed investigation, engagement, and conversation, and relies on the best practice recommendation of the expert market regulators. Of course, investors can also rely on, and pay for, the advice of governance specialists;¹⁴⁵ however, such specialists have a deep vested interest in a strong compliance culture that keeps governance relevant. This surely gives such advisors a pro-compliance bias. Second, compliance pressure may arise from the fact that many passive fund managers may themselves be subject to external pressure to be seen to be acting in order to be seen to be doing their job. Such pressure could come from the ultimate investors—for example, pension trustees, but could also come from government. In the UK, for several decades the monitoring and activism of shareholders has been on the regulatory agenda. Government ministers who have decried the role of shareholders prior to the crisis have described them as "absentee landlords."¹⁴⁶ Most recently this resulted in the introduction of a "comply or explain" Stewardship Code for investors.¹⁴⁷ Notably, this pressure and criticism rarely takes account of the fact that, due to limited share holdings as well as the practicalities and compensation structures of long UK fund management, shareholder activism may not be in the economic interests of the fund manager or the investor. However, fund managers sensitive to these pressures and criticisms are aware that they need to be seen to be acting, even when they are of the opinion that it is not in their, or their (p. 900) ultimate investors', economic interests to invest resources in being more attentive and active. Opposing non-compliance with the Corporate Governance Code is arguably a very cheap way of being responsive to such external pressures.

As Ed Rock and Marcel Kahan have recently taught us,¹⁴⁸ in each jurisdiction, we need to understand the symbolism of investor activism which may reveal that the reason for acting is very different than the reason given for acting. It seems likely in the UK that compliance pressure comes *in part* from the symbolic capital investors can earn by opposing—loudly—non-compliance, regardless of explanations. High-profile examples of shareholder dissatisfaction with Code non-compliance would appear to fit with such an understanding. Consider, for example, the decision in 2008 by Marks & Spencer Plc., a household name in British retail, not to comply with the Code provision recommending separation of the chairman and CEO roles. Investors treated the separation rule as a mandatory provi-

sion, accusing the company of being “in breach” of the Code, leading one City commentator to observe that “apparently the English word ‘or’ in comply or explain has lost its meaning.”¹⁴⁹ If this correctly describes investor motivation some of the time in objecting to non-compliance, then directors of companies cannot expect a fair hearing for their explanations. Furthermore, it seems probable that as soon as one investor publicly complains, other investors will line up to drink at the trough of symbolic capital, and directors will suffer reputational damage regardless of the strength of the justification for non-compliance. The larger and more high-profile the company the more likely it will be to trigger a knee jerk “object and shout loudly” response from the investment community. And the more likely the directors will be to comply rather than bother to explain why non-compliance makes sense, even when it does.

4.4 The effects of regulatory technique on rule choice

As noted in the Introduction to this chapter, one of the concerns about delegating regulatory authority to the marketplace is that the regulation will have a pro-market bias. Is it then surprising that the UK’s market-controlled “comply or explain” Code is much more detailed and demanding, and much more pro-shareholder than mandatory governance regimes subject to state regulatory oversight such as those found in the US?¹⁵⁰ Two familiar explanations offer themselves for this variation, but neither are satisfactory. First, that the market-controlled rulemaking process has been captured by the interests of institutional shareholders which have pushed the Code’s shareholder orientation. Indeed, it is clearly the case that for the past two decades institutional investors themselves, and via their trade associations, have exerted a strong public governance voice in the UK. However, a case for the overweighting of such direct influence is difficult to make when one considers the background of the key players of the members of the Cadbury Committee, the membership of the FRC, or the leading players in governance reform such as Sir Adrian Cadbury and Sir (p. 901) Derek Higgs.¹⁵¹ Second, that the Code’s shareholder primacy bias may be an extension of, or a reflection of, UK company law’s established shareholder rights orientation.¹⁵² Whilst a pro-shareholder legal environment is surely an important contextual factor, given the absence of these type of rules until the 1990s, it is clearly only an ancillary driver.

The primary driver of this rule detail and rule orientation, it is submitted, is the effect of the “comply or explain” technique itself on the market-controlled regulator’s outlook. The market-controlled regulatory bodies charged with drafting and amending a “comply or explain code” will approach their task very differently from a body tasked with drafting a set of mandatory governance rules. The latter is aware that the rules it selects must be adopted by the subject companies. It is, therefore, likely to be highly attuned to the authority/accountability¹⁵³ trade-offs associated with different rule choices and much more wary of changing the rules in the face of governance scandals. In contrast, a “comply or explain” regulator may feel that she has more room to ignore, or at least be less concerned about, the trade-offs and can “aim high” by providing truly best practice rules. This is because in such a regulator’s mind’s eye the trade-off, if it needs to be made, can be made by the company itself. That is, built into the “comply or explain” approach is the

safety value that if the regulator gets it wrong for the company in question the company may simply ignore the rule and explain why. Such an outlook would also make a “comply or explain” regulator more receptive to calls for reviews of, and changes to, the rules in the face of public and political pressure to address governance scandals. Where “comply or explain” works as it is designed to, such responsiveness to accountability pressures and best practice outlook are not problematic. However, if “comply or explain” malfunctions for the reasons discussed above and in effect turns an optional regime into a mandatory regime, when combined with such a regulatory outlook, there is a strong case that “comply or explain” is a suboptimal regulatory technique likely to result in a regulatory overweighting of accountability concerns.

Take, for example, governance rules that determine whether a director is independent or not. Very demanding independence rules that provide for no business relations with the company or long employee cooling-off periods will exclude many individuals with the right skills and knowledge from performing the directorial role effectively: to exercise the managerial function and to bring industry-relevant experience, contacts, and networks to bear. There is a trade-off between tight independence rules and the pool of knowledgeable directors: the tighter the rules, the shallower the available pool of directors. This trade-off has been brought to light by the financial crisis. A “comply or explain” regulator may be more likely to select demanding rules that take independence seriously because she knows that if the rules are not suitable, the company can elect not to comply with the independent non-executive recommendation and appoint a non-independent but knowledgeable director. In an optional “comply or explain” environment there is, in theory, no demarcated pool of talent because companies can dip into the non-independent pool. In contrast, in a mandatory rule environment, as is the case for example with corporations listed on the New York Stock Exchange,¹⁵⁴ there is no option not to comply with the 50% independent non-executive director requirement and appoint the non-independent knowledgeable (p. 902) director. In such a mandatory environment the regulator will be acutely aware of the need to ensure that the definition of independence does not cut off the supply to the talent pool. However, if in a “comply or explain” environment companies experience the rules as mandatory rules, they are then faced with the same predicament as companies in the mandatory regime but with a regulator who thinks that the regime’s non-compliance flexibility gives it more room to set rules that represent ideal standards. Of course a regulator could adjust its approach to rulemaking to take account of an over-compliance culture. However, such over-compliance with a rule may equally be viewed by the regulator as the broad affirmation of its rulemaking choices. When faced with interpretations of empirical facts that challenge or affirm our identities and roles, invariably people select the interpretation which defensively affirms their identity and their prior actions.¹⁵⁵ It is, therefore, improbable that one would see such an adjustment by a “comply or explain” regulator to its rulemaking outlook.

It is problematic to attribute jurisdictional variation to any particular driver. There are likely to be many drivers of variation. It is submitted, however, that a comparison of the UK corporate Governance Code with the US rules as set forth, for example, in the NYSE Listing Rules, raises concerns that the above suboptimality problem is present in the UK.

Both jurisdictions have a 50% independent non-executive director requirement.¹⁵⁶ However, the independence definition is much more demanding in the UK than in the US. The UK has, for example, a cooling-off period of five rather than three years under the NYSE rules.¹⁵⁷ In the UK any performance-based pay for independent directors renders them presumptively non-independent,¹⁵⁸ as does nine years' continuous service; the NYSE rules contain no such limitations.¹⁵⁹ It is of course empirically very difficult/impossible to assess whether such rules are resulting in the staffing of UK boards with independent but unknowledgeable directors. The consequences of this being the case are reason enough to consider whether the UK should step back from governance leadership. It may also be a salient lesson that there is always a darker side to every governance innovation and that in practice we may find that regulatory theory—such as the probable bias associated with delegating regulatory power to the regulated—may be significantly wide of the mark.

4.5 Cultural governance beyond the ticked box

A traditional view of self-regulation focuses on the creation of law-like rules produced by market actors. More contemporary ideas of how to get the market to self-regulate focus less on enabling market actors to create and enforce rules applicable to all market actors, and more on facilitating pro-regulation norm formation within the players themselves: within the cultures of the firms and within the heads and identities of their managers and employees. If successful, this is true *self-regulation* in the literal meaning of the term and (p. 903) external rules, whether state- or market-controlled, become far less important as internal firm norms ensure targeted behaviors. This approach to regulation has multiple academic labels, including meta-regulation,¹⁶⁰ principles-based regulation,¹⁶¹ and process-based regulation.¹⁶² The idea is that the regulator sets forth broad objectives and then requires the regulated firms to explore processes and procedures to enable those goals to be realized.¹⁶³ This both utilizes local knowledge to provide tailored firm-level regulation but also creates conversations and processes that bias local norm formation.¹⁶⁴ Several factors contribute to the likely success of this regulatory strategy that we cannot explore in detail here. First, and most importantly, clear and credible buy-in by senior management and the board must drive internal (firm-level) enforcement of failures to engage with the processes.¹⁶⁵ Secondly, the subject firms' incentives, in particular, but not only, those of senior management, must not be demonstrably non-aligned with the regulatory objectives.¹⁶⁶

While increasingly this strategy is being used in the regulation of corporate activity, it has not featured significantly in corporate law. One area in which it is deployed is in relation to board performance. Again we see the UK as market leader in the use of this innovation. Whether this is connected to a traditional deference to market-solutions which remains embedded in the UK's regulatory psyche is clearly plausible, although speculative. The FRC has become increasingly aware that ticking several board composition and structure boxes provided by "comply or explain" codes may not necessarily drive improved performance in the boardroom. In this regard a key, if innocuous, change in the UK Corporate Governance Code in 2010 provided that boards must undertake a "formal

and rigorous” annual evaluation of their performance. As per the process-based regulation tool-kit, the FRC also provides a non-binding set of objectives and guidance on both board effectiveness and the effectiveness of the different directors including the CEO and CFO, the chairman of the board, the lead independent non-executive director (known as a *senior independent director*), and more generally in relation to executive and non-executive directors. This guidance states, for example, that “effective boards” provide direction for management, demonstrate ethical (p. 904) leadership, and make well informed and high-quality decisions.¹⁶⁷ Importantly, the Code both builds in senior board responsibility for this evaluation—by requiring the chairman of the board to act on the results—and provides the means of imposing discipline on this evaluation process through: an annual report to shareholders on the evaluation; performance evaluation of the chairman led by the senior independent director; and a tri-annual facilitation of this performance review through an external facilitator.¹⁶⁸

The effects of this process-based approach remain invisible to external scrutiny, which renders it unstable in the face of high-profile failure. However, in contrast to other areas of regulation where this technique is deployed¹⁶⁹ there are good reasons to be optimistic about its effects. The board, and in particular, the non-executive directors and the chairman have strong incentives to take, and to be seen to be taking, board performance and evaluation seriously. Failure to do so puts at risk their reputational capital.

5 Conclusion

A typical caricature of self- or market-controlled regulation is that it serves the needs only of the regulated constituencies by producing rules that purport but fail to really address the problems that require regulatory attention and which are rarely enforced against their “brethren.” We see from the market-leading examples of self- and market-controlled regulation in the UK discussed in this chapter that, paradoxically, this is palpably not the case in corporate law. In the context of both takeover regulation and corporate governance codes, we find rule overload and rigorous enforcement. Do these examples then provide model approaches to regulation that other jurisdictions would be well advised to emulate? Has corporate law missed a trick in failing to employ more broadly such regulatory devices? The analysis in this chapter suggests that there is significant doubt that this is the case. The rule-content and enforcement overload in both the context of takeovers and “comply or explain” codes appear in part to be the product of regulatory malfunction. In relation to takeovers such overload may be a function of rent seeking itself—the investment banking role, which in the context of enforcement generates a positive regulatory dividend but may be a factor in the production of what is now a 300-page Code. In the context of “comply or explain” codes, over-enforcement generates a best practice, accountability driven code from which opt-outs are in many instances impracticable even though such a best practice outlook is premised on the possibility of opt-out.

The diffusion of market-controlled “comply or explain” codes shows that such innovations are clearly replicable. Any state can direct market actors to produce rules and can deploy

the process-based tool-kit which we see used in the UK Corporate Governance Code's board evaluation requirement. But in relation to endogenous self-regulation where the state does not have a direct role, the analysis in this chapter does not hold out significant hope for effective replication where market actors—in jurisdictions such as in Brazil today in the (p. 905) takeover context—attempt to provide welfare-enhancing regulatory solutions where the state has failed to do so. The UK Takeover Panel and Code is in multiple respects a sui generis regulatory product. That said, the analysis in this chapter suggests that if there is one lesson which it offers in the hope of making it work it is “bribe your quarterback”: bond the investment banking community to your regulatory product by showing them that it can generate income. If successful, it may be that you end up with a 300-page code! *Maybe* the trade-off is worth the candle.

My thanks to the participants at the Columbia Law School conference on the Oxford Handbook of Corporate Law and Governance, with particular thanks to John Armour, Paul Davies, Michael Klausner, Georg Ringe, and Edmund Schuster.

(²) Of course this may be viewed simply as a form of indirect taxation as the costs of the regulation will be passed through to the consumers in the marketplace. Furthermore, there is no reason why state regulation cannot impose the costs directly on market players through a regulatory levy—which again would be passed through to end users.

⁽¹³⁾ Fox, *supra* note 7.

⁽¹⁴⁾ Clearly this chapter cannot undertake a broad-ranging comparative analysis of the conceptions of the regulatory state in US and European jurisdictions. But in support of this claim consider, and compare, for example, the mid-twentieth-century UK approach to the regulation of financial markets, corporate law, antitrust, and labor law with the evolution of US federal securities regulation (Gower, *supra* note 12), antitrust regulation, corporate law (see David Kershaw, “The Path of Corporate Fiduciary Law”, 8 *NYU J. L. & Bus.* 395 (2012)), and labor law (see generally Fox, *supra* note 7).

⁽¹⁵⁾ The German Corporate Governance Code is not part of the German Stock Corporation Act but the requirement for publicly traded German stock corporations to comply with or to explain the failure to comply with its provisions are set forth in section 161 of the German Stock Corporation Law. The Code is produced by a government-appointed commission. Similarly, the UK Corporate Governance Code, although maintained by a quasi-state body, the FRC, benefits from a mandatory requirement in the UK Financial Conduct Authority’s Listing Rules to comply or explain non-compliance with the Governance Code (LR 9.8.6(5)). Across the Atlantic, the governance rules set forth in the New York Stock Exchange are the product of a self-regulatory organization, but SROs are authorized by the SEC and its rules, including the governance rules, are subject to SEC oversight and approval (see section 19 Securities and Exchange Act of 1934).

(⁴⁷) *Id.*

(⁴⁸) In 1969 (see *supra* note 9) Otto Kahn-Freund argued in the context of industrial relations that the law “should be called upon to play a much increased role in the moulding of industrial relations, and this in a manner that is contrary to a long established tradition, a tradition, however, that is beginning to fade.” Although beginning to fade, it remained a forceful lens. Consider, for example, that the Royal Commission on Trade Unions and Employee Associations, the Donovan Commission, was set up in the mid-1960s to consider labor relations and collective bargaining problems. Several of the recommendations involved direct legal intervention. However, importantly, the primary innovation recommended by the Donovan Commission, and subsequently adopted by the Labour Government in its 1969 White Paper, *In Place of Strife*, involved the setting up of a Commission on Industrial Relations, a body staffed with non-governmental members from unions, business, and academia. The Commission was designed to facilitate the voluntary reform of the collective bargaining system; this was “organized persuasion” par excellence.

(⁴⁹) Armour & Skeel, *supra* note 29, at 1776–85, detailing the centrality of the SEC to the US regulatory response to takeover concerns in the 1960s.

(⁵²) CAF Code, Introduction, 1.

⁽⁵³⁾ See CAF Code, Introduction, 3. Companies sign up by amending the subject company's bylaws to provide that they are subject to the Code. In addition directors, officers, and controlling shareholders sign "statements of adherence" to the Code.

⁽⁵⁴⁾ CAF Code, Introduction, 1(iii).

⁽⁵⁵⁾ Panel on Takeovers and Mergers, Policy Statement, Apr. 28, 1969.

⁽⁵⁶⁾ See CAF Code, Section VI on Material Ownership Tender Offers.

⁽⁵⁷⁾ See definition of "Material Ownership" in CAF Code.

⁽⁵⁸⁾ Article 65(1) CAF Code.

⁽⁵⁹⁾ Article 29(1) CAF Code.

⁽⁶⁰⁾ Lock in here is somewhat limited given to option of exit from the Code following a one year notice period. See CAF Code, Articles 23–25.

⁽⁶¹⁾ See generally William Ewald, "Comparative Legal Jurisprudence (II): The Logic of Legal Transplants", 43 Am. J. Comp. Law 489 (1995) discussing the work of Alan Watson on legal transplants.

⁽⁶²⁾ See Brian R. Cheffins, Corporate Ownership and Control 301–77 (2008).

⁽⁶³⁾ Kynaston, *supra* note 11.

⁽⁶⁴⁾ Roberts *supra* note 17. See also Armour & Skeel, *supra* note 29, at 1775 also observing that "there was plenty of money to be made on advising on acquisitions."

⁽⁶⁵⁾ The Issuing Houses Association and the Accepting Houses Association.

⁽⁶⁶⁾ See generally Armour & Skeel, *supra* note 29.

⁽⁶⁷⁾ See *supra* notes 25–27 and *infra* note 76.

⁽⁶⁸⁾ Sir Leslie warns on the Takeover Code, Guardian, Aug. 16, 1968. A different metaphor used in relation to the Bank of England was the Bank as "parent." Harry Siepmann of Lazards: "faith in the Bank as the Leader and Parent of the City . . ." (Kynaston, *supra* note 11, at 57).

⁽⁶⁹⁾ Importantly, the Bank of England was also strongly incentivized to ensure City coordination as any state interference in this zone would have represented a significant loss of authority at a time when its authority was increasingly being questioned. See, generally, Kynaston *supra* note 11.

⁽⁷⁰⁾ For a more detailed account of how state expectation and the Bank of England resolved this investment banking compliance prisoners' dilemma in the post-Notes period as well as a more detailed analysis of the substantive responses and how such responses

connected to existing corporate law, and the interests of varying constituencies see Kershaw, *supra* note 18.

(⁷¹) Armour & Skeel, *supra* note 29.

(⁷²) They view the Takeover Code as a “good example” of “the observed strategy . . . of co-ordinated lobbying for rules that were expected to maximise the joint welfare of institutional shareholders,” *id.* at 1771.

(⁷³) Welcome for a new initiative, *The Times*, July 20, 1967, observing that “It might be a useful long stop if the insurance companies, investments trusts, pension funds and unit trusts all formed a protection committee to look after those interests which they have in common. Such body would have a formidable influence.”

(⁷⁴) For example, Edwin Herbert of the Industrial and General Trust, and later a representative on the Notes Working Group, observed in the wake of British Aluminium that “where a change of control of a company is envisaged, or where the nature of the company’s business is to be changed, shareholders should first be consulted”—Watney Sears Silence, *Fin. Times*, June 12, 1959.

(⁷⁵) Several bids that contributed to the view that regulatory action was necessary gave institutional investors preferential price treatment. See, for example: RTB wins control of Whiteheads, *Fin. Times*, Feb. 2, 1963, noting that “the dealings in Whitehead shares aroused criticism in the Stock Exchange because different treatment was being accorded to different sellers”; Behind the Scenes of the Wilkinson & Riddell Battle, *Fin. Times*, June 29, 1967; Aberdare Wins MI Battle: Call for Inquiry, *Fin. Times*, July 13, 1967.

⁽⁸⁷⁾ A reduction and cancellation scheme involves the cancellation of existing shares in exchange for the deal consideration and then an issue of new shares to the bidder. See, Jennifer Payne, *Schemes of Arrangement: Theory, Structure and Operation* (2014).

⁽⁸⁸⁾ Rule 2.6 Takeover Code.

⁽⁸⁹⁾ Rule 2.8 Takeover Code.

⁽⁹⁰⁾ note 2 to Rule 2.8 Takeover Code.

⁽⁹¹⁾ The CAF Code provides for private censure, public censure, and then “withdrawal of the Panel seal,” i.e., no longer being part of the CAF system (after a one-year exit period)—Art. 136 CAF Code.

⁽⁹²⁾ Although the Code purports to be a form of principle-based regulation, in addition to six General Principles, there are 300 pages of rules and sub-rules.

⁽⁹³⁾ Introduction, 3(f) Takeover Code.

⁽⁹⁴⁾ Rule 2.7 Takeover Code.

⁽⁹⁵⁾ Practice Statement No 20: Rule 2–Secrecy, possible offer announcement and pre-announcement responsibilities (2008) refers to the “particular responsibility of financial advisors for ensuring compliance with Rule 2” and that the financial advisors should be in control of drafting the announcement.

⁽⁹⁶⁾ Rule 28 Takeover Code.

⁽⁹⁷⁾ Rule 16.2 Takeover Code.

⁽⁹⁸⁾ See notes 25, 26, and 27. Elaborating this claim, see further Kershaw, *supra* note 18, Chapter 3.

⁽⁹⁹⁾ Note also that when actions were brought in the courts for judicial review of Panel decisions the courts adopted an explicit and extremely deferential stance. They made it clear that although that they had the power to intervene—because the Panel, although a self-regulatory body, was performing state functions—it would only be in the most egregious of circumstances in which they would intervene. Furthermore, the courts clarified that in the very rare event in which they deemed intervention to be necessary, if the matter related to an ongoing takeover the court’s ruling would be historic and not contemporaneous.

aneous. This meant the court's ruling would only apply to future action by the Panel and would not alter the Panel's decision in the immediate case—*R. v. Panel on Takeovers and Mergers ex p Datafin Plc* [1987] QB 815 and *R. v. Panel on Takeovers and Mergers, ex p Guinness plc* [1989] 1 All ER 509.

See Consultation Paper Issued By the Code Committee of the Panel: Review of Certain Aspects of the Regulation of Takeover Bids (PCP 2010/2).

⁽¹⁰⁷⁾ As I have argued elsewhere, a strong case can be made that in fact the non-frustration rule does not make a significant difference to exposure levels for UK targets (see Kershaw, *supra* note 100); however, before one could consider altering UK company law to make it more board friendly the non-frustration rule would have to be addressed.

⁽¹⁰⁸⁾ Although some composition rules are set forth in the Securities Exchange Act of 1934, as amended by the Sarbanes–Oxley Act, most composition and structure rules are set forth in the governance rules of the trading platform, for example, in Section 3.03A of the NYSE Listing Manual.

The Evolution in the U.S. of Private Enforcement via Litigation and Monitoring Techniques: Are There Lessons for Germany?

James D. Cox and Randall S. Thomas

The Oxford Handbook of Corporate Law and Governance

Edited by Jeffrey N. Gordon and Wolf-Georg Ringe

Print Publication Date: May 2018 Subject: Law, Company and Commercial Law

Online Publication Date: Jul 2015 DOI: 10.1093/oxfordhb/9780198743682.013.38

Abstract and Keywords

This chapter examines the evolution of private enforcement in the United States and the lessons that can be learned by German public companies from the experiences of their US counterparts. It first looks at the place of representative shareholder litigation within the US corporate governance system before turning to the broad-based criticisms against all forms of representative shareholder litigation on the grounds of excessive litigation agency costs. It then discusses the role of shareholder derivative suits in remedying breaches of duty of loyalty, along with the use of hedge funds in shareholder monitoring. It explores the increasing role of appraisal remedy against the backdrop of developments in shareholder litigation focused on acquisitions, and highlights the limitations of hedge fund activism. Finally, it assesses the implications of shareholder monitoring mechanisms in the United States for shareholders in Germany.

Keywords: private enforcement, United States, Germany, public companies, representative shareholder litigation, agency costs, shareholder derivative suits, hedge funds, shareholder monitoring

1 Introduction

¹²TWO decades ago, it was generally agreed that US public companies had dispersed ownership structures, whereas almost all German public companies had a controlling shareholder, generally supported by a house bank.³ Financial capital markets have changed dramatically since then so that today, in the US there is an increasing level of ownership consolidation,⁴ whereas in Germany at public companies there has been a marked reduction in block holder size and a reduced governance role for banks.⁵ If these trends continue, the two systems may  wind up having very similar public company ownership structures.⁶ As ownership patterns in the US and Germany move toward one another, in this chapter we explore whether each country may learn from the other's past.

The Evolution in the U.S. of Private Enforcement via Litigation and Monitoring Techniques: Are There Lessons for Germany?

Historically, in the US dispersed ownership system, the central corporate governance problem was the agency costs arising out of the separation of ownership and control.⁷ To police these costs, shareholders employed a variety of monitoring methods—corporate voting, the threat of a change of control transaction, and representative litigation—by which managers were disciplined if they were poor stewards and failed to create shareholder value. Over time, the value of these different devices for disciplining managers ebbed and flowed as capital markets evolved and legal rules changed. This was especially true for private representative shareholder litigation.

During the past 70 years, shareholder representative litigation has acted as an important policing mechanism of managerial abuses at US public companies.⁸ Different types of representative litigation have had their moment in the sun—derivative suits early on, followed by federal securities class actions and most recently merger litigation—often producing benefits for shareholders but posing difficult challenges as well. In the last few years, new developments have placed pressure on representative shareholder litigation in each of its forms and cast doubt on the continuing ability of such suits to act as an effective monitoring device to constrain managerial agency costs.

Concurrently with, and perhaps causally related to, this development, a number of relatively new policing mechanisms for managerial agency costs have sprung up in the US. Most prominently, activist hedge funds that control large pools of unregulated capital have assumed a role of “governance intermediaries,” as they develop and present choices to more docile institutional holders who can become supporters but rarely initiators.⁹ Institutions are informed by their proxy advisors on initiatives teed up by the activist hedge fund.¹⁰ These proxy advisors play a key role in this movement as they help to solve the collective action problems faced by investors. The passage of the Dodd-Frank Act further armed institutional investors by mandating that public companies hold a non-binding Say on Pay vote.¹¹

We also consider the rising role of the appraisal remedy against the backdrop of developments in shareholder litigation focused on acquisitions. As we will see, the appraisal proceeding, an old, and previously largely defunct, form of litigation has been spruced up by a few intrepid investment groups, who have begun filing these actions in an effort to (p. 908) engage in what some have called “appraisal arbitrage.”¹² Each one of these new, or revived, monitoring techniques may be able to stand in for representative shareholder litigation during its hour of need to insure that managerial agency costs do not get out of line.

We finish by attempting to draw lessons from the evolution of monitoring devices in the US and apply them in Germany, and vice versa. As mentioned above, Germany has long been viewed as a control shareholder dominated system.¹³ Such systems face a different type of agency cost problem than dispersed ownership systems: instead of constantly worrying about constraining managers’ interests, they are more concerned with minimizing the conflict between the interests of controlling shareholders and those of minority investors.¹⁴

The Evolution in the U.S. of Private Enforcement via Litigation and Monitoring Techniques: Are There Lessons for Germany?

But things are changing rapidly in Germany. Control blocks are shrinking with time at German public companies.¹⁵ The resulting increased dispersion of ownership has been accompanied by a decline in traditional bank monitoring at German public firms and a vast increase in foreign equity ownership. Germany's ongoing transition toward greater dispersed ownership has led commentators to argue in favor of greater shareholder protections to combat the rising managerial agency costs associated with shareholder dispersion.¹⁶

2 The Contracting Space for Shareholder Litigation

While there have been many shifts between forms of representative litigation over the past 70 years, its place within our corporate governance system has been secure, at least until recently. At present, there is a broad-based attack being mounted on all forms of representative shareholder litigation on the grounds that it creates excessive litigation agency costs. In this section, we outline the parameters of that assault.

2.1 Shareholder Merger and Acquisition Suits

Delaware jurisprudence has for some time placed a litigation bullseye on merger and acquisition transactions. Delaware's heightened judicial scrutiny for change of control transactions, control shareholder squeeze-outs, and defensive tactics in hostile litigation led plaintiffs to file numerous cases challenging mergers and acquisition deals.¹⁷

(p. 909) Litigation against publicly held companies that are engaged in deals overwhelmingly arises in the form of class actions, as opposed to derivative suits.¹⁸ Generally, multiple suits are filed very quickly after the announcement of a transaction, by law firms who are repeat players in such litigation.¹⁹ Early data indicated that suits challenging deals in which managers had a conflict of interest in the proposed deal were the most likely to produce cash settlements and that these suits did not exhibit the same degree of litigation agency costs as suggested for other representative suits.²⁰ Thus, during 1999–2000, only 12% of deals had litigation and most of the deal litigation related to Delaware firms was in Delaware.²¹ Furthermore, this litigation decreased the likelihood of a deal closing, but also increased return on the deals that closed, so that overall it was associated with an increased return for the deals.²²

This has since changed dramatically with most deals attracting suits.²³ Cain et al. report that in 2013 96% of deals over \$100 million in value experienced deal litigation.²⁴ Roughly 61% of these deals also resulted in litigation in more than one jurisdiction.²⁵ While several commentators have opined on the underlying causes for these developments,²⁶ we observe that it has occurred while, as seen later in section 2.3, the number of securities class actions and their lawyers has declined. Although causal relationship of observed social events is always a difficult challenge, we do surmise that the rapid rise in

The Evolution in the U.S. of Private Enforcement via Litigation and Monitoring Techniques: Are There Lessons for Germany?

transaction-oriented litigation may, at least in part, be reflective of many plaintiff-oriented law firms redirecting their foci.

Just as too much fudge can be a problem, the warm invitation that Delaware substantive law extends to challenge commonly engaged in transactions also has its list of problems. When all the suits were in Delaware, this was a manageable problem. For example, simplifying rules such as “first to file,” while crude, had the benefit of quickly whittling multiple nettlesome complaints down to a more easily managed consolidated case. However, with multiple suits involving the same transaction outside of Delaware, a problem of a very different order of magnitude arises. In addition to the higher administrative costs, a real fear existed that this could feed a reverse auction whereby a cooperative plaintiff would collaborate with the defendant corporation to bring all challenges to a swift resolution by a court-approved low-ball settlement that yields a quick return to the lawyers but fails to protect the interest of the shareholders.²⁷

The antidote followed by many companies has been forum selection bylaws, approved solely by directors, which mandate most forms of shareholder suits can only be maintained in a particular forum; Delaware is generally the designated forum. In 2013, the Delaware (p. 910) Chancery Court upheld a unilaterally adopted forum selection bylaw, reasoning that the bylaws, including the board’s authority to adopt bylaws, were an extension of the shareholders’ contractual rights to the corporation.²⁸ More recently, the Delaware Supreme Court similarly reasoned that a bylaw by a non-profit corporation could impose a “loser pays” standard on shareholder litigation.²⁹ The Delaware legislature has since divided the judicial baby, authorizing forum selection bylaws but prohibiting bylaws that would assign fees to the losing party. The ultimate step in a board of directors’ resort to the bylaws to address feared shareholder suits will be mandated arbitration; this step remains to be adjudicated in Delaware but is clearly at hand elsewhere.³⁰

We therefore see colliding developments in Delaware. On the one hand, the Delaware courts have developed substantive doctrines inviting shareholders to head to court to challenge the conduct of the board of directors in mergers and acquisitions. On the other hand, the Delaware courts have approved boards adopting bylaws that channel those challenges to Delaware, that discourage such suits’ maintenance by shifting costs to the losing party, and that portend sweeping all such disputes behind the veil of arbitration. While there is no reason to believe that forum selection bylaws inevitably lead to less accountability on the part of managers and their boards, the other two developments most likely will.

2.2 Shareholder Derivative Suits

Traditional derivative cases raise state law breach of fiduciary duty claims by directors and officers. Typically, these claims allege breach of the duties of loyalty (including good faith) and care, as well as other state law issues. They are commonly used to attack directors or officers engaging in conflict of interest transactions with the corporation or taking

The Evolution in the U.S. of Private Enforcement via Litigation and Monitoring Techniques: Are There Lessons for Germany?

a corporate opportunity belonging to the corporation. The options backdating scandal, in which a number of large corporations were found to have provided their executives with options to buy stock on dates and terms that were backdated, is a good example of such predilection.³¹ These cases arose after a scandal sparked by academic research and news stories led to government regulatory investigations that revealed wide-ranging misbehavior. In the aftermath of these events, shareholders filed a series of derivative suits to recover benefits that insiders unjustly obtained from the corporation.³²

(p. 911) This category of shareholder suits is probably the most stable set of cases of all of the representative litigation groups. There has been little change in the underlying set of legal and procedural rules for derivative litigation in the past 20 years. In prior research, one of the authors studied all derivative litigation filed in Delaware during 1999 and 2000.³³ That article found that Delaware public companies were hit with about 30 cases per year with about 30% of them yielding relief to the corporation or its shareholders, and the remainder being quickly dismissed with little litigation activity.³⁴ Private Delaware firms were targeted with a dozen lawsuits annually, typically raising claims of minority oppression.³⁵

This research showed that a careful distinction must be made between public and private corporations when discussing the role of shareholder derivative suits. Derivative suits are very much alive and well in the private company setting; in this context they perform their historical function of remedying breaches of duty of loyalty, customarily in the form of acts in bad faith and more particularly self-dealing practices. In the close corporation context they are better seen as remedying opportunistic behavior by those in control. While opportunistic grabs for assets and business are not foreign to public companies, in the non-private context the malefactor is more likely to enjoy the insulation provided by the demand requirement. That is, a major feature of the derivative suit is the requirement that the suit's plaintiff must either make a demand on the board of directors or establish a basis why such a demand would be futile. The ultimate outcome in either case depends on whether the board, or a subcommittee of the board, is believed to be sufficiently independent of the suit so that the board or committee's opinion that the suit fails to serve a corporate interest will be upheld by the reviewing court. As a consequence, the robust derivative suit boneyard for public companies is predominantly the handiwork of the demand requirement. In the case of the private corporation, because those disputes are largely between the "ins" and the "outs," the demand requirement is much less lethal as the alleged wrongdoing at the heart of the suit frequently can be more easily linked to a majority of the board. In addition, shaping the contours of such suits is the wide adoption of immunity shields whereby a provision in the firm's articles of incorporation insulates directors from liability for misconduct that is not illegal, in bad faith, or a knowing violation of the law.³⁶ Immunity shields thus limit suits focused on alleged managerial failures to those involving knowing and systematic breaches on the part of the board.

Failure to oversee claims finds its source in former Chancellor Allen's path-breaking Caremark decision holding that the directors' duty of good faith was breached when there is evidence of a "sustained or systematic failure of a director to exercise reasonable

The Evolution in the U.S. of Private Enforcement via Litigation and Monitoring Techniques: Are There Lessons for Germany?

oversight.” A dramatic instance of such a suit is *In re Massey Energy Company Derivative and Class Action Litigation*,³⁷ where the complaint withstood defendants’ motions to dismiss by alleging facts reflecting that the board repeatedly ignored reports and sanctions of mine safety violations in the years preceding the explosion in its Upper Big Branch mine which killed 29 miners—the deadliest mine accident in 40 years. But, absent such dramatic pre-disaster warnings as occurred in *Massey*, there is generally insufficient evidence on which to conclude that the board has engaged in more than negligent oversight for which the ubiquitous (p. 912) immunity shield, discussed above, protects it from being accountable in the derivative suit. Indeed, the Delaware judiciary may well conclude that ignoring red flags may not even rise to director negligence. To illustrate, consider *In re Citigroup Inc. Shareholder Derivative Litigation*,³⁸ holding that the business judgment rule insulated the directors against charges that they failed to take precautions to avoid the ensuing financial losses arising from Citigroup’s large exposure to the subprime lending markets. The suit alleged various red flags such as an economist’s forecast that a speculative bubble was nearing its end, a leading subprime lender closing its 229 offices, another lender filing bankruptcy, analysts downgrading subprime mortgages, and a warning of increasing subprime delinquencies by another lender. The court reasoned:

[The “red flags”] amount to little more than portions of public documents that reflected the worsening conditions in the subprime mortgage market and in the economy generally. Plaintiffs fail to plead particularized facts suggesting that the Board was presented with “red flags” alerting it to potential misconduct . . . [The plaintiffs] repeatedly make the conclusory allegation that the defendants have breached their duty of oversight, but nowhere do [they] adequately explain what the director defendants actually did or failed to do that would constitute a violation. Even while admitting that Citigroup had a risk monitoring system in place, plaintiffs seem to conclude that, because the director defendants were charged with monitoring Citigroup’s risk, then they must be found liable because Citigroup experienced losses as a result of exposure to the subprime mortgage market. The only factual support plaintiffs provide for this conclusion are “red flags” that actually amount to nothing more than signs of continuing deterioration in the subprime mortgage market. These types of conclusory allegations are exactly the kinds of allegation that do not state a claim for relief under *Caremark*.³⁹

The above reasoning appears consistent with observation made in a widely noted earlier Delaware Supreme Court decision that conduct that offends good corporate governance practices nonetheless is not inherently negligent conduct.⁴⁰ Thus, not only the immunity shield but more importantly the high standard of fault required to constitute an actionable breach on the part of the directors severely restrict the scope of duty to monitor suits.⁴¹

One type of derivative suits that has increased is the questionable “tag-along” derivative suits that parallel securities class actions. Erickson finds that in 75% of the derivative cases, there were also 10b-5 securities class actions.⁴² She discovered that most of these (p. 913) cases produced nothing in the way of specific monetary recovery for the

The Evolution in the U.S. of Private Enforcement via Litigation and Monitoring Techniques: Are There Lessons for Germany?

company.⁴³ Non-monetary relief was more common, and often came in the form of corporate governance changes, such as more independent directors, or splitting the chief executive officer and chair of the board positions.⁴⁴ However, such suits likely are corrosive in that they too frequently appear driven by the rewards they garner for their attorneys rather than the shareholders.

2.3 Federal Securities Class Actions

The story of the few trials and many tribulations of securities class actions is well known. Faced with the obstacles to derivative litigation, plaintiff shareholders moved to federal court and filed actions under Rule 10b-5 of the federal securities laws. Investors benefited from temporarily favorable interpretations of federal securities laws for such claims.⁴⁵ This led to a surge of federal securities class action filings, which was ultimately followed by a negative shift in judicial and legislative perceptions. Just as with derivative suits, legislatures and courts heard arguments that hasty, frivolous cases were being filed. These trends led to the passage of the PSLRA in 1995 in an effort to reform the field.

Since the mid-1990s the trend line for the number of filed and settled securities class actions has been downward; at the same time, the trend line for total settlements and the average amount of settlements has risen.⁴⁶ Thus, we might conclude that the good life of the securities class action lawyer persists; what is new is that today the good life is enjoyed by fewer than before.⁴⁷

(p. 914) The seeds of eviscerating the antifraud provision potential to address agency costs were sown much earlier. The mantra invoked in the 1960s and 1970s to justify curbing the then ever-expanding scope of Rule 10b-5 was that it could not address “acts of corporate mismanagement.” This phrase arose from *Birnbaum v. Newport Steel Corp.*,⁴⁸ where the gravamen of the complaint was that the controlling stockholder thwarted an ongoing acquisition of the company at a premium so that he could garner the entire control premium for himself. Later, the Supreme Court in *Santa Fe Industries, Inc. v. Green*⁴⁹ would take a similar position in holding that alleged unfairness, absent deception, in connection with a forced sale of securities held by minority holders was outside the scope of the antifraud provision. Thus, the *sine qua non* for a violation of the securities laws is a material deception; an egregious breach of fiduciary obligation absent deception is not within the reach of antifraud provisions.

Despite the legislative and judicial restrictions that have been imposed on 10b-5 private suits, we do see one form of antifraud suit that at its heart is addressed to managerial misconduct, not just misconduct by managers. As seen earlier, state fiduciary duty claims that the directors and officers were poor stewards must confront not only the business judgment rule’s strong presumption of propriety but more importantly that at least with respect to directors the claim is likely insulated by the immunity shield that limits damage actions against directors to breaches of duty of loyalty. Suits focused on failure to disclose practices constituting poor to unlawful business practices are now being filed under the antifraud provision. The Supreme Court’s recent *Omnicare* decision can be expected

The Evolution in the U.S. of Private Enforcement via Litigation and Monitoring Techniques: Are There Lessons for Germany?

to encourage federal securities law suits based on generalized claims by companies that they operate legally; *Omnicare* holds that claims of legal compliance are to be evaluated with regard to whether facts known to the speaker regarding the illegality of operations needed to be disclosed to prevent what was represented from being materially misleading.⁵⁰ A purely state fiduciary suit on such a claim would not only confront the problems described above, but also would be a derivative claim for which the necessity of a demand on the board or a committee of the board greatly weakens the suit's possibilities.

We therefore find that disclosure-oriented federal securities suits can address errant stewardship provided the managers proffer bold claims of their compliance with the law, that their business strategies are yielding great returns, or that existing contracts will add immensely to future profits, when behind each assertion is an ongoing violation of federal or state law that upon detection and compliance will prove immensely unrewarding to the firm. However, outside this realm, the most significant contribution of private and public enforcement of the securities laws is the culture of compliance they compel. Complaints abound that suits, or most suits, are frivolous and drive up the cost of business transactions. Regardless of the accuracy of this claim, it nonetheless supports a healthy awareness of the (p. 915) perils of nondisclosure of material information in securities transactions, which includes periodic reports and other announcements that reach investors. Enforcement, public and private, of the securities laws shines a bright light on managers with not only the therapeutic effect of warding some from misbehavior, but also by alerting investors and regulators of facts warranting inquiry and perhaps enforcement.

3 Evolving US Non-Litigation Monitoring Substitutes

To summarize, all of this evidence suggests that shareholder litigation has a lessening role in addressing managerial agency costs. Managerial underperformance is insulated by the business judgment rule, the demand requirement in derivative suits, and the immunity shield. Finally, although it remains early in the life cycle of forum selection and fee shifting bylaws, they each portend weakening whatever force shareholder suits have had in protecting shareholders in acquisitions.

Coterminous with the constriction of shareholder litigation, a number of alternative monitoring techniques have developed that address, to some extent, the voids created by its contraction. While each of these methods has its advocates and critics, collectively they have brought about significant changes in the relationship between management and shareholders at American public corporations. In this section, we explore each one of these areas to explain how they are affecting corporate governance today as well as their limits as monitoring devices.

The Evolution in the U.S. of Private Enforcement via Litigation and Monitoring Techniques: Are There Lessons for Germany?

3.1 Hedge Funds as Effective Monitors

Hedge funds have been actively engaged in shareholder monitoring in recent years, both on their own and also by providing leadership to quieter institutional investors.⁵¹ Hedge funds target firms that are undervalued by the market, perhaps because of poor management.⁵² The stock market appears to recognize the hedge fund's potential impact on these firms as the filing of an activist hedge fund's Schedule 13D filing creates positive average abnormal returns from 7% to 8%.⁵³ These benefits appear to last: firms targeted by activists see a 1.22% increase in operating efficiency one year after acquisition.⁵⁴

(p. 916) Despite these apparent benefits, hedge funds have their detractors, being referred to as “villains,”⁵⁵ who pursue short-term profits at the expense of the long-term value of their portfolio companies.⁵⁶ Such charges have raised interest in whether fiduciary duties ought to be reformed to include the actions of hedge funds.⁵⁷ The data is inconsistent with the view that hedge fund activism is short-term oriented.⁵⁸ First, hedge funds seem to have little trouble recruiting long-term investors to support their activist goals.⁵⁹ If a hedge fund's plans actually only produced a short-term gain at the expense of long-term profitability, one would think that long-term investors would be reluctant to support them.⁶⁰ Second, hedge fund activism seems to improve a firm's long-term prospects.⁶¹ Third, activist hedge fund holding periods are not that short, with one study finding they have an average holding period of 31 months.⁶² Finally, one study of hedge fund interventions from 1994 to 2007 found that the initial stock price gains resulting from the initial announcement of a hedge fund's activism were sustained over a five-year period as were improvements in other measures of returns.⁶³ All of this evidence supports the claim that hedge fund activism is not generally a short-term strategy and generates valuable monitoring of corporate management.⁶⁴

(p. 917) 3.2 Say on Pay: The New Conversation between Boards and Shareholders

In the US, derivative suits have proven impotent to either redress or retard excessive executive compensation.⁶⁵ In search of alternative monitoring mechanism, Congress passed the Dodd-Frank Act, which, among other things, required public companies to hold an advisory shareholder vote on the compensation of their top executives.⁶⁶ Why would such a vote, one that is merely advisory, be expected to produce tangible benefits to the firm?

Say on Pay may affect governance and compensation at firms for a variety of reasons. First, if a CEO is powerful enough to extract rents from his or her firm, then Say on Pay may provide the board of directors with additional leverage to negotiate a better deal for the firm.⁶⁷ Second, if directors are worried about being re-elected to the board, they may attach great importance to the level of shareholder support in a Say on Pay vote, and may therefore be more willing to reduce compensation levels or eliminate abusive pay practices.⁶⁸ Finally, Say on Pay may improve communication between shareholders and managers on compensation issues, which could result in a general improvement of corporate governance.⁶⁹

The Evolution in the U.S. of Private Enforcement via Litigation and Monitoring Techniques: Are There Lessons for Germany?

We now have several proxy seasons' experience with Say on Pay. Generally speaking, shareholders strongly support existing pay practices at most firms with Say on Pay votes with only 1-2% of firms (40 to 60 firms of the Russell 3000) receiving less than 50% shareholder support during these same years.⁷⁰

Despite the hopes of some proponents, Say on Pay has not led to lower executive pay levels or changes in its composition in the US.⁷¹ Research on the UK has also found that overall CEO pay levels do not seem to have changed as a result of the Say on Pay vote.⁷² However, (p. 918) Correa and Lel find that executive pay growth rates are lower in countries that have adopted Say on Pay legislation.⁷³ If their results are correct, it is hard to know whether the relative decline in CEO pay levels reflects additional leverage for directors in negotiations with CEOs, or greater willingness of directors to stand up to CEOs because of their fear of losing their jobs.

Say on Pay's introduction did have a significant effect on American corporate governance though.⁷⁴ Dodd-Frank's mandated shareholder votes focused directors on shareholders' concerns about executive pay, increased shareholder participation in corporate governance, and opened lines of communication between management and shareholders (and proxy advisory firms) regarding executive compensation.⁷⁵ Management at many companies made changes to the substance and disclosure of their pay programs in an attempt to more clearly align pay to performance.⁷⁶ Other companies improved the compensation disclosures contained in their annual meeting proxy materials. At companies whose pay programs received negative Say on Pay recommendations by proxy advisory firms, management at some firms initiated discussions with shareholders following an "against" recommendation.⁷⁷

3.3 A New Role for Appraisal Actions

Merger litigation has played a significant monitoring role of abusive corporate transactions in the past.⁷⁸ However, as we discussed in section 2.1 above, merger litigation's future has been placed in jeopardy by the board-adopted forum selection bylaws and fee shifting bylaws. If this is true, is there another form of litigation that could take its place?

One possible candidate is appraisal litigation. Traditionally, appraisal has been viewed as an ineffective remedy for shareholders that is cumbersome and very limited in its scope. It has three disadvantages that commentators have focused on:⁷⁹ difficult procedural steps that must be followed in precise order to preserve one's right to the remedy; the lack of a class action procedure that would permit easy joinder of all dissenting shareholders so that the costs of bringing an action could be more widely shared; and the narrow limits of the remedy, particularly in Delaware, where it is limited to mergers or consolidations and further restricted by the market out provision.⁸⁰

(p. 919) Since appraisal is not a class action, a shareholder bringing such an action can only spread the costs across the group of shareholders that actually file complaints seeking such relief.⁸¹ For small shareholders, this effectively means that seeking appraisal is

The Evolution in the U.S. of Private Enforcement via Litigation and Monitoring Techniques: Are There Lessons for Germany?

almost never cost-justified. Perhaps as a result, in the past, few appraisal actions were filed and even fewer were actively litigated.⁸²

However, Professors Kahan and Rock have recently observed that hedge funds may be adapting appraisal litigation to a new role.⁸³ After noting that hedge funds had been successful in blocking several proposed mergers when they believed that the price offered was too low, they noted that:

[w]hen hedge funds are dissatisfied with the terms of an acquisition and unable to obtain better terms, they also resort to litigation. In particular, hedge funds have filed statutory appraisal actions, in which shareholders receive a court-determined fair value instead of merger consideration.⁸⁴

Professor Geis⁸⁵ and Professors Korsmo and Myers⁸⁶ have advanced this idea and debated the appropriate role of appraisal litigation as a monitor of M&A deals.

Professor Geis focused on a relatively obscure Delaware Chancery Court appraisal decision involving a company called Transkaryotic Therapies.⁸⁷ The net effect of the decision was to facilitate hedge funds accumulating large stakes in target companies in order to file appraisal actions in the hopes of making large profits on their investments. Using this decision as a springboard, Geis argued that, “it is certainly possible that a robust after-market for appraisal rights will develop, analogous to the market for corporate control that allegedly disciplines otherwise entrenched managers with the threat of an external takeover.”⁸⁸ After reciting the many limitations of appraisal as a remedy, he concludes that “corporate law might play a meaningful role in enhancing firm value by policing freeze out mergers in a more nuanced and creative manner.”⁸⁹ In the end though, Geis equivocates about whether this is beneficial to target company shareholders because of concerns that opening up the appraisal remedy will lead to more strike suits, and therefore suggests further restrictions on shareholders’ (already quite limited) ability to bring these cases.⁹⁰

Professors Korsmo and Myers are much more enthusiastic about appraisal’s current and future role as a managerial agency cost monitor. Using a data set on appraisal cases from 2004 to 2013, they find that the dollar value of dissenting shares in appraisal actions spiked (p. 920) sharply in 2013.⁹¹ They document the rise of a small, but growing, group of investors filing multiple appraisal actions arising out of different transactions. These “repeat petitioners [are] increasingly dominating appraisal activity.”⁹² They go on to find that these repeat petitioners “target deals where the merger premium is low and where controlling shareholders are taking the company private.”⁹³ Based on these findings, Korsmo and Myers argue that a robust appraisal remedy could be working in a socially responsible way as a “back-end check on abuses by corporate managers, controlling shareholders, or other insiders in merger transactions.”⁹⁴

We are much more cautious about this potential trend and its effects on the market for corporate control. First, any monitoring effects on M&A activity that will arise out of appraisal litigation will be limited to a relatively small set of deals where appraisal is avail-

The Evolution in the U.S. of Private Enforcement via Litigation and Monitoring Techniques: Are There Lessons for Germany?

able. Moreover, Korsmo and Myers find that only slightly more than 15% of the transactions that are covered have appraisal actions filed challenging the consideration paid in the deal.⁹⁵

To the extent that appraisal is effective within this narrow class of deals, we would expect to see controlling shareholders and other acquirers revising existing deal structures to avoid appraisal's reach. Delaware's equal dignity doctrine will insulate other forms of acquisition from claims that appraisal ought to be available to shareholders in the event of changes of the form of the transaction. This suggests a need to expand the class of transactions covered by appraisal rights in order to offset such manipulations.

Another important limitation of appraisal is that it is realistically limited to big shareholders that own substantial dollar amounts of the stock. Smaller shareholders will not find appraisal to be cost effective and so their only real choices are either to take the merger consideration or sell to a hedge fund that is planning on seeking appraisal.

Indeed, small investors will benefit, if at all, from this appraisal litigation only if there is an ex ante effect on acquirers' original pricing of the deal because recent amendments to 8 Del. Code §§102(f) and 115 bar appraisal actions by shareholders whose holdings sum to less than \$1 million. An acquirer might take into account the likelihood of subsequent appraisal litigation and, in an effort to stop such cases from being filed, choose to pay an acquisition price that is closer to the actual fair market value of the stock as it would be determined by a court in an appraisal proceeding. In this case, smaller investors might get a higher deal price. But note that, even if this is true, a rational acquirer will still offer less than fair market value in the deal because even if an appraisal action was filed and won, the acquirer would only pay fair market value of those shares covered in the appraisal action, which are still a small minority of the total number of shares outstanding. Furthermore, even if all of the dissenting shares seek appraisal, a majority of the stock must have voted in favor of the deal or it would not have closed, so that at most the acquirer will need to pay off the minority of investors. It is only in situations where shareholders accurately anticipate that they will win an appraisal action, and therefore threaten to block a deal, plus have the power to block a deal, that the ex ante effect of appraisal litigation would lead acquirers to pay close to fair market value for the target's stock.

(p. 921) Appraisal litigation may have a limited, but valuable role, to play as a monitor of managerial agency costs in mergers. For that to happen though, we agree with Professors Korsmo and Myers that the market-out exception must be eliminated.⁹⁶ As numerous critics have pointed out, it makes no sense to say that shareholders who receive marketable securities for their shares in a merger do not need appraisal: if they sell those shares in the market after the merger, then they will suffer an uncompensated loss. We would also go further and expand the number of transactions that qualify for appraisal, especially in Delaware, to limit acquirers' ability to recast the form of their acquisition to avoid appraisal's reach. Finally, we would note that the Delaware courts have the power to change, or reinterpret, the rules surrounding appraisal in ways that would greatly reduce its attractiveness to hedge fund and other appraisal seekers.⁹⁷ If that were to hap-

The Evolution in the U.S. of Private Enforcement via Litigation and Monitoring Techniques: Are There Lessons for Germany?

pen, this form of shareholder monitoring of M&A transactions could come to a screeching halt.

3.4 The Limits of Governance

Say on Pay and the revived appraisal remedy are unlikely to have strong immediate effects on managerial agency costs. First, it remains to be seen whether the American experience with Say on Pay votes will be more than a ritualistic blessing of the status quo or what the impact of hedge funds' opportunistic use of the appraisal remedy will be. If their promise fades over time, then established corporate doctrines that interface strongly with governance will likely remain the major bulwark to protect shareholder value. To this end, the antidote for the present epidemic of suits in multiple jurisdictions is a well-crafted forum selection bylaw, not the dilution of substantive doctrine that invites such suits. What remains to be seen is whether, just as the plaintiffs' bar overreacted to permissive substantive doctrines, there will be an overreaction by the defense bar drafting director-adopted bylaws that are more sweeping than necessary to centralize suits in an appropriate forum. One example would be director-approved bylaws that lodge shareholder suits behind the impenetrable veil of arbitration or eviscerate such suits by adopting a loser pays standard.

By far the most significant force addressing agency costs has been shareholder activism by hedge funds. Their effect is broader than the lash of change of control that has long been championed as a mechanism to address significant agency costs. But as significant as hedge funds have been, their impact does not reach abuses targeted in shareholder failure to monitor suits. Simply put, hedge funds are not likely to find the rewards of changing the mine safety in Massey or risk management at Citigroup at all sufficient to attract their attention. In contrast, vigorous application of Caremark obligations on the part of directors can be expected to promote better oversight by outside directors. Thus, hedge fund activism complements, but does not supplement, shareholder suits in this area, and likely other forms of agency costs.

(p. 922) 4 Implications for and from Germany

As we noted earlier, Germany is evolving into a more dispersed ownership system.⁹⁸ This will lead managerial agency costs to rise, and Germany will need to develop techniques to reduce them. While Germany already has some legal rules and institutions in place that facilitate minority shareholder monitoring,⁹⁹ the decline in bank monitoring, the increased levels of equity securities held by foreign investors, and the rapid drop in block holder ownership levels, in combination emphasize the need for it to carefully evaluate new options.¹⁰⁰

Any such reform for shareholder litigation must overcome substantial inertial forces as for some time Germany has been skeptical of it, in large part because of concerns about litigation agency costs.

The Evolution in the U.S. of Private Enforcement via Litigation and Monitoring Techniques: Are There Lessons for Germany?

4.1 Representative Shareholder Litigation

Historically, German public company shareholders have not used litigation much as a device to discipline managers. This difference from the US is explained by the dominating role of the control block holder within the typical German public company. Even with the weakening of the role of banks and block holders generally in Germany, today derivative suits remain virtually non-existent. Moreover, the two-tiered board structure for German companies itself provides a governance structure to manage agency costs. Although the supervisory board has the statutory authority and requirement to initiate suit against misbehaving managers, there is a recognized bias on the part of the supervisory board not to go after managers since this may suggest weaknesses in oversight by the supervisory board that enabled the misbehavior.¹⁰¹

To be sure, there is express statutory authority for derivative-like suits in Germany to step in where the supervisory board has been reluctant to act. One means for such shareholder suits is upon the approval of a majority of the shareholders.¹⁰² Alternatively, a shareholder or group of owners holding 1% of the firm's capital (or €100,000) can initiate suits for violations of the articles of incorporation or serious violations of law.¹⁰³ The board can nonetheless scuttle the suit, but to do so must show that the overriding interest of the company calls for the suit to be dismissed.

Few such suits occur, most likely due to Germany having, like most of continental Europe, a loser pays system so that representative shareholder litigation rarely makes sense and even less so in the absence of class action procedures.¹⁰⁴ However, the plaintiff can escape (p. 923) the clutches of loser pays upon the courts' preliminary determination that the suit should proceed and this outcome is not affected if the suit ultimately rules in favor of the manager defendants. Once the suit survives the preliminary determination, the court has the power to appoint a neutral party to prosecute the suit on behalf of the shareholders. Moreover, in making this preliminary determination, the court accords much less deference to the conclusions reached by the supervisory board than an American court customarily assigns to the business judgment rule.

The leading decision on supervisory boards' responsibility to address misconduct by managers is ARAG/Garmenbeck.¹⁰⁵ It involved two members of a supervisory board who sought review of that body's decision not to pursue the firm's CEO in connection with losses suffered by the corporation when it became the victim of a Ponzi scheme. Twice the supervisory board refused to authorize an investigation into the CEO's possible culpability in connection with the corporation's losses. The BGH held that in light of the supervisory board's affirmative duty to monitor the managing board that the supervisory board has a duty to determine whether members of the managing board have engaged in misconduct. If so, the supervisory board must evaluate the litigation risk and the burdens of the suit; if these weigh in favor of prosecuting the suit, then the supervisory board must, except in extraordinary circumstances, proceed with a suit against the offending manager.¹⁰⁶ Accordingly, the BGH overruled the decision of the supervisory board not to investigate the CEO.

The Evolution in the U.S. of Private Enforcement via Litigation and Monitoring Techniques: Are There Lessons for Germany?

Germany does have another species of lawsuit, the rescission, or contesting action. The German statute confers the power to shareholders who oppose either in person or by proxy resolutions at a stockholders' meeting, to challenge the action approved in a shareholder resolution.¹⁰⁷ The strength of such suits is that the corporation cannot complete the challenged transaction so long as the challenge is outstanding. These suits have over time grown in popularity. An empirical study by Vermeulen and Zetzsche make the case that the German contesting suits are fraught by unprofessional conduct by their lawyers and suggests they produce hardly any substantive relief to the corporation or its stockholders.¹⁰⁸ We can see that the German experience with contesting actions compares with the multi-forum litigation that thrives in the US with respect to mergers and acquisitions. Of interest is that Professors Vermeulen and Zetzsche, while marshaling a good deal of evidence of abuse with the German contesting action, find that the Dutch process whereby such shareholder claims must first pass through a neutral body before being initiated frequently leads to positive outcomes. Their finding underscores the virtues of a neutral screening mechanism for shareholder suits and lifting the blunt instrument of loser pays as the governor on shareholder suits.

Despite the infrequency of German derivative suits and the likely abuses of the more prevalent contesting actions, the German procedure whereby an external auditor can be appointed shows a good deal of promise.¹⁰⁹ A dramatic illustration of the special auditor was in *IKB*,¹¹⁰ where the court granted the request for a special auditor to be appointed, holding that (p. 924) the petitioner had pleaded sufficient facts of gross breach of duty. IKB had invested 46% of its assets in collateral debt obligations (CDOs) where the underlying assets were subprime US home mortgages. Its articles of incorporation provided that IKB was to promote "trade and industry, in particular through the provision of mid- and long-term financing" and thereby meet the "financial needs of medium-sized enterprises." The appellate court stressed that it was the role of the auditor, if appointed, to determine whether a breach had occurred such that the role of the reviewing court was to determine if sufficient facts were pled to begin that inquiry, not to resolve the truthfulness or accuracy of the pled facts. The business judgment rule was held not to be a defense to violating a provision of the articles of incorporation. Furthermore, the court concluded that the petition alleged that the directors had acted in total reliance on the ratings provided by rating agencies which the IKB directors must have known were subject to a conflict of interest that rendered them less than independent. Notwithstanding not being fully informed, the petition set forth sufficient facts that the directors' action exposed the firm to excessive risk of loss. The court emphasized that the CDO holdings were not just risky themselves but given their magnitude relative to the firm's size thereby jeopardized the solvency of the IKB.

As seen in *IKB*, the procedure introduces a neutral party to the dynamics, rids the process of agency costs by the initiating lawyers, as occurs in the contesting action, and should with the auditor's independence accepted weaken the claim for further restraints such as automatic fee shifting as is the case in other forms of shareholder litigation. The outcome in *IKB* stands in stark contrast to the more deferential and less skeptical approach in *Citi-group*, discussed earlier. To be sure, *IKB* involved the distinguishing factor of involving,

The Evolution in the U.S. of Private Enforcement via Litigation and Monitoring Techniques: Are There Lessons for Germany?

albeit only partly, the board acting inconsistently with the clear strictures of the company's bylaws; however, the focus of the *IKB* court was not this factor but rather the failure of the board to act reasonably in assessing the firm's substantial purchase of CDOs.

4.2 Evolving Monitoring Devices

Besides litigation, Germany does have a number of other shareholder monitoring mechanisms for protecting minority shareholders' rights. These are of varying strength, but include the duty of loyalty, German "group" law, and the equality principle.¹¹¹ But these devices are imperfect and seem insufficient to address the rising level of managerial agency costs that will accompany the shift from control shareholder ownership to dispersed ownership. As discussed in section 3, several new forms of shareholder monitoring have evolved in the US in recent years that could be considered for deployment in Germany.

While the market for corporate control in Germany has long been dormant, commentators have been pushing for it to open up to take the place of control block holder monitoring.¹¹² Hedge fund activism has become a powerful monitoring force that could be harnessed in Germany to free up the market for corporate control.¹¹³ Hedge funds have had some success in raising shareholder value in Europe, including in Germany, although the levels of activism (p. 925) are much lower than in the US.¹¹⁴ While international studies of hedge fund activism have found that the cumulative abnormal returns to activism in Europe are lower than in the US and Japan, they are still positive and significant.¹¹⁵ European returns are especially high for hedge fund interventions that lead to restructurings or takeovers.¹¹⁶

However, Germany makes life very difficult for many hedge fund activists.¹¹⁷ For example, German shareholders cannot gain access to the corporation's stock list in order to communicate with their fellow shareholders, making proxy solicitation very difficult.¹¹⁸ Importantly, markets are also illiquid for many German companies, making it more difficult for hedge funds to accumulate large positions and to exit at the end of an engagement.¹¹⁹ Given the significant monitoring potential of hedge fund activism, Germany might do well to consider making legal and structural changes that make it more feasible.

The Germans should also consider providing shareholders with an alternative device for monitoring abuse friendly transactions along the lines of appraisal arbitrage discussed above; indeed, this may be seen as a response to the overuse of contesting actions, described above. There is presently a limited appraisal remedy for minority shareholders in German firms.¹²⁰ In the event of a friendly change of control transaction at an unfair price, minority shareholders would benefit from having a stronger version of the appraisal remedy, particularly in management-financed transactions such as private equity management buyouts.

Shareholder monitoring of executive compensation is a third promising area for development. In the past, there was concentrated ownership by banks, which, all other things being equal, was associated with lower levels of CEO compensation at German

The Evolution in the U.S. of Private Enforcement via Litigation and Monitoring Techniques: Are There Lessons for Germany?

companies.¹²¹ Now, as ownership concentration has become more dispersed, we are seeing much higher levels of executive compensation. For example, the mean compensation of a member of the (p. 926) management board of a DAX company soared from €1.2 million in 2001 to over €2.8 million in 2011, an increase of over 240%.¹²²

One potential pay-monitoring device is mandating a Say on Pay advisory shareholder vote. The Germans have made some tentative movements in this direction. The Law on the Appropriateness of Director Compensation states that the general meeting of shareholders may be provided an advisory vote of the remuneration system of the management board of listed companies.¹²³ While not mandatory, all DAX companies nonetheless have had their management board remuneration system approved at least once by their general meeting of shareholders since 2010.¹²⁴ While most such proposals are strongly supported by shareholders,¹²⁵ institutional investors make use of the advisory Say on Pay to signal their worries over pay increases.¹²⁶

There is room to strengthen the German Say on Pay voting system. First, we would urge the Germans to adopt a mandatory vote on the top executives' pay level, such as the one in the US, rather than on the remuneration system of the management board.¹²⁷ Second, Germany should give serious consideration to making this vote binding, as it is in the UK and Australia, perhaps going so far as to implement the Australian "two strikes" rule.¹²⁸ The combination of a mandatory and binding vote might significantly improve shareholders' monitoring power over executive pay at German public companies.

We believe there are lessons for America to draw from the German experience. First, we believe that when evaluating a board's rejection of a demand in derivative suits that American courts would be better advised to accord, as German courts have, less deference to the board's determination on matters not germane to matters directly related to the conduct of the company's business. Just as the business of business is business, which supports the deference embodied in the business judgment rule, we believe courts have greater experience than the board or a committee of the board with matters related to the likely strengths of a derivative suit. Second, we believe that if this approach were taken that bylaws mandating fee shifting could more readily be seen as striking the right balance between fostering the meaningful therapeutic of the derivative suit and curtailing abusive litigation. However, once the demand is excused under the less deferential treatment of the board or committee (p. 927) rejection of a demand, this should lead to the same result as in Germany so that loser pays abates regardless of the ultimate outcome of the suit. We believe this balance approach could reflect moderation so that courts can be somewhat more welcoming to limited fee shifting via bylaw provisions.

5 Conclusions

Shifting ownership structures lead to changes in corporate governance systems as those systems evolve to address new problems. In the US, ownership structures have moved from largely dispersed to more concentrated in the past few decades, while in Germany the old control-shareholder-dominated, house-bank-driven ownership arrangements are

The Evolution in the U.S. of Private Enforcement via Litigation and Monitoring Techniques: Are There Lessons for Germany?

slowly dissolving. For Germany, these changes will ultimately result in higher levels of managerial agency costs as control shareholders become less capable of engaging in close monitoring of managers.

In this chapter, we have closely examined shareholder monitoring devices created in the US and asked whether they might be of some service to (more) dispersed shareholders in Germany. We proposed that representative litigation, despite its flaws, may be useful to shareholders in their quest to monitor managements. We also suggested that Germany consider loosening the barriers to hedge fund activism and shareholder Say on Pay voting. Finally, we recommended that Germany consider adopting an appraisal-type remedy for minority shareholders to address potential unfair friendly transactions, especially when they benefit corporate managers.

(⁴¹) We raise here a comparative conundrum, namely that scholars are divided whether, in Germany, the business judgment rule carries as high a presumption as the US, in light of the fact that objectives are not isolated to shareholders but cover a range of stakeholders. Compare Franklin A. Gevurtz, "Disney in a Comparative Light", 55 Am. J. Comp. L. 452 (2007) (lower presumption of propriety attaches to decisions of a German supervisory board than a US board) with Theodor Baums & Kenneth E. Scott, "Taking Shareholder Protection Seriously? Comparative Governance in the United States and Germany", 53 Am. J. Comp. L. 31 (2005) (duty owed to multiple and diverse constituencies "tends to

The Evolution in the U.S. of Private Enforcement via Litigation and Monitoring Techniques: Are There Lessons for Germany?

broaden the likelihood of upholding management actions that are contrary to the interests of the shareholders”).

(⁴³) Jessica M. Erickson, “Corporate Governance in the Courtroom: An Empirical Analysis”, 51 Wm. & Mary L. Rev. 1749, 1803 (2010).

(⁴⁴) These corporate governance changes in some cases bear little relation to the wrong alleged, but they do count as a benefit to the corporation which can support an award of attorneys’ fees.

(⁴⁵) See *Basic Inc. v. Levinson*, 485 U.S. 224, 245–46 (1988) (applying a presumption of reliance in a fraud on the market context, facilitating filings of class action suits in a Rule 10b-5 context).

(⁴⁶) Securities Class Action Filings: 2013 Year in Review, Cornerstone Research (2014) available at <http://www.cornerstone.com/Publications/Reports/Securities-Class-Action-Filings-2013-Year-in-Review>.

(⁴⁷) The cost curve for private suits has been greatly impacted by multiple developments over the last few decades with the consequential effect of reducing not just the areas where antifraud suits might be successful but the frequency of suits under the antifraud provision. For example, the Private Securities Litigation Reform Act of 1995 burdens the plaintiff with a heightened pleading requirement as well as barring discovery until all motions to dismiss have been resolved. This effectively requires plaintiff firms to be more resourceful prior to filing suit so that the complaint’s factual allegations meet the “strong inference” of fraud demanded by the PSLRA. Such resourcefulness demands plaintiff firms to invest non-trivial sums in investigating possible cases so as to marshal the facts to meet the pleading requirement. The Supreme Court has also worked its transformative magic. The most dramatic effects on the conduct of securities class actions has been the Supreme Court’s sweeping limitations on who is subject to liability under the antifraud provision. For example, *Janus Capital Group, Inc. v. First Derivative Traders*, 131 S. Ct. 2296 (2011) limits liability to individuals who had “ultimate authority over the statement, including its content and whether and how to communicate it.” Thus, many individuals whose involvement was indispensable to the disclosure violation, such as the outside lawyer who schemes with managers to fabricate a series of transactions to conceal the firm’s financial position, are beyond the reach of private litigants and therefore weaken the deterrence effect of antifraud provision. Moreover, Congress’s enactment of the Securities Litigation Uniform Standards Act provides further insulation as SLUSA has the effect of imposing the same narrow standard for state law class actions premised on securities violations. The Supreme Court has been equally restrictive in the realm of causality with the consequential effect of driving litigants to commission expensive econometric studies to address a range of causation issues that arise in the pre-trial period. See e.g., *Dura Pharmaceuticals Inc. v. Broudo*, 544 U.S. 336 (2005) (complaint must set forth facts

The Evolution in the U.S. of Private Enforcement via Litigation and Monitoring Techniques: Are There Lessons for Germany?

supporting the claim that the alleged material misrepresentation caused the plaintiff to suffer a material loss); *Halliburton Co. v. Erica John Fund, Inc.*, 134 S. Ct. 2398 (2014) (defendants can challenge class certification by econometric evidence that alleged omission or misstatement did not distort the security's price).

Interestingly, family ownership of German firms increases compensation, perhaps because families use it as a mechanism for diverting value to themselves. *Id.*

Private and Public Enforcement of Securities Regulation

Howell E. Jackson and Jeffery Y. Zhang

The Oxford Handbook of Corporate Law and Governance

Edited by Jeffrey N. Gordon and Wolf-Georg Ringe

Print Publication Date: May 2018 Subject: Law, Company and Commercial Law

Online Publication Date: Aug 2015 DOI: 10.1093/oxfordhb/9780198743682.013.39

Abstract and Keywords

This chapter examines the impact of private and public enforcement of securities regulation on the development of capital markets. After a review of the literature, it considers empirical findings related to private and public enforcement as measured by formal indices and resources, with particular emphasis on the link between enforcement intensity and technical measures of financial market performance. It then analyses the impact of cross-border flows of capital, valuation effects, and cross-listing decisions by corporate issuers before turning to a discussion of whether countries that dedicate more resources to regulatory reform behave differently in some areas of market activities. It also explores the enforcement of banking regulation and its relationship to financial stability and concludes by focusing on direct and indirect, resource-based evidence on the efficacy of the US Securities and Exchange Commission's enforcement actions.

Keywords: private enforcement, public enforcement, securities, regulation, capital markets, enforcement intensity, regulatory reform, banking, financial stability, Securities and Exchange Commission

1 Introduction

¹²IN a widely influential article published in the *Journal of Political Economy* in 1998, La Porta, Lopez-de-Silanes, Shleifer, and Vishny ("LLSV") pioneered the quantitative coding of legal rules to explore the relationship between the rule of law and the development of capital markets.³ Their analysis produced the now well-familiar finding that common law countries have greater investor protection than civil law countries and that greater shareholder protection is associated with a lower level of ownership concentration. LLSV also inspired numerous sub-fields related to the theme of law and finance. In this chapter, we review one of them—the empirical relationship between actual enforcement of the law and the robustness of capital markets.

Private and Public Enforcement of Securities Regulation

Research on the significance of enforcement intensity, especially the importance of private versus public enforcement, has provided a healthy debate with valuable insights. In a 2006 paper published in the *Journal of Finance*, La Porta, Lopez-de-Silanes, and Shleifer (“LLS”) examined capital market development in 49 countries and concluded that private enforcement through liability rules positively affected capital market development while public enforcement had negligible consequences.⁴ Jackson and Roe (“JR”) revisited this issue a few years later, arguing that real resources in the form of a regulator’s budget or staff, (p. 929) as opposed to formal legal indices, would better proxy public enforcement intensity.⁵ Using resource-based measures of enforcement, the authors concluded that public enforcement was consistently associated with several measures of robust capital markets, most notably market capitalization, the number of publicly traded firms, initial public offerings, and overall trading levels. Moreover, for these measures, the authors claimed that public enforcement performed at least as well as the measures of private enforcement identified as important to capital market development in earlier research.

Although the debate between private and public enforcement is ongoing, at least two subsequent empirical studies have indirectly confirmed significant relationships between enforcement and robust capital markets found in JR and LLS. In a 2010 working paper, Echeverri-Gent and Bloom focused their attention on the relationship between politics and financial development.⁶ In a model that incorporates controls for electoral competitiveness, federalism, and checks on executive power, the authors conceptualized regulatory budgets and staffing as reflections of political choices and thus also included the JR resource-based variables in the analysis. Using measures of robust financial markets similar to those used in JR, they concluded: “[W]e find support for those who argue that the well-endowed government regulators play an important role in promoting financial market development.”⁷

In a recent publication, Cumming, Knill, and Richardson explored the influence of public and private enforcement on securities issuances using a research strategy that distinguishes between the size of issuers.⁸ Their paper exploits a newly assembled data set of over 45,000 firms across 46 countries and spanning the years 1996 to 2007, thus generating considerably more statistical power than the country cross-sectional sample upon which the JR and LLS results were based. Utilizing various measures of enforcement intensity, the authors reported two main results:

First, counter to what has been previously found in the literature, public enforcement, as measured by legal statute (i.e., LLS, 2006) and resources (JR, 2009), is influential in firm access to capital and seems to level the playing field for small firms who struggle for adequate access to equity capital . . . Second, private enforcement is not found to be unilaterally beneficial as previously suggested in LLS; laws regulating private transaction exacerbate preferential access to equity markets for large firms. The disparate effects of private enforcement likely have to do with the marginal benefits versus the costs of additional regulation for firms of different sizes.⁹

Specifically with respect to the JR staffing variable, the authors reported that a one standard deviation increase in the resource-based proxy raised the probability of equity issuance of small firms by nearly 4%.¹⁰ While documenting the beneficial impacts of greater public (p. 930) enforcement, the paper also presents a more nuanced view of private enforcement by showing that, once small firms gained access to equity markets, greater private enforcement intensity allowed them to raise significantly more capital.¹¹

The papers by Echeverri-Gent and Bloom and by Cumming et al. are closest to directly addressing the JR conjectures, but they are only part of the growing literature in support of the view that enforcement, particularly public enforcement, plays an integral role in the development of robust capital markets. Our main analysis in this chapter appears in section 2, which summarizes the literature exploring the relationship between enforcement and other measures of robust capital markets, between enforcement and capital flows, valuations, and cross-listing decisions, and between enforcement and the success of regulatory reform efforts. At the end of that section, we offer a cursory review of some of the emerging literature surrounding the global financial crisis and discuss potential implications for public enforcement. Section 3 deals with issues of causation in the existing literature and presents papers which utilize data and methods capable of overcoming those obstacles. Finally, section 4 concludes and offers some tentative suggestions for future research.

2 Empirical Research

This section focuses exclusively on empirical findings related to private and public enforcement as measured by formal indices and resources. Many of the papers reviewed do not themselves have enforcement as their primary focus. Rather, each of these papers investigates a distinctive hypothesis and, as part of that analysis, utilizes one of the JR resource-based measures, the LLS measures, or some variant thereon to determine whether enforcement intensity has a bearing on the variables of interest. Oftentimes, the enforcement aspect of the analysis is a relatively minor piece of the overall paper. The goal of this section is to bring together these disparate lines of research to present a larger picture of the extent to which enforcement has been found to have a consistent and significant association with important indicia of financial market performance.

2.1 Financial Market Performance

We first turn to the association between enforcement intensity and technical measures of financial market performance (as opposed to the broader measures of capital market development explored in the original JR and LLS papers). In a 2012 working paper, Amiram and Owens studied the relationship between income smoothing in financial statements to the cost of firm debt.¹² Using 1,817 facility-level debt observations for 639 non-US borrowers across 20 countries from 1996 to 2009, the authors concluded that income smoothing was associated with lower costs of debt in countries where it was more difficult for managers (p. 931) to extract private benefits of firm value and was associated with

Private and Public Enforcement of Securities Regulation

higher costs of debt in jurisdictions where it was easier to extract private benefits. In deriving the main results, the authors captured the threat of private benefits extraction using the anti-self-dealing index created by Djankov et al., which was based on private enforcement mechanisms available to minority shareholders related to disclosure, approval, and litigation in 2003.¹³ In alternative specifications, the authors segmented jurisdictions by substituting the JR enforcement variables as a proxy for restraints on private benefits and reported “qualitatively consistent” results.¹⁴ Accordingly, the paper offers evidence that increased levels of both public and private enforcement can be associated with lower costs of capital.

Another paper investigating technical measures of performance is Kerl and Ohlert’s 2014 working paper on the accuracy of forecasts by star analysts.¹⁵ Using over 30,000 analyst reports from 2005 to 2010, the authors tested a number of hypotheses, including the question of whether the quality of corporate governance affects the accuracy of analysts’ forecasts. In distinguishing among corporate governance regimes, they used several different proxies, including the Djankov et al. anti-self-dealing index, the Leuz et al. public enforcement index,¹⁶ and the JR staffing variable. In jurisdictions with higher levels of enforcement capabilities, the forecasts of all analysts were more accurate and the relative merits of star analyst forecasts were especially pronounced.¹⁷ The paper concludes: “[B]etter corporate governance and stronger investor protection have a positive effect on forecast accuracy of star-analysts.”¹⁸

In a similar vein, Arand, Kerl, and Walter undertook a study into the informativeness of nearly 700,000 sell-side analyst reports in eight leading capital markets.¹⁹ The authors explored whether the regulatory environment of both issuers and institutional investors influenced the informativeness of analyst reports, measured by both short-term market reactions and an ex post assessment of report accuracy. They experimented with several different measures of the quality of the regulatory environment, including three mentioned previously (the Djankov et al. anti-self-dealing index, the Leuz et al. enforcement proxy, and the JR staffing variable). In all of these cases, the authors found that “the information value of target price and earnings forecast revisions, as proxied by the level of market reaction, increases with the level of investor protection.”²⁰ Moreover, with the exception of the Leuz et al. measure of public enforcement, the other enforcement proxies generated results (p. 932) showing that “forecast errors are negatively associated with the respective investor protection measure and highly significant at the 1% level.”²¹

To be sure, not all intervening studies have reported robust effects of private or public enforcement on capital market performance. In a 2012 working paper, Cumming, Imad’Eddine, and Schwenbacher analyzed various law and enforcement proxies in connection with the degree of spread of UCITS equity funds and bond funds to other countries.²² While the authors found a statistically significant correlation between the level of spread and host countries with better anti-director rights or with better creditor rights, they failed to indicate any association between enforcement measures (namely, the JR regulatory budget and staffing levels and the LLSV and LLS legal indices of law enforcement) of host countries and the spread of UCITS funds.²³ Similarly, in a 2009 working pa-

per, Frijns, Gilbert, and Tourani-Rad developed a data set containing the scope, sanctions, and enforcement of insider trading laws for a sample of 1,432 firms from 30 countries to examine their efficacy in decreasing informational asymmetry and the incidence of insider trading.²⁴ In their analysis, they found private and public enforcement variables to be insignificant in the deterrence of insider trading; their empirical tests included the resource-based proxies of enforcement as well.²⁵

At least one working paper identifies an association between enforcement and reform outcomes that might be viewed as having negative implications. In a study exploring the speed with which national authorities adopted International Financial Reporting Standards (IFRS), Pownall and Wieczynska concluded that a higher level of the JR regulatory budget variable was negatively associated with the likelihood that a firm in the European Union adopted IFRS.²⁶ However, when assessing their results involving other proxies for enforcement, the authors reported: “We find little evidence that cross-country enforcement conditions or mechanisms are associated with IFRS adoption during our period.”²⁷

In sum, it appears that private and public enforcement play significant roles in improving essential aspects of capital markets, notably with regards to the private cost of capital and the value of information, but these benefits do not seem to extend to areas such as insider trading and the speed of regulatory adoption. The negative results are not too surprising given that enforcement is only a piece of the regulatory framework, but the mixed results reported above are important to note as they highlight the importance of multiple channels of supervisory impact.

(p. 933) 2.2 Capital Flows, Valuations, and Cross-Listing Decisions

A separate strand of research investigates the impact of cross-border flows of capital, valuation effects, and cross-listing decisions by corporate issuers. While some of the studies find statistically significant correlations with enforcement variables, the results again are mixed. On balance, however, the evidence available to date suggests a possible impact of public and private enforcement activities on cross-border capital flows and valuations.

In a 2012 paper published in the *Journal of International Money and Finance*, Eichler examined a data set measuring the equity home bias of US investors toward 38 countries from 2003 to 2008 with the goal of exploring the influence of the quality of corporate disclosure in each country on mitigating the equity home bias of US investors—a bias which generally leads investors to overinvest in the United States at the expense of what is thought to be more desirable levels of international diversification.²⁸ After first determining that the quality of corporate disclosure in foreign jurisdictions was associated with a statistically significant reduction in home country bias on the part of US investors,²⁹ the author expanded the analysis to the marginal impact of supervisory intensity, using the liability standards index from LLS to proxy for private enforcement and the JR staffing variable to proxy for public enforcement. Significant results were found using both variables. Specifically, investors preferred stocks from countries with more comprehensive corporate disclosure only if enforcement levels in those countries were sufficiently high.³⁰

Private and Public Enforcement of Securities Regulation

In comparing private and public enforcement, the authors noted that “fewer countries have sufficient public enforcement to ensure that more comprehensive corporate disclosure yields significantly less home bias,” thus implying that the relatively “lax public enforcement of securities laws may be a more probable cause of US investors’ equity home bias than low liability standards.”³¹ Overall, the analysis corroborates a hypothesis advanced in JR that one of the channels through which public enforcement benefits capital markets is through its interaction with disclosure standards.³²

In a further exploration of the relationship between disclosure and public enforcement in cross-border context, Loureiro and Taboada presented a 2012 working paper exploring the relationship between stock market informativeness and the adoption of IFRS of nearly 4,000 firms across 30 countries from 1999 through 2010.³³ While their primary investigation concerned the positive effect on stock market informativeness of voluntary adoptions, they also investigated whether higher public enforcement levels were associated with greater informativeness where issuers were mandated to adopt IFRS. Using both the public enforcement index from Djankov et al. and the JR budget variable, the authors concluded that “mandatory adopters in countries with better enforcement exhibit a more significant increase in stock price informativeness following IFRS adoption. These results are both statistically and economically significant.”³⁴ The authors interpreted these results to suggest that, when an issuer (p. 934) is forced to adopt IFRS as the result of a government mandate, stock market pricing rewards that adoption only when the jurisdiction maintains robust systems of supervisory oversight: the authors reasoned that mandatory IFRS adoption does not send a credible market signal in lax jurisdictions.³⁵

Studies regarding the cross-listing of securities are more mixed in their findings with respect to enforcement intensity. In a 2012 paper published in the *Journal of Banking & Finance*, Sarkissian and Schill explored the importance of law enforcement in explaining foreign listing premiums in 2,838 listings on 32 foreign stock exchanges from 69 home markets during the period 1985–2006.³⁶ The authors used the JR budgetary and staffing variables to compare enforcement levels between countries, but failed to find any statistically significant correlation between the intensity of public enforcement and foreign listing premium, other than in a small positive effect in the cases of US firms listed overseas.³⁷

Researchers have also utilized the Supreme Court’s 2010 decision in *Morrison v. National Australia Bank Ltd.* to test the consequences of private enforcement on cross-listing decisions.³⁸ Previously, private lawsuits under Rule 10b-5 of the Securities Exchange Act of 1934 could be filed against non-US issuers if the alleged fraud occurred in the United States or had substantial consequences for the United States. In *Morrison*, however, the Court ruled that 10b-5 would only apply to securities transacted upon a US stock exchange or otherwise sold through US domestic transactions. According to a forthcoming article by Bartlett, institutional investors claimed that such a decision would bias investments toward securities listed on US exchanges.³⁹ Because the ruling was unexpected, it provided a natural experiment to test the influence of private enforcement on cross-list-

ing decisions. Using proprietary trading data from over 300 institutional investors, Bartlett found:

[N]o significant change in investor trading in the thirty month period surrounding Morrison. Nor did investors appear to be allocating more narrowly to US exchanges after Morrison in those cross-listed issuers where preserving the right to bring a 10b-5 action might be especially desirable. Most notably, an investor's level of US trading after Morrison appears to have had no demonstrable relation to a trade's investment risk, trading cost, or the condition of a local market's investor protection regime. Similarly, even though Morrison made it considerably easier to determine which foreign issuers were subject to the risk of a private 10b-5 action, investors showed no evidence of reallocating toward these "bonded" issuers within their non-US equity portfolios.⁴⁰

(p. 935) It should be noted that, following the Morrison ruling, Congress added Section 929P to the then-pending Dodd-Frank Wall Street Reform and Consumer Protection Act in order to allow the SEC "to bring public enforcement actions against non-US firms under the conduct and effects test."⁴¹ This could partially explain the insignificant results, assuming that investors expected increased involvement from public regulators. However, the Bartlett findings do pose a question of whether market participants actually value the benefits of private enforcement provided by 10b-5.

The Bartlett article includes evidence suggesting that some measures of enforcement did seem to affect trading practices before the Morrison case was decided. In particular, the author found that, prior to the Morrison ruling, there was a significant negative relationship between the JR resource-based proxies of public enforcement and US trading of cross-listed issuers, which is consistent with the JR results. Regarding private enforcement, a significant negative association was found with respect to the anti-self-dealing index created by Djankov et al. (2008) but not the LLSV anti-director rights index.⁴² In other words, investors were "more likely to purchase cross-listed shares in the US when an issuer's local market was characterized by low measures of investor rights protections."⁴³

In a separate investigation of cross-border listings, Samarasekera, Chang, and Tarca presented a study of the accounting quality of 495 UK listed firms who implemented IFRS, including 246 cross-listed firms (mostly from Germany and the United States).⁴⁴ Finding that accounting quality improves for only cross-listed firms, the authors reported that changes in regulatory scrutiny (by cross-listed countries) had a material effect on the quality of accounting reporting, reasoning that the additional scrutiny imposed on firms listed in multiple jurisdictions contributed to these improvements. While the authors did not utilize the JR variables in their analysis, they concluded: "Consistent with the view of Jackson and Roe (2009) that public enforcement is a key mechanism for promoting protection of investors and growth of securities markets, our evidence shows benefits from activity by public bodies to promote the quality of audit and compliance with accounting standards."⁴⁵

The affirmative results in this subsection are consistent with the previous analysis on technical measures of capital market performance. On the other hand, the mixed cross-listing results, especially the ones derived from the Morrison ruling, are somewhat surprising. The Supreme Court's unexpected decision in that case provided an opportunity to examine the benefits of private enforcement, but a negative investor reaction was simply not present in the empirical results. Perhaps the available data were not of sufficient quality to construct a valid counterfactual or perhaps the Dodd-Frank Act mitigated the potential fallout of weaker private enforcement. Regardless, the results presented here suggest that readers should carefully consider seemingly intuitive assumptions about the efficacy of private enforcement.

(p. 936) 2.3 Success of Reform Efforts

Another group of studies utilize measures of enforcement to examine whether countries that dedicate more resources to regulatory reform behave differently in some areas of market activities. While the results of these studies are again not entirely uniform in their findings, in many contexts, greater public enforcement intensity has been found to have a statistically significant association with the market variable of interest.

For example, in a 2013 working paper, Christensen, Hail, and Leuz conducted an empirical study of the changes in the market liquidity and the cost of capital to firms in each of the countries in the European Union as the countries implemented Market Abuse Directive and Transparency Directive on a staggered basis between 2001 and 2011.⁴⁶ The paper shows that the implementation of the two directives was significantly correlated with the increase of market liquidity, as measured by bid-ask spreads and percentage of zero-return days, and the decrease of cost of capital, as measured by implied cost of capital and dividend yields. Of particular interest here, the authors' examination of liquidity effects partitioned countries based on various implementation and enforcement variables. They concluded that the "liquidity effects of the two directives are stronger in countries with a history of higher regulatory quality. Stricter implementation and enforcement of the two directives also result in larger liquidity effects, but these effects exist primarily in countries with strong prior regulatory quality."⁴⁷

The Christensen, Hail, and Leuz results are informative on multiple dimensions. First, they provided evidence of a positive relationship between supervisory resources and a technical measure of market performance (bid-ask spreads), which might reasonably be thought to contribute to robust capital markets. Second, at least in this context, they isolated the source of this improvement as coming largely from countries that already had substantial supervisory staffing as measured by the growth in the number of full-time supervisory employees from 2004 to 2009. In other words, the gains did not come from traditionally low-supervisory jurisdictions that contemporaneously increased supervisory resources. The authors concluded with the following interpretation:

In sum, our findings support a causal link between stricter securities regulation and market liquidity. They also support the notion that the success of regulation

depends critically on how regulation is implemented and enforced. Thus, policy debates should pay close attention to implementation and enforcement issues if regulation is to have the intended effects. Our finding that countries with weaker securities regulation do not catch up with stronger countries illustrates the difficulty of harmonizing capital markets through regulatory reforms. It highlights that prior regulatory conditions matter and that imposing the same regulation on countries with disparate initial conditions can have the (unintended) effect of making countries diverge more, not less.⁴⁸

(p. 937) In a subsequent paper published in the Review of Finance, Dubois, Fresard, and Dumontier also explored the effects of adoption of the EU Market Abuse Directive (MAD) by documenting changes in other technical measures of stock market performance: biased research advice from the sell-side equity research industries in 15 European countries between 1997 and 2007.⁴⁹ Utilizing the JR budgetary and staffing variables as well as the LLS public enforcement index, the authors partitioned countries into “weak” and “strong” enforcement countries and found that optimism bias was significantly diminished after MAD in strong enforcement countries while it was not as effective in reducing bias in weak enforcement countries. The authors also included proxies for actual legal sanctions and found further positive effects. They concluded: “[U]sing the heterogeneity that exists in legal sanctions and enforcement practices across European countries, we find that the curbing effect of MAD largely depends on countries’ institutional traits. The impact of MAD is significantly stronger in countries where the sanctions applicable in cases of violations of MAD’s rules are severe.”⁵⁰

2.4 Financial Stability

Although our primary focus in this chapter is on the enforcement intensity of securities regulation, it is worth briefly discussing a few notable strands of research on the enforcement of banking regulation and its relationship to financial stability. The global financial crisis of 2008 caused a tremendous loss of economic output, employment opportunities, and social welfare. Since then, considerable academic work has attempted to identify its root causes, with many emphasizing banking supervision and regulation. Identifying the relationships between the type or degree of regulation and the incidence or severity of the crises is difficult not only because of the paucity of relevant data available to researchers, but also because of the complexity of the financial system and the inherent confounding factors in cross-country analyses. For instance, the United States and the United Kingdom both dedicated high levels of resources to supervisory functions but both were at the epicenter of the crisis. Australia and Canada, on the other hand, also invested high levels of resources into supervision and both are regarded as having weathered the crisis particularly well.⁵¹ Nevertheless, the growing body of empirical investigation into regulation and financial stability offers intriguing insights into the study of public enforcement. We focus the following discussion on the consequences of the regulatory structure and content on stability, and conclude with some potentially undesirable effects of robust capital markets on stability.

(p. 938) 2.4.1 Regulatory Structure

In a 2011 IMF working paper, Masciandaro, Pansini, and Quintyn investigated the association between the macroeconomic performance of 102 countries during the financial crisis in 2008–2009 and their supervisory unification, degree of central bank involvement in supervision, and supervisory governance (in terms of independence and accountability) in 2007.⁵² The authors proxied macroeconomic performance using the average real output growth in the years 2008 and 2009. Possibly because of misaligned incentives of supervisors, their result suggests that the high levels of supervisory governance, as well as supervisory consolidation, were negatively associated with economic resilience, with central bank involvement in supervision having little effect on outcomes.⁵³

In another recent paper studying the relationship between regulatory structure and crisis incidence, authors Amri and Kocher reviewed 124 banking crises from 65 advanced and developing countries during the period 1976–2005.⁵⁴ Their results depend on the specific measure of regulation used for analysis. With a measure that combined the scope and legal framework for banking regulators' ability to conduct on- and off-site examinations, compliance with Basel capital requirements, and independence of supervisory bodies, the authors found a significantly negative relationship with the probability of the incurrence of banking crises.⁵⁵ Interestingly, the authors found no significant relationship when using a private monitoring index, which proxied for the extent to which market or private monitoring exists; the authors noted that the latter result may be due to data limitations since certain index variables were available only for 1999.⁵⁶

2.4.2 Content of Regulation

In a 2011 article, Ahrend, Arnold, and Murtin examined various indicators of on-the-book banking regulation, as collected by the World Bank, and their associations with the damage to each country during the crisis, as measured either by the degree of equity value destruction in the banking sector or by the fiscal cost of financial sector rescue.⁵⁷ The results reveal that moderately stronger prudential regulation, stricter regulatory requirements with respect to accounting and provisioning, and stricter restrictions on entry rules and ownership structures were associated with better stock prices and a lower expected rescue cost. Stricter (p. 939) requirements for capital were also found to be correlated with a lower expected cost for the financial crisis.⁵⁸

In the same mold, Čihák and co-authors highlighted findings from the World Bank's 2011–2012 Bank Regulation and Supervision Survey, which was distributed to 143 countries during the period 2008–2010.⁵⁹ First, the authors noted that countries affected by a systemic banking crisis imposed less stringent definitions of capital on their banks, allowed them to have more discretion in calculating capital requirements, and, not surprisingly, had lower actual capital ratios.⁶⁰ Second, crisis-hit countries had fewer restrictions on nonbank activities such as insurance, investment banking, and real estate. Third, regulations concerning the treatment of bad loans and loan losses were less strict in crisis countries. Fourth, regulators in crisis countries were less able to demand banks to put up more equity. Last, but not least, there were weaker incentives for the private sector to

monitor bank risks in crisis countries because of a proliferation of credit rating for bonds and deposit insurance.⁶¹ These findings provide systematic evidence of regulatory differences between countries which experienced a crisis and those that did not, and the evidence points toward regulatory leniency in crisis countries.⁶²

While the beneficial effects of regulatory structure seem mixed and those of regulatory content more robust, it should be noted that all of these studies are conducted across countries, which inherently involves confounding factors. To prove a causal relationship, one would have to take country-level details and the specific type of supervision into account.⁶³ Having said that, the research presented in the previous two subsections (p. 940) suggests that financial stability and the ability to withstand global financial distress are variables of interest and should be part of future work on the effects of regulation and supervision.

2.4.3 Robust Capital Markets

When we analyzed the effect of enforcement on various indicators of capital markets in previous subsections—for example, market capitalization and trading volumes—we implicitly assumed that higher levels of those indicators were an unambiguously desirable outcome since they made capital markets more “robust” in a sense. A somewhat more troubling strain of empirical research into financial crises concerns the potentially destabilizing relationship between robust capital markets in ordinary times with the performance of national economies in times of financial stress. Several studies have drawn a connection between bank reliance on short-term credit and the severity of the financial crisis.⁶⁴ Particularly to the extent that banks moved away from deposit funding to reliance on short-term capital market funding, those institutions and their surrounding system appear to have been more vulnerable in times of financial turmoil.⁶⁵ Strong reliance on depository funding is one of the factors that researchers have cited as explaining the relatively strong performance of Canadian⁶⁶ and Australian⁶⁷ banks in the financial crisis.

A negative correlation between capital market funding for banks and poor results in financial crises is relevant to the study of enforcement and the law and finance approach more generally in that it suggests some potentially undesirable consequences of robust capital markets. Even if more robust capital markets lead to greater economic growth on average, a higher probability of experiencing financial crises may still result in an outcome that is suboptimal for social welfare. The possibility that some capital market expansions might have negative ramifications in times of financial distress suggests that a more nuanced analysis may be needed in the future.⁶⁸

(p. 941) 3 Critiques

A weakness of some earlier papers in the literature is their use of cross-sectional analysis (i.e., analysis using data from only a certain point in time), which is poorly suited to deciphering causality. Such data limitations in the time dimension cannot guard against causation running in the opposite direction. Many authors, including some of those cited

above, have utilized longitudinal data (i.e., analysis using data across time) to address this issue.⁶⁹

Armour et al. expanded the time dimension to overcome the obstacles presented by attempting to uncover causation. They pooled together time series from multiple countries during 1995–2005 to see whether common law or civil law countries had better shareholder protection, which was one of the main findings by LLSV.⁷⁰ Using this panel data approach, the authors found that common law countries did have better shareholder protection but that civil law countries were catching up to common law countries during the period studied. Importantly, they also found no positive relationship between changes in shareholder protection and stock market development, contrary to the proposition that better shareholder protection causes more rapid financial development.⁷¹

A second potential problem of many earlier papers in this line of research is their reliance on cross-country analysis (i.e., using data where the unit of observation is a country). It is understandable why authors would take such an approach since certain questions are specifically about the adoption of regulations across countries. However, this approach is often too coarse to establish causation because there are numerous confounding factors within each country that could affect the relationship of interest. Controlling for those factors can help to clarify the analysis but oftentimes does not completely resolve the issue.

Cheffins and co-authors revisited the law and finance relationship by focusing on the United States from 1930 to 1970.⁷² As a first step, the authors presented various measures of stock market performance (e.g., SEC data on the value of publicly traded stocks, normalized by GDP) to show that they were more or less flat from the early 1930s through the early 1950s. (p. 942) Subsequently, the authors created a time series version of the anti-director index for the United States and demonstrated that the index was practically the same during the doldrums (1930s–1950s) as it was in the boom times, and thus inferring that this lack of correlation did not bode well for the law and finance argument with respect to anti-director rights.⁷³ The authors also considered the development of federal securities law, which is not captured by the anti-director index, but saw no convincing connection there either. Although no sophisticated statistical methods are used in the paper, it still shows that expanding the time horizon of the analysis (from a slice of time to decades) and internalizing country-specific details can potentially yield mixed results.

Articles such as the ones by Cheffins et al. and Armour et al. highlight issues with the causal element of law and finance analysis. We should note that the vast majority, if not all, of those articles discussed above do not claim to establish a causal mechanism. Moreover, some of the papers cited above actually take care to address both concerns. However, it is still the case that strong correlations can be misinterpreted by researchers and policy makers. In the next subsection, we focus on a growing body of enforcement related research that is well poised to disentangle causation by exploiting the wealth of data on the budget and enforcement actions of the US Securities and Exchange Commission. The reader will notice that, by taking a more rigorous approach to tackling the relationship

between enforcement and market outcomes, researchers have sacrificed breadth. They are no longer able to address the grand questions on law and finance across national jurisdictional boundaries.

3.1 Resources Allocated to Enforcement

We start with a discussion of indirect, resource-based evidence on the efficacy of SEC enforcement actions. Lohse, Pascalau, and Thomann assembled a data set of SEC funding and enforcement between 1946 and 2010 in order to investigate whether increases in SEC resources improved compliance with securities market rules.⁷⁴ Following the resource-based approach taken by JR, the authors used SEC budgets as a proxy for public enforcement. The authors summarized their findings as follows:

In a theoretical model, we characterize a corporation's compliance decision with the securities laws under the SEC's supervision. The model predicts, first, that increases in the regulator's resources deter firms from misbehaving (compliance hypothesis). Second, the model predicts that an increase in the SEC's budget leads to a (temporary) decrease of observed compliance. Given that the SEC may even police past misbehavior, this decrease reflects the delayed adjustment of corporations' compliance behavior (adjustment hypothesis). We test these hypotheses by using data on the SEC's funding and the reported cases of current noncompliance (injunctions). We find supportive evidence for our theory: Our empirical results show that the increases in the SEC's budget lead to a higher compliance by financial market participants. First, using Granger-causality tests we establish that there is a significant link between the SEC's resources and corporations' contemporaneous misbehavior. Second, we show that an (p. 943) increase in the SEC's budget leads to a (temporary) decrease of observed compliance. This is reflected in a temporary increase in the number of injunctions that the SEC brings against the securities industry. Third, the longer-term effect of an increase in the SEC's resources is a decrease in (reported) ongoing misbehavior. The results from the VAR analysis suggest that a positive budget shock leads to an aggregate decrease in the number of ongoing misbehavior, reflected by a decrease in the number of injunctions by 10% within five years and by 18% within ten years, respectively. This is clear evidence for higher firm compliance.⁷⁵

Though limited to the United States, the analysis offers perhaps the most compelling evidence to date of the causal relationship between public enforcement and capital market behavior. In addition, the study documents the impact of real resources on an intermediate outcome: firm compliance. As the authors explained:

In practice, before enforcement can lead to better financial markets, i.e., markets where investors demand a relatively low return on their capital as they do not have to be afraid of being defrauded, it must initially influence firms' decisions to comply with securities market rules. By analyzing the incentives for firms' disclo-

sure provided by the SEC's enforcement, our study closes this gap. It is those changes in compliance that—over time—can lead to improved financial markets.⁷⁶

Thus, the paper presents additional evidence of a channel through which real resources could lead to more robust capital markets.

A similar type of study was undertaken by Blackburne, who focused on the link between industry-level political activity and the SEC's regional budgetary allocation, and on the link between regulatory intensity (proxied by the budgetary allocation) and managers' reporting incentives.⁷⁷ The data used in the exercise were quite extensive. The author received proprietary SEC data on staffing and salary levels in each of the 12 disclosure review offices of the Division of Corporation Finance and the annual budgetary resources for the Division as a whole for fiscal years 2003 to 2012. The author then collected data for over 4,000 firms over the period 2003–2011 and matched each firm to the SEC office that reviews its disclosure filings. Notably, Blackburne first discovered that a 1% increase in industry-level political contributions was associated with a 0.12 to 0.31% decrease in the following year's SEC office-level budget allocation.⁷⁸ Since the SEC's budget is known to managers in advance (because it's allocated by Congress for an upcoming fiscal year), the author also tested whether the resource allocation caused managers' reporting behaviors to change. Again, the author used resource allocation as a proxy for enforcement intensity, finding that when SEC oversight was stronger, company managers reported lower discretionary accruals and were less likely to issue financial reports that were subsequently restated. On top of that, a 1% increase in the resource proxy resulted in a 0.3% decrease in firms' bid-ask spreads, which is a sizable market consequence. The results of this paper tell a story similar to that of Lohse et al., namely, that (p. 944) SEC enforcement as measured by real resources allocated to the institution can have real and sizable effects on capital markets.

3.2 Direct Enforcement Actions

Recent research has also tried to quantify the market effect of direct regulatory actions undertaken by the SEC. Using a before-and-after event study approach, Bengtsson and co-authors looked at the market reaction after the SEC enforcement actions on the structure of the PIPEs markets in 2002.⁷⁹ Using PIPE transactions data from 1999 to 2006, the authors demonstrated the existence of significant changes in the structure of PIPE transactions after the SEC's 2002 enforcement. Specifically, PIPE transactions after the SEC action were less likely to include the contractual element that the SEC was targeting.⁸⁰ While the authors reserved judgment on whether the effects served to enhance shareholder value, their work offers further empirical validation of the impact of supervisory actions on market behavior.⁸¹

Besides intervening in specific market activities, the SEC has a more routine task of reviewing company filings and sending comment letters should those filings be deemed lacking in any way. Johnston and Petacchi analyzed the effect of these comment letters on the abnormal returns and trading volume corresponding to a recipient firm around subse-

quent earnings report.⁸² To conduct this experiment, the authors collected all the SEC comment letters regarding annual (10K) and quarterly (10Q) filings for the period 2004–2006. The sample consisted of over 6,000 letters from 2,374 cases for 2,256 firms and most of the letters' contents were about accounting, financial reporting, and disclosure issues. By looking at a letter recipient firm's subsequent eight earnings announcements, and comparing them to the previous eight earnings announcements, the authors found that absolute abnormal returns and trading volume around those earning announcements declined and that analyst forecast accuracy improved.⁸³ These results led the authors to conclude that the SEC's supervisory action (in the form of comment letters) had positive informational effects on the market.

The articles cited above all employ data and techniques better suited to establishing a causal link between enforcement and market outcomes than analyzing cross-sectional data or country-level data, and the results are striking. They show that the SEC's enforcement actions caused a real market effect, which strongly suggests that public enforcement intensity matters in the United States. If the data exist for other countries, it would be important to know whether this is a general empirical phenomenon or if there is something unique about the regulatory environment in the United States.

(p. 945) 4 Conclusion

Building upon the work of LLS and JR, researchers have tested various hypotheses related to the link between enforcement intensity and capital markets. The work in this field has done much to support the theory that higher enforcement intensity can have positive effects on capital market outcomes. For instance, private and public enforcement are significantly associated with essential elements of capital markets like the private cost of capital and the accuracy of information. In addition, studies show that greater public enforcement intensity is significantly associated with market variables of interest in countries that dedicate more resources to regulatory reform.

Recent work using higher-quality data and more sophisticated statistical methods has also been carried out to establish that causality runs from enforcement to market outcomes and not in the opposite direction, especially with respect to public enforcement. Several articles focusing on the enforcement actions of the SEC show that the agency's actions have caused real market effects, which strongly suggests that public enforcement matters in the United States. Although much work remains—and the global financial crisis suggests ways in which future work might be refined—the intervening body of work confirms that greater levels of private and public enforcement are associated with key measures of robust capital markets.

Another lesson of the large and growing body of subsequent work is the appetite that the academic community has for data on enforcement beyond legal rules. The global financial crisis has demonstrated the necessity of maintaining effective supervision of financial markets and financial institutions. With more data on key variables of enforcement, re-

Private and Public Enforcement of Securities Regulation

searchers can tackle a myriad of questions and, just as importantly, provide more convincing answers.

(⁶²) See also Vighneswara Swamy, *Bank Regulation, Supervision and Efficiency during the Global Financial Crisis* (Sept. 4, 2014), available at <http://papers.ssrn.com/abstract=2491413> (confirming that crisis-hit countries had weaker regulatory frameworks than non-crisis hit countries and differentiating the regulatory framework of the BRICS countries from those two groups).

(⁶³) Consider the question of supervisory unification and economic resiliency. In a recent paper, Agarwal et al. exploit a legal setup in US banking rules in which federal and state supervisors take turns examining the same bank at predetermined time intervals. See Sumit Agarwal, David Lucca, Amit Seru, & Francesco Trebbi, “Inconsistent Regulators: Evidence from Banking”, 129 *Q. J. Econ.* 889 (2014). The authors discovered that federal regulators were consistently tougher when it came to assigning bank ratings. Moreover, this relative leniency of the state regulator came at a real cost—namely, higher bank failure rates and lower repayment rates of government assistance funds. This type of natural experiment approach provides a more precise method to identifying the result. Of course, the trade-off results in a more narrow question.

(⁶⁴) See, e.g., Rüdiger Ahrend & Antoine Goujard, *Drivers of Systemic Banking Crises: The Role of Bank-Balance-Sheet Contagion and Financial Account Structure* (June 5, 2012), available at <http://papers.ssrn.com/abstract=2113095>.

(⁶⁷) See Alison Lui, Macro and Micro Prudential Regulatory Failures amongst Financial Institutions in the United Kingdom: Lessons from Australia (Apr. 27, 2011), available at <http://ssrn.com/abstract=1716264> (noting that, among other things, Australian banks had better loans-to-deposits ratios than the UK banks).

(⁶⁸) See also Beltratti and Stulz, *supra* note 53 (noting that banks located in shareholder friendly regimes may have been encouraged to take on excessive risks before the financial crisis and therefore suffered greater losses when the crisis occurred).

(⁶⁹) In addition to causation, there are concerns in this literature related to data quality. In an influential 2010 paper, Spamann revisited a key legal indicator developed in the 1998 law and finance paper by La Porta et al. See Holger Spamann, “The ‘Antidirector Rights Index’ Revisited”, 23 Rev. Fin. Stud. 467 (2010). The question posed by the author is straightforward: How accurate is the original antidirector rights index (ADRI)? Teaming up with local lawyers from 46 out of the 49 countries documented in the original La Porta et al. project and using primary sources instead of secondary ones, Spamann discovered that 33 of the 46 countries required revisions. In some cases, the extent of the revision was significant. The correlation between the 46 revised ADRI values and those of the original 46 was only 0.53. Not surprisingly, the revised ADRI values no longer support a couple of the well-known La Porta et al. findings: (1) shareholder protection is higher in common law than in civil law countries and (2) greater shareholder protection is associated with larger stock market size and lower ownership dispersion.

Public Enforcement: Criminal versus Civil

Amanda M. Rose

The Oxford Handbook of Corporate Law and Governance

Edited by Jeffrey N. Gordon and Wolf-Georg Ringe

Print Publication Date: May 2018

Subject: Law, Company and Commercial Law, Crime and Criminology

Online Publication Date: Jun 2015 DOI: 10.1093/oxfordhb/9780198743682.013.8

Abstract and Keywords

This chapter examines issues relating to corporate governance in closely held corporations. It begins by describing the typical characteristics of closely held corporations, with particular emphasis on shareholder involvement in management, number of shareholders, share transfers, market for shares, and the broad spectrum of shareholders and applications. It then considers common governance issues and conflicts in closely held corporations and proceeds with a discussion of the governance framework for such corporations consisting of company law, model articles, articles of association, shareholder agreements, and corporate governance guidelines. It also explores the internal governance and management of closely held corporations, the governance of share transfer restrictions, and provisions for shareholder withdrawal and expulsion. The chapter concludes with an analysis of shareholder conflicts, especially oppression by majority shareholders and ex-post opportunism by minority shareholders, and how they are governed in closely held corporations.

Keywords: public enforcement, civil enforcement, theories, criminal enforcement, corporate law, UK, United States, Continental Europe, criminal liability

1 Introduction

PRIOR chapters have explored the distinction between private and public enforcement of corporate laws and standards. Whereas private enforcement mechanisms are necessarily civil, public enforcement may be civil or criminal in nature. What theories animate the choice between civil and criminal enforcement? How well do these theories explain the public enforcement choices we see in practice in the United States, the United Kingdom, and continental Europe? It is to these questions that this chapter turns.

2 The Civil-Criminal Divide: Theoretical Foundations

If asked what distinguishes criminal and civil cases, a lay person would likely recite the traditional markers: criminal cases require a showing of *mens rea* or “guilty mind,” whereas negligence or strict liability may prevail in a civil case; criminal prosecutions seek to punish defendants for violations of community norms, through fines or imprisonment, whereas civil cases seek to compensate victims through money damages; criminal defendants enjoy heightened procedural protections relative to their civil counterparts; and so on. These traditional markers fail, however, to provide a coherent theoretical account of the civil-criminal divide. Moreover, they are increasingly inaccurate even as a descriptive matter. Consider the United States. Public civil enforcement has taken on a variety of traditionally “criminal” characteristics. Civil public enforcers like the Securities & Exchange Commission (SEC) do not limit themselves to seeking compensatory relief on behalf of victims, for example. Rather, their goal is often expressly to punish defendants through the imposition of severe (p. 947) fines.¹ Criminal prosecutions have also become more characteristically “civil,” most notably through a loosening of the *mens rea* requirement. This is evident not only in criminal prosecutions of regulatory offenses, but also in the imposition of vicarious criminal liability on corporations.² In order to evaluate the wisdom of these changes, as well as to appreciate the significance of cross-border differences in public enforcement patterns, a normative theory of the civil-criminal divide is necessary. This part provides an overview of the competing alternatives.

The oldest normative theory of the civil-criminal divide is rooted in deontological ethics. It posits that the criminal label should be reserved for misconduct that is morally blameworthy. This view, shared by Blackstone, traces its roots to ancient Greek philosophers as well as natural law proponents like St. Thomas Aquinas.³ Modern supporters include Henry Hart, who wrote in his seminal 1958 article “The Aims of the Criminal Law”:

[A crime] is not simply anything which a legislature chooses to call a “crime.” It is not simply antisocial conduct which public officers are given a responsibility to suppress. It is not simply any conduct to which a legislature chooses to attach a “criminal” penalty. It is conduct which, if duly shown to have taken place, will incur a formal and solemn pronouncement of the moral condemnation of the community.⁴

Hart viewed the criminal label, when appropriately limited to morally repugnant conduct, as an important part of a free society’s effort to develop a shared sense of conscience. Not surprisingly, he objected to the imposition of criminal sanctions for strict liability or negligence-based offenses, noting the “shocking damage that is done to social morale by open and official admission that crime can be respectable and criminality a matter of ill chance, rather than blameworthy choice.”⁵ Jerome Hall similarly believed that criminal punishment is just only when imposed on “those who have knowingly committed moral wrongs.”⁶

Public Enforcement: Criminal versus Civil

A utilitarian challenge to this view of the civil-criminal divide was mounted by Jeremy Bentham and Cesare Beccaria in the eighteenth century,⁷ and again by Oliver Wendell Holmes in the nineteenth,⁸ but did not gain traction until Gary Becker's 1968 article "Crime and Punishment: An Economic Approach."⁹ Becker argued that the civil and criminal law (p. 948) should be viewed as serving the same goal: social welfare maximization. This goal is advanced when threatened legal sanctions—whether civil or criminal—cause individuals to internalize the costs their activities impose on third parties. In Becker's view, the criminal label derives its importance not because it targets "immoral" conduct, as Hart believed, but rather by virtue of the sanction it uniquely makes available: imprisonment. Imprisonment is more socially costly than monetary sanctions, but is better able to deter judgment-proof individuals. Becker therefore argued that conduct should be pursued criminally only if a defendant lacks sufficient assets to satisfy an optimal monetary sanction, warranting imprisonment; otherwise, civil remedies are preferred.¹⁰

Becker's article spawned tremendous interest in the economic analysis of criminal law.¹¹ It also attracted its share of critics.¹² For example, many objected to the notion that only judgment-proof defendants should face imprisonment as unfairly privileging the rich.¹³ Others attacked the assumption that potential criminals behave as rational economic actors, weighing their anticipated gain from engaging in criminal conduct against the threatened criminal sanction.¹⁴ Still others took offense at the idea that sanctions should invite such weighing in the first place. In Becker's framework, sanctions should cause a potential defendant to internalize the harm his actions will impose on society; if the benefit of a crime to the perpetrator exceeds this expected sanction, the socially efficient result is for the perpetrator to commit it. But such a notion is at odds with the traditional deontological account of the criminal law, as well as with common sense. Criminal sanctions should be designed to deter unconditionally, it is generally thought, not to price criminal behavior in the Pigouvian sense.

Subsequent writers in the law and economics tradition have attempted to deal with the last critique.¹⁵ For example, in an influential article Steven Shavell assumed that the social benefits from crime are zero, regardless of the private benefits perpetrators (p. 949) derive.¹⁶ "Allowing for a divergence between social and private benefits gives the analyst greater freedom to describe society's values," Shavell explained.¹⁷ This approach calls for setting expected criminal sanctions so that they exceed the private gain the perpetrator would obtain from committing the crime, resulting in unconditional deterrence.¹⁸ Richard Posner has similarly observed that criminal sanctions "are not really prices designed to ration the activity," as Becker's model suggests; rather their "purpose so far as possible is to extirpate it."¹⁹ While this approach may comport better with our sensibilities than Becker's, it fails to provide a normative justification for the civil-criminal divide. When exactly should conduct be deterred unconditionally, thus warranting a criminal sanction, and when should it merely be priced? Are answers available that do not fall back on concepts of morality?

Public Enforcement: Criminal versus Civil

Guido Calabresi and Douglas Melamed provide one in their famous article “Property Rules, Liability Rules, and Inalienability: One View of the Cathedral.”²⁰ According to Calabresi and Melamed, the first issue which must be faced by any legal system is the allocation of entitlements—for example, “the entitlement to make noise versus the entitlement to have silence, the entitlement to pollute versus the entitlement to breathe clean air, the entitlement to have children versus the entitlement to forbid them.”²¹ The second issue a legal system must confront is how to protect the entitlements it has decided to grant, whether by property, liability, or inalienability rules. Property rules require “someone who wishes to remove the entitlement from its holder [to] buy it from him in a voluntary transaction.”²² A liability rule, by contrast, allows someone to destroy the initial entitlement so long as they are willing to pay an objectively determined value for it, and inalienability rules forbid the transfer of the entitlement entirely, even if the holder consents.²³ Property rules are an appropriate way to protect entitlements when the transaction costs associated with voluntary negotiation are low, Calabresi and Melamed explained; liability rules, by contrast, are to be preferred when high transaction costs make a collective determination of value preferable, and inalienability rules when society wishes to bar transfer of the entitlement altogether.²⁴ Within this framework, Calabresi and Melamed view criminal punishment (which they understand as seeking to deter unconditionally) as a mechanism for preventing people from essentially converting property and inalienability rules into liability rules through fiat.²⁵

(p. 950) Like the deontological account discussed at the outset, Calabresi and Melamed’s approach assumes that the criminal category includes only intentional misconduct. They explain that the thief or rapist must be treated differently from the negligent driver:

The only level at which, before the accident, the driver can negotiate for the value of what he might take from his potential victim is one at which transactions are too costly. The thief or rapist, on the other hand, could have negotiated without undue expense (at least if the good was one which we allowed to be sold at all) because we assume he knew what he was going to do and to whom he would do it.²⁶

Richard Posner, who has similarly argued that the “major function of criminal law in a capitalist society is to prevent people from bypassing the system of voluntary, compensated exchange,”²⁷ offers an additional reason for limiting the criminal law to intentional misconduct: a requirement of intent limits the unique over-deterrence potential of criminal sanctions.²⁸ Without an intent requirement, which allows one to avoid criminal liability with some degree of confidence, the severity of criminal sanctions might chill socially productive activities.²⁹ The same over-deterrence concern dictates clarity in the scope of the criminal prohibition.³⁰

Expanding on Posner’s work, Keith Hylton has addressed in more detail “when penalties should be set to internalize social harms and when they should be set to completely deter offensive conduct.”³¹ According to his model, sanctions designed to deter unconditionally (i.e., criminal sanctions) are appropriate in two situations: (1) when the offender’s gain is never greater than the victim’s loss (as one might presume is the case with respect to vio-

lent crimes) and (2) when the conduct is market-bypassing. If the transaction costs associated with bargaining over the entitlement are low, Hylton explains, “then the optimal punishment policy is to set the penalty at the full deterrence or gain-eliminating level” so as to “force potential offenders to use the market.”³² By contrast, if transaction costs are high, and the offender’s gain may exceed the victim’s loss, “then the optimal policy is to set the penalty at a level that internalizes society’s losses.”³³ Hylton proceeds to explain how the doctrine of criminal (p. 951) intent “serves a channeling function that permits us to distinguish the different sorts of conduct” in order to allocate civil and criminal penalties appropriately.³⁴

The theories advanced by Posner and Calabresi and Melamed have, like the Beckerian model, been subject to critique. Alvin Klevorick, for example, has faulted them for being too restrictive.³⁵ To illustrate, he points out that buying votes may be deemed a crime even though it is not market-bypassing (to use Posner’s lexicon) and even though it represents the conversion of an inalienability rule into a property rule rather than a liability rule (to use Calabresi and Melamed’s).³⁶ He offers a similar but more generalized formulation of the civil–criminal divide: “An act is a crime because the actor behaves in a way that is contrary to [] the transaction structure that society has established.”³⁷ This structure, he explains, “sets out the terms or conditions under which particular transactions or exchanges are to take place under different circumstances.”³⁸ He emphasizes that the criminal category therefore ultimately depends on the transaction structure a society has chosen to adopt—something that is informed by moral and political considerations that disciplines other than economics are best suited to explore.³⁹

All of the economic accounts of the civil–criminal divide discussed thus far treat individual preferences as exogenous to the criminal law. In “An Economic Analysis of the Criminal Law as a Preference-Shaping Policy,” Kenneth Dau-Schmidt questions this assumption.⁴⁰ He suggests that the criminal law, in addition to shaping opportunities, should be viewed as a mechanism for shaping preferences. In other words, in addition to making crime unprofitable through the imposition of sanctions, Dau-Schmidt posits that the criminal law also has the capacity to make crime less desirable by shaping attitudes. He argues that the criminal label should apply to conduct only when the social benefits of changing individual preferences through the criminal law outweigh the social costs. This condition is most likely to be met, he explains, with respect to preferences “whose realization is assigned no value in the social welfare function and which interfere with preferences whose realization is highly valued in the social welfare function.”⁴¹ Dau-Schmidt fails to explain how a society should pick which preferences to ignore or exalt in the social welfare function, however, referring such questions to philosophers, theologians, and other non-economists.⁴² Dau-Schmidt’s analysis thus essentially recasts in economic terms the deontological theory of the civil–criminal divide discussed at the outset. As he himself explains, “[u]nder the preference-shaping theory, criminal punishment is not merely the price of crime, but is also an expression of society’s condemnation of the criminal act and an effort to discourage preferences for such activity.”⁴³ Social preferences, he writes, “can be understood as the economic description of morality.”⁴⁴

(p. 952) Like the deontological theory, Dau-Schmidt's preference-shaping account implies that the criminal category should be limited to intentional conduct: "If the person does not intend the proscribed harm but rather causes it out of negligence or mistake, the person's acts do not indicate deviant preferences" that require shaping.⁴⁵

3 Theoretical Implications for Corporate Law

From these diverse theories of the civil-criminal divide flow some common implications regarding the public enforcement of corporate laws and standards. It is worthwhile to briefly survey these implications before turning, in the next part, to review actual public enforcement patterns in the United States and abroad.

With the possible exception of Becker's pricing model of the criminal law, which I will not consider further, each of the approaches discussed above would support imposing criminal sanctions on corporate managers who intentionally defraud or steal from shareholders.⁴⁶ The same can be said for intentional derelictions of duty—"bad faith" conduct, in the language of the Delaware courts. This sort of behavior is widely perceived as morally blameworthy or, if you would rather, as reflecting deviant preferences. Moreover, it is an affront to a capitalist society's "transaction structure": shareholders are entitled to the residual value of their firms; if managers want to appropriate part of that value for themselves, or intentionally put it at risk through their recklessness, they are required to bargain for the right⁴⁷—something a pricing system of civil liability would not encourage them to do.

Conversely, none of the theories would support imposing criminal sanctions on corporate managers who merely breach their duty of care, as none consider negligence an appropriate basis for criminal sanctions. If it were difficult to distinguish fraud or bad faith from mere negligent management or bad luck (in other words, if legal error were a significant (p. 953) risk), these theories would also uniformly urge caution in imposing criminal sanctions: imposing criminal sanctions on undeserving defendants would both be unjust and could lead to significant over-deterrence.

Each of these approaches also casts doubt on the use of vicarious corporate criminal liability—the imposition of criminal sanctions on a corporation (and, ultimately, its shareholders) for the crimes of its employees undertaken in the scope of their employment. Those who take a deontological view of the civil-criminal divide have traditionally rejected vicarious corporate criminal liability on the ground that it is divorced from personal guilt and moral agency.⁴⁸ Vicarious corporate liability has also been attacked as inefficient in the criminal context.⁴⁹ This is because the economic justification for vicarious liability presumes the underlying offense is "priced," rather than criminally sanctioned. When this is in fact the case, vicarious liability can have the laudable effect of incentivizing shareholders to prod their firms to invest socially optimal amounts of corporate resources in deterrence efforts.⁵⁰ When the conduct is sanctioned, by contrast, vicarious liability threatens to over-deter by causing shareholders to internalize more than the social harm employees cause.⁵¹ Framed differently, the failure of shareholders to prevent em-

Public Enforcement: Criminal versus Civil

ployee misconduct is not itself an affront to society's "transaction structure" warranting criminal sanctions—at least absent evidence of shareholder complicity in, or willful blindness to, the employee misconduct (which would support direct, fault-based liability).

To be sure, attempts have been made to defend corporate-level criminal sanctions, on both moral and instrumental grounds. For example, theories of organizational guilt have been advanced to justify the practice.⁵² It has also been argued that corporate-level criminal sanctions may serve a valuable "preference-shaping" or "expressive" function.⁵³ I cannot do (p. 954) these arguments justice in the space afforded here,⁵⁴ but will simply note that they rarely go so far as to support true vicarious liability; rather, most require as a predicate to corporate liability a showing of fault that is either pervasive throughout the organization or traceable to the top management level.⁵⁵

Vicarious corporate liability, whether imposed criminally or civilly, suffers from a more fundamental weakness when it comes to the public enforcement of laws that are meant, first and foremost, to protect shareholders from managerial opportunism. Imposing liability for misconduct on the victims of that misconduct is rarely just or efficient, and that is precisely what occurs when vicarious corporate liability is imposed for managerial violations of corporate laws and standards.⁵⁶

The theories of the civil-criminal divide discussed in the last part also help illuminate the private-public divide discussed earlier in this book. If a polity took a pure approach to the civil-criminal divide, limiting civil enforcement to "pricing" with the task of "sanctioning" reserved for criminal enforcers, it would follow that public civil enforcement should properly be viewed as filling private enforcement gaps. After all, if shareholder suits were brought every time corporate managers breached their duties, and resulted in the offending managers paying damage awards that fully compensated for all the harm inflicted, there would be no pricing work left for public enforcers to do. Thus, an inquiry into the ways in which private enforcement fails would help elucidate the desired contours of public civil enforcement.⁵⁷

Of course, the label a polity has chosen to assign a public enforcer may not correlate with the nature of the sanctions they actually impose. Lines can be blurred, with "civil" enforcers sometimes seeking "criminal" sanctions (in the sense of sanctions designed to deter unconditionally) and "criminal" enforcers sometimes seeking "civil" sanctions (in the sense of sanctions designed merely to price). The theories discussed above suggest this may be undesirable. Such blurring may make it more difficult for the populace to absorb messages about (p. 955) morality (or, if you would rather, social preferences) that criminal sanctions are hoped to deliver.⁵⁸ It also raises efficiency concerns. For example, if civil and criminal enforcers sought to sanction the same misconduct, it would create the prospect of wasteful redundancies; if both sought to price the same offense, it might lead to over-deterrence.⁵⁹ Furthermore, the involvement of multiple enforcers risks distorting litigation dynamics in unpredictable ways,⁶⁰ and overlapping authority can undermine accountability and in turn the performance of public enforcers.⁶¹ This is not to say that a blurred civil-criminal divide is always undesirable: overlapping enforcement authority

can, under the right circumstances, have laudable effects on regulatory incentives, for example.⁶² It is to say, though, that a careful assessment of the institutional dynamics and political economy of a jurisdiction is necessary in order to determine whether shared responsibility is truly social welfare enhancing.⁶³

4 Theory versus Reality in the United States and Abroad

How closely do countries hew to the theoretical ideal when allocating public enforcement efforts between criminal and civil enforcers in the corporate law sphere? As one might expect, the answer varies depending on the particular area of corporate law being examined, as well as the country of interest.

The nearly universal treatment of negligent corporate mismanagement as a civil offense tracks well with theory. In the United States, duty of care violations are primarily litigated in private derivative suits brought under state law, as discussed in the chapter by James Cox and Randall Thomas, this volume.⁶⁴ But in other countries with less robust private enforcement mechanisms, such as the United Kingdom, civil public enforcement plays a greater role.⁶⁵

(p. 956) In the wake of the financial crisis, there have been calls for more *criminal* prosecutions of the individuals and institutions whose risk taking contributed to the crisis.⁶⁶ Others have cautioned against criminalizing risk taking (or the failure to adopt adequate internal controls to regulate risk taking), and criticize recent prosecutions that they contend do so under the guise of criminal fraud.⁶⁷ As a matter of theory, the latter have the better argument. Imposing criminal sanctions for poor business decisions threatens to dilute the moral force of the criminal law, and risks over-detering socially desirable behavior. Under no theory of the civil-criminal divide is it advisable.

True fraud presents a very different case, of course, as do other intentional violations of managers' fiduciary duties. These sorts of offenses do warrant criminal sanctions as a matter of theory, and in reality most jurisdictions treat this behavior as criminal. That is not to say that all jurisdictions pursue corporate fraud and disloyalty with the same level of intensity. As discussed in the chapter by Howell Jackson and Jeffery Zhang, this volume, there is significant variation in the level of public resources that countries invest in public enforcement efforts, whether civil or criminal.

One important dimension along which countries vary significantly concerns the use of corporate criminal liability. At one end of the spectrum stands the United States, which authorizes criminal sanctions against corporations for any employee's crime, so long as it is committed in the course of employment and the employee intended to benefit the company (with both conditions interpreted loosely by courts).⁶⁸ This may be referred to as the "agency" or "*respondeat superior*" approach to corporate criminal liability. At the other end of the spectrum stands Germany, which does not impose criminal liability on corpora-

tions at all, limiting corporate liability for employee misconduct to (p. 957) administrative fines and only then for wrongs committed by certain corporate officers.⁶⁹ Taking an intermediate position is the UK, which holds corporations criminally liable, but only for crimes by persons who control and direct the activities of the corporation.⁷⁰ This is sometimes referred to as the “identification” or “alter ego” approach to corporate criminal liability.

Only the German approach is consistent with traditional theoretical accounts of the civil-criminal divide. The UK approach deviates from these, but finds some modern normative support given its restriction to crimes by high-level corporate officers.⁷¹ The approach taken by the United States, however, finds no support in any extant theory of the civil-criminal divide.⁷² What might then explain it? A full treatment of this interesting question is beyond the scope of this chapter, but a few preliminary observations may help to set it in context. The first is that criminal prosecutions of corporations in the United States may sometimes be driven by political or strategic, rather than theoretical, concerns. Billion-dollar settlements to resolve allegations of “corporate crime” play well in the headlines, after all, especially when populist sentiment runs high. It is also the case that criminal prosecutors can leverage the threat of corporate criminal liability (which can impose devastating collateral consequences on a firm) to obtain assistance in prosecuting individuals within the firm who might be difficult to convict without board cooperation.⁷³ The threat of corporate criminal prosecution may also be used to pursue non-criminal remedial objectives, like corporate governance reforms (which are often featured in so-called deferred prosecution agreements (“DPAs”) entered into between companies and the United States Department of Justice⁷⁴). While theory suggests that the pursuit of such objectives is better left to civil enforcers, path dependency and other frictions may give the edge to criminal enforcers in the United States. Finally, the United States may not be as different from the UK as it first appears. It may be that criminal enforcers in the United States use their prosecutorial discretion to target their enforcement efforts at firms with serious problems at high levels of the corporate hierarchy.⁷⁵ Moreover, the United States Sentencing Guidelines instruct courts to consider a corporation’s internal control structure when making sentencing determinations.⁷⁶

(p. 958) 5 Conclusion

A variety of theoretical and practical considerations may inform a polity’s choice between civil and criminal public enforcement of corporate law violations. This chapter has identified the main normative arguments relevant to the choice between civil and criminal enforcement, both generally and as applied to the corporate law context specifically, and has examined actual corporate law enforcement patterns in the United States and abroad. While enforcement patterns vis-à-vis individual defendants hew closely to the theoretical ideal, there is substantial variation in countries’ use of corporate criminal liability, with some countries (most notably the United States) pursuing policies that are difficult to defend theoretically.

Chapman eds., 1985). For updated references, see Murat C. Mungan, "The Law and Economics of Fluctuating Criminal Tendencies and Incapacitation", 72 Md. L. Rev. 156, 159 n.2 (2012).

(¹²) For a survey of the main critiques, see *id.* at 169–75.

Public Enforcement: Criminal versus Civil

(¹³) Becker anticipated this critique, explaining that “[w]hether a punishment like imprisonment in lieu of a full fine for offenders lacking sufficient resources is ‘fair’ depends, of course, on the length of the prison term compared to the fine.” Becker, *supra* note 9, at 197. He observed that people “are often imprisoned at rates of exchange with fines that place a low value on time in prison,” which “may explain why imprisonment in lieu of fines is considered unfair to poor offenders, who often must ‘chose’ the prison alternative.” Id. at 197–98.

(¹⁴) Becker did observe that the sensitivity of criminal behavior to changes in expected sanctions may vary by type of crime, with crimes of passion being less responsive than calculated economic crimes. Id. at 205. See also Richard A. Posner, *Economic Analysis of Law* 279 & n.2 (8th ed. 2011) (defending the notion of the criminal as a rational actor).

(¹⁵) See Kenneth G. Dau-Schmidt, “An Economic Analysis of the Criminal Law as a Preference Shaping Policy”, 1990 Duke L. J. 1, 12 & n.55 (1990) (noting that “[e]ven among economists, there is a growing consensus that criminal benefits should carry no weight in the social welfare function” and citing references).

(²⁴) Id. at 1105–15.

(²⁵) See id. at 1126 & n. 70. Cooter expresses his normative theory for choosing between prices and sanctions somewhat differently than Calabresi and Melamed. Cooter argues that sanctions should be used when it is easier for lawmakers to identify socially optimal

Public Enforcement: Criminal versus Civil

behavior than it is to determine the external costs created by that behavior, and that prices should be used when the opposite is true. Because “the information requirements for pricing crimes are prohibitive, while the information requirements for sanctioning crimes are relatively low,” he posits that crimes should be sanctioned rather than priced. Cooter, *supra* note 19, at 1550.

(²⁶) Calabresi & Melamed, *supra* note 20, at 1127.

(²⁷) Posner, *supra* note 19, at 1195. Posner’s analysis differs from Calabresi and Melamed’s by focusing exclusively on efficiency considerations; Calabresi and Melamed, by contrast, recognize that distributional considerations may inform a society’s choice between property and liability rules. See Calabresi & Melamed, *supra* note 20, at 1110.

(²⁸) Posner, *supra* note 19, at 1221–22.

(²⁹) *Id.* Of course, to the extent there is legal error the intent requirement does not wholly guard against the risk of over-deterrence. See Shavell, *supra* note 16, at 1243–46 (discussing, *inter alia*, the risk of over-deterrence as a reason why criminal sanctions should not be made arbitrarily high).

(³⁰) See Coffee, *supra* note 2, at 208 (discussing the need for the criminal law to speak with greater precision than tort law due to the exemplary penalties it threatens); see also Cooter, *supra* note 19, at 1532 (explaining that “lawmakers who create an obligation backed by a sanction must be certain that the partition between permitted and forbidden zones is in the right place”).

Public Enforcement: Criminal versus Civil

(⁴¹) Id. at 21. Changing such preferences, he explains, would yield the greatest net social benefit “because society highly values the realization of the preferences that are saved from frustration, and there is no countervailing social cost from the loss of the realization of the preferences that are changed.” Id.

(⁴²) Id. at 37.

(⁴³) Id.

(⁴⁴) Id. at 19.

(⁴⁵) Id. at 26–27. John Coffee, who has similarly argued that the “factor that most distinguishes the criminal law is its operation as a system of moral education and socialization,” agrees that “the existence or non-existence of criminal intent. . . furnishes the most practical breakpoint at which to shift from pricing to prohibiting.” Coffee, *supra* note 2, at 239. He warns that expanding the criminal law to cover strict liability and negligence-based offenses risks diluting the power of the criminal law, pointing out that “stigma is a scarce resource.” Id. at 238. See also Paul H. Robinson, “The Criminal-Civil Distinction and the Utility of Desert”, 76 B. U. L. Rev. 201 (1996) (warning that applying the criminal label to conduct that is not morally blameworthy will weaken the power of the criminal law).

(⁴⁶) Recall that Becker argued that criminal sanctions, which he equated with imprisonment, are warranted only when asset insufficiency undermines the effect of civil monetary sanctions. Although corporate managers tend to be affluent, they may expect to be “judgment proof” in precisely the situations in which they are likely to defraud shareholders. See Jennifer H. Arlen & William J. Carney, “Vicarious Liability for Fraud on Securities Markets: Theory and Evidence”, U. Ill. L. Rev. 691 (1992) (explaining why corporate officers may be under-deterred by monetary sanctions in “last period” situations, when telling the truth will cost them their job and most of their wealth). Thus, criminal sanctions for securities fraud may be warranted even under Becker’s approach. Because Becker’s model has fallen into disfavor (see *supra* note 15), I will not consider it in subsequent analysis.

(⁴⁷) Failure to do so represents the conversion of a property rule into a liability rule and is market-bypassing.

(⁴⁸) See, e.g., Michael S. Moore, The Moral and Metaphysical Sources of the Criminal Law, in NOMOS XXVII: Criminal Justice 12–13 (J. Pennock & J. Chapman eds., 1985); Albert Alschuler, 71 B. U. L. Rev. 307 (1991).

(⁴⁹) See, e.g., Daniel R. Fischel & Alan O. Sykes, “Corporate Crime”, 25 J. Leg. Stud. 319 (1996) (making the case that the civil liability system is better suited to calculate appropriate fines for organizational defendants than the criminal system); Vikramaditya S. Khanna, “Corporate Criminal Liability: What Purpose Does It Serve?”, 109 Harv. L. Rev. 1477 (1996) (arguing that, except in the rarest of circumstances, corporate civil liability

Public Enforcement: Criminal versus Civil

is more socially desirable than criminal liability); see also Posner, *supra* note 14, at 578 (questioning whether criminal as opposed to civil corporate liability makes sense).

(⁵⁰) For a summary of the traditional deterrence argument for vicarious employer liability, as well as its limitations, see Amanda M. Rose & Richard Squire, “Intraportfolio Litigation”, 105 Nw. U. L. Rev. 1679, 1683–85 (2011).

(⁵¹) See Fischel & Sykes, *supra* note 49, at 324 (explaining that “the corporation should bear no more than the social cost of harm caused by crime, adjusted for the chance of nondetection,” otherwise shareholders will expend socially excessive amounts on monitoring); see also Coffee, *supra* note 2, at 196 (“to the extent that the role of corporate criminal liability is to encourage the principal to monitor its agents, the criminal law is inevitably caught up in the problem of pricing”).

(⁵²) See, e.g., Lawrence Friedman, “In Defense of Corporate Criminal Liability”, 23 Harv. J. L. & Pub. Pol’y 833 (2000); William S. Laufer, “Corporate Bodies and Guilty Minds”, 43 Emory L.J. 647, 665–68 (1994); William S. Laufer & Alan Strudler, “Corporate Intentionality, Desert, and Variants of Vicarious Liability”, 37 Am. Crim. L. Rev. 1285 (2000); Pamela H. Bucy, “Corporate Ethos: A Standard for Imposing Corporate Criminal Liability”, 75 Minn. L. Rev. 1095 (1991).

(⁵³) See, e.g., Dan M. Kahan, “Social Meaning and the Economic Analysis”, 27 J. Leg. Stud. 610 (1998); Samuel W. Buell, “The Blaming Function of Entity Criminal Liability”, 81 Ind. L. J. 473 (2006); Gregory M. Gilchrist, “The Expressive Cost of Corporate Immunity”, 64 Hastings L. J. 1 (2012).

(⁵⁴) For a broad compilation of English language literature on the topic of corporate criminal liability, see Joseph F.C. DiMento, et al., “Corporate Criminal Liability: A Bibliography”, 28 W. St. U. L. Rev. 1 (2000).

(⁵⁵) See Buell, *supra* note 53, at 520 (explaining that “people simply do not blame entities for their agents’ crimes across the board” and that “almost no one” has defended strict vicarious liability as the right liability rule). These modifications do not, however, fully alleviate the traditional deontological and utilitarian concerns with corporate-level criminal sanctions. See Alschuler, *supra* note 48, at 312 (“To suppose that minor variations on the theme of threatening to punish blameless shareholders can infuse the criminal law with its moral mission is once again unreal”); Fischel & Sykes, *supra* note 49, at 324–25 (explaining that the involvement of the board in the misconduct does not render corporate criminal liability efficient because “[w]hatever level of authority at which the decision is taken, there will always be opportunities for shareholders to utilize additional auditors, independent directors, consultants, and the like to economize on any attendant liability,” such that imposing sanctions in excess of social cost will lead to excessive monitoring).

(⁵⁶) A stronger case can be made for granting private enforcers the right to pursue vicarious corporate liability for managerial misconduct directed at shareholders, though this too has its drawbacks. See Amanda M. Rose, “Better Bounty Hunting: How the SEC’s

Public Enforcement: Criminal versus Civil

New Whistleblower Program Changes the Securities Fraud Class Action Debate”, 108 Nw. L. Rev. 1235 (2014) (explaining that shareholders might benefit from corporate liability to the extent that it funds fraud detection efforts by the plaintiffs’ bar that help shareholders monitor management); Rose & Squire, *supra* note 50, at 1693–98 (discussing the potential informational benefits to shareholders of vicarious liability in private litigation).

(⁵⁷) See, e.g., Fischel & Sykes, *supra* note 49, at 330 (describing some scenarios in which private enforcement is likely to fail to adequately deter).

(⁵⁸) See Robinson, *supra* note 45, at 208 (arguing that without a distinct criminal system, it would be more difficult for criminal sanctions to signal condemnation to the average person).

(⁵⁹) See, e.g., Amanda M. Rose, “The Multienforcer Approach to Securities Fraud Deterrence: A Critical Analysis”, 158 U. Pa. L. Rev. 2173, 2204–05 (2010).

(⁶⁰) See, e.g., Jennifer Arlen, *Evolution of Corporate Criminal Liability, in Leadership and Governance from the Inside Out* (2004).

(⁶¹) See, e.g., Amanda M. Rose, “State Enforcement of National Policy: A Contextual Approach” (with Evidence from the Securities Realm), 97 Minn. L. Rev. 1343, 1354 (2013); Miriam H. Baer, “Choosing Punishment”, 92 B. U. L. Rev. 577, 637–39 (2012).

(⁶²) See Rose, *supra* note 59, at 1357.

(⁶³) See Rose, *supra* note 59, at 2210–27.

(⁶⁴) Without allegations of disloyalty, however, derivative litigation is unlikely to succeed, due to the protection afforded defendants by Delaware’s business judgment rule and the prevalence of charter provisions insulating directors of American public companies from liability for breaches of the duty of care. See Del. Code § 102(b)(7) (permitting waivers of director liability). To the extent that there is public civil enforcement related to corporate mismanagement in the United States, it tends to come in the form of SEC enforcement of federal securities law provisions. See, e.g., 15 U.S.C. § 78m(b)(2) (mandating that reporting companies adopt reasonable recordkeeping and internal control provisions); 15 U.S.C. § 7243 (requiring forfeiture of CEO and CFO incentive compensation when issuer misconduct leads to a restatement); 15 U.S.C. § 78j-4(b) (permitting clawback of officer incentive compensation when a restatement is required due to material noncompliance with reporting requirements).

(⁶⁵) The relative lack of derivative litigation in the UK is due in part to differences in procedural rules (see, e.g., John Armour et al., “Private Enforcement of Corporate Law: An Empirical Comparison of the United Kingdom and the United States”, 6 J. Emp. Legal Stud. 687, 693, Table 1 (2009) (cataloguing the differences in US and UK civil litigation procedure that may explain the higher rates of private enforcement in the US)), as well as a tradition of informal enforcement activities by UK institutional investors (see John Armour, “Enforcement Strategies in UK Corporate Governance: A Roadmap and Empirical

Assessment”, 36–45, European Corporate Governance Inst., Working Paper No. 106 (2008), available at http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1133542). Derivative suits are also a rarity in continental Europe, although shareholder suits seeking to rescind or nullify decisions made in the shareholder meeting play a comparable role. See Martin Gelter, “Why Do Shareholder Derivative Suits Remain Rare in Continental Europe?”, 37 *Brook. J. Int’l. L.* 843, 881–87 (2012). Like US-style derivative suits, nullification suits provoke controversy. See *id.* at 884–85 (describing allegations of abuse and legislative responses). Dutch law provides a hybrid private-public model of civil enforcement to challenge problems with company management: a privately instituted judicial investigation. See *id.* at 889–891.

Abstract and Keywords

Plaintiffs' lawyer fees and monetary awards have a distorting effect on shareholder value effects in US derivative cases. In this chapter we analyze the benefits of corporate litigation without these externalities using a data set for the Netherlands between 2002 and 2013. We find significant abnormal returns within a short timespan surrounding the filing and resolution of M&A-related lawsuits. Over longer horizons, resolutions have little impact on shareholder value. However, our findings suggest that longer waiting times for court resolutions are costly. The evidence from the Netherlands supports the view that in settings without strong distortions derivative style litigation may be important.

Keywords: corporate litigation, derivative cases, business courts, derivative style litigation, shareholder value effects

1 Introduction

CORPORATE litigation is a topic of much interest due to its potential effect on firm value. Prior literature shows that the cost and likelihood of litigation may have a negative impact on shareholder value.¹ Romano, for example, assumes that derivative cases are frivolous and add little shareholder value due to the size of the awards.² Supporting this view, Coffee focuses on the large fee awards that the plaintiff's attorneys expect to receive in a court settlement.³ While prior research has attempted to disentangle the effects of attorney fees and case merits, the analysis of derivative litigation in the absence of externalities has largely been overlooked.

One common feature of the recent literature is the suggestion that the increase of independent board directors has made it more difficult to launch a derivative action since independent directors are unlikely to excuse the demand requirement.⁴ Better legal protections and corporate governance have also been reported to lead plaintiffs to file higher-quality suits that increase the probability of success. Supporting this view is the growing role of M&A-related litigation that has prompted attorneys to file cases in multiple jurisdictions, causing diminishing effects on shareholder wealth.⁵ Armour, Black, and Cheffins

further (p. 960) show that a “high-quality” filing is consistent with a pattern of negative effects due to the percentage of high damage and attorney fees awards.⁶ Additionally, Curtis and Myers report that the merit-related factors play a role in the initiation and disposition of derivative litigation, showing that plaintiffs’ attorneys are selective in cases where both the underlying legal merits and backdating of options are more egregious, since they are more likely to bring larger settlements.⁷ The focus of the current literature is to find the control forms to determine if these cases add value.

In this chapter, we use a natural experiment provided by the absence of attorney fees and monetary awards to examine whether derivative litigation impacts shareholder wealth negatively. Though the literature suggests that attorney fees and monetary awards stimulate the filing of derivative cases, we conjecture that the absence of such incentives has the potential to result in filings that may be associated with gains for shareholders. This is because when conflict resolution is speedy and effective it is likely to have an important impact on a variety of the corporate finance issues the firm faces. Moreover, if filings result in settlements that involve corporate governance reforms, the market’s reaction to a perception of better post-litigation outcome might also materially benefit shareholders. The intuition is that shareholder wealth effects should be observable since conflict resolution improves the alignment of management’s interests with shareholders’ and provides new information to the market.

We select a sample of shareholder suits from a country that has a well-developed corporate litigation market that does not provide incentives for lawyers and private litigants: the Netherlands. We carry out our analysis using 589 filings that have been collected through multiple databases from the beginning of 2002 through the end of 2013. Corporate litigation in the Netherlands is comparable to the US derivative suit since litigation costs are borne by shareholders. Moreover, shareholder litigation in the Dutch Enterprise Chamber focuses mostly on providing nonpecuniary remedies to resolving deadlocks or other intra-firm disputes. In contrast to the US, a filing in the Enterprise Chamber involves a two-step procedure in which the court first investigates the complaint and produces an independent report on the correctness of the management’s decision. In the second step, the court determines if there has been mismanagement and then may take appropriate measures to remedy them.

We examine corporate litigation in two ways. First, we empirically analyze filings of listed and non-listed firms at the Enterprise Chamber. Since most plaintiffs are non-listed firms that have different governance structures and economic resources than listed firms, we conjecture a different demand for corporate litigation. In contrast, listed firms typically have better governance mechanisms, and therefore shareholders are more likely to rely on public enforcement.⁸ To evaluate the characteristics of listed firms, we split our sample and analyze these cases. Second, we focus on filings and resolutions to determine whether (p. 961) acquisition-related lawsuits have an effect on firm value. To our knowledge, we provide the first empirical evidence on the effect of acquisition-related litigation on the firm value of Dutch firms.

Corporate Litigation in Specialized Business Courts

We first begin our investigation of these questions by examining the differences in the case filings of non-listed and listed firms. We find that most plaintiffs are non-listed firms seeking to obtain injunctions or resolve intra-firm conflicts, whereas listed firms are usually involved in merger and acquisition related corporate litigation. To proxy for the effect of corporate litigation on firm value in non-listed, we focus on the effectiveness of court mechanisms to resolve conflicts between shareholders. In this way, we consider the court's functioning in removing deadlock situations in small firms. While we cannot measure the wealth effects as is possible with listed firms, we nevertheless conjecture that, using our empirical evidence, litigation adds value for small, non-listed firms. In fact, our findings strongly support the view that where the threat of litigation is high, the withdrawal effect of a case filing may add value.

Second, we examine how a selection of acquisition-related filings could generate positive abnormal returns. First, similarly to Cain and Davidoff,⁹ we focus on the relationship between M&A litigation and shareholder value. We collect data on the share prices and perform an event study for the impact of case filings and court resolutions. Using event windows of varying lengths to estimate the short- and longer-term effects, we find an abnormal return of 0.5% for firms that are subject to merger-related litigation between 2002 and 2013. Our findings imply, taking the abnormal returns on the day of the filing, that shareholders do significantly better. Our results highlight that the market responds positively to a filing since it may remove asymmetrical information and a deadlock situation between shareholders. In terms of resolution, we find a negative effect over the short-term period near the resolution. This indicates that shareholders incur actual costs from the proceedings in the Enterprise Chamber. However, over the long term, we find that resolutions have little impact on the stock price. The result of this analysis is consistent with previous literature.

Overall, our research contributes to prior literature in three distinct aspects. First, this study is most clearly related to work by Kroeze that shows the Dutch model of corporate litigation has similar features to the Delaware Court of Chancery even though it is much smaller and provides few, if any, incentives to overcome lawyers' collective action problems.¹⁰ Second, while there are empirical studies on the effect of merit-based M&A litigation on firm value,¹¹ we believe that our findings are novel in this literature. To our knowledge, we are the first to show that M&A-related litigation is associated with positive shareholder wealth effects. Third, our work adds to the literature on the corporate litigation of publicly listed firms. Prior studies have often assumed that private conflict resolution is rarely launched by private parties against directors of publicly listed companies. The results of this study are consistent with other related studies on entrepreneurial firm litigation and venture capital¹² (p. 962) whose findings suggest that non-listed firms are more likely to rely on private enforcement to resolve conflicts.

This chapter proceeds as follows. Section 2 provides a review of the trends of corporate litigation in the US and provides summary statistics of the pattern of shareholder litigation in the Dutch Enterprise Chamber. Section 3 presents the empirical analysis of the ef-

fectiveness of the Dutch conflict resolution model. Section 4 examines the market impact of M&A-related litigation on firm value. Section 5 concludes.

2 Corporate Litigation in the United States

In this section, we review recent trends in corporate litigation in the United States. We organize the theoretical discussion into the factors that can lead to externalities in derivative lawsuits. We also discuss the related empirical literature on multi-jurisdictional litigation. We continue by looking at how corporate litigation can, from a theoretical perspective, lower agency costs in a public firm. Finally, we describe the structure and characteristics of shareholder litigation in the Dutch Enterprise Chamber during the period 2002–2013.

2.1 Trends in American Corporate Litigation

The Delaware Court has been widely recognized as the main forum of corporate litigation.¹³ Recent studies have identified two major trends in corporate litigation that complicate the analysis of shareholder wealth effects. The first trend reveals the number of acquisition-related cases strongly dropped in the period before 2009.¹⁴ Since acquisition-related litigation is the predominant source of lawsuits filed in Delaware, this sharply reduces the court influence on corporate litigation. As Thompson and Thomas report, the majority of cases filed in the years 1999–2000 against public firms were acquisition-oriented class actions.¹⁵ A second trend indicates an increase of multi-jurisdiction lawsuits between 2005 and 2010. In addition to identifying the increased role for foreign jurisdictions in adjudicating leveraged buyout and merger transactions, empirical evidence lends support to the view that litigation in Delaware appears to have contracted earlier in the decade due to a variety of factors. Thus, in an increasingly competitive and transparent litigation environment, it becomes harder for any jurisdiction to maintain the competitive advantage while providing the same quality and fairness in litigation.

Several theories have been put forward for the shift out of Delaware. The first theory reflects the pro-defendant orientation of the Delaware Chancery. Armour et al. argue that the sentiment has turned away plaintiffs to more favorable jurisdictions.¹⁶ While Armour (p. 963) et al. report the Vice Chancellor's quotes that capture the sentiment against plaintiffs, they are unable to locate a shift in Delaware law that would lead to precedents favoring defendants.¹⁷ Conversely, a second theory holds that plaintiffs' attorneys have a direct financial incentive to file cases outside Delaware. The implication is that factors, such as attorney fee cuts by the Delaware court in agreed settlements, create strong incentive to file cases outside Delaware. As attorneys seek out more profitable fees outside Delaware, state courts accelerate this trend by competing for acquisition-related cases. Cain and Davidoff show that states compete on attorneys' fees and settlement rate.¹⁸ As such, to compensate for the loss of market share of cases, courts adjust these factors to account for their losses.

Filing cases in multiple jurisdictions allows for additional strategic advantages. First, attorneys can press for expedited proceedings. Second, filing cases in other jurisdiction can support objections made in previous filed cases. These advantages increase the pressure for the defendants to settle and increase the leverage of the plaintiffs. Collectively, these factors will accelerate the move out of Delaware and affect the results of measuring the shareholder wealth effect.

However, Delaware remains an important corporate litigation forum as it signals the determination of the plaintiff. Armour et al. report that plaintiffs' counsel still favors Delaware as the leading forum for acquisition-related and derivative litigation.¹⁹ Given the stature of the court, plaintiffs filing cases in Delaware over competing jurisdictions still have credibility. In fact, over the period 2009–2011, the number of cases strongly increased. It is likely, moreover, that this trend will continue, particularly in light of the Delaware State Legislature's recent approval of amendments to the Delaware General Corporation Law authorizing forum selection clauses in the charters and bylaws that designate Delaware as the sole forum for litigation.

2.2 Measuring Wealth Effects of Corporate Litigation

This section examines the factors motivating corporate litigation and the effect of litigation on shareholder value. Absent externalities, corporate litigation is a mechanism that can improve the alignment of interests between shareholders and management. This alignment is typically conjectured to play an important role in generating value for shareholders. Two important factors influence shareholder value as lawsuits tend to limit the negative effect of principal-agent problems between shareholders and management.²⁰ First, as the early literature has established, asymmetric information may prevent an efficient outcome. In typical shareholder lawsuits, such as mergers and acquisitions (M&A), information known to the board, but unknown to shareholders, may prevent the shareholders from fully valuing and assessing a bidder's offer. Litigation can theoretically add value by removing the information asymmetry between parties. Second, inequality in bargaining power between the two parties may lead to inefficient outcomes. Hence, corporate litigation works to protect minority shareholder rights and improve shareholder value by limiting externalities in settlement procedures.

(p. 964) Empirically, the relationship between corporate litigation and generating shareholder value is less well established. Early literature has moved from a focus on case studies of corporate litigation²¹ to measuring wealth effects of intra-firm litigation.²² One important strand of recent empirical evidence stems from studies that have focused on lawsuits related to M&A. An observation of M&A transactions is that most deals lead to litigation. Cain and Davidoff report that in 2005 only 38.7% of significant-sized deals were subject to litigation, whereas in 2011 this rose to 94.2%.²³ There is also evidence that, during the same period, the cases filed in multiple jurisdictions increased from 8.6% to 47.4%. Overall, the growing role of M&A-derivative litigation has led to the heavy use

Corporate Litigation in Specialized Business Courts

of fee-shifting and minimum-stake-to-sue provisions, as well as attorneys filing cases in multiple jurisdictions, which is consistent with diminishing effects on shareholder wealth.

Some writers argue that the optimal strategy of plaintiffs' law firms is to settle claims rather than pursue strong lawsuits.²⁴ There is also evidence that top plaintiffs' law firms are more likely to gain success in M&A lawsuits, suggesting the value-enhancing mechanism of filing plaintiff's lawsuits.²⁵ The implication of this study is that litigation offsets the fall in probability of deal completion with an increase in expected takeover premiums generating economic value for target shareholders.

On the other hand, target stock price reactions to bid announcements do not fully anticipate the positive effect from the potential litigation. One strand of the literature focuses on how settlements appear to have negative effects on share prices, whereas court rulings have a positive effect.²⁶ Typically, firms with weak corporate governance structures are willing to settle, signaling to investors they are vulnerable due to high agency costs. Thompson and Thomas find evidence that M&A lawsuits have high levels of litigation agency costs.²⁷ As a consequence, we would expect to see a weak response of the share price. Since litigation may remove asymmetric information, Thompson and Thomas argue that in 1999–2000 merger litigation had a role in reducing managerial agency costs.²⁸

Another strand of literature offers insight on the shareholder wealth effect of corporate litigation via derivative lawsuits. Theoretically, derivative lawsuits can increase shareholder value through the protection of shareholder rights. As noted, early empirical studies find that the filing of a derivative lawsuit does not significantly affect the stock price.²⁹ This work is in line with prior findings that a negative effect can be expected with dismissals of a derivative suit and no market reaction to court decisions that overrule proposals to dismiss a case.³⁰ More recent literature, however, indicates a negative effect on shareholder value for (p. 965) the filing of derivative cases, and this effect increases with case quality.³¹ One explanation for the decrease in shareholder wealth is that markets respond to increased uncertainty regarding the impact of the litigation on business continuity. The filing of a derivative suit signals unexpected corporate governance or management issues and information disclosed at the trial may harm future firm revenues.

An interesting recent suggestion is that shareholder litigation can increase shareholder value.³² In fact, the \$279 million settlement of a derivative suit involving Activision Blizzard in 2014, and a \$130 million derivative settlement of the Freeport-McMoRan action in 2015 seems to reinforce the suggestion that settlements of derivative litigation will lead to direct dividend payments to shareholders, resulting in shareholder gains.

Other studies have investigated the wealth effects of corporate litigation in the pricing mechanism of IPOs. Underpricing at the IPO provides insurance for firms with high litigation risk and can lower the expected litigation costs.³³ In order to defend against corporate litigation, firms with high litigation risk might increase their cash holdings. Shareholders, on the other hand, would prefer higher payouts as excess cash might increase damage payments.³⁴ These findings suggest that while the size and impact of litigation

risk is well known, the resulting effect on shareholder wealth is not entirely known due to the possible impact of externalities.

2.3 The Dutch Enterprise Chamber

In this section, we describe the development of the Dutch Enterprise Chamber from the perspective of its long-standing role in the enforcement of corporate governance. We then provide summary statistics about trends in cases filed and withdrawn and verdicts rendered over the last decade. The data shows that while there was a decline in cases from 2004 to 2007, there has been a steady increase in new cases after 2010.

For years, the Netherlands ranked consistently behind the United States and United Kingdom, with respect to corporate governance. This is reflected in much lower firm performance and increased cost of capital. In terms of the legal regime, the Netherlands ranked low in investor protection and, in the context of listed companies, Dutch firms were seen to make takeovers very difficult to achieve. The Netherlands has taken steps, over the last decade, to provide better legal protections for minority shareholders, and mechanisms to monitor management's actions. Starting with the introduction of the Dutch Corporate Governance Code in 2003, and amendments to the Dutch Civil Code in 2004, Dutch firms have been committed to the implementation of higher standards of governance. The perceived payoff of better corporate governance standards was also influenced, in some cases, by firms' calculation of potential costs associated with the "Dutch discount," which refers to the fact that firms trade lower than their competitors abroad due to the lower standards of governance (p. 966) in the Netherlands. According to this theory, managers have tended to focus on lowering the "Dutch discount" as a motivation for their strongly held commitment to the enforcement of the Dutch corporate governance code. One of the results of the amendments to the Dutch law is the renewed focus of the Enterprise Chamber. The Dutch Enterprise Chamber has been labeled as the European counterpart of Delaware.³⁵ While there are similarities between Delaware and the Enterprise Chamber, a closer look at the Dutch statute and procedure suggests that there may be some differences. For example, derivative lawsuits are not possible in the Netherlands. Under Dutch law, the Enterprise Chamber has jurisdiction when: (1) doubts arise as to whether a company is properly managed (the inquiry procedure)³⁶; (2) there are conflicts regarding the removal of a firm's Supervisory Board organized under the Structure Regime³⁷; (3) shareholders are dissatisfied with financial reporting and challenge the annual account³⁸; (4) a shareholder that owns at least 95% of the outstanding share capital seeks to freeze out the remaining shareholders³⁹; or (5) conflicts arise between shareholders and harm the existence of the corporation, allowing for a forced buyout of shareholders.⁴⁰ Also, in the absence of contingency fees, Dutch lawyers do not have the same incentives as US lawyers.⁴¹ Hence, plaintiffs' attorneys working under a fixed fee system in the Netherlands will no doubt have incentives to settle cases.⁴²

The court, which includes three justices and two lay members with financial experience, has arguably exerted most influence on the development of Dutch corporate law and the protection of minority shareholders through the inquiry procedure.⁴³ Upon request, the

Corporate Litigation in Specialized Business Courts

court has the ability to initiate an inquiry into the policy, management, and conduct of business in a company when there are well-founded reasons to believe that a company is or has been managed improperly and incorrectly. The inquiry procedure was first introduced in 1928 to strengthen the position of minority shareholders in Dutch listed firms, although it had no practical use until 1971, when an overhaul of Dutch company law laid the foundation for a popular dispute resolution mechanism.

Over the years from 1996, the demand for the court in conflict resolution has increased substantially. Figure 36.1 shows that the arrival of new cases has mostly increased from the period 1996–2001. In this period, the number of new cases grew 165%, from 68 cases in 1996 (p. 967) to 180 in 2001. The large increase in these cases can be attributed to changes in the law. In the subsequent period, the number of cases started to decline. Several theories have been put forward to explain this trend. First, changes in the law and the appointment of a new president of the court may be one of the contributing factors.⁴⁴ Other factors contributing to the decline include the rapid and transparent proceedings of the Enterprise Chamber itself. Recent media accounts indicate that plaintiffs that prefer less transparent proceedings typically will lodge actions in Dutch civil courts to prevent negative publicity following from a lawsuit with the Enterprise Chamber.⁴⁵

Figure 36.1 The Enterprise Chamber's proceedings.

Source: Data from the Enterprise Chamber.

The two periods of decline in new cases seem to imply that the improved incentives to bring litigation in the first period may have had the unintended effect of increasing the costs of this style of litigation for some parties. Our evidence suggests that the Enterprise Chamber's highly public exposure of the details of the litigation, often involving weak cases and corporate governance practices, may have triggered the migration of cases away from the Enterprise Chamber to civil courts. The "reputation theory" holds that some shareholders tend to pursue claims in civil court to avoid the impact of negative publicity on firm value.

We also find some evidence that the pickup in new cases after 2010 is consistent with the corporate governance hypothesis that shareholders have incentives to litigate code violations to influence the quality of the firm's internal governance regime. This data is also

consistent with Figure 36.3, which shows the increase in inquiry procedure requests from 2010 to 2014.

Figure 36.2 The number of cases withdrawn in the Enterprise Chamber.

Source: Data from the Enterprise Chamber.

(p. 968)

We also ask whether the Enterprise Chamber, like Delaware, is delivering settlements between shareholders, and decreasing the costs of litigation to all parties. To understand the role of the Dutch Enterprise Chamber in facilitating agreements, Figure 36.2 shows the number of withdrawn cases. Over the period from 2003 to 2014, an average of 40.4% of new cases were withdrawn. There are various ways to interpret the increasing trend of settlements. First, it is quite possible that the economic downturn of 2008 and the following crisis may have triggered an increase in the number of settlements. Since most plaintiffs are unlikely to have recovered economic damages or costs, it is more likely that parties would focus on the potential to resolve conflicts through other channels. Similarly, since attorney fees are typically proportional to the length of procedure, plaintiffs clearly had an incentive to settle. To be sure, there is another possibility: that plaintiffs simply filed claims as a threat, which had lost its effectiveness during the financial crisis, to induce a settlement.

3 The Dutch Enterprise Chamber and the Conflict-Resolution Model

This section examines the two stages of the inquiry procedure and the injunction relief, which are the two main functions of the Dutch corporate court mostly sought after by firms. We analyze the number of inquiry procedure requests and measures that have been brought to the Enterprise Chamber by listed and non-listed companies.⁴⁶ Finally, we investigate the impact of the court on the Dutch governance model.

Figure 36.3 Characterization of the inflow of new cases.

Source: Data from the Enterprise Chamber.

(p. 969)

3.1 Stage One: The Inquiry Procedure

As we have noted, the inquiry procedure is one of the most important mechanisms of the Dutch Enterprise Chamber. It is generally recognized that the certainty, speed, and predictability of the Enterprise Chamber increased as precedent expanded. Figure 36.3 shows that over the period 2010–2014 about 60% of the new cases were seeking conflict resolution within the scope of the inquiry procedure. The bulk of the remaining actions involve conflicts about the supervisory board, financial statements, squeeze-outs, and buy-outs. As we might expect, Table 36.1 shows that while the length of these procedures can vary, the Enterprise Chamber is able to deliver fast-track conflict resolution.

Dutch corporate law provides that only a narrow range of individuals are entitled to request an inquiry procedure.⁴⁷ Besides the public prosecutor (for reasons of public interest) and labor unions (for employees' interests), the most important constituency allowed to request an inquiry procedure is shareholders (or depository receipt holders) alone or collectively owning at least 10% of the outstanding shares (or depository receipts, respectively) of a company or shares with a nominal value of €225,000, or a lesser amount as provided by the articles of association. The inquiry procedure contains two stages. In the first stage, parties may request an inquiry into the affairs of the corporation to determine whether the firm has been mismanaged. If the Enterprise Chamber shares the applicant's concerns, it will appoint one or more individuals, who will conduct an investigation and file a report with the court.⁴⁸ In the second stage, the Enterprise Chamber may (p. 970) be requested to take certain measures, provided that improper conduct and mismanagement follows from the report.⁴⁹ These measures include: (1) the suspension or dismissal of board members; (2) the nullification or suspension of board or shareholder resolutions; (3) the appointment of temporary board members; (4) the temporary transfer of shares; (5) the temporary deviation of provisions of the articles of association; and (6) the dissolution of the company.⁵⁰ The firm or the applicants may appeal to the Supreme Court on legal grounds.⁵¹ On appeal, the Supreme Court will not review the factual findings and background of the case.

Corporate Litigation in Specialized Business Courts

Table 36.1 Average length of procedures

Period	Inquiry procedure stage 1	Inquiry procedure stage 2	Supervisory Board	Squeeze out	Conflict buy-out
2012	25	232	26	108	125
2013	37	245	43	103	125
2014	64	108	46	132	–

The average length of the main procedures in the Enterprise Chamber in days. The length is measured between the filing of the case and a court ruling.

Corporate Litigation in Specialized Business Courts

Table 36.2 summarizes the number of inquiry procedure requests and measures that have been brought by listed and non-listed companies to the Enterprise Chamber. Judging from the number of cases in the period 1971–1994, the inquiry procedure initially played a modest role in the development of company law and the reduction of managerial agency costs. First, the lengthy and formalistic two-stage procedure rendered immediate responses to practical needs in a dynamic and ever-changing business environment impossible. Second, the limitation on the number of measures that the Enterprise Chamber could order constituted another reason for initial caution in employing the inquiry procedure. If, for instance, a conflict between shareholders caused the mismanagement of a company, the court’s discretion was limited to ordering the temporary transfer of shares to a nominee. This prevented the court from effectively resolving the dispute. Finally, the uncertainty about the application of the open “improper management” standard tempered the initial success rate of the inquiry (p. 971) procedure. Interestingly, as case law expanded, the certainty, predictability, and speed of the inquiry procedures increased (see Table 36.3). Table 36.1 shows that the length of the inquiry procedure has been considerably shorter in the recent period 2012–2014. The results highlighted here may partly explain the spur for new case demands in the same period, as shown in Figure 36.1.

Corporate Litigation in Specialized Business Courts

Corporate Litigation in Specialized Business Courts

An analysis of the decisions into the inquiry procedures shows that the Enterprise Chamber defined a number of situations in which there are reasonable doubts whether a company is properly managed. A large percentage of these actions involve conflicts with minority shareholders in non-listed firms. Most actions arising in the Enterprise Chamber involve the following conflicts: (1) a deadlock in the decision-making process of the company; (2) management has failed to disclose vital information to the minority shareholders; (3) conflicts of interest between managers and shareholders have arisen or have not been (p. 972) properly countered by the company; (4) the company does not comply with the disclosure and accounting requirements; (5) the company has no, or an unfair, dividend policy; (6) assets are being removed or reallocated to the detriment of the shareholders or other stakeholders of the company; or (7) decisions of management are challenged as being inconsistent with the rules of the Dutch Corporate Governance Code.

3.2 Stage Two: Injunctive Relief

Thus far we have looked at the number of inquiry procedure requests and measures that have been brought by listed and non-listed firms in the two-stage proceedings of the Enterprise Chamber. In this section we analyze requests for injunctive relief covering the period 2000–2008, and examine the factors contributing to the high settlement rate of these actions.

In 1994, the implementation of injunctive relief in Art. 349a (2) BW gave rise to the current popularity of the Enterprise Chamber (see Figure 36.4). Pursuant to Art. 349a (2) BW:

where an immediate remedy is required in connection with the condition of the company or in the interest of the inquiry, the Enterprise Chamber may at any stage of the proceedings, upon the application of the persons that requested the inquiry, order preliminary injunctions for the duration of the proceedings at most.

Corporate Litigation in Specialized Business Courts

Since then, an application for injunctive relief was the rule rather than the exception. In the period 2000–2007, out of 23 inquiry requests with respect to public firms, injunctive relief was requested in 21 of these cases; a preliminary remedy was granted in 57% of these cases. In the context of closely held firms, the number reached 234 requests for injunctive relief in 300 cases with a “success rate” of 47%.

(p. 973)

Table 36.4 Injunctive relief

	Mean	Median
Listed companies	5 days	4 days
Non-listed companies	72 days	65 days

The time length (day) before injunctive relief is granted by the Enterprise Chamber. These statistics are calculated over the period 2002–2008.

Source: Adapted from K. Cools, P. G. F. A. Geerts, M. J. Kroeze, & A. C. W. Pijls, *Het recht van enquête, een empirisch onderzoek* (2009).

Recall that the “fast-track” procedure, under Art. 349a (2) BW, is characterized by speed and informality. Even though the formalistic two-stage inquiry continues after the court has granted an injunctive relief, the preliminary nature of the decision furthers the judiciary’s ability to assist in resolving the issues caused by the alleged improper management of the firm. Data on the number of days before an injunctive relief bears this out. During the period of 2002–2008, the average number of days before injunctive relief was granted was five days for listed and 72 for non-listed companies (see Table 36.4). On both counts, the procedure offered is clearly efficient for shareholders. Additionally, the process of injunctive relief is much quicker for publicly listed companies due to the amount of media attention and greater pressure that can be exerted by institutional investors involved in the litigation.

In terms of relief, the Enterprise Chamber has full discretion to order any preliminary remedy as it sees fit. The most popular remedies for publicly listed firms are: (1) the appointment of independent board members; (2) the prohibition of voting on particular agenda items; and (3) deviation from the articles of association.⁵² Conversely, the preliminary remedies that are most popular for non-listed companies include: (1) suspending directors; and (2) suspending shareholder resolutions.⁵³ These results confirm our hypothesis that the inquiry procedure is not limited to mere after-the-fact adjudication. The evidence, moreover, indicates that the Enterprise Chamber procedure assists the parties in overcoming their differences by promoting informal and supposedly efficient solutions. These nonformalistic remedies offer parties an additional round of after-the-fact bargaining either by themselves or under the supervision of independent observers. The princi-

ple of (p. 974) fast, informal, and what we call judge-initiated “mediation” or “conciliation” appears to be very attractive to minority shareholders.⁵⁴ In many cases, after the injunctive relief, the firm and its shareholders tend to follow the preliminary relief or settle their disputes amicably under the “supervision” of the Enterprise Chamber. In the context of non-listed firms, 120 out of 309 disputes in the period 2002–2008 were settled and published by the Enterprise Chamber.

3.3 The Chamber’s Impact on the Governance Model in the Netherlands

In this section we document the dramatic differences in case characteristics of listed and non-listed firms. We use hand-collected data from lawsuits of the Dutch Enterprise Chamber. Our data set consists of all the 589 cases for the period 2002–2013. Most of the cases consist of non-listed companies that seek to obtain injunctions or resolve conflicts through an effective and efficient conflict-resolution process. Recall that listed firms typically have better governance mechanisms and shareholders are more likely to rely on public enforcement.⁵⁵ To explore the different dynamics of listed and non-listed firms, we split our sample and analyze the case characteristics.

Table 36.5 highlights the differences in litigation characteristics between listed and non-listed firms. Almost 90% of the cases filed in our sample are from non-listed companies. We find that proceedings on merits and Supreme Court rulings are substantially more frequently invoked in lawsuits with listed firms. For example, 55% of the cases for listed firms proceed on the merits, while only 40% for the non-listed firms. Supreme Court rulings are more frequently invoked for listed firms, about 28% for listed firms whereas only 2% of the cases for the non-listed firms. These findings support the size effect of the firm characteristics in our sample. Again, listed firms, because of their economic resources, are considerably more involved in complex litigation proceedings. Conversely, non-listed firms are typically smaller firms with fewer economic resources compared to listed firms.

In several lawsuit characteristics non-listed firms do not differ from listed firms. Surprisingly, we find no differences for interim measures taken by the court and recognition of mismanagement in lawsuits. Theory suggests that listed firms are more likely to establish good governance mechanisms than non-listed firms. As a result, mismanagement and court intervention would naturally be deemed less likely to be filed. On the other hand, listed firms may be considered mismanaged by self-interested managers in a struggle for corporate control. Indeed, it is possible to conceive of a firm as mismanaged not only if a potential conflict of interest existed, but also if it failed to take protection against such a conflict. Our data suggest, however, that listed firms are equally likely to face such matters in corporate litigation.

The data shows that, together with a decrease in rulings, the duration of the cases has strongly increased from 61 business days in 2002 to 95 business days in 2013. This result is (p. 975) also in line with our previous conclusion from Table 36.1 on the average length of the inquiry procedure. While the average durations of court cases through the years

Corporate Litigation in Specialized Business Courts

have varied, the trend seems to be that these are increasing. This leads to a lower efficiency level in the Dutch model of corporate litigation.

Table 36.5 Summary characteristics of our sample of lawsuits from 2002 to 2013

	Listed	Non-listed
General characteristics		
Total cases 2002-2013	47	542
Average business days between filing and resolution	106	99
Mismanagement found by court	4	31
Proceeding on the merits	26	215
Supreme court ruling	13	9
Type of conflict		
Takeover	5	16
Restructuring	33	6
Merger	0	1
Conflict	8	276
Unknown	0	243
Interim measures		
Changes in statutes	6	46
Appointment of director	3	57
Appointment member of the board	4	25
Appointment member of the board with Veto	1	15

Overall, these findings raise questions about the current levels of litigation and the impact of the quality of the Enterprise Chamber as a platform for conflict resolution in the Netherlands. On the other hand, the data may be explained by the fact that mediation or

Corporate Litigation in Specialized Business Courts

negotiation may have been more effective in recent years. As highlighted earlier, this would explain the notable decrease. One might expect that the Enterprise Chamber would facilitate more efficient conflict resolution outside the courtroom. Such an explanation is consistent with the evidence of longer case duration.

While efficiency reductions in conflict resolution for non-listed firms have a strong and direct effect on the Dutch economy, lower efficiency for listed firms will have a negative impact on international reputation and the possible establishment of international firms in the Netherlands. Table 36.6 shows the strong reliance of non-listed firms on the court resolution mechanism. The volume of cases involving non-listed firms has actually increased over time, while case characteristics remained relatively unchanged. (p. 976) However, a reduction in these trends can lower the conflict resolution efficiency of the Dutch model.

Corporate Litigation in Specialized Business Courts

Table 36.6 Case characteristics of non-listed firms

	Total cases	Duration	Proc. merits	Interim measures	Mismanagement

The case characteristics of our sample of lawsuits for non-listed firms from 2002 to 2013. The duration of the case is measured in business days.

Corporate Litigation in Specialized Business Courts

Table 36.7 confirms a similarly negative effect for listed firms. While we have established differences in the characteristics of conflicts brought to court, the data show a similar time trend to that of non-listed firms. In absolute terms, the number of cases for non-listed firms have decreased over the time period, and the duration of some cases remains extensive and is unlikely to change.

Overall, this evidence suggests that the increased duration of corporate litigation will have an effect on the market. Given the great uncertainty about interim measures, the market may respond negatively to filings of cases. On the other hand, this pattern of filings may suggest improved efficiency obtained through litigation. Given the evidence, we cannot fully exclude the hypothesis that shareholders are more likely to settle through the litigation phase without a final court ruling. Note that as out-of-court settlements are typically conducted outside the public scope, empirical evidence is hard to obtain.

In this section, we have provided evidence on the important relationship between a specialized company law court and improving the quality of corporate governance at the firm level. The data indicate the important role that the Enterprise Chamber plays in the enforcement of the Dutch Corporate Governance Code and in limiting the asymmetric information problems for non-listed companies in governance conflicts. The evidence also reveals that the popularity of the Enterprise Chamber's unique two-stage inquiry procedure is linked to the success of its proceedings in balancing power in conflict-of-interest cases, and influencing the outcome of financial problems between parties. To some extent, the data presented here shows the extent to which lawmakers' commitment to the introduction and enforcement of efficient corporate-governance rules may make it possible eventually to eliminate the Dutch discount.

4 Shareholder Wealth Effects

In Section 2, we discussed how corporate litigation could affect shareholder wealth through market reactions on firm value. Indeed, recent studies have focused on the filings effects of M&A-related lawsuits in Delaware on equity prices.⁵⁶ In this section, we present evidence of the cumulative abnormal common stock returns around the initial announcement and the final outcome of M&A-related cases in the Enterprise Chamber.

4.1 Measuring the Shareholder Wealth Effects in the Netherlands

Three central hypotheses are routinely discussed to explain the effect of acquisition-related litigation on equity prices. One explanation why derivative litigation has no impact on equity prices is that investors do not believe litigation will motivate management and deter misconduct.⁵⁷ A second explanation suggests that the market's reaction is an indication that a lawsuit will be used to negotiate a higher control premium, which should have a positive impact on share prices.⁵⁸ A third explanation documents how filings negatively impact the market's perception of the firm, leading to lower shareholder value.⁵⁹ This research suggests (p. 978) that the market's reaction to the filing of M&A-related litigation can provide us with an indication of the litigation's impact on the firm value.

Our focus of analysis concerns two important events in the litigation process. The first event is the filing of the case at the Enterprise Chamber, which allows us to verify the effect of the market on the presence of a conflict between shareholders. The second event is the resolution of the matter in the Enterprise Chamber in which the conflict is settled by court intervention.

To measure the impact on shareholders' wealth for both events, we employ an event study for all the cases for the listed firms in our sample.⁶⁰ We collect the share prices⁶¹ for each individual firm and regress the stock performance on the market index,⁶² using the following equation

$$Return_t^i = \alpha_i + \beta_i Return_{Market,t} + \varepsilon_t,$$

where $Return_{t,i}$ denotes the daily stock returns of firm i at time t . The parameters α_i and β_i are estimated over a period of 200 days that ends ten days prior to the court filing. In this way, our abnormal returns derived from our estimates are not influenced by the events. Next, we determine the abnormal returns of the stock, which is the difference between the predicted return using the estimated parameters and the observed return. To analyze the effect of the events, we select a number of event windows and determine the cumulative absolute return over these periods.

Table 36.8 presents the cumulative abnormal returns (CARs) on the day of the filing of the litigation in the Enterprise Chamber and the final outcome of the litigation, as well as during the interval in between. These results are consistent with previous studies on gen-

Corporate Litigation in Specialized Business Courts

eral corporate litigation that find an average positive market response to the filing of litigation even though the firm has lost the lawsuit.⁶³ The data indicate that the day after the filing, the market reacts with a slight decrease in value, lowering its expectation.

The findings also confirm our hypothesis that a filing in the Dutch Enterprise Chamber may lead to a positive increase in the stock price, and therefore the conflict-resolution mechanism of the Dutch Enterprise Chamber might ultimately add value for shareholders. This impression is confirmed because the CAR over the event window $[-2, 2]$ days is positive and significant.

We also find, on the longer horizon, a CAR that has a negative effect on the filing. On the one hand, this might indicate that case filing might lower the shareholder value. However, the event window with a longer horizon is based on a sample with only cases that have not yet been resolved. One explanation could be that over longer periods, the results suggest that these cases signal complexity to the market, causing additional uncertainty. The result is consistent with the view that after the filing, it is more likely that shareholder wealth will (p. 979) decrease, as uncertainty about the settlement increases. This interpretation is consistent with our view that speedy court procedures can add value for shareholders. Accordingly, if the time to settlement increases, the odds are that the market will react by lowering its expectation of the firm's value.

Table 36.8 The impact of litigation on shareholder value

Window	Event	
	Filing	Resolution
[0]	0.48%*** (0.16%)	0.65%*** (0.15%)
[-2, 0]	0.25% (0.15%)	-0.05% (0.10%)
[-1, 0]	0.29%** (0.10%)	0.00% (0.13%)
[0, +1]	-0.30%** (0.11%)	0.26%*** (0.09%)
[-1, +1]	-0.22%* (0.10%)	-0.05% (0.11%)

Corporate Litigation in Specialized Business Courts

[-2, +2]	0.21%* (0.11%)	-0.28%** (0.11%)
[-1, +10]	-0.14%* (0.06%)	-0.09% (0.08%)

The cumulative abnormal returns for the events of filing a case at the Enterprise Chamber and of a resolution by the court. Event window 0 is the abnormal return for the day of the event. Subsequent periods denote the cumulative abnormal returns and are either days before or after the events. The standard error of the coefficients are reported between brackets and significance at a level of 0.10, 0.05, 0.01 with respectively *, **, ***. The total amount of companies used is 43 and varies across periods to avoid overlaps between filling and resolution events.

On the other hand, Table 36.8 shows that if the court announces a resolution, the market will respond positively. Over a period of two days before the resolution and two days after, we find a negative CAR, indicating that the resolution is costly in terms of the shareholders. However, over a longer horizon there is no significant impact on the share price. This suggests that the market has already priced the resolution at the times of the filing, which is consistent with prior US literature that the resolution of cases has little market impact.⁶⁴

From the above analysis, it appears that the Dutch Enterprise Chamber has a reasonably similar conflict-resolution process to the Delaware court. Note, however, that while (p. 980) Badawi and Chen find empirical evidence for the negative impact of filing a derivative suit in Delaware,⁶⁵ we show, in contrast, a positive effect associated with the filing of merger-related litigation in Amsterdam. Importantly, while cases at the Enterprise Chamber can be compared to derivative suits, as previously explained, the crucial difference is that the Enterprise Chamber is able to pursue an inquiry into management using the two-stage inquiry procedure. Yet, due to the special setting and inquiry methods, the court is able thoroughly to investigate claims in a transparent and low-cost fashion. For these and possibly other reasons, this procedure could in principle help out other countries with specialized courts to litigate mergers efficiently.

Overall, our results are consistent with the shareholder wealth effects hypothesis of litigation filings, suggesting that positive abnormal returns reflect the possibility that the case will lead to an increase in shareholder wealth. Our results are robust and suggest that the Enterprise Chamber could, over time, attract more plaintiffs in acquisition-related cases. Further, our results indicate that speed is an important factor for the Enterprise Chamber to prevent erosion of shareholder wealth.

5 Conclusion

The main purpose of this chapter is to examine if, absent attorney fees and monetary awards, the filing of a derivative case will add value for shareholders. Using Dutch data from the Enterprise Chamber, we show that a filing in an acquisition-related suit can have positive shareholder effects. This chapter finds that, in contrast with US literature, M&A-related litigation in the Netherlands' Enterprise Chamber is associated with an abnormal return for target firms on a shorter horizon. We also show that the conflict-resolution procedure of the Enterprise Chamber appears to be very effective because of its speed and reliability. We find that the data reveal a negative effect for prolonging resolutions. However, as the US evidence shows,⁶⁶ resolutions do not necessarily improve shareholder value over a long horizon. These results support the view that markets may not fully account for how a case is resolved or the importance of complexity for interpreting the impact of the decision.

The findings of our chapter should be of interest to lawmakers and regulators who are interested in examining derivative litigation mechanisms. Our results suggest that a more effective derivative-suit mechanism can be obtained by prohibiting the use of incentives and improving speed to settlement. These findings also add further evidence as to the importance of the Dutch Enterprise Chamber's model of corporate litigation, which has significantly better outcomes in promoting shareholder wealth by relying on the impact of the proposed litigation on attorney reputations, and the prevalence of nonpecuniary settlements.

(⁴⁹) Each case could generate several decisions, such as a preliminary measure, a final measure, the appointment of one or more persons to undertake an inquiry into the policy and conduct of the company, or the determination of the maximum amount of the costs of the inquiry.

(⁵⁰) See Art. 356 of Book 2 of the Dutch Civil Code. Table 36.1 shows that only 6% of the requests in the context of listed companies (this is 13% in the context of non-listed companies) will result in a final measure. If we analyze our dataset for the period 2002–2008, we find that the appointment of temporary board members is the most popular measure (28%), followed by the suspension or dismissal of board members (23%), the temporary transfer of shares (18%), the nullification or suspension of board or shareholder resolutions (17%), the temporary deviation of provisions of the articles of association (11%), and the dissolution of the company (3%).

(⁵¹) See Art. 359 of Book 2 of the Dutch Civil Code.

(⁵²) The list is derived from our dataset including both listed and non-listed firms that were not involved in bankruptcy proceedings. In the period 2002–2008, the Enterprise Chamber granted more than 130 preliminary reliefs.

(⁵³) Since the inquiry proceeding is often used in non-listed firms to resolve deadlock situations and minority squeeze-outs, the majority of resolutions that are either withdrawn or suspended include shareholder resolutions.

⁽⁵⁴⁾ This is true for both listed and non-listed companies. It appears that the inquiry proceeding is a very attractive mechanism for resolving deadlock situations in closely held firms.

The Compliance Function: An Overview

Geoffrey Parsons Miller

The Oxford Handbook of Corporate Law and Governance

Edited by Jeffrey N. Gordon and Wolf-Georg Ringe

Print Publication Date: May 2018 Subject: Law, Company and Commercial Law

Online Publication Date: Oct 2015 DOI: 10.1093/oxfordhb/9780198743682.013.9

Abstract and Keywords

This chapter discusses the compliance function, a form of internalized law enforcement employed by corporations and other complex organizations to ensure that employees and others associated with the firm do not violate applicable rules, regulations or norms. It first examines compliance within a general theory of enforcement. It considers the concept of internal control, the development of the compliance function and its distribution among control personnel, and compliance programs, policies, and contracts within an organization. It then analyzes the oversight obligations of the board of directors and the management team including the chief executive officer, the chief financial officer, the chief compliance officer, the chief legal officer, and the chief risk officer. It also outlines the elements of a robust compliance program and concludes by considering internal investigations, whistleblowers, criminal enforcement, compliance outside the firm, and business ethics beyond formal compliance.

Keywords: compliance function, enforcement, internal control, compliance programs, chief compliance officer, internal investigations, whistleblowers, criminal enforcement, business ethics

1 Introduction

THE compliance function consists of efforts organizations undertake to ensure that employees and others associated with the firm do not violate applicable rules, regulations, or norms. It is a form of internalized law enforcement which, if it functions effectively, can substitute for much (although not all) of the enforcement activities provided by the state. The importance of compliance and the extent of liability for its failure have greatly increased over the past decades in countries around the world. Together with its close cousins, governance and risk management, compliance is an essential internal control activity at corporations and other complex organizations.¹

The compliance function is embodied, in part, in the fiduciary duty of directors, whose obligation to direct the management of corporations includes the responsibility to guard against illegal activities. The corporate law of compliance, however, extends beyond fidu-

The Compliance Function: An Overview

ciary duties traditionally understood. It also includes substantive regulatory statutes, criminal laws, guidance from administrative agencies, codes of best practices, internal corporate rules, and other governing norms.

This chapter will examine the following topics: the analysis of compliance within a general theory of enforcement; the development of the compliance function; the concept of internal control; the distribution of the compliance function among control personnel;

(p. 982) oversight obligations of directors and executives; compliance programs and policies; internal investigations; whistleblowers; criminal enforcement; compliance outside the firm; and business ethics beyond formal compliance.

2 Compliance in a Theory of Enforcement

At the most general level, compliance involves a trade-off of costs and benefits. On the one hand, compliance can be a cheaper and more effective means to ensure that complex organizations obey applicable norms. The reason is that an external norm enforcer may not have the resources or the ability either to detect violations or to devise an effective system of sanctions. The organization has the knowledge and the ability more effectively to perform these tasks. It therefore makes sense for institutions to police themselves—to carry out a compliance operation.

On the other hand, because compliance delegates responsibility for norm enforcement to the organization, the external enforcer (regulator, prosecutor, etc.) loses some degree of control over the situation: It may be perilous to rely on an institution to police itself when the institution wants to flout the norm or to cover up violations. Accordingly, the external enforcer needs to monitor the compliance function to ensure that it is faithfully and effectively carried out—adding to aggregate social costs.

There is also a problem of incentives. When the external enforcer operates directly, rather than through a compliance program, the enforcer bears most of the costs of the enforcement activity. It has an incentive to perform in a cost-effective way. When, however, the external enforcer relies on internal compliance to enforce norms, the enforcer does not bear the costs of enforcement; these are imposed on the organization. Since the external enforcer doesn't internalize the costs of compliance, it may demand that the organization implement compliance operations which are costly but not particularly effective or necessary.

The job of policy makers is to devise a system which minimizes total costs of norm enforcement and norm violations. This task cannot be performed scientifically. Lawmakers are not structural engineers. When it comes to designing a compliance system much is done by intuition and guesswork. Nevertheless, in examining any given compliance system, we can still ask the basic questions: Does it draw the right line between internal and external enforcement; are the requirements appropriate, insufficient, or excessive; are

there sufficient backup lines of defense; and overall, does the chosen structure represent a reasonable trade-off of costs and benefits.

3 Development of the Compliance Function

The history of the compliance function across the world remains to be written. Every country has a different history of compliance reflecting its unique legal, historical, and political circumstances. It appears, however, that two elements play a principal role.

First, compliance is a function of the enormous growth of the administrative state. This chapter will discuss developments in the United States; similar developments occurred in (p. 983) many countries around the world. In the case of the US, the compliance function might be said to have started in the Interstate Commerce Act of 1887, which created a federal administrative agency, the Interstate Commerce Commission, to regulate the railroads. The Progressive Movement of the 1890s through 1920s, another important step in the development of compliance, reflected concern for eliminating corruption and enhancing the efficiency of government. Among its achievements were the Pure Food and Drug Act (1906), the Federal Reserve Act (1913), and the Clayton antitrust law (1914). The collapse of financial markets and the Depression of the 1930s led to the Banking Act of 1933, the Securities Acts of 1933 and 1934, and other regulatory enactments. More generally, this period witnessed a change in attitude on the Supreme Court, from one that resisted regulation of business to one that enthusiastically embraced it.

In more recent times, the rise of environmental concerns in the 1960s sparked a series of important federal statutes, including the Clean Water Act and the Clean Air Act, as well as the birth of a new federal administrative body, the Environmental Protection Agency. In the mid-1970s, revelations of American companies bribing foreign officials led to the Foreign Corrupt Practices Act in 1977. In the 1980s, the collapse of savings and loan institutions shook America's confidence in the integrity of the financial system and sparked legislation that upgraded banking regulation in many respects. The corporate scandals of the early 2000s, including spectacular failures of Enron and other firms, led to the enactment of the Sarbanes-Oxley Act (2002). The terror attacks of September 2001 focussed attention on new threats to national security and triggered enhanced obligations to report suspicious activities and combat terror financing. Finally, the financial crisis of 2007-2009 undermined public confidence in banks and financial markets and led to a host of new regulations, including the Dodd-Frank Act of 2010.

These and other events punctuated what has been a broader and more "tectonic" change in American law. In the nineteenth century, relations between corporations and the state followed a judicial model in which the government was required to prove its case in court like any other litigant. Due to changes in constitutional doctrine and administrative law, the judicial model no longer accurately describes the government's relationship with regulated firms. Governments today possess awesome powers of enforcement and authority to impose devastating penalties, often with only minimal judicial involvement.²

The Compliance Function: An Overview

The contemporary law of compliance in the US is profoundly influenced by these developments. Corporations faced with compliance problems are sometimes better described as supplicants seeking mercy from their regulators rather than as equal adversaries. Facing severe penalties for violations and significantly reduced powers to defend themselves in court, organizations have a strong incentive to internalize the law enforcement function by instituting procedures to guard against misconduct by their employees.

The second key factor that influences the growth of compliance is the globalization of enterprise and the parallel growth of service providers in the areas of internal control that have played a major role in standardizing the compliance activities of multinational firms. A global enterprise with operations in dozens of countries cannot, as a practical matter, operate independent compliance operations in every country where it does business. Even if (p. 984) it wished to operate in this fashion, doing so would not be wise because the activities of the enterprise cannot be hermetically sealed within national silos. Further, international organizations utilize consultants and other service providers, and look to models developed in similar institutions as prototypes for their open operations. These institutions operate in a world corporate culture in which developments that occur in one country or in one institution or one industry quickly transmit themselves to many others.

4 The Concept of Internal Control

Compliance is a form of internal control. The concept of internal control suggests that a well-managed organization is one in which assets and resources are effectively deployed to serve the purposes of the corporation. At one time in corporate history, a function of internal control was assigned to the corporate charter which would specify the purposes for which the firm was established and enumerate the powers it could exercise. Actions by a corporation that went beyond the purposes or powers so defined were ultra vires and wholly or partly unenforceable. In the modern corporation, however, purposes and powers restrictions have been all but nullified. The resulting gap has been filled by contemporary notions of internal control.

The leading statement of internal control in the modern business enterprise is set forth by the Committee of Sponsoring Organizations of the Treadway Commission (COSO), an umbrella of groups in the fields of accounting, auditing, and financial management.³ COSO's *Integrated Framework* is the standard most public company auditors employ to evaluate management's assessment of the company's internal controls. COSO describes internal control as "a process, effected by an entity's board of directors, management and other personnel, designed to provide reasonable assurance regarding the achievement of objectives relating to operations, reporting, and compliance."⁴ Internal control, so defined, consists of the following components: control environment, risk assessment, control activities, information and communication, and monitoring activities.

As implemented within firms, the concept of internal control is embodied in the metaphor of the "Three Lines of Defense." The metaphor associates internal control with the process of defending territory from an external threat. It stresses the gravity of break-

The Compliance Function: An Overview

downs in the internal control function; defines the threat as external to the organization; and offers reassurance that if control functions are properly designed and maintained, the threat of a breakdown can be kept within tolerable limits.

The first line of defense is the operating units and the heads of the entities, offices, or divisions that carry out business activities. These people are named first because if they do not transgress applicable norms, the organization will not commit violations. But the metaphor also recognizes that the operating units cannot be relied on fully as a bulwark against violations, both because the line employees are not compliance professionals and (p. 985) because they may experience incentives to test limits in order to enhance their status or compensation.

The second line of defense consists of persons or offices charged with carrying out monitoring and control activities. Two second-line offices are most important: the senior official responsible for preventing and/or detecting violations of legal norms (chief compliance officer or general counsel); and the chief risk officer, whose job is to ensure that the risks undertaken by the line employees are consistent with the risk appetite established by the board of directors.

The third line of defense, which is supposed to catch problems that filter through the first two, is internal audit. The internal audit department is responsible for checking on the entire organization, including senior managers, in order to ensure that policies and procedures are being observed and shortcomings in the organization's internal controls are identified and promptly fixed.

The metaphor of the three lines of defense is useful, but also incomplete and inaccurate. It omits to mention other important controls that serve to catch and correct problems that get past internal audit: the board of directors (especially the audit committee), the external auditor, and, for regulated firms, the government supervisor. Even more broadly, the concept of control includes figures such as activist shareholders, proxy advisory firms, takeover bidders, and the financial press, all of whom, to one degree or another, monitor the behavior of the organization's managers. The metaphor of the three lines of defense also fails to capture the ambiguous role of the second and third lines, which are supposed to operate as independent checks on the business lines, but at the same are themselves part of the management team.

5 Distribution of the Compliance Function

As suggested in the concept of the three lines of defense, the compliance function is distributed across institutions rather than being centralized in any single person or office. The distribution of responsibility is often unclear and varies from organization to organization.

To address the lack of clarity as to role responsibilities, a United Kingdom reform proposed in 2014 would require banks to maintain and disclose a "management responsibili-

The Compliance Function: An Overview

ties map” describing how control functions are allocated across the firm, outlining reporting lines and lines of responsibility, and providing detailed information about senior managers and their responsibilities.⁵

In the US, the Volcker Rule, which restricts proprietary trading by banks, requires large depository institutions to implement a framework that clearly delineates responsibility and accountability for compliance.⁶ As yet, however, the US has not implemented more general requirements for disclosing the allocation of compliance responsibilities.

(p. 986) 5.1 The Board of Directors

It has always been clear that the board’s responsibility for directing the management of a corporation includes a duty to oversee the activities of employees to ensure that they do not break rules.⁷ The contours of this fiduciary duty of oversight, however, have evolved over time.

In the US, the business judgment rule, which protects directors against personal liability for actions undertaken in good faith, long appeared to provide a shield that protected directors in compliance cases. It is true that if a director failed to act as a director *at all*, the business judgment rule would not protect against liability.⁸ But if a director carried out even minimal responsibilities and did not willfully ignore evidence of illegal conduct, corporate law provided substantial immunity.

This shielding of directors was problematic from the standpoint of public policy. The discretion afforded to directors under the business judgment rule is appropriate for ordinary business decisions because the incentives of shareholders align with the interests of society. In the case of compliance violations, however, illegal behavior might increase rather than reduce profits (an example is bribery to obtain lucrative contracts). In such cases, the business judgment rule threatened to immunize conduct inimical to the public interest. The problem became even more acute after Delaware authorized charter provisions that shield directors from monetary liability in duty of care cases.⁹

Delaware courts have attempted to remediate this problem. The theory, endorsed in *Stone v. Ritter*,¹⁰ is that the director’s duty of compliance is an aspect of the duty of loyalty, and therefore cannot be shielded by the business judgment rule or exculpated by charter amendment.¹¹ This duty requires directors to implement a “reporting or information system or controls”; and to “monitor or oversee” the operation of the system once implemented.¹² The meaningfulness of these duties is undercut, however, by the leniency of the standard of care: directors are liable only if they utterly fail to implement a compliance program or consciously fail to monitor its operations.¹³ Delaware’s approach to compliance thus has a curiously ambivalent quality: directors are subject to significant obligations, but are held liable only if they fail to manifest even minimal efforts.¹⁴ Although Delaware might be criticized as ineffectual, the state’s approach arguably influences attitudes within the boardroom and empowers lawyers to encourage clients to upgrade compliance efforts.

The Compliance Function: An Overview

(p. 987) In addition to liability for breach of fiduciary duty, directors may face exposure under regulatory statutes for failure to exercise oversight over compliance.¹⁵ As yet the scope of this more general oversight liability is unclear. Future cases may clarify which regulatory statutes can support oversight liability, whether oversight liability can be based on negligence, and in what circumstances members of boards of directors face liability for money damages under this theory.

While the full board is charged with assuring compliance, primary responsibility is often allocated to committees. The audit committee is most important. Often the audit committee charter includes a specific reference to compliance, and key officers in the second and third lines may have substantive reports to the audit committee rather than to a senior executive. Other committees also play a role in compliance. Some firms have established committees with responsibility for compliance matters. The compensation committee can become involved because of the link between the incentives created by compensation arrangements and the propensity of managers to test the limits of legality. The nominating and governance committee may play a role, especially in cases where a member of the board or a senior manager is accused of wrongdoing.

5.2 The Management Team

Some compliance obligations are imposed on senior managers as a team. Section 404(a) of the US Sarbanes-Oxley Act requires that a reporting company's annual report must contain an "internal control report" which states "the responsibility of management for establishing and maintaining an adequate internal control structure and procedures for financial reporting."¹⁶ The report must also contain management's assessment of the effectiveness of these procedures.¹⁷ SEC regulations require reporting firms to "maintain disclosure controls and procedures" and "internal control over financial reporting."¹⁸ "Disclosure controls or procedures" are designed to ensure that the necessary information "is accumulated and communicated to the issuer's management, including its principal executive and principal financial officers, or persons performing similar functions, as appropriate to allow timely decisions regarding required disclosure."¹⁹

5.3 The CEO

The chief executive officer (CEO) is the public face of a firm—the living embodiment and symbol of the institution in the eyes of the public and its regulators. She is ultimately responsible for decisions the organization makes (subject to oversight by the board). Most importantly, from the standpoint of compliance, the CEO is responsible for setting the "tone at the top"—a culture, flowing from the highest management level, which endorses scrupulous adherence to applicable rules and norms. For this reason, even if only a relatively small (p. 988) percentage of her time is spent on compliance matters, the CEO is in a real sense the most important compliance officer in the organization.

Aside from the responsibility to establish a healthy tone at the top, CEOs have more specific compliance obligations. Section 302 of the Sarbanes-Oxley Act requires the CEO and

The Compliance Function: An Overview

chief financial officer (CFO) to certify that a public company's annual and quarterly reports are not misleading and that the information included in the reports fairly presents the financial condition and results of operations of the issuer.²⁰ In addition, the CEO and CFO must certify that they "are responsible for establishing and maintaining internal controls"; have "designed such internal controls to ensure that material information relating to the issuer and its consolidated subsidiaries is made known to such officers by others within those entities"; have "evaluated the effectiveness of the issuer's internal controls"; and have "presented in the report their conclusions about the effectiveness of their internal controls."²¹

The CEO and CFO must also certify that they have disclosed to the issuer's auditors and the board audit committee: "all significant deficiencies in the design or operation of internal controls which could adversely affect the issuer's ability to record, process, summarize, and report financial data and have identified for the issuer's auditors any material weaknesses in internal controls;" as well as "any fraud, whether or not material, that involves management or other employees who have a significant role in the issuer's internal controls."²² The signing officers must indicate "whether or not there were significant changes in internal controls or in other factors that could significantly affect internal controls subsequent to the date of their evaluation, including any corrective actions with regard to significant deficiencies and material weaknesses."²³

A related provision, § 906 of the Sarbanes-Oxley Act, requires that an issuer's periodic reports to the SEC be accompanied by a written statement of the CEO and CFO certifying that the information contained in the reports "fairly presents, in all material respects, the financial condition and results of operations of the issuer."²⁴ Anyone who certifies a financial statement that does not comport with this requirement is subject to criminal penalties: up to 10 years' imprisonment if the officer acted "knowing that the periodic report accompanying the statement does not comport with all the requirements," and up to twenty years if the officer acted "willfully."²⁵

5.4 The Chief Compliance/Chief Legal Officer

Many organizations active in international business employ a senior officer who has explicit authority for compliance. Traditionally, that officer was the in-house general counsel (GC). Many organizations continue to assign compliance to general counsels, but others have vested the responsibility in a chief compliance officer (CCO), who is usually but not always an attorney. The rationale for creating the CCO position is the inherent tension in the GC's role: Is the person charged with overseeing compliance supposed to be a zealous advocate for the organization's interests in regulatory matters, or does she owe professional duties to a broader public? By separating the roles, organizations allow the GC to act with undivided (p. 989) loyalty to the client without being subject to potentially countervailing obligations to the public.²⁶

To what extent should the CCO act independently of the CEO and other senior executives? There are advantages and disadvantages to any arrangement. Requiring the CCO

The Compliance Function: An Overview

to report to another executive officer—the CEO, the CFO, the GC, or perhaps the chief risk officer (CRO)—has the virtue of centralizing management and bringing an advocate for compliance into the senior management team. On the other hand, making the CCO subordinate to other executive officials can be dangerous when the boss might herself be involved in a violation. Considerations such as these suggest that the CCO should be given a direct reporting line to the board of directors or to the audit or compliance committee, and that the CCO may also be given a degree of budgetary independence. One common solution is for the CCO to report substantively to the audit committee and administratively to an executive such as the CFO or CEO.

The CCO can perform her job effectively only if she has unfettered access to information about the firm. Organizations thus need to empower CCOs to expect full cooperation from others in the organization. In the case of US mutual funds, such an expectation is guaranteed by law. SEC Rule 38a-1(c) prohibits an officer, director, or employee of a mutual fund or its investment advisor from taking any action to coerce, manipulate, mislead, or fraudulently influence the fund's chief compliance officer in the performance of her duties.²⁷

Even in the absence of a statute, the power and independence of compliance officers has increased as a result of judicial decisions. An example is *UBS v. Kommunale Wasserwerke Leipzig*, [2014] EWHC 3615 (Comm), a 2014 decision of the Commercial Court of the British High Court of Justice holding a bank responsible for contracts procured through bribery; even though bank officials were not shown to have any direct culpability in the misconduct. An important fact that appeared to have influenced the decision is the finding that senior bank officials interested in obtaining large profits had overruled the bank's compliance department's objections to the deal.

The activities and powers of the CCO are generally defined in internal documents. In some cases, however, the law imposes non-delegable duties on these officials. In the US, for example, the Dodd-Frank Act's rules regulating swap dealers require the CCO to review and ensure the registrant's compliance with the Commodities Exchange Act (CEA), to resolve conflicts of interest, and to establish procedures for remediation of noncompliance. The CCO must prepare and sign an annual report describing the registrant's compliance with the CEA, the code of ethics, and the internal conflict of interest policy.²⁸

What happens if the CCO doesn't perform effectively? In ordinary business settings, an officer who falls down on the job will face pay cuts, demotion, transfer, or dismissal. But these measures may not be effective in the case of the CCO, since that officer must monitor senior officials who determine the CCO's compensation and authority. Addressing this problem, the US SEC imposes supervisory liability on broker dealer CCOs who fail to prevent or detect wrongdoing. A difficulty here is an allegedly ineffective CCO may defend on the ground that they were not a supervisor of the culpable employee.²⁹

(p. 990) 5.5 The Chief Audit Executive

The internal audit function is carried out by a department within a firm. Internal audit departments are led by people with titles such as “Chief Audit Executive.” The head of internal audit often has a direct reporting line to the chief executive officer—a formal acknowledgment that the audit function is not subject to the control of any other department and a recognition that the head of internal audit has rights of access to the senior leadership. At the board level, the head of internal audit reports principally to the board audit committee.

What is the relationship between internal audit and the external auditor? On the one hand, the two operate at arm’s length. The external auditor reviews all aspects of financial controls, including internal audit. In this respect, the external auditor is an independent and potentially exacting critic. On the other hand, internal audit typically cooperates in the external audit, reducing the independence of the two functions to some extent. External audit may also help empower internal audit in cases where others in the organization are impeding the latter’s work. In such cases, internal audit may find a way to get its needs met through the (more powerful) voice of the external auditor.

5.6 The Chief Risk Officer

Many financial institutions and an increasing number of other organizations have created specialized risk management offices headed by a CRO. The CRO has an important, although indirect, role in compliance. Compliance risk is one of the most important threats facing an organization, and therefore a matter falling within the natural purview of the CRO. Accordingly, when an organization hosts both a CRO and a CCO, the two offices must operate according to a border treaty that establishes the boundary between their respective responsibilities.

6 Compliance Programs, Policies, and Contracts

The compliance function is implemented through compliance policies, programs, and contracts. A compliance policy is a statement of an organization’s approach to ensuring adherence to its normative obligations, approved by the board of directors or other managing body, and announced internally and externally as representing the organization’s approach to carrying out this responsibility. A compliance program is a detailed statement of how (p. 991) the organization intends to carry out the obligations that it has recognized in its compliance policy. In addition to these internal documents, the compliance function increasingly involves a host of representations, commitments, rights, and obligations contained in contractual agreements with counterparties, in areas as diverse as vendor risk management and supply chain due diligence.³⁰

The Compliance Function: An Overview

Most large organizations have adopted compliance policies and compliance programs. There are many reasons for doing so. Such activities reduce board members' potential liability under *Stone v. Ritter*. Implementing a robust compliance program can also shield managers from regulatory oversight liability. For example, the US Securities and Exchange Act of 1934 contains a safe harbor protecting against supervisory liability if "there have been established procedures, and a system for applying such procedures, which would reasonably be expected to prevent and detect [violations]." ³¹

Organizations have other reasons to adopt compliance programs. In some cases, the law directly requires regulated industries to do so. An example is the US Bank Secrecy Act, a law which seeks to combat money laundering and the financing of illegal activities. This statute requires banks to establish anti-money-laundering programs with explicit compliance requirements. ³² Similarly, the SEC has adopted regulations under the Investment Advisors Act and the Investment Company Act, which require regulated investment companies and their advisors to create and maintain compliance programs. ³³ The Dodd-Frank Act, likewise, requires swap dealers and major swap participants to designate a chief compliance officer who reports to the board of directors or CEO. ³⁴

Corporations also establish or upgrade compliance programs as a result of regulatory enforcement actions. Settlements of regulatory enforcement actions often include undertakings to enhance compliance activities. A similar pattern is observed in criminal cases: prosecutors demand that targets upgrade compliance programs as a condition to deferred prosecution or non-prosecution agreements. ³⁵ These programs, adopted in the shadow of enforcement proceedings, will not necessarily be the same as the ones that the firms would have chosen in the absence of an enforcement action. Among other things, settlement agreements often provide for the retention of a third party monitor to verify that the target fulfills its commitments.

Compliance programs are affected by private litigation. Shareholders' derivative lawsuits challenging misconduct sometimes terminate in a settlement under which the company commits to implement "prophylactic" reforms to internal governance, often including reforms to processes of internal control. Compliance obligations may also be included in settlements of *qui tam* litigation brought by private parties in the name of the government. (p. 992) Less commonly, compliance-related settlements are negotiated in class action litigation challenging allegedly illegal conduct.

Firms also implement compliance programs in order to mitigate the severity of enforcement. Regulators consider an organization's commitment to compliance when they decide whether to initiate enforcement actions. Federal prosecutors undertake a similar analysis: if a potential defendant has operated a compliance program and has cooperated wholeheartedly with the investigation, these factors will count in the decision whether or not to charge the entity.

An organization's compliance-related conduct is also taken into account at the penalty stage. Among civil regulators, the US Environmental Protection Agency is a leader in promising to mitigate the severity of sanctions if the defendant demonstrates sufficient

The Compliance Function: An Overview

cooperation and evidences a commitment to compliant behavior.³⁶ As for criminal conduct, the US Sentencing Guidelines provide for credit in sentencing to organizations that operate effective compliance programs, even if the program in question failed to deter or detect the criminal conduct.³⁷

Conversely, an organization that implements a compliance program but then fails to administer it in an effective manner can suffer enhanced penalties. In 2011 the US SEC rolled out a policy applicable to firms that are warned about deficiencies in their compliance programs, fail to correct the problem, and subsequently commit violations. The program encourages firms to adopt robust compliance programs because if they do not do so and are warned about the problem, they will receive especially harsh treatment in the event of a violation.³⁸

7 Elements of a Robust Compliance Program

It is obvious that the mere creation of a compliance program will not ensure results. The program must also be effective.³⁹

Perhaps the earliest statement of the requirements for a robust compliance program in the US is contained in the Federal Sentencing Guidelines, promulgated in 1991.⁴⁰ To qualify for potential reductions in sentencing, an organization must “exercise due diligence to prevent and detect criminal conduct; and otherwise promote an organizational culture that encourages ethical conduct and a commitment to compliance with the law.” The organization must establish standards and procedures to prevent and detect criminal conduct; ensure that its governing authority understands the content and operation of the program and exercises reasonable oversight over its implementation; conduct effective training programs; (p. 993) establish incentives to comply and disciplinary sanctions for noncompliance; and take reasonable steps to respond to the criminal conduct and to prevent repeat violations.

Other official pronouncements identify somewhat different ingredients of a robust compliance program. The Bank Secrecy Act specifies four elements: internal policies, procedures, and controls; a compliance officer; an employee training program; and an independent audit function.⁴¹ The US Department of Justice notes 10 features: high-level commitment to compliance; written policies; peer-based review; oversight and independence of compliance officers; training and guidance for employees; internal reporting; investigation; enforcement and discipline; oversight of agents and business partners; and monitoring and testing.⁴² The SEC and Department of Justice, in joint guidance on foreign corrupt practices, identify the following factors: commitment from senior management; code of conduct and compliance policies and procedures; oversight, autonomy, and resources; risk assessment; training and advice; incentives and disciplinary measures; third-party due diligence; confidential reporting and internal investigation; testing and review; and pre-acquisition due diligence and post-acquisition integration in mergers and acquisitions.⁴³

The Compliance Function: An Overview

The Volcker Rule, jointly promulgated by federal banking agencies, requires that the compliance programs of mid-sized banks satisfy the following six elements: written policies and procedures; a system of internal controls; a management framework that clearly delineates responsibility and accountability for compliance; independent testing and audit of the effectiveness of the compliance program; training for trading personnel and managers; and making and keeping records sufficient to demonstrate compliance.⁴⁴ In the case of mega-banks, the rule mandates enhanced programs with more detailed policies, limits, governance processes, independent testing and reporting, and CEO attestation.⁴⁵

Several features of robust compliance discussions warrant further discussion. One is the idea of “tone at the top.” The concept is vague and indefinite, and it is all too easy for an unscrupulous CEO to mouth the right words while secretly subverting performance. Nevertheless, many government officials and compliance professionals view tone at the top as essential.⁴⁶ Part of the challenge of an effective compliance program is to signal the credibility of senior managers’ commitment to compliant behavior.

Another key feature is controls over hiring. If an organization hires only employees of outstanding character, it is unlikely to run into compliance problems down the line. The problem is how to sort between good and bad candidates. People do not show up at the job interview bearing signs signaling the quality of their character. Human resources departments have developed a number of techniques to overcome this information asymmetry. The organization (p. 994) may investigate a job candidate’s arrests, convictions, bankruptcies, credit scores, and employment history. The HR department may administer psychological assessments and may require employees and candidates to undergo drug or alcohol tests. These investigative techniques can be effective, but also pose legal risks. The organization must be careful not to cross the line into employment discrimination or illegal intrusions on privacy.

Yet another key feature of a robust compliance program is employee training. A robust program should inform traders, salespeople, and other employees about their obligations and—if possible—encourage them to internalize an ethical norm against shady dealing. Organizations devote considerable ingenuity to finding ways to ensure that the lessons conveyed during employee training have a real impact on behavior. Barclays, a large British bank, may have gone as far as any institution in this regard. In addition to making ethics training available to approximately 140,000 of its employees, Barclays has established a “Compliance Career Academy,” a joint effort with the Cambridge Judge Business School, to deliver compliance training in Cambridge, Johannesburg, New York, and Singapore.⁴⁷

Compliance programs may also include controls such as record keeping, reporting, data analysis, and sign-off requirements. Record keeping creates an audit trail that internal audit or other investigators can use to check on potential violations. Compliance officers can use the power of “big data” to identify red flags of potential misconduct; a host of vendors offer software, systems, and services to assist firms in implementing such analytic methods. Sign-off requirements call a supervisor’s attention to decisions that might im-

The Compliance Function: An Overview

plicate compliance concerns, and operate as a check against uninformed or unethical behavior by junior staff.

Merely undertaking the steps described above is no guarantee that the program will function well. It is possible to establish a “paper program” that includes state-of-the-art compliance procedures but still operates ineffectively. Enron’s cutting-edge compliance program failed to prevent one of the largest frauds in American history (although, in fairness, it should be noted that Sherron Watkins, the Enron whistleblower, did take advantage of one feature of Enron’s program when she elevated concerns about the organization’s financial shenanigans to the highest management level).

Regulators are taking an increasingly active interest in the compliance programs operated by firms they oversee. This interest involves not only obtaining extensive information about the nature and operations of the program,⁴⁸ but also substantive involvement in assessing whether the program is adequate to meet the regulators’ expectations.

(p. 995) 8 Investigations

Once an organization has received evidence of a violation, it must determine what to do. In many cases, the next step is an investigation which seeks to ferret out the underlying facts. Some companies have spent millions or tens of millions of dollars a year in an effort to get to the bottom of potential violations.

Compliance investigations come in two general types. One concerns the routine violations that occur at any workforce. Typically, organizations have a set procedure for such cases. Investigations of minor misconduct are almost always conducted in-house, and may be undertaken by the human resources department under the direction of in-house counsel. The other type of internal investigation is the large-scale inquiry associated with violations that are serious, systematic, or likely to result in government enforcement actions. These investigations are often outsourced to law firms which specialize in the practice area; the reasons are that the organization may not have the resources in-house for such a major undertaking and that enlisting the aid of an independent attorney may induce leniency by the regulators. A downside of outside investigations is that organizations lose control of costs: having assigned a third party to perform the inquiry, they cannot afford to be seen as denying the investigators the resources needed to pursue their inquiry wherever it may lead.

A notable feature of internal investigations is the fact that employees enjoy few of the rights that would be afforded to them if the investigation were being carried out by the government. Private employers are not bound by constitutional norms. Further, because employees generally lack an expectation of privacy in the workplace, there are few limits on what the employer may scrutinize: the employer can read the target’s emails, monitor her web-browsing habits, listen to her voicemails, train video cameras on her (in public spaces), confiscate her hard drive, interview her without disclosing that she is under suspicion, and deny her the right to counsel during such interrogations. Even worse, from

The Compliance Function: An Overview

the employee's point of view, information obtained by the employer during such an investigation may be turned over to the government, and can even be used by the organization as a strategy for obtaining leniency for itself.⁴⁹

Employees found to have committed a compliance violation will often be summarily terminated under circumstances that are hard to explain to other employers. They may lose their professional reputations. The emotional strains of investigation and punishment are likely to be high. They may experience a loss of benefits or a claw-back of compensation previously advanced. And while many who suffer these consequences have committed infractions that merit punishment, some who are innocent may find it difficult to clear their reputations.

9 Whistleblowers

Whistleblowers are key to compliance because they come forward with private information about violations. The potential advantage offered by such informants, however, is (p. 996) threatened by the powerful social norm against "snitching."⁵⁰ No one likes a tattletale, and people who report compliance violations face retribution, not only from the people they expose, but also from others who enforce the social code. To counteract this problem, compliance programs typically provide an anonymous means for whistleblowers to communicate with senior officers, potentially including the CEO or the board audit committee chair, and also offer guarantees against retaliation. Some organizations have gone further and defined whistleblowing not only as a right but also as an obligation: all employees are required to come forward and report when they observe evidence of misconduct.

Whistleblowing is now protected by law in many countries. The UK's Public Interest Disclosure Act of 1998 provided a degree of protection against retaliation for employees who report their employer's unlawful practices by making a "protected disclosure." In 2013 the UK substantially expanded these protections by, among other things, imposing vicarious liability on employers for retaliatory actions by employees as well as individual liability on co-workers who engage in such retaliation.⁵¹ Most other Western European countries provide similar protections. Spanish case law protects employees from employer retaliation in response to acts undertaken to protect the employee's rights; this general rule can cover acts of whistleblowing as well as other conduct.⁵² French law provides that employees may not be sanctioned by their employers for reporting facts of corruption which they learned in the course of their duties.⁵³ European firms, for their part, appear to have been somewhat slower to adopt whistleblower policies than their American counterparts, but by now a large majority of firms chartered in Western Europe have such policies in place.⁵⁴

In the US, the phenomenon of whistleblowing is regulated by federal and state law. Typically, these laws offer protections against retaliation as well as compensation if retaliation occurs.⁵⁵ Several regulatory schemes also provide bounties for people who come forward with evidence leading to enforcement actions. The SEC's program authorizes payments to

The Compliance Function: An Overview

qualifying individuals who provide original information that leads to an enforcement action generating more than \$1 million in sanctions; qualifying individuals receive between 10% and 30% of the penalty.⁵⁶ The Internal Revenue Service operates a similar program for persons who come forward with information about tax violations.⁵⁷ In the banking law area, the Federal Financial Institution Reform, Recovery and Enforcement Act of 1988 provides that private individuals may submit confidential claims of violations to the Department of Justice, which has 12 months to investigate. If the government responds by initiating enforcement proceedings, the whistleblower is entitled to between 20% and 30% of the first million recovered, 10% to 20% of the next \$4 million, and 5% to 10% of the next \$5 million.⁵⁸

Also important are *qui tam* actions. The False Claims Act, the most important *qui tam* statute, sets forth a procedure under which a private party (a “relator”) can file a lawsuit on behalf of the government, charging that a person has made a false claim on the government.⁵⁹ The relator (p. 997) must deliver a copy of the complaint plus supporting evidence to the government, which has 60 days to decide whether to intervene. If the government intervenes, it takes responsibility for the litigation although the relator retains the right to participate. If the government doesn’t intervene, the relator may continue the case on her own. Relators receive a bonus if the litigation generates a settlement or judgment on the merits, ranging from 15% to 25% if the government intervenes to 25% to 30% if it does not. The relator is also entitled to attorneys’ fees and costs.

10 Criminal Enforcement

Criminal enforcement of regulatory norms is problematic. Organizations are not human beings; they cannot feel remorse or act with evil intent. They cannot be imprisoned or executed (other than by being put out of business). The most effective sanction against an offending organization is a fine; but fines can be obtained in civil enforcement actions without the high burden of proof and constitutional protections required in criminal cases. Why prosecute organizations, moreover, when prosecutions against individuals appear to be effective? And prosecutors have responsibilities other than enforcing compliance obligations—they need to deal with murderers, drug kingpins, and terrorists. Since civil authorities are available to enforce regulatory norms, would a prosecutor’s resources be better directed elsewhere? Notwithstanding these objections, criminal prosecution is now well entrenched as one of the government’s arsenal of weapons arrayed against regulatory violations.⁶⁰ So active are prosecutors, in fact, that commentators debate whether regulatory enforcement has become “over-criminalized.”⁶¹

A key issue in criminal cases is whether to initiate a prosecution. The Department of Justice’s *Principles of Federal Prosecution of Business Organizations*⁶² identifies factors that play a role in the charging decision. These include the nature and seriousness of the offense; the pervasiveness of wrongdoing; the organization’s past history of offenses; the value of cooperation and voluntary disclosure; the existence of a pre-existing compliance program; remedial actions undertaken by the organization; collateral consequences to

The Compliance Function: An Overview

third parties; the adequacy of prosecution against the individual offenders; and the availability of remedies such as civil or regulatory enforcement actions.

Criminal cases only rarely result in a verdict after trial. More often, prosecutors and the regulated party settle the dispute. Traditionally, settlements took the form of plea bargains in which the defendant pleaded guilty to a lesser offense. A problem with plea bargains is that the offender is generally required to admit its guilt.⁶³ Organizational defendants don't want (p. 998) to admit to criminal behavior for a number of reasons. Admitting guilt will likely damage their reputations, may result in their being debarred from providing services to government entities, and may be used against them in subsequent civil litigation. In many cases, therefore, the need to admit guilt in a plea bargain will be a stumbling block to settlement.

To avoid this problem, the US government has devised alternative remedies: deferred prosecution agreements (DPAs) and non-prosecution agreements (NPAs).⁶⁴ Because they are private agreements without a formal finding of liability, DPAs and NPAs do not involve judicial oversight and thus do not insert the court as an independent check on prosecutorial behavior. DPAs and NPAs may contain an agreed statement of facts but don't require an admission of guilt. Key to these agreements is the organization's commitment to cooperate with the government and to rectify control deficiencies. Often the agreement will set forth detailed obligations to establish or enhance compliance programs, policies, and procedures.⁶⁵

11 Compliance beyond the Firm

Traditionally, the law of compliance has focused on a firm's internal norm enforcement activities. In recent years, however, law enforcement agencies and others have sought to enlist organizations to enforce norms against third parties. These cases of "compliance beyond the firm" can cause problems for the administration of compliance programs.

Consider the requirement under the US Bank Secrecy Act for financial institutions to file Suspicious Activity Reports (SARs) with FinCEN, an agency of the Department of the Treasury. These reports are required whenever a transaction involves at least \$5,000 and the bank knows, suspects, or has reason to suspect that the transaction involves funds derived from illegal activities or is intended or conducted in order to hide or disguise funds or assets derived from illegal activities.⁶⁶ The SAR filing requirement is an example of compliance beyond the firm because the bank is asked to facilitate the government's efforts to combat money laundering and terror financing.

Another example of compliance beyond the firm is the UK Bribery Act, enacted in 2010, one of the most comprehensive and far-reaching anti-corruption measures in the world. This statute imposes penalties of fines and up to 10 years' imprisonment, and also provides for disqualification of directors found responsible for violations. The jurisdictional scope of this statute is exceptionally broad.

The Compliance Function: An Overview

In the US, the Foreign Corrupt Practices Act (FCPA) prohibits firms with US connections from bribing foreign officials.⁶⁷ While the statute is directed at corrupt activity by employees or agents of US firms, it also has the obvious function of deterring corruption in foreign governments—a form of outsourced compliance.

(p. 999) Compliance beyond the firm has also become an issue in US securities law. The SEC's "conflict minerals" rule requires companies that use "conflict minerals"—tantalum, tin, tungsten, and gold—to disclose to the Commission whether those minerals originated in the Democratic Republic of the Congo or an adjoining country.⁶⁸ If such materials did originate in the defined area, then companies must also submit an additional report to the Commission containing a "description of the measures taken . . . to exercise due diligence on the source and chain of custody of such minerals," and "a description of the products manufactured or contracted to be manufactured that are not DRC conflict free."⁶⁹ An important purpose of this rule is to discourage companies from activities that could indirectly contribute to human rights abuses in the affected region.

12 Ethics beyond Compliance

Organizations often include the term "ethics" in their compliance programs, promulgate codes of "ethics" that include a compliance component, and create positions such as "chief ethics officer" that include responsibility for compliance. As illustrated by these and other governance features, the law of compliance shares an uneasy boundary with a broader set of issues that might loosely be termed "ethics beyond compliance."

Several factors explain the ambiguity in topic definition. First, the notions of a culture of compliance and tone at the top cannot be strictly limited to formal legal requirements; otherwise the task of compliance could become synonymous with skirting legal regulations. Second, it may be advisable for an organization to place a "fence" around legal norms, thus helping to ensure that even if employees make mistakes they are unlikely to break the law. Third, the norms enforced by the compliance function include not only external rules but also internal norms. Self-imposed rules are often thought of as matters of ethics rather than law (consider bar association ethics codes). Finally, organizations can benefit from the "good guy" image that ethical behavior beyond compliance can promote, either because the organization's constituents obtain psychological benefits from doing the "right thing" or because a favorable public image may enhance sales, attract investment, deflect criticism, or deter enforcement actions.

Issues of ethics beyond compliance were problematic in an earlier era. Corporations were conceived of as exclusively profit-seeking enterprises that existed to serve the financial interests of shareholders. Such a firm could not make substantial gifts to charity without raising concerns that the donations were *ultra vires*. Early decisions on charitable gifts gave credence to this idea, at least when the gift was unusually large or general in scope.⁷⁰ More recently, corporate law has evolved to a point where gifts to charitable causes are clearly authorized.⁷¹ Nevertheless there probably are limits beyond which a

The Compliance Function: An Overview

firm's charitable activities could be called into question—either because the gift is large relative to profits or because an insider is seen as obtaining some special benefit.

(p. 1000) Ethics beyond compliance has expanded beyond its initial grounding in charitable gifts. Permitted public interest goals include matters such as social responsibility, community empowerment, respect for human rights, sustainable environmental policies, labor rights, and other objectives.⁷² Open any company website and you are likely to find a description of the various activities the firm is supporting to serve the public interest. State legislatures have also taken an active role. Many states now authorize “public benefit corporations” which serve the public interest as well as private profit.⁷³ A potential advantage of these companies is that they inform investors of their public interest goals; shareholders cannot claim unfairness or surprise when the company goes about seeking those goals at the expense of profits. It is too early to tell if public benefit corporations will have an important impact or to assess whether they will be subject to the same compliance obligations as apply to traditional profit-oriented firms.⁷⁴

The Oxford Handbook of Corporate Law and Governance

Edited by Jeffrey N. Gordon and Wolf-Georg Ringe

Print Publication Date: May 2018 Subject: Law, Company and Commercial Law

Online Publication Date: Dec 2016 DOI: 10.1093/oxfordhb/9780198743682.013.42

Abstract and Keywords

This chapter deals with fundamental issues of corporate insolvency (bankruptcy) law. Particular attention is paid to the agency problems related to “insolvency (bankruptcy) governance” of corporations and how these problems are addressed in various jurisdictions. Methodologically, the chapter is based on a functional approach that compares different legal regimes against the yardstick of economic efficiency. The structure of the chapter follows the issues as they arise in time in a corporate insolvency proceeding: objectives of insolvency laws, opening and governance of proceedings, ranking of claims and the position of secured creditors and shareholders, and rescue proceedings. The chapter also covers the contractual resolution of financial distress. It concludes with thoughts on the reasons for the identified jurisdictional divergences and an outlook on the worldwide efforts toward harmonization of (corporate) insolvency laws. In terms of jurisdictions, the chapter mainly draws on the corporate insolvency laws in the US, England, France, and Germany.

Keywords: insolvency, bankruptcy, corporations, corporate insolvency law, corporate bankruptcy law, comparative law, insolvency governance, bankruptcy governance

1 Introduction

CORPORATE law and governance on the one hand and insolvency/bankruptcy¹ law on the other have long been viewed as distinct disciplines: whereas the former deal with legal issues associated with the organization and operation of a solvent corporation, the latter is meant to address a new set of legal problems arising once a corporation finds itself in severe financial distress. Agency conflicts between shareholders and management and between majority and minority shareholders figure prominently in corporate law and governance.² Agency conflicts between the corporation and its creditors and within the creditor community are at the center of insolvency law.³

Comparative Corporate Insolvency Law

The divide between these two spheres of law and academic discipline becomes less clear, however, once one conceives of insolvency law as “corporate governance under financial distress.” Indeed, “insolvency governance” can be characterized as a special form (or case) of “corporate governance.”⁴ The conceptual/analytical apparatus to understand the regulatory problems and develop potential policy responses is the same; it is only the framework conditions which change, and possibly only to a small degree: laws on the (financial) restructuring of businesses pre-insolvency are gaining increasing importance, in the European Union and elsewhere.⁵

(p. 1004) Hence, it appears sensible to include a chapter on corporate insolvency law in a handbook on corporate governance. Such a chapter should of course be comparative in nature, i.e., it should consider the regulatory approaches of different jurisdictions with respect to corporate insolvency law issues and compare their respective merits. Adopting a comparative perspective enlarges the “solution set” for legal problems and also helps evaluate domestic regulatory approaches against an international benchmark (“best practice”). This chapter focuses on the corporate insolvency laws of the US, England, France, and Germany. It does so because these jurisdictions are representative of diverse legal traditions and because they can rightfully be characterized as leading the international search for optimal insolvency and/or restructuring regimes with respect to corporate entities that find themselves in or near financial distress. Harmonization efforts worldwide are, or have been, heavily influenced by Chapter 11 of the US Bankruptcy Code, the English Scheme of Arrangement, the French *sauvegarde* proceedings, and German proposals to regulate insolvencies of members of a group of companies—to name just a few examples.⁶

Interest in comparative corporate insolvency law has grown considerably in the last years, driven by various factors. It is increasingly recognized that (corporate) insolvency laws have a significant impact on entrepreneurship and economic growth.⁷ Hence, jurisdictions attempt to identify best practices that allow them to boost their domestic economies. At the same time, the number of transnational insolvencies is clearly on the rise. Given the growth in international commerce, today even the insolvency of small or medium-sized (closed) corporations usually will exhibit some transnational aspect such as foreign creditors, subsidiaries/branches/offices in other jurisdictions, or assets that are located abroad. However, scholarly work in the field of comparative corporate insolvency law up till now has been rather scarce.⁸

This chapter will start out with an introduction to the comparative approach as applied to corporate insolvency law (section 2). It will then provide a taxonomy of insolvency laws and identify objectives that these pursue (section 3). Substantive issues covered will be the (p. 1005) opening (section 4) and governance (section 5) of insolvency proceedings, the ranking of claims, and, in particular, the position of secured creditors (section 6), contracting for assets of the debtor (section 7), rescue proceedings (section 8), and the contractual resolution of financial distress (section 9). The chapter concludes with some thoughts on the reasons for the identified jurisdictional divergences (section 10) and an outlook on the worldwide efforts toward harmonization of insolvency laws (section 11). It

goes without saying that the level of detailed analysis that can be reached in a book chapter on these many important issues is limited. The emphasis will be on those issues that are more closely related to questions of corporate governance.

2 The Comparative Approach

The comparative approach is characterized by a functional perspective. It starts with a particular regulatory problem, and it seeks to understand, describe, and evaluate how that problem is “solved” in a particular jurisdiction. This implies that the comparative approach needs to abstract from jurisdiction-specific categorizations and doctrinal classifications. To illustrate: one important issue in comparative insolvency law is the “initiation problem”:⁹ What triggers insolvency proceedings? How do they get started? Jurisdictions worldwide approach this issue very differently. Some use liability rules—in corporate and/or insolvency law—that penalize managers for filing too late. Some reward managers for initiating insolvency proceedings in time by, for example, rights and/or privileges such as the “debtor in possession” (no insolvency administrator is appointed and management stays in charge of running the bankrupt firm) or an “exclusivity period” during which only the debtor may propose a restructuring plan (see in detail section 4 *infra*). Comparative analysis must be open to very different regulatory approaches and techniques in order not to lose sight of the wealth of rules and mechanisms that attempt to address a particular regulatory problem.

Another recurrent and important issue in comparative law is the problem of the appropriate measuring rod. Once different regulatory approaches and techniques have been identified, their operation in legal practice and their effects in reality must be studied in closer detail. The former task involves, in particular, an in-depth analysis of the relevant case law and contract practice; the latter social-scientific studies of causal consequences of legal rules. It is against this background that the important normative question must be put: Which regulatory approach/technique is or works best, given the regulatory background? This question can only be answered, if it can be answered at all,¹⁰ on the basis of a clearly specified measuring rod. For a long time, “conventional” comparative private law scholarship has not been very convincing in this respect. To characterize a specific jurisdiction’s rule or regime as “better” or “more appropriate”¹¹ rather begs the question: Why? The analytical (p. 1006) landscape has changed considerably with the advent of the economic analysis of law in the 1970s. “Positive Law and Economics” offers tools to predict the effects of laws in reality, and “Normative Law and Economics” uses welfare economics to evaluate these effects, judging the underlying laws to be more or less efficient.¹² To be sure, both branches of the economic analysis of law are subject to severe criticisms.¹³ The analytical apparatus of economics has been refined to respond to these criticisms, leading inter alia to new sub-disciplines such as “Behavioural Law and Economics.”¹⁴ For this reason and because (1) the economic analysis of legal rules often generates relatively precise answers (compared to more fuzzy measuring rods) and (2) efficiency has a relatively high appeal as a normative criterion especially in the field of commercial and corporate activities, this standard will be used in this chapter. However,

shortcomings and/or limitations of the economic analysis will be mentioned where necessary.

3 Taxonomy and Objectives of Insolvency Laws

As a starting point for comparative corporate insolvency law scholarship, it seems helpful to take stock of existing corporate insolvency law systems in select jurisdictions, identify the objectives these pursue, and compare them. A particular issue in this context is whether there is a need for a special insolvency regime for systemically important financial institutions. This issue has assumed a significant importance in the regulatory aftermath of the most recent global financial and economic crisis.

3.1 Taxonomy of Insolvency Laws: Different Systems

Corporate insolvency law systems in various jurisdictions differ formally especially in that some jurisdictions have a multiplicity of proceedings that are regulated in different statutes or at least different chapters in one statute, whereas others are less “rich” in the choices they offer for corporate debtors that find themselves in or near financial distress.¹⁵ A broad distinction can be drawn between proceedings that aim at a restructuring of corporate debtors and those that are directed toward liquidation. In its simplest form, this distinction is reflected in two well-known Chapters of the US Bankruptcy Code: Chapter 7 on liquidations and Chapter 11 on reorganizations. Germany modeled its own *Insolvenzordnung* (in force (p. 1007) since 1999) against the background of these two Chapters: the statute contains liquidations in its initial parts and a Chapter-11-type debtor in possession restructuring proceeding in Parts 6 and 7.

With the increasing importance of corporate restructurings and the need for legal regimes to facilitate these, especially pre-insolvency, some jurisdictions now offer not just one restructuring regime but a multifaceted set of restructuring laws. This is true, for example, with respect to England: the Insolvency Act 1986 contains the Winding Up procedure in Part IV, a liquidation proceeding, but also the Administration (Schedule B1) and the Company Voluntary Arrangement [CVA] (Part I), which can be used as a restructuring framework. These are complemented by the Scheme of Arrangement (SoA) (sections 895–901 of the Companies Act 2006), another restructuring tool that can be employed both before and after insolvency (Solvent and Insolvent Schemes of Arrangement). The French insolvency landscape is even more diverse. Book 6 of the *Code de commerce* contains different types of court-supervised proceedings (*Redressement judiciaire*, *Liquidation judiciaire*), but also many different forms of restructuring proceedings with minimal or no court intervention: *Procédure de conciliation*, *Procédure de sauvegarde*,¹⁶ *Procédure de sauvegarde financière accélérée*, and *Procédure de sauvegarde accélérée*.

A crucial distinguishing feature with respect to these various “modern” restructuring proceedings is whether they offer tools to discipline holdouts such as, for example, an automatic stay and/or the possibility of majority voting with respect to a restructuring plan.¹⁷ Without these devices, the proceeding is purely voluntary in the sense that creditors can-

not be forced to participate. This allows for strategic maneuvering and free riding. At the same time, introducing a stay or majority voting comes at a cost: it increases court involvement and (public) visibility and, as a consequence, direct and indirect bankruptcy costs.¹⁸ The English Scheme, for example, does not impose a stay but allows majority voting, the French Procédure de sauvegarde and the Procédure de sauvegarde accélérée impose a (universal) stay but do not allow all dissenting creditors to be bound by a plan agreed by a majority of creditors, and the Procédure de conciliation exhibits neither of these “collectivizing” devices.¹⁹

Whether or not liquidations and (various forms of) restructurings are or should be regulated in different chapters of the same statute or in different statutes is more a formal (p. 1008) than an important substantive question. Putting them in the same statute might generate certain cost advantages because an initial general chapter can be used to stipulate certain rules that apply to all types of proceedings. On the other hand, clarity and marketability of the proceeding for potential users might be said to argue in favor of a separate statute. Furthermore, including a chapter on restructurings in legislation entitled “Insolvenzordnung” (Insolvency Code)—as in Germany—might be said to be particularly bad in this respect, as “Insolvency Code” tends to be associated with liquidations.

A more important substantive issue is whether firms worldwide have access to efficient restructuring proceedings that can be initiated pre-insolvency. A lack of efficient local proceedings is not so much a problem for multinational corporations as they are usually able to forum shop for the best or most suitable restructuring regime. However, given the costs involved with forum shopping, this is not a viable alternative, especially for many SMEs. Hence, a case can be made for “minimum harmonization” with respect to jurisdictions’ provisions of pre-insolvency restructuring regimes. Such harmonization efforts are currently being undertaken in the European Union, for example (see in detail section 11).

3.2 Bank Insolvency and Resolution

Before the most recent global financial and economic crisis, very few jurisdictions worldwide had special bank insolvency and restructuring/resolution regimes in their statute books. It is true that banks were mostly subject to distinctive supervisory regimes. But once it came to insolvency, regular insolvency proceedings were applied, usually with certain exceptions—to account for the banks’ unique corporate features—such as, for example, filing rights and pick of insolvency administrators.

This all changed with the global financial and economic crisis, starting in the UK with the bank run on Northern Rock (2007) and involving the bankruptcy of Lehman and a bailout of American International Group (AIG)—both within a couple of days of each other in September 2008. The policy shift followed rapidly. The evidence supporting the shift was not very strong though: if one compared the reaction of certain capital market indices to the Lehman Chapter 11 filing on the one hand and to the AIG bailout on the other, it appears that it was not the bankruptcy procedure itself that was the problem—the TED spread, for example, increased more after the AIG bailout.²⁰ Nevertheless and very soon,

a worldwide near-consensus amongst policy makers and regulators emerged that the default, in particular, of a systemically important financial institution demands a special regime that kicks in earlier, is more flexible, and also much speedier than an ordinary bankruptcy proceeding.²¹ Further, depositors should not have to fear that their claims would be reduced in a bankruptcy proceeding. After the 2007 collapse of Northern Rock, the UK was (p. 1009) the first jurisdiction to enact a “modern” bank resolution and recovery regime (Banking Act 2009).²² Other jurisdictions followed suit: the US with Title II of the Dodd–Frank Wall Street Reform and Consumer Protection Act (2010)²³ and Germany with the Kreditinstitute-Reorganisationsgesetz (2010).²⁴

Experimenting with different types of bank resolution and recovery regimes might be viewed as a potential regulatory option—let the market decide which rule systems work (best). However, at least in the banking field, a consensus amongst policy makers and regulators soon again emerged that this was no real option and that, wherever feasible, harmonization along the lines of best practice should be achieved. One can, of course, ask critical questions as to the existence of a best practice in a regulatory field so new and untested as bank resolution and recovery, and point to the dangers of harmonizing along the lines of principles that are potentially fundamentally flawed.²⁵ Nevertheless, the European Union (EU), for one, pushed forward and enacted the “Bank Recovery and Resolution Directive (BRRD)” in 2014.²⁶ Member States only had until January 1, 2015 to adjust their domestic regimes to the rules stipulated in the Directive.

Simply put, it provides for a unitary system of bank resolution and recovery throughout the EU. The BRRD provides authorities with comprehensive and effective arrangements to deal with failing banks at national level, as well as cooperation arrangements to tackle cross-border banking failures. It sets out the rules for the resolution of banks and large investment firms in all EU Member States. Banks will be required to prepare recovery plans to overcome financial distress. Authorities are also granted a set of powers to intervene in the operations of banks to avoid them failing. If they do face failure, authorities are equipped with comprehensive powers and tools to restructure them, allocating losses to shareholders and creditors following a clearly defined hierarchy. They have the power to implement plans to resolve failed banks in a way that preserves their most critical functions and avoids taxpayers having to bail them out (bail-in versus bail-out). Precise arrangements are set out for how home and host authorities of banking groups should cooperate in all stages of cross-border resolution, from resolution planning to resolution itself, with a strong role for the European Banking Authority to coordinate and mediate in case of disagreements. National resolution funds are (p. 1010) also being established. In the case of Member States within the Eurozone, these funds were replaced by the Single Resolution Fund as of 2016.

3.3 Economic versus Non-Economic Goals

What are the proper goals of a corporate insolvency procedure? The normative importance of the answer to this question cannot be overestimated. It defines the architecture of an insolvency proceeding and is also important with respect to most specific regulatory

issues in corporate insolvency law. As with many other areas of the law, an economic perspective on insolvency laws has become very influential—both in the scholarly literature and in law-making. Hence, it is indispensable to understand and study this perspective in order to be able to follow the conceptual debates about most insolvency law issues. However, jurisdictions differ markedly regarding the extent to which they design corporate insolvency law systems according to economic principles. This difference is also reflected in another distinction, namely whether a country's corporate insolvency regime is more creditor or more debtor oriented.

3.3.1 The Economic Perspective of Insolvency Laws

The economic perspective clearly distinguishes between an ex post and an ex ante view of insolvency laws. The former view is the one usually adopted by lawyers and legal scholars. With respect to corporate insolvency law, it focuses on the question of what to do with the assets of a corporation and the corporation itself in a situation in which it finds itself in financial distress, i.e., unable to pay all its debts as they fall due.²⁷ The economic maxim to address this question is simple: maximize the net company value. The larger the pie, the more is available for distribution to the company's creditors. This goal (function) implies at least three important sub-goals: (1) First, prevention of an asset race, i.e., a solution to the common pool problem.²⁸ Creditors of a financially distressed corporation find themselves in a multi-party prisoners' dilemma.²⁹ Each creditor has a dominant strategy to seize assets as fast as possible—with potentially disastrous consequences for the group. (2) Second, restructuring of the firm only if the restructuring value exceeds its liquidation value, i.e., if the firm is economically viable.³⁰ On the basis of this test, the great majority of insolvent corporations in legal practice should be liquidated because they suffer from financial *and* economic failure.³¹ (3) Third, minimization of the direct and indirect costs of insolvency proceedings. (p. 1011) Direct costs comprise the transactions costs triggered by the procedure such as, for example, administrators' or court fees. Indirect costs are economic losses caused by the procedure such as, for example, the reputational damage to the firm associated with the mere fact of an insolvency procedure. Indirect bankruptcy costs are usually much higher than direct bankruptcy costs and tend to consume approximately 10-20% of the remaining firm value.³² Given the creditors' interest in as large a pie as possible in bankruptcy, minimizing direct and indirect bankruptcy costs is an economic imperative.

Economic analysis complements the ex post view of insolvency laws with an ex ante perspective. The message is as clear-cut and simple as the maxim from an ex post perspective. Ex ante is about setting the appropriate, i.e., welfare-maximizing, incentives for shareholders and managers of a corporation that might find itself in financial distress (with a non-trivial probability). This goal (function) implies at least two important sub-goals: (1) First, agency costs of debt must be reduced. As is well known, shareholders of a near-insolvent corporation have an incentive to undertake risky projects that might even have a negative net present value ("betting the bank's money").³³ Managers have similar incentives to the extent that they can be assumed to act according to the shareholders' preferences.³⁴ Hence, in closed corporations, where shareholders are usually able to di-

rectly control managers' actions, the "risk shifting incentive" of managers will be stronger than in public corporations where management enjoys more freedom in business decisions. (2) Second, restructuring efforts of a firm that faces serious business problems should be initiated sooner rather than later. Experience teaches us that the timely triggering of restructuring initiatives is a crucial success factor for these initiatives.³⁵ Indeed, it is never too early to think about the competitiveness of one's business, and there is no clear-cut line between keeping a business on a competitive track—by appropriate measures—and restructuring it to avert a decline in financial and/or economic performance.

How do different jurisdictions' insolvency laws worldwide fare against these criteria for ex post and ex ante efficient insolvency regimes? There are no overall empirical analyses of the relevant cost/benefit effects available, and the methodological hurdles for such studies do (p. 1012) seem insurmountable: recovery rates for creditors in bankruptcy tell only part of the story,³⁶ and how would one even start to identify and measure accurately all relevant cost/benefit factors that go into an overall calculus of the efficiency effects of a particular insolvency regime? What probably can be said, though, is that the ex ante effects are more important than the ex post effects: the former relate to all firms, whereas the latter are important only with a subset of firms, namely those that find themselves in financial distress.³⁷ To put it differently: maintaining the health of all firms is more important than getting it right with respect to the subset of firms that find themselves in the emergency room. Hence, the fixation of lawyers and legal scholars with ex post efficiency is misplaced—at least from an economic standpoint.

3.3.2 Diversity of Bankruptcy Philosophies

As already stated in the introduction to this section, jurisdictions worldwide differ markedly with respect to the "bankruptcy philosophies" that they pursue.³⁸ On the one hand, there are jurisdictions that view insolvency law primarily or even exclusively as debt collection law, i.e., as an instrument to best satisfy creditors' interests when the debtor is in a situation of financial distress. These jurisdictions tend clearly to prioritize economic efficiency vis-à-vis any other potential goal to be pursued by insolvency laws. On the other hand, there are jurisdictions that entertain a policy according to which insolvency law should serve not only creditors' but also other stakeholders' interests, for example those of the debtor, workers, and the (local) community.³⁹ Under this policy, environmental concerns are a legitimate factor in a corporate insolvency as well as are, potentially, redistributive aims: insolvency is not just about enforcing pre-existing entitlements under conditions of scarcity; it is also about redefining entitlements and shifting rents.⁴⁰

(p. 1013) The current German insolvency regime for corporate debtors clearly falls in the first group, i.e. it is debt collection law and nothing else. Section 1 of the Insolvenzordnung reads as follows:

The insolvency proceedings shall serve the purpose of collective satisfaction of a debtor's creditors by liquidation of the debtor's assets and by distribution of the proceeds, or by reaching an arrangement in an insolvency plan, particularly in order to maintain the enterprise. Honest debtors shall be given the opportunity to achieve discharge of residual debt.

The discharge mentioned in the second sentence is irrelevant for corporate debtors: it applies only to natural persons (see sections 286 et seq. Insolvenzordnung). On the other end of the spectrum, we find the current French insolvency laws. With respect to a *Redressment judiciaire*, the Code de commerce sets out the following objectives: "The purpose of the judicial restructuring is to allow the continuation of the business's operations, the maintenance of employment and the settlement of its liabilities."⁴¹ Hence, considerations of maintaining employment (in the short run) or "local business structures" may well trump economic logic. The "middle ground," so to speak, is firmly occupied by the US and the English insolvency regimes. Traditionally, US Chapter 11 has a very strong debtor orientation: despite some changes in more recent times,⁴² the fresh start philosophy and giving the debtor a second chance is still characteristic of Chapter 11 proceedings. Of course, discharge can be advocated both on economic and on redistributive grounds, and the US version of discharge as a tool to promote entrepreneurship probably falls more in the first than in the second category (whether it is successful in that regard is another matter⁴³). English insolvency law used to be and still is fairly creditor rights oriented. For example, the holder of a qualifying floating charge may appoint an administrator or an administrative receiver under the Insolvency Act 1986 without the need for an order of the court.⁴⁴ However, as early as 1982, the "Cork Report" (commissioned by a Labour government in 1977) had suggested that insolvency laws should pursue a multiplicity of aims and that the effects of insolvency are not limited to the private interests involved.⁴⁵ This view was reflected in later reforms, especially in those introduced by the Enterprise Act 2002. The Act made substantial amendments to the administration procedure for failing companies. The purpose was to enhance the policy of creating a "rescue culture," so that insolvent companies should so far as possible be saved, before their assets are stripped and distributed to creditors.⁴⁶

Against the background of even this small sample of insolvency policy debates and law-making in select countries, it clearly emerges how markedly jurisdictions worldwide differ with respect to the "bankruptcy philosophies" that they pursue. The extent to which economic reasoning should appropriately inspire corporate insolvency law reform certainly is one of the features of this ongoing discussion. At the same time, the marked differences also (p. 1014) indicate how difficult harmonization efforts with respect to corporate insolvency lawmaking are and will be (on this, see section 11 *infra*).

3.3.3 Creditor versus Debtor Orientation

The significant differences between various jurisdictions with respect to the degree to which their insolvency systems attempt to achieve economic efficiency is also reflected in another distinction, namely whether a country's corporate insolvency regime is more creditor or more debtor oriented. There are at least two reasons why one might want to

undertake such a categorization or classification: first, it serves a heuristic purpose in the sense of informing scholars or policy makers of the principal direction of a jurisdiction's bankruptcy philosophy; second, it might be used as a basis for undertaking econometric analysis, for example with respect to the level and/or structure of debt financing in a particular jurisdiction. One could hypothesize, for example, that more creditor orientation will lead to more credit being extended and at terms more favorable to the debtors—a hypothesis that has indeed been confirmed by econometric studies.⁴⁷

Various features of an insolvency regime can be singled out to signal more or less creditor or debtor orientation: the appointment of a trustee to safeguard creditors' interests versus the "debtor in possession" (DIP), the imposition of an automatic (and complete) stay with respect to creditors' enforcement actions (less creditor protection), or the so-called absolute priority rule, i.e., the rule that lower-ranking creditors or, more generally, claim-holders are allowed to receive any value only if higher-ranking claim-holders have been paid in full (more creditor protection). Other criteria that have been suggested are the existence of a set-off in insolvency, the protection of security interests, the existence of the trust as a legal device, the marketability of contracts, and the tracing of tainted money⁴⁸—every single one of these criteria is meant to indicate a stronger creditor orientation. While most of these criteria make intuitive sense, others appear to be more idiosyncratic such as the existence of the trust, which is unknown in civil law jurisdictions without it being obvious that these jurisdictions therefore necessarily are less creditor oriented. Clearly for econometric studies such as those mentioned above, a less heterogeneous proxy needs to be constructed, and in fact it was constructed ("creditor rights index"),⁴⁹ without doing away with the controversies about the appropriateness of the chosen index for its specific purpose.⁵⁰

As with a categorization of jurisdictions as being more or less inclined to follow economic logic in the design of their insolvency laws, one can also categorize jurisdictions as being more or less creditor or debtor oriented (based on any of the metrics mentioned above). This would lead to Germany and England being representative of a fairly strong creditor-orientation policy, whereas France counts as strongly debtor oriented, with the US being positioned somewhere in the middle. The above-mentioned heuristic value of such a categorization or classification exists, but it is limited.⁵¹ To begin with, it obviously (p. 1015) makes a significant difference whether creditor orientation is about the interests and rights of secured creditors or whether one is talking about the interests and rights of unsecured creditors. Most metrics or schemes simply assume that, in principle, secured credit should receive priority in insolvency—an assumption that is far from uncontroversial (see section 6 *infra*). Moreover, a classification or categorization of an insolvency regime as creditor or debtor oriented neglects the importance of ownership, debt, and governance structures in a particular jurisdiction for the design of its insolvency laws.⁵² For example, concentrated debt structures—such as exist in jurisdictions where the majority of debt is held by a few large commercial banks—facilitate workouts, i.e., out-of-court restructurings: the free-rider problem associated with holdouts is less acute in such jurisdictions, and negotiations amongst creditors proceed with greater ease and efficiency compared to jurisdictions in which most corporate debt is held by dispersed bondhold-

ers. Hence, in a jurisdiction with concentrated debt structures, there is less need for a debtor-friendly reorganization procedure. By contrast, fragmented and dispersed debt ownership calls for a statutory and debtor-friendly reorganization procedure that supports ex post efficiency in the restructuring of a financially distressed corporate debtor. To conclude, statements with respect to the creditor or debtor orientation of a particular jurisdiction need to be put in context, i.e., adjusted for the ownership, debt, and governance structures in the respective jurisdiction.

4 Opening of Insolvency Proceedings

When should statutory insolvency proceedings with respect to a corporate debtor be opened? “The Initiation Problem in Bankruptcy”⁵³ is certainly one of the most important insolvency policy questions that every jurisdiction has to answer in one way or another. Based on economic reasoning, the answer to this question seems straightforward: insolvency proceedings should be opened in case of financial failure of a company. More formally, the test is $V = \max(V_{gc}, V_l) < L$, where V stands for the greater of the going concern value and the liquidation value of the company and L for its liabilities. In essence this means that insolvency proceedings should be initiated once whatever value is left in the firm is less than the firm’s liabilities to its creditors. This does not mean that the firm should be shut down. The latter question, i.e., economic failure, is defined by the following condition: $V_{gc} < V_l$. A firm should be shut down if its going concern value is lower than its liquidation value.

In reality, it can be very difficult to determine whether $V = \max(V_{gc}, V_l) < L$ holds. Whereas it usually will be relatively straightforward to determine L , both the liquidation value of the firm (V_l) and especially its going concern value (V_{gc}) may be hard to estimate, let alone to quantify precisely. Hence, for practical purposes, a proxy for financial failure as defined above is needed. Most jurisdictions worldwide use some form of liquidity test: a firm that is not able to pay all its debts as they fall due must file for insolvency. Usually, illiquidity in this sense will occur after a firm fails financially based on the $V < L$ test. This is so because (p. 1016) even firms whose asset value is lower than its debts may still be able to obtain credit, given information asymmetries, and hence still be liquid.

Initiating insolvency proceedings only once a firm fails financially (on either test) may be too late for two reasons. First, it ignores the effect of backward induction and the incentives thereby created for the firm’s creditors.⁵⁴ If creditors anticipate that a firm will fail financially the day after tomorrow, they all have an incentive to enforce their claims tomorrow, and they all know this. If they all know that everybody will take enforcement action tomorrow, they all have an incentive to do this today, and that is what is going to happen. So backward induction “backdates” the common pool problem. Second, creditors’ interests are already endangered before financial failure of a corporation. Once the equity position of a corporation deteriorates, shareholders and managers have an incentive to engage in risk shifting, i.e., in initiating risky projects that might even have a negative net present value (see section 3.3.1 *supra*). It is difficult to draw a precise lesson from these

two complicating factors for the design of laws on the initiation of corporate insolvency proceedings. The only thing that can be said with certainty is that both backward induction by creditors and risk shifting by shareholders/managers may need to be addressed by insolvency-type rules that apply before a firm is technically financially insolvent.

Different jurisdictions approach the “Initiation Problem” very differently. In the US, for example, the regulatory strategy was, and still is, primarily based on rewarding shareholders/managers for filing early. Central features of (the practice of) Chapter 11, such as the “debtor in possession,” the “exclusivity period” for the debtor to propose a reorganization plan, the automatic stay, and violations of the absolute priority rule,⁵⁵ are best explained as carrots for the incumbent shareholders/managers to use the statutory reorganization procedure as a tool to get a distressed company back on track. The English and the French approaches differ significantly. Both jurisdictions rely on sticks rather than carrots to secure a timely filing. In England, section 214 of the Insolvency Act 1986 imposes unlimited personal liability (“make such contribution (if any) to the company’s assets as the court thinks proper”) for “wrongful trading” on a director of a company that went into insolvent liquidation, if he or she “knew or ought to have concluded that there was no reasonable prospect that the company would avoid going into insolvent liquidation” and did not take “every step with a view to minimizing the potential loss to the company’s creditors.”⁵⁶ This statutory liability is flanked by a similar liability at common law.⁵⁷ In addition, “misbehaving” directors face potentially stiff sanctions under (p. 1017) disqualification rules.⁵⁸ The French liability regime is similar to the English one. Art. L. 651-2, sentence 1 of the Code de commerce (“action en comblement de l’insuffisance d’actif”) reads as follows:

Where the judicial liquidation proceedings of a legal entity reveals an excess of liabilities over assets, the court may, in instances where management fault has contributed to the excess of liabilities over assets, decide that the debts of the legal entity will be borne, in whole or in part, by all or some of the de jure or de facto managers, or by some of them who have contributed to the management fault.⁵⁹

In Germany, neither effective sticks nor sufficiently attractive carrots are currently in place to secure a timely filing. Managers face criminal and tort liability if they fail to file within three weeks *after* cash flow or balance sheet insolvency of a corporation (section 15a Insolvenzordnung, section 823 Bürgerliches Gesetzbuch). They are also liable vis-à-vis the corporation for payments made after that point in time (sections 64 GmbH-Gesetz, 92 para. 2 Aktiengesetz). Hence, it is only upon acute financial distress of a corporation that managers are required to take action.⁶⁰ In 2012, the German lawmaker tried to improve the situation by introducing a reformed DIP procedure which provides the debtor with a “protective regime” of three months during which creditors’ enforcement action is stayed and the debtor is able to conceptualize and propose a reorganization plan (sections 270, 270a, 270b, 270c Insolvenzordnung). However, unlike in the US, the debtor may resort to this regime only after the firm is already balance sheet insolvent or there is a serious threat (likelihood > 50%) of a cash flow insolvency within the foreseeable fu-

ture, i.e., the next months. This may be too late for the initiation of a successful restructuring operation.

The significant diversity of rules that seek to secure a timely initiation of insolvency proceedings in Europe and beyond gives rise to the question of whether some form of harmonization might be beneficial. The case for such harmonization rests on forum shopping by firms in the vicinity of insolvency. Imagine an English company whose directors would face liability under section 214 of the Insolvency Act 1986 were they to put the company in an English insolvency proceeding. They decide to move the “Centre of Main Interests”⁶¹ (COMI) of the company from England to Germany and file for insolvency in Germany. Moving a firm’s COMI from one jurisdiction to another is costly, but it can be done (it is less costly within Europe than, say, from England to the US).⁶² Under German insolvency (p. 1018) laws, they are free from liability as long as they stay within the three-week period mentioned above.⁶³ Hence, they can escape liability in England by shifting the firm’s COMI to Germany. Against this background, a uniform European wrongful trading rule appears to be sensible, and it would also be within the competence of the EU to enact it.⁶⁴

5 Governance of Insolvency Proceedings

Once corporate insolvency proceedings are initiated, a governance mechanism must be put in place—“insolvency governance” substitutes “corporate governance.” However, as mentioned in section 1, the divide between these two spheres of law and academic discipline is less pronounced once one conceives of insolvency law as “corporate governance under financial distress.” To some extent, corporate law already caters for creditors. Just think about the European rules on legal capital, i.e., the regime established by the second company law directive on minimum capital (for certain corporations), capital maintenance, and actions to be taken upon a serious loss of capital.⁶⁵ Agency theory can be used to understand the regulatory problems and develop potential policy responses both with respect to financially healthy and financially distressed corporations. What is true, though, is that insolvency does not only exacerbate existing agency conflicts. The conflicts of interests also change, and new actors and interested parties come on to the stage: in addition to the debtor (shareholders/managers) and its creditors, insolvency courts—alongside general private law courts or specialized corporate courts— insolvency practitioners, and new institutions or agencies of the state/government—looking into, for example, tax, welfare, or environmental matters—become relevant actors, performing specific roles.

Who sits “in the driver’s seat” in various jurisdictions? Again, jurisdictions worldwide differ significantly in the governance mechanisms employed.⁶⁶ Mirroring an earlier categorization or classification of different jurisdictions being more or less creditor or debtor (p. 1019) oriented, creditors enjoy a very strong position both in England and in Germany. This holds true for the various (insolvency) proceedings in England, especially for the CVA and the SoA, which do not involve an insolvency administrator/receiver, but also, al-

beit to a somewhat lesser degree, for the German Insolvenzordnung under which the appointment of at least a supervisor is mandatory if no insolvency administrator is installed. Such a supervisor functions as a controller for significant transactions but also as a mediator between the interests of all other stakeholders. Both in England and in Germany, the insolvency courts are of course in the picture, too. However, they don't actively "manage" the case but rather function as an arbiter that makes sure that fundamental procedural rules and rights are observed.

By contrast in the US, the debtor typically sits "in the driver's seat." This was certainly the case before the Bankruptcy Abuse Prevention and Consumer Protection Act of 2005 curbed some of the debtor's rights and privileges in Chapter 11,⁶⁷ but it is still true today, albeit to a somewhat lesser degree. In France, it is the bankruptcy courts that hold a strong governance position. It was already mentioned that in a Redressement judiciaire, for example, the competent court can always decide on the closure or sale of distressed business—regardless of the business' economic viability (section 3.3.2 *supra*).

As a matter of first principles, there is much to be said in favor of a strong governance role of the firm's creditors in an insolvency proceeding. As the new residual claimants to the firm's assets, their money is at stake, so they have appropriate incentives to take economically rational decisions. However, not all creditors are alike, of course. Fully secured creditors may press for a premature liquidation even in cases where the company is not economically distressed, i.e., its going concern value exceeds its liquidation value. Conversely, creditors who are completely out of the money will push for a continuation of the business even where this would be unjustified economically. Hence, designing an appropriate "creditor governance mechanism" must ensure that creditors' control and decision rights are channeled toward value-maximizing decisions—by establishing appropriate procedural controls (by the competent courts), for example.

Putting creditors in the driver's seat does not imply that the debtor should be completely disempowered. The debtor's managers and, with respect to closed corporations, its shareholders will usually have a significant comparative informational advantage with respect to the debtor's economic and financial health. This can best be "exploited" for the timely initiation of insolvency proceedings if the debtor's managers and its shareholders are rewarded by retaining some control over the firm's management by a debtor in possession-like proceeding, and possibly also can expect to receive some equity value in the firm that is to be restructured. However, here again biases need to be controlled: as with out-of-the-money creditors, shareholders have a strong continuation bias even where a financially distressed firm should be liquidated because it suffers from economic failure.

Do courts have the information, expertise and incentives to play an active governance role that goes beyond arbitrating between competing stakeholders' interests and making sure that fundamental (procedural) rights are observed? Most scholars would probably doubt the courts' competence to perform such a role on all three counts mentioned (information, (p. 1020) expertise, and incentives) and hence be very critical of the very active, managerial role assumed by the French courts in a Redressement judiciaire, for example.

However, there is some evidence that courts may do a better governance job than one could and would expect. In a study on Chapter 11 bankruptcies, it appeared that judges do not suffer from a continuation bias and that they are able and competent to filter correctly economically distressed from healthy firms and to do so quickly.⁶⁸ One probably needs to distinguish between judges in various jurisdictions, their training, expertise and also powers and “goal function” as established by the insolvency rules in place.

An illustrative example of the governance problems raised in insolvency proceedings is offered by going concern sales as a substitute for restructuring proceedings. Such going concern sales seem to offer the possibility of preserving a viable business as a going concern while avoiding the duration and costs involved with developing, negotiating, and confirming a restructuring plan. At the same time, markets for distressed firms often are thin—if they exist at all—and insiders have a strong interest to acquire whatever value is left in the firm at as low a price as possible (see in detail section 8.5.1 *infra*).

6 Ranking of Claims and Position of Secured Creditors

One of the most important questions in the design of (corporate) insolvency procedures is the ranking of claims in general and the position of secured creditors in particular.⁶⁹ Jurisdictions worldwide differ significantly in their approach to this question, not least because it is perceived to involve highly “political” judgments, and the scholarly work, if it exists, does not provide clear guidance. It is not surprising, then, that harmonization efforts in this area face significant challenges.

6.1 Approaches of Different Jurisdictions

If one makes a very stylized distinction between different types of claims, one can differentiate between administrative expenses (AE), secured creditors (SC), and unsecured creditors (UNSC). The latter include tax claims, wages and pensions, and shareholder loans. Based on these three categories, the ranking of different types of claims in England, the US, France, and Germany is remarkably different (see Table 38.1).⁷⁰

The simplest ranking system appears to be the German one: secured creditors come first, followed by administrative expenses and all unsecured creditors. The English system varies this ordering in two important respects: first, floating charges have a lower (p. 1021) ranking compared to fixed charges; second, certain unsecured creditors, including wage claims and unpaid pension contributions, receive a preferential treatment compared to general unsecured creditors. The differentiation between various types of unsecured creditors is also reflected in the US and the French system, with preferred unsecured creditors ranking highest in France—they top all other types of claims, even secured creditors.

Comparative Corporate Insolvency Law

Table 38.1 Ranking of Different Types of Claims				
	England	US	France	Germany
1	SC (fixed charges)	SC (but see § 364 BC for post-commencement financing)	Pref. UNSC (certain taxes, wages/benefits)	SC
2	AE	AE	AE	AE
3	Pref. UNSC (including certain wages, unpaid pension contributions)	Pref. UNSC (including certain wages, unpaid pension contributions, taxes)	SC	UNSC
4	Up to £600,000 for General UNSC	General UNSC	General UNSC	
5	SC (floating charges)			
6	General UNSC (including taxes)			

6.2 Secured Creditors

The treatment of secured creditors in insolvency proceedings has a significant effect on lending practice. One would assume that the higher the ranking of secured creditors in insolvency proceedings is, the cheaper credit will be for debtors, and the higher debt levels/lending volume will be in a particular jurisdiction. This is exactly what is confirmed by the available evidence: Using a sample of small firms that defaulted on their bank debt in France, Germany, and the UK, Davydenko and Franks found that large differences in creditors' rights across countries lead banks to adjust their lending and reorganization practices to mitigate costly aspects of bankruptcy law. In particular, they found that French banks respond to a code that is "unfriendly" to secured creditors by requiring more collateral than lenders elsewhere, and by relying on forms of collateral that minimize the statutory dilution of their claims in bankruptcy.⁷¹

These effects say something about the empirical importance of how secured creditors in particular are treated in insolvency proceedings. A very different matter is whether (p. 1022) according secured creditors full priority in insolvency proceedings is a defensible policy choice. This is a normative question, and it is one of the most controversial ones in the scholarly and political debate about the design of (corporate) insolvency proceedings. LoPucki once put the problem succinctly by stating that "Security is an agreement between A and B that C take nothing."⁷² As between A (creditor) and B (debtor), security clearly has efficiency benefits: it lowers A's monitoring, enforcement, and risk costs, and it protects A against opportunistic business policies that would require B to use the pledged collateral. However, these efficiency benefits come at a cost to C if C cannot adjust to the transaction between A and B: the total asset pool available for the other creditors shrinks, and correspondingly their expected recovery prospects are reduced as well. C might not be able to adjust to the transaction between A and B either because C is an involuntary creditor such as a tort creditor, because C finds it not worth the effort given the size of his claim, or because he lacks the skill or bargaining power to push B to agree to a contractual regime that would effectively protect his interest.⁷³ Do the efficiency benefits of secured credit in the relationship between A and B outweigh the costs imposed on C? This is an empirical question, and some evidence suggests that in fact they do.⁷⁴ Hence, according secured creditors (full) priority in insolvency proceedings appears to be a defensible policy choice in principle.⁷⁵

Even if, in principle, secured creditors are given this priority position, the question arises of whether certain limits may be justified vis-à-vis all other creditors and the debtor. It is easy to see that the immediate realization of a secured claim upon the opening of an insolvency proceeding may have detrimental effects on the going concern value of a distressed firm. Consider, for example, a machine that is crucial for running a production process in a business. If the financing bank were allowed to take it away and sell it on the market to realize its claim, restructuring prospects for the firm would be greatly reduced or even eliminated. Hence, imposing a stay on enforcement actions also with respect to secured creditors, as many jurisdictions do,⁷⁶ makes sense. However, jurisdictions differ in the protection granted to secured creditors on whom such a stay is imposed. The US

Supreme Court once held that § 362(d)(1) of the Bankruptcy Code does not afford protection in the form of interest for the deferred realization of the encumbered asset with respect to undersecured creditors.⁷⁷ The converse holds true under section 169 of the German Insolvenzordnung.

(p. 1023) 6.3 Administrative Expenses

The rationale for putting administrative expenses—such as court fees or fees for an insolvency administrator—before general unsecured creditors is straightforward: as a collective proceeding that aims to solve a multi-party prisoners’ dilemma, an insolvency proceeding is run for the benefit of the unsecured creditors’ collective. A more difficult question is whether contributions of the secured creditors to the administrative expenses are justified as well. A case can be made for such contributions if it can be shown that secured creditors, too, benefit from a collective proceeding or that certain costs can be attributed to them, for example costs of identifying collateral and realizing its value. Section 171 of the German Insolvenzordnung, for example, forces secured creditors to contribute as much as 4% of the collateral value as sorting costs, 5% as realization costs, and, if applicable, 19% VAT, i.e., a total of 28% of the collateral value. Based on the above-stated considerations, this appears to be justifiable. Against this background, secured creditors have an incentive to “oversecure” their claim, and German law allows them to do this within certain limits.⁷⁸

6.4 Unsecured Creditors

No apparent efficiency rationale exists why certain unsecured creditors, for example tax, wage, and pension claims, should be given priority over the claims of other, general unsecured creditors. It is rather fairness or distributional concerns that are instrumental in this regard, as with the wage or pension claims of workers, or the clout that certain stakeholders have in the political process, as with claims of tax authorities, i.e., the state.

An interesting and important case for the design of corporate insolvency laws in particular is the ranking of shareholder loans vis-à-vis other unsecured creditors. Debt finance by shareholders is an important source of financing for closed corporations or in group structures in particular. It is driven primarily by tax considerations. Some jurisdictions subordinate shareholder loans relative to the claims of other unsecured creditors. This is the case, for example, according to section 39 para. 1 no. 5 of the German Insolvenzordnung. In the US, 11 U.S.C. § 510(c)(1) gives the bankruptcy court discretion to subordinate claims (equitable subordination).⁷⁹ By contrast, English law treats claims arising from shareholder loans *pari passu* with other unsecured claims, as does French law.⁸⁰

It is relatively easy to come up with a justification for provisions that subject payments on shareholder loans to the avoidance provisions of an insolvency code (within certain time limits): shareholders are insiders, and they may enrich themselves to the detriment of other creditors by such payments in the vicinity of insolvency.⁸¹ However, it is much more difficult (p. 1024) to identify a convincing rationale for subordination rules if no such pay-

ments have taken place. Clearly, a subordination rule discourages debt financing by shareholders if the company is in financial distress, and the shareholders may be the only available financing source in such a setting. As a consequence, the prospects for a restructuring of the firm might be greatly reduced. On the other hand, one can argue that distressed firms might (ab)use funds made available by shareholder loans to “gamble for resurrection,” further diluting existing claims of outside creditors. This is a serious concern. At the same time, it would appear that a liability rule for wrongful trading addresses this concern more directly and efficiently than a rule that subordinates all shareholder loans—whatever their purpose. The one remaining advantage of such a subordination rule might then lie in the lower-risk costs imposed on shareholders/managers compared to a liability regime: the loss from the shareholders’ perspective is limited to the amount of the loan under a subordination regime, whereas they face a potentially unlimited personal liability under a liability regime.

7 Contracting for Assets of the Debtor

Given the statutory ranking of claims in an insolvency proceeding, creditors have an incentive to try and contract for a better position than that accorded to them by the statutory ranking. In principle, such contractual arrangements appear problematic as they are aimed at upsetting the statutory order. At the same time, creditors can legitimately contract for security and, hence, improve their ranking compared to having an unsecured position. So why not allow them to modify their statutory ranking in other ways?

A good illustration of the problem is the so-called “flip clause” that was the subject of litigation in the US and the UK in the aftermaths of the latest financial and economic crisis. The issue arose in the context of the Lehman bankruptcy. In essence, the flip clause stipulates that upon A’s bankruptcy, a charge held by A over certain of B’s assets would flip to certain of A’s creditors. This results in these creditors gaining an advantage over A’s other creditors: an asset that would have been available to *all* of A’s creditors has now been carved out of the asset pool and is available only to *some* of them.

In the US, 11 U.S.C. § 365(e)(1) stipulates that executory contracts may not be terminated or modified as a result of a contractual provision which purports to permit such termination or modification conditioned on the insolvency of the debtor. According to § 541(c)(1) (B), an interest of the debtor in property becomes property of the estate notwithstanding any provision in an agreement, transfer instrument, or applicable non-bankruptcy law that is conditioned on the insolvency or financial condition of the debtor and that effects or gives an option to effect a forfeiture, modification, or termination of the debtor’s interest in property. These provisions invalidate so-called ipso facto clauses,⁸² and it has been held that the flip clause amounted to just that.⁸³ Further, the clause was judged to violate the automatic stay.⁸⁴

(p. 1025) The English courts came to a different conclusion. The litigation in the UK centered around the common law “anti-deprivation principle,” which aims to prevent arrangements—operating upon bankruptcy—which withdraw from the insolvent estate as-

sets which would be otherwise available to the debtor's creditors.⁸⁵ The rationale of the principle originally was to prevent "false" ownership of assets and a deception of creditors.⁸⁶ Later on, the policy of preventing contracting out of bankruptcy became an issue as well, but there are other ways to contract out of bankruptcy not affected by the principle, such as creating a charge or contractually subordinating a claim.⁸⁷

In *Belmont Park*, the UK Supreme Court held that a good faith transaction without the purpose of circumventing bankruptcy rules does not violate the anti-deprivation principle.⁸⁸ So the crucial test appears to be whether there is a "valid commercial reason" for the transaction or whether the only ("real") purpose is to circumvent bankruptcy rules.⁸⁹ Such a valid commercial reason was found to be present in *Belmont Park* and, accordingly, the transaction was upheld.

However, distinguishing cases based on the (non-)existence of valid commercial reasons for the transaction in question appears to obfuscate the real issue. If an insolvency system creates a mandatory statutory order with respect to the ranking of claims, *any* private arrangement that has the *effect* of upsetting or modifying the order must be judged to be impermissible. It simply does not matter whether it is a good faith transaction that was undertaken with other (legitimate) motives (also) in mind. The policy underlying the mandatory statutory ordering system overrides any "legitimate" commercial goal that the parties to the transaction wish to pursue. The only permissible contractual arrangement is for parties to agree to a priority position as defined by the statute, for example by creating a security right.⁹⁰

8 Rescue Proceedings

A central feature of modern corporate insolvency systems are rescue proceedings. These are proceedings that aim at restructuring the financially (and possibly also economically) distressed firm and putting it back on track financially (and possibly also economically). Various types of rescue proceedings exist in the US, England, France, and Germany.

(p. 1026) 8.1 Types of Proceedings

One way to classify or categorize these proceedings is to distinguish between "structured bargaining" procedures that involve negotiations over a restructuring plan and procedures that do not involve such negotiations.⁹¹ Another differentiating feature is whether the procedure allows dissenting creditors to be bound by a restructuring plan or not. Chapter 11 of the Bankruptcy Code in the US, Company Voluntary Arrangements and Schemes of Arrangements under English law, the French Procédure de sauvegarde, and the Insolvenzplanverfahren according to sections 217 et seq. of the German Insolvenzordnung are structured bargaining procedures, and they also allow dissenting creditors to be bound. The French Redressement judiciaire allows dissenting creditors to be bound (but is not a structured bargaining procedure), the French Procédure de conciliation is a structured bargaining procedure (but does not allow dissenting creditors to be bound),

and the English Administration is neither a structured bargaining procedure nor does it allow dissenting creditors to be bound (but it may be used as a restructuring tool).

Within the category of structured bargaining procedures, a further distinction can be drawn between systems that provide for a segmentation of creditors into classes with each class voting on the restructuring plan (followed by court approval)—this is the case, for example, with respect to Chapter 11, the Scheme of Arrangement, and the Insolvenzplanverfahren—and systems that do not provide for such a segmentation as, for example, the Company Voluntary Arrangement. Conducting bargaining and voting within classes enhances the legitimacy of the process as the likelihood of voting results that reflect the interests of similarly situated creditors increases. At the same time, the process becomes more cumbersome, and therefore costly. If time is of the essence, as it is with respect to the restructuring of financial institutions, for example, one would rather not want to use a structured bargaining process with creditors voting in classes (if one wanted to use an “ordinary” bankruptcy procedure at all).

8.2 The Position of Shareholders

Structured bargaining procedures with voting by classes often provide that the incumbent shareholders of the corporation form one or more of the various classes, i.e., they are “part of the plan,” and their interests can be affected by it. This makes sense conceptually, as a corporation’s shareholders, in a situation of financial distress, have the lowest ranking claim on the corporation’s assets, i.e., they are “sub-subordinated.”⁹² This is how shareholders are treated, for example, in a Chapter 11 process (11 U.S.C. § 1123(a)(1)) and in (p. 1027) an Insolvenzplanverfahren according to the German Insolvenzordnung (sections 217, 225a) since 2002.⁹³

Integrating the shareholders into the structured bargaining and voting process allows debt to equity swaps to be part of a restructuring plan. Such swaps are an important element of restructuring practice. They reduce debt levels and interest payments, improving the balance sheet and liquidity position of a distressed firm. If they could not be implemented in a restructuring plan against the will of the incumbent shareholders as well, these shareholders could use their legal position to extract rents from the creditors—which is not justified. However, the prospect of being “expropriated” in an insolvency procedure by virtue of a debt to equity swap might lead the shareholders to delay the filing of an insolvency petition—which is not in the interest of the creditors. On the other hand, debt to equity swaps are a tool that is usually employed more with respect to large public corporations, and in these managers enjoy more independence vis-à-vis the shareholders—also with respect to the filing decision—than in small closed corporations.

8.3 Cram Down Power of Courts

Structured bargaining procedures with class-wise voting differ with respect to the majority requirements that must be met if the plan is to be approved by the competent court. In the US, for example, a plan must, in principle, be accepted by each impaired class (11

U.S.C. § 1129(a)(8)). However, the competent court may “cram down” the plan on a non-accepting class if the members of this class do not fare worse than in a liquidation, and lower-ranking classes receive nothing under the plan (“absolute priority rule”). A similar provision can be found in the Insolvenzplanverfahren of the German Insolvenzordnung (section 245).

One of the critical questions relating to this cram-down power centers around a potential equity stake in the reorganized enterprise for the incumbent shareholders. Sometimes it appears commercially sensible to give them such a stake, for example in order to incentivize an early filing or to make them contribute productively to the restructuring process. US courts, therefore, have recognized a “new value” exception to the absolute priority rule. If the incumbent shareholders contribute “money or money’s worth” to the restructured firm, they may retain an equity stake.⁹⁴ The German rule in section 245 of the Insolvenzordnung is stricter than its US counterpart and does not allow for a similar exception.

8.4 Financing Rescue Proceedings

Critically important for the success of a rescue proceeding is the issue of financing.⁹⁵ The firm entering an insolvency proceeding will usually be (extremely) cash short, making (p. 1028) continuation and restructuring of the enterprise a difficult task that requires “fresh money.” If no further security is available for a potential lender, no loan might be forthcoming and restructuring may be made impossible. Hence, many jurisdictions have provisions granting “superpriority” to financiers of restructuring proceedings under certain circumstances. This is the case, for example, with respect to a Chapter 11 proceeding. 11 U.S.C. § 364(d) permits the use of already encumbered assets as security for new loans provided that adequate protection is given to existing (secured) lenders. Superpriority loans are also possible in France⁹⁶ (but not vis-à-vis employee claims) but not in England⁹⁷ or in Germany.⁹⁸

It is clear that superpriority provisions not only facilitate the financing of rescue proceedings. They also have a significant governance impact. The debtor in possession financier usually will condition lending on being granted important “governance rights”—for example, via loan covenants—on top of a superpriority before providing “fresh money.” Baird and Rasmussen once put it succinctly as follows: “The board may be in the saddle, but the whip is in the creditors’ hands.”⁹⁹ The clout exercised by dominant lenders is potentially problematic for various reasons: the managers negotiating the financing agreement on behalf of the firm may not have the best incentives to do so if they (are forced to) leave the firm and a new crisis management team comes in; firms might take too little risk in the restructuring process, and the dominant lenders might divert value from outside creditors with less clout but who are still in the money. The applicable insolvency regime needs to make sure that the benefits of superpriority are not outweighed by these costs.

8.5 Reform Proposals

Rescue proceedings for corporate debtors are a vibrant field for law reforms worldwide. Jurisdictions experiment with new proceedings (such as, for example, France with the *Procédure de sauvegarde accélérée*), or they try to improve on existing ones (such as, for example, the US with reforms of Chapter 11¹⁰⁰).¹⁰¹ Two “radical” proposals for corporate insolvency law reform deserve to be singled out: going concern sales as a substitute for restructuring proceedings, and “full” debt to equity swaps as a specific form of such proceedings.

(p. 1029) 8.5.1 Going Concern Sales

Restructuring proceedings are often lengthy and costly. This is especially so with respect to structured bargaining procedures with class-based voting. Hence, instead of restructuring a firm in the hands of an existing legal entity by creating a new financial structure, one can also try to salvage its going concern value by selling all its assets to another legal entity (an investor). This entity would implement the necessary reforms of the business, having paid a purchase price for the assets out of which the firm’s creditors can be paid. In order to maximize the returns to the creditors, an auction might be set up under which the investor who puts up the highest bid gets the firm’s assets.

Such going concern sales were already suggested many decades ago as a viable alternative to Chapter 11,¹⁰² and they are used by many jurisdictions’ corporate insolvency regimes as one form of restructuring of a distressed firm.¹⁰³ At the same time, there are limits to this approach which reconfirm the need for a statutory restructuring proceeding directed toward the legal entity that faces financial distress. First, markets for firms do not always exist, and if they exist, they may not be very competitive and/or informationally efficient. In crisis-ridden industries, usually only a few potential buyers will be interested. These buyers will often be insiders (managers, shareholders) or competitors of the distressed firms because these are, given their industry knowledge and experience, best positioned to assess its economic prospects. At the same time, they have a strong incentive to acquire the firm as cheaply as possible, possibly at a price much lower than the value of the firm were it to be restructured in the hands of the existing legal entity. Second, asset sales sometimes do not allow the transfer of “dedicated assets” which make up a significant part of the firm’s value. Such dedicated assets can come in the form of IP rights, (public) permits, or leases at favorable conditions—to give just three examples. Again, to capture the full going concern value, the firm should be restructured in the hands of the existing legal entity in such circumstances.¹⁰⁴

If a jurisdiction permits or even promotes going concern sales in insolvency proceedings, it must address the intricate governance problems raised thereby. The most fundamental of these problems is the pricing issue. More specifically, precautions must be taken to avoid sales to insiders at fire sale prices. Jurisdictions differ significantly in their approach to this problem. Under the German *Insolvenzordnung*, for example, creditors are involved in the sale decision (sections 160 et seq. *Insolvenzordnung*). A sale to insiders requires the assent (by majority decision) of the whole creditors’ assembly (section 162 *Insolvenzordnung*). By contrast, in England and Wales, administrators have the power to carry out a pre-packaged (p. 1030) sale without the prior approval of the creditors or the

permission of the court under certain conditions, including extensive disclosure obligations (Statements of Insolvency Practice (SIP) 16). In addition, section 129 of the Small Business, Enterprise and Employment Act 2015 provides the UK Government with the power to enact legislation restricting, or imposing conditions on, administrators' powers to sell or otherwise dispose of assets to "connected persons" (such as directors of the company) in the event that the insolvency industry fails to comply with SIP 16. In comparison, the German approach places greater emphasis on ex ante controls and safeguards, and the UK approach on procedural efficiency.¹⁰⁵ Alternatively, or in addition to these measures, one could contemplate a fault-based liability of administrators who fail to effect a sale that is in the interest of all creditors. Data on recovery rates for creditors that could help assess the merits of the respective regulatory approaches are missing.

8.5.2 Full Debt to Equity Swaps

It has already been mentioned that debt to equity swaps are an important element of modern restructuring practice (see section 8.2 *supra*). The good thing about such swaps is that they put creditors in a position in which they then all have the "correct" economic incentive to implement whatever measures maximize firm value. As creditors, they do not always have this incentive: fully secured creditors may push to liquidate the firm even if restructuring would be value-maximizing, and creditors who are out of the money will push toward a restructuring even if the firm is economically distressed and should be liquidated. It is hard to design rules on class formation and voting that make sure that such "skewed" incentives are not decisive for the outcome of the process.

As early 1988, Lucian Bebchuk suggested a radically different reorganization procedure based on a "full debt to equity swap" that would "solve" this problem and also be in line with the absolute priority rule.¹⁰⁶ Assume that a firm has two creditors with a claim of US\$1 million each: a fully secured creditor (SC) and an unsecured creditor (UNSC). The firm has one (sole) shareholder (SH). Under Bebchuk's scheme, SC would become the sole shareholder. UNSC would get an option to acquire SC's shares at an exercise price of US\$1 million. SH would get an option to acquire UNSC's option and SC's shares at an exercise price of US\$2 million. This scheme preserves absolute priority. Each stakeholder would get exactly what she can claim under the absolute priority rule. Whoever ends up as the sole shareholder of the firm will implement the restructuring plan that maximizes firm value.

Bebchuk's scheme is elegant and in line with fundamental principles of corporate insolvency law. At the same time, to date it has not been implemented in the real world of restructuring. The simple reason is probably that policy makers worldwide stay clear of (p. 1031) all proposals that force all creditors to exchange their debt against an equity position. In many jurisdictions, such an involuntary swap would violate fundamental constitutional guarantees. In others, political lobbying by banks in particular prevents legislatures from moving to implement Bebchuk's scheme. If it were implemented, creditors would need to expect to find themselves in the position of a shareholder of a distressed firm whenever they extend credit to a firm with a non-trivial prospect of insolvency. This would potentially have a serious impact on their business model, and many creditors are

not comfortable with that prospect. That said, however, Bebchuck's model is useful for restructuring practice because it highlights important features (and benefits) of debt for equity swaps.

9 Contractual Resolution of Financial Distress

Statutory insolvency proceedings are associated with significant direct and indirect bankruptcy costs (see section 3.3.1 *supra*). Hence, stakeholders of a financially distressed firm have a strong incentive to avoid these costs and attempt a private resolution of financial distress: the “privatization of bankruptcy” promises flexible, tailor-made, and fast solutions that come with significantly reduced bankruptcy costs.¹⁰⁷ Two forms of such a privatization must be distinguished: ex ante contracting about bankruptcy, and an ex post renegotiation of the firm's debt structure (“workouts”).

9.1 Ex ante Contracting about Bankruptcy

There would be no need for a statutory bankruptcy procedure if all of the firm's creditors and the firm were able to contractually agree ex ante on the procedure that would be applicable if the firm entered a—contractually specified—condition of financial distress. In reality, this is not feasible as some creditors, for example those who have a claim based on tort, do not have a contractual relationship with the firm at all. Nevertheless, scholars have designed schemes that would give contracts with individual lenders an *erga omnes* effect vis-à-vis the whole creditor community.¹⁰⁸ Instead of a full-blown statutory insolvency procedure, the statutory rules would then operate as a backup to legitimize certain private schemes under specified conditions.

Another, probably more realistic form of ex ante contracting about bankruptcy would be to allow firms to choose the applicable bankruptcy regime in their charter.¹⁰⁹ This could be (p. 1032) done by either allowing firms to choose the bankruptcy forum—with the applicable bankruptcy law being that of the forum—or by giving firms the option to directly pick a particular bankruptcy regime out of a “menu” of different regimes provided for by the competent lawmaker. The former regime would be easier to implement—no need to agree (as between states) on the “menu”—and it also has the advantage that it directly incentivizes states to improve their domestic bankruptcy procedures and make them more competitive. Moreover, in contrast to ex post forum shopping by COMI manipulations in times of crisis, picking the forum ex ante in the corporate charter makes the choice visible to all creditors, allowing them to adjust. A critical issue with respect to this form of contracting for bankruptcy is charter amendments. These would need to be subject to a super-majority requirement. To further reduce the danger of opportunistic maneuvers on the eve of bankruptcy, a “waiting period” of a couple of months before the amendment takes effect probably also makes sense.

9.2 Ex post Renegotiation of Debt Structure

Ex ante contracting for bankruptcy regimes is still very much a scholarly enterprise, not a real-life phenomenon. By contrast, ex post renegotiation of the debt structure of a firm that finds itself in financial distress is an important fact of restructuring practice worldwide.¹¹⁰ Such “workouts” face many challenges, of which the free-rider (or hold-out) problem probably is the most important one: all creditors have a common interest in a success of the restructuring process, but each individual creditor of course wants to maximize her economic benefit, i.e., reduce her contribution to the common good. This strategic incentive problem of a multi-party prisoners’ dilemma is “solved” by statutory insolvency procedures that impose a stay on creditors’ enforcement actions. Out of court, no such general statutory regime exists. No legal duty forces creditors and/or shareholders to cooperate in a workout.¹¹¹ Hence, workout negotiations are destabilized by the free-rider problem.

Creditors can address this issue by putting “majority voting clauses” in common debt instruments such as syndicated loans or bond indentures. Such clauses allow a majority of the creditors—based on voting rights—to agree on debt reductions even if a minority objects. Some jurisdictions are more accommodating of these clauses than others. For example, US law does not allow a reduction of the principal claim by majority decision in a bond indenture (15 U.S.C. § 77ppp),¹¹² but section 5 of the German *Schuldverschreibungs-gesetz* (2009) does.

In any event, such clauses are helpful only with strategic/opportunistic actions of certain creditors that are part of a specific debt instrument. They do not address the free rider problem as between the creditor community as a whole, i.e., regarding creditors of different debt instruments. Various attempts have been made to ameliorate this problem by “soft law” tools. One of these is the so-called London Approach to out-of-court restructurings, which achieved a certain prominence with respect to the restructuring of City firms in the (p. 1033) 1980s and 1990s.¹¹³ Another soft regulatory instrument is the INSOL Principles for a global approach to multi-creditor workouts (2000).¹¹⁴

These instruments are helpful especially in settings with a relatively homogeneous and stable creditor community such as, for example, in cases where a firm is financed primarily by bank debt. However, debt structures worldwide have changed significantly compared to what they looked like in the City of London two or three decades ago. Bond financing has become much more widespread, also with respect to smaller firms. Debt is traded on secondary markets, and new activist investors have entered the scene, especially hedge funds and private equity funds. Credit default swaps (CDS) are available to protect against insolvency risks, changing the incentives of insured creditors or other holders of these instruments. Hence, firms today face workout scenarios where the creditors are extremely heterogeneous and deeply fragmented, have very different interests (effects of CDS, hedge funds as active investors [“loan to own”], etc.), and the composition of the creditors is permanently changing (due to debt trading). Workouts have become more difficult than a couple of decades ago.¹¹⁵

If a workout fails because of strategic maneuvers of hold-outs, one way to save at least some of the benefits of an out-of-court restructuring is a “slim statutory reorganization” procedure that is initiated only to get a restructuring plan passed by a majority vote. These types of procedures are often termed “pre-packaged bankruptcies” because most of the issues except the acceptance of the pre-negotiated plan have already been resolved before the bankruptcy petition is filed.¹¹⁶ The technique of pre-packaged bankruptcies is most advanced in the US where the vote on the plan can also be taken out of court—only plan confirmation requires initiation of a bankruptcy procedure and court approval (“pre-voted pre-packaged bankruptcy”).¹¹⁷ If this is not feasible, the drafted and pre-negotiated plan will be subject to a vote after the bankruptcy petition has been filed (“post-voted pre-packaged bankruptcy”).¹¹⁸ If a full-blown “pre-packaged bankruptcy” is not feasible, the Chapter 11 process can at least be streamlined by so-called restructuring support agreements. These are usually concluded between the debtor and other key players, often senior secured lenders.¹¹⁹

(p. 1034) **10 Reasons for the Jurisdictional Divergences**

Insolvency laws worldwide differ significantly—as should be apparent by now. This is true both with respect to corporate and individual insolvencies. Crucial issues of corporate insolvency law, such as the opening and governance of insolvency proceedings, the ranking of claims, the position of secured creditors, and the type and structure of rescue proceedings, are regulated very differently in the jurisdictions that are the focus of this chapter (US, England, France, and Germany). What are the reasons for these jurisdictional divergences? Answering this question can inform projects that aim at harmonizing (corporate) insolvency laws (see section 11 *infra*). If, for example, competitive pressures (regulatory competition) gradually push jurisdictions to adopt particular “solutions” to corporate insolvency law problems, harmonization might not be necessary. And if certain divergences are rooted in different regulatory philosophies or even in differences between the “deep normative structures” of particular societies, then harmonization might be positively harmful—at least from the perspective of those jurisdictions whose regimes are replaced by harmonization.

The reasons for jurisdictional divergences with respect to important corporate insolvency law issues have yet to be studied (empirically) in detail. It is probably true that competitive pressures are influencing corporate insolvency lawmaking, but their intensity is far from clear. The latest major reform of the German Insolvenzordnung was explicitly motivated, for example, by the fact that some German firms “forum shopped” to England, seeking access to a more attractive restructuring regime than that in place in Germany before the reform.¹²⁰ At the same time, it would be a gross overstatement to say that market pressures (in Europe) are so strong that we can identify a clear trend toward certain uniform procedures.

Forces that hinder further convergence are, for example, strong lobbying by well-organized stakeholder groups, different regulatory or insolvency philosophies, and “functional” reasons such as differences in financing structures. There are probably many other causes influencing the degree of jurisdictional divergences, and their explanatory force will always be a function of the specific regulatory problem and jurisdiction(s) studied. Insolvency administrators, for example, are a very powerful lobby group in a country like Germany that, for a long time, did not recognize debtor in possession-like proceedings. Hence, it does not come as a surprise that it took Germany so long to introduce such proceedings and that, in practice, they are still a very rare phenomenon. By contrast, the fresh-start philosophy is characteristic for insolvency policy and practice in the US (see section 3.3.2 *supra*). It would require a paradigm shift to move to a regime that starts from the premise that, in the great majority of cases, insolvency is not an “accident” but the consequence of (p. 1035) negligent if not fraudulent management actions. Finally, concentrated debt structures reduce the need for a debtor-friendly restructuring procedure, as has already been pointed out (see section 3.3.3 *supra*). Whether this really *explains* the existence of such procedures in jurisdictions with fragmented and dispersed debt ownership is another question.

If anything, the absence of empirical evidence for dysfunctional regulatory diversity cautions against too much zeal in pursuing harmonization projects in the field of corporate insolvency law. Regulatory competition with respect to corporate insolvency law systems has certain benefits of its own, and what appears “dysfunctional” may be an expression of completely different (but legitimate) insolvency philosophies, as will be seen in the concluding section of this chapter.

11 Outlook: Harmonization of Insolvency Laws

The great diversity of (corporate) insolvency systems worldwide has benefits: it creates an “international laboratory” for better solutions, spurring regulatory competition between states for the best “insolvency product.” At the same time, last-minute forum shopping by firms—possibly initiated by dominant lenders—can create problems, especially for outside creditors whose interests might be compromised by the move.¹²¹ Further, not all firms have the knowledge and money to engage in sophisticated regulatory arbitrage and, as a consequence, might not have access to an efficient domestic insolvency or restructuring regime. Hence, a case can be made for harmonization of insolvency laws, at least in the form of “minimum harmonization” that allows states to go beyond the required minimum.

Even then, however, harmonizing substantive insolvency laws will always be an exceedingly difficult enterprise, given the heterogeneity of bankruptcy philosophies (objectives of insolvency laws, governance of proceedings, ranking of claims, etc.) and the legitimate resistance of states to harmonization if it is felt directly or indirectly to impact negatively on their respective autonomous regulatory policy. It is not surprising, therefore, that “early” harmonization efforts focused rather on jurisdictional and private international law

rules and not on issues of substantive law as a first step. The guiding philosophy with respect to these projects was and is that, as a start, predictable and stable jurisdictional rules should be established and cases should be decided on the basis of the same or at least similar rules, regardless of the forum in which the insolvency procedure takes place. In Europe, the outcome of these efforts was the European Insolvency Regulation of 2002, which was recast in 2015.¹²² (p. 1036) The UNCITRAL Model Law on Cross-Border Insolvency (1997) attempted to provide a blueprint for states to harmonize their cross-border insolvency regimes on a global scale.¹²³

More recently, efforts to also harmonize substantive insolvency laws have gained greater momentum. Early on, it was again UNCITRAL that moved first with the “Legislative Guide on Insolvency Law” (2004)¹²⁴ and its special provisions on “Group Insolvencies” (2010).¹²⁵ However, these are, like the 1997 Model Law, not binding legal instruments but merely blueprints for states who wish to reform their domestic regimes based on what might be considered international best practice. The European Union, as with the European Insolvency Regulation, plans to move one step further: in 2014, the European Commission issued a “Recommendation on a New Approach to Business Failure and Insolvency”,¹²⁶ and it has proposed, in 2016, a binding legal instrument (a Directive) as part of its plan to complete the capital markets union.¹²⁷ The driving force behind this initiative is the idea of giving firms in all Member States of the EU access to efficient pre-insolvency restructuring proceedings.¹²⁸ By and large, the substantive insolvency regimes of the Member States would be left intact, potentially reducing the political resistance that is to be expected. However, important elements of the proposed restructuring regime are subject to criticism. The draft directive is flawed because it (i) creates a refuge for failing firms that should be liquidated; (ii) rules out going-concern sales for viable firms; (iii) is, in essence, a twisted and truncated insolvency proceeding but without strong court involvement from the beginning and without the tools needed for the court to guarantee a fair outcome of the process.¹²⁹ Further, there would be a stifling effect on regulatory competition between the Member States and on the benefits that could bring (“laboratory for the best solutions”)

Notes:

(1) “Bankruptcy law” is the term more commonly used in the US, “insolvency law” is more common elsewhere in the world, especially in the UK.

(2) Reinier Kraakman et al., *The Anatomy of Corporate Law: A Comparative and Functional Approach* (2009), chapter 2; Gregor Bachmann et al., *Regulating the Closed Corporation* 8–13 (2014).

(3) Kraakman et al., *supra* note 2, at 115 et seq.; Horst Eidenmüller, *Unternehmenssanierung zwischen Markt und Gesetz* (1999).

(4) While “insolvency governance” probably is a new term, the interaction of corporate law and corporate bankruptcy was noted decades ago by scholars such as Whitford, *LoP-*

ucki, and Skeel. See David Skeel, “Rediscovering Corporate Governance in Bankruptcy”, 87 Temple L. Rev. 1021 (2015).

⁽⁵⁾ In 2014, for example, the EU Commission published a Recommendation on a new approach to business failure and insolvency (2014/135/EU, OJ of the EU of 14 March 2014, L 74/65) that asks the Member States to bring their domestic pre-insolvency restructuring regimes into line with the principles set out in the recommendation (see Horst Eidenmüller & Kristin van Zwieten, “Restructuring the European Business Enterprise: the European Commission’s Recommendation on a New Approach to Business Failure and Insolvency”, 16 Eur. Bus. Org. L. Rev. 625 (2015)). The Commission has presented a legislative proposal in 2016; see Commission Proposal for a Directive of the European Parliament and of the Council on preventive restructuring frameworks, second chance and measures to increase the efficiency of restructuring, insolvency and discharge procedures and amending Directive 2012/30/EU, COM (2016) 723 final (22 November 2016). On the proposal see Horst Eidenmüller, “Contracting for a European Insolvency Regime”, 18 Eur. Bus. Org. L. Rev. 273 (2017). See also section 11 *infra*.

⁽⁶⁾ As for the last example, the recast European Insolvency Regulation (Regulation (EU) 2015/848 of 20 May 2015) contains a new Chapter V on insolvency proceedings of members of a group of companies (Arts. 56 et seq.). The conceptual approach underlying this chapter was first proposed by the German government in its legislative proposal for new domestic rules on insolvency proceedings of members of groups of companies. See Entwurf eines Gesetzes zur Erleichterung der Bewältigung von Konzerninsolvenzen, Bundestag-Drucksache 18/407 of 30 January 2014.

⁽⁷⁾ See, for example, John Armour & Douglas Cumming, “Bankruptcy Law and Entrepreneurship”, 10 Am. L. & Econ. Rev. 303 (2008); Kenneth M. Ayotte, “Bankruptcy and Entrepreneurship: The Value of a Fresh Start”, 23 J. L. & Econ. 161 (2007).

⁽⁸⁾ Gerard McCormack, *Corporate Rescue Law: An Anglo-American Perspective* (2008), focuses exclusively on the UK and the US. Philip R. Wood, *Principles of International Insolvency* (2007), is characterized by an enormous breadth of coverage and detail in the analysis but less by consideration of conceptual issues. Lawrence Westbrook et al., *A Global View of Business Insolvency Systems* (2010), are quite selective with respect to the issues studied. A book like Kraakman et al., *supra* note 2, for corporate insolvency law is missing.

⁽⁹⁾ Douglas G. Baird, “The Initiation Problem in Bankruptcy”, 11 Int’l. Rev. L. & Econ. 223 (1991).

⁽¹⁰⁾ Apart from the regulatory background (complementarities in other areas of the law etc.), business realities (type of economy etc.) and the strength of different types of stakeholders of firms play an important role, to name just a few relevant factors. The point in the text is simply this: Without a precise normative measuring rod, no proper evaluative comparison of different approaches in different jurisdictions is feasible.

(¹¹) Konrad Zweigert & Hein Kötz, *An Introduction to Comparative Law* 15 (1998).

(¹²) Pioneering work in the field was done by Richard Posner. His book on *Economic Analysis of Law* was published in its first edition in 1972. It is now in its 9th edition (2014). “Law and Economics” has had and continues to have a significant influence on bankruptcy scholarship. See, for example, Mark J. Roe, *Corporate Reorganization and Bankruptcy* (2000); Douglas G. Baird, *Elements of Bankruptcy* (2006); Barry E. Adler, *Foundations of Bankruptcy Law* (2005).

(¹³) Horst Eidenmüller, *Effizienz als Rechtsprinzip* (2015).

(¹⁴) See, for example, *Behavioral Law & Economics* (Cass Sunstein ed., 2000).

(¹⁵) For reorganization in the US and in European bankruptcy law, see Maria Brouwer, “Reorganization in US and European Bankruptcy Law”, 22 *Eur. J. L. Econ.* 5 (2006).

(¹⁶) This procedure was used, for example, in the Eurotunnel restructuring (2006), <https://www.nouvelobs.com/economie/20060801.OBS6977/procedure-de-sauvegarde-pour-eurotunnel.html>, and in the Thomson case (2009), <http://www.lefigaro.fr/societes/2009/12/01/04015-20091201ARTFIG00013-thomson-tente-un-plan-de-sauvegarde-express-.php>.

(¹⁷) See Sarah Paterson, “Rethinking the Role of the Law of Corporate Distress in the Twenty-First Century”, 35 *Oxford J. Leg. Stud.* 1 (2015). Paterson distinguishes between “insolvency law” and “restructuring law.” Whereas the former, in her view, is geared toward liquidation with the creditors facing a prisoners’ dilemma justifying a stay, the latter is concerned with providing a deadlock resolution procedure that can discipline hold-outs but does not necessarily need a stay. Paterson does not, I believe, sufficiently appreciate that the strategic problem faced by creditors in a liquidation and in a restructuring is very much the same (prisoners’ dilemma), and a stay is no less justified in a restructuring than it is in a liquidation.

(¹⁸) On bankruptcy costs see *infra* note 32 and accompanying text.

(¹⁹) In the case of the *procédure de conciliation*, there is no general stay affecting all creditors. However, where a creditor seeks to enforce his or her rights, the debtor can apply to the court for a moratorium (specific to that creditor) lasting a maximum of two years: Art. L.611-7 of the French Code de commerce, Art. 1343-5 Code civil.

(²⁴) For a comparison of the US, the English and the German system, see Matej Marinč & Razvan Vlahu, *The Economics of Bank Bankruptcy Law* 97 et seq. (2012). See also John Armour et al., *Principles of Financial Regulation* 340 et seq. (2016) with further references.

(²⁵) Roberta Romano, “For Diversity in the International Regulation of Financial Institutions: Critiquing and Recalibrating the Basel Architecture”, 31 *Yale J. Reg.* 1 (2014).

(²⁶) Directive 2014/59/EU of the European Parliament and of the Council of 15 May 2014 establishing a framework for the recovery and resolution of credit institutions and investment firms and amending Council Directive 82/891/EEC, and Directives 2001/24/EC, 2002/47/EC, 2004/25/EC, 2005/56/EC, 2007/36/EC, 2011/35/EU, 2012/30/EU, and 2013/36/EU, and Regulations (EU) No 1093/2010 and (EU) No 648/2012, of the European Parliament and of the Council, OJ of the EU of 12 June 2014, L 173/190.

(²⁷) In insolvency law and scholarship, usually two different tests for financial distress are used: cash-flow insolvency and balance-sheet insolvency. According to the former (used in the text above), a firm is insolvent if it cannot fully meet its financial obligations as they fall due. According to the latter, a firm is insolvent if its liabilities exceed its assets, measured by the applicable accounting rules. On the opening of insolvency proceedings see in detail section 4 *infra*.

(²⁸) Thomas H. Jackson, *The Logic and Limits of Bankruptcy Law* 7 et seq. (1986).

(²⁹) Eidenmüller, *supra* note 3, at 19 et seq.

(³⁰) To put it differently, if a firm is not only financially but also economically distressed, it should be liquidated. It should also be liquidated if it is economically distressed but not financially distressed. This scenario would lead to a liquidation outside bankruptcy/insolvency, however.

(³¹) In Germany, for example, businesses are reorganized in an *Insolvenzplanverfahren* according to sections 217 et seq. of the German Insolvenzordnung in no more than 1% of all business insolvencies; see the analysis of Schultze & Braun based on all business insolvencies from 1999–2011, available at <http://www.schubra.de/de/presseservice/pressemitteilungen/sb/InsolvenzplanIndex1999bis2011.pdf>. Data from other jurisdictions point in the same direction with respect to the ratio between reorganizations and liquidations.

Clearly these data are no more than a proxy for the statement in the text: businesses may be liquidated even though they should have been reorganized or vice versa. But even if the former is more likely than the latter (which is unclear), the ratio is not going to change much in absolute terms.

(³²) See Michelle J. White, The corporate bankruptcy decision, in *Corporate Bankruptcy: Economic and Legal Perspectives* 207, 226 et seq. (Jagdeep S. Bhandari & Lawrence A. Weiss eds., 1996), with further references. A rough proxy for indirect bankruptcy costs with respect to listed firms is the loss in market capitalization triggered by an insolvency filing.

(³³) Bachmann et al., *supra* note 2, at 11 et seq.

Rev.* 301, 306–07 (2006); Horst Eidenmüller, “Trading in Times of Crisis: Formal Insolvency Proceedings, Workouts and the Incentives for Shareholders/Managers”, 7 *Eur. Bus. Org. L. Rev.* 239, 243 (2006).

(³⁵) For this reason, leverage has a positive influence on the likelihood and success rate of a restructuring: it triggers insolvency at an earlier point in time. See Michael C. Jensen, “Active Investors, LBOs, and the Privatization of Bankruptcy”, 2 *J. Appl. Corp. Fin.* 35, 41 et seq. (1989).

(³⁶) Recovery rates measure the return for creditors on the nominal value of their claim in a bankruptcy proceeding. They vary depending on various factors such as whether the company is liquidated or restructured, whether the claim is secured or unsecured, the claim ranking order in a specific jurisdiction, etc. For comparisons between France, Germany, and the UK see, for example, Régis Blazy, Joël Petey & Laurent Weill, “Can Bankruptcy Codes Create Value? Evidence from Creditors’ Recoveries in France, Germany, and the United Kingdom”, 2014, available at <https://ssrn.com/abstract=2447296>.

North American Catholic Educational Programming Foundation, Inc. v. Gheewalla, 930 A.2d 92 (Del. 2007).

⁽⁵⁸⁾ Pursuant to section 6 of the Company Directors Disqualification Act 1986, directors of insolvent companies who are deemed “unfit” to act as directors can be disqualified for a minimum of two, and a maximum of 15, years.

⁽⁵⁹⁾ The English translation is taken from <https://www.legifrance.gouv.fr/Traductions/en-English/Legifrance-translations> (last visited February 23, 2018).

⁽⁶⁰⁾ According to sections 64 GmbH-Gesetz, 92 para. 2 Aktiengesetz, managers also face a fault-based liability for payments to shareholders that directly caused the insolvency of the corporation. However, these provisions have only a very limited practical relevance as the insolvency administrator will usually find it extremely difficult to prove such an effect of a payment that was made.

⁽⁶¹⁾ Under the European Insolvency Regulation (EIR), this is the criterion for jurisdiction to open a “main insolvency proceeding” which has, in principle, worldwide effect (Article 3 EIR).

⁽⁶²⁾ The recast EIR does not change this. It only tries to limit opportunistic COMI moves on the eve of bankruptcy by limiting the scope of the presumption that the COMI is where the place of the registered office of the company is. Article 3(1) EIR now reads as follows: “In the case of a company or legal person, the place of the registered office shall be presumed to be the centre of its main interests in the absence of proof to the contrary. That presumption shall only apply if the registered office has not been moved to another Member State within the three-month period prior to the request for the opening of insolvency proceedings.” Moreover, this provision does not affect the most “dangerous” of all COMI shifts, namely those that are factual only and not accompanied by a move of the registered office. These are detrimental to the company’s creditors in particular because moving the registered office usually is done under the regime set up by the tenth company law directive on cross-border mergers (Directive 2005/56/EC of 26 October 2005) which contains safeguards for creditors and employees.

⁽⁶³⁾ On the issue of characterizing which laws are insolvency laws for the purposes of Article 4 EIR see CJEU, Case C-594/14 (*Kornhaas*), Judgment of 10 December 2015.

⁽⁶⁴⁾ See Eidenmüller, *supra* note 34, at 251 et seq. This proposal was suggested originally by the High Level Group of Company Law Experts, A Modern Regulatory Framework for Company Law in Europe, 2002, 68-69, available at http://www.ecgi.org/publications/documents/report_en.pdf.

(⁹⁰) The flip clause did not give rise to litigation in Germany. If it had, there is little doubt that according to section 81 para. 1 of the Insolvenzordnung, the clause would have been held to be invalid. According to this provision, rights in objects forming part of the insolvency estate cannot be acquired with legal effect after the opening of the insolvency proceedings even if such acquisition of rights is not based on the debtor’s transfer or effected by way of execution. For a comparison of section 81 para. 1 of the Insolvenzordnung and the anti-deprivation principle see Reinhard Bork & Martin Voelker, “§ 91 InsO und die Anti-Deprivation Rule—ein Rechtsvergleich”, 74 *KTS* 235 (2013).

(⁹⁷) Gerard McCormack, “Super-priority new financing and corporate rescue”, J.B.L 701 (2007), notes that the Enterprise Act 2002 did not provide a legislative “superpriority” due to risk that it would grant a superpriority to all lenders irrespective of prospects of success of rescue proposals. He suggests that DIP financing will normally end up with a priority, however, if it is classed as an expense of the administration (section 19 Insolvency Act 1986 and para. 99 to Schedule B1 to the Insolvency Act 1986)—which are generally paid out of the pot of money available to the floating charge holders, as the fixed chargeholders are paid out of proceeds of realization of the assets to which they relate.

Abstract and Keywords

Rent-sharing between employees and shareholders is a necessity if the societal value of the firm is to be maximized. This is reflected in laws across the world which, in different ways, underpin job security and worker voice. Where employees have no role in firm-level governance and are weakly protected by regulation, contractual arrangements intended to align investor and worker interests often fail. A growing body of empirical evidence, drawing in part on leximetric data, points to the beneficial economic effects of employment protection and codetermination laws for innovation and productivity. These laws also promote equality, in contrast to laws mandating additional protections for shareholders to those provided by basic corporate law, which are distributionally regressive as well as being of questionable value for efficiency.

Keywords: corporate governance, employment relations, shareholder rights, corporate law, employee protection, innovation, takeover bids, residual income, shareholders, employees

1 Introduction

¹WHY does capital hire labor, rather than the reverse? Why are employee-owned enterprises so rare? Modern institutional economics has answers to these questions, which stress the efficiency properties of shareholder-based monitoring of managers.² Following this lead, the corporate governance literature evolved during the 1980s and 1990s to arrive at a consensus around the salience, in both positive and normative terms, of the norm of shareholder primacy.³ Alternative approaches, such as the “stakeholder” or “team production” model,⁴ did not win general acceptance in the field. In the 2000s, policy makers around the world followed this consensus, adopting numerous laws and corporate governance codes which set out to strengthen the rights of shareholders to hold managers to account.⁵

The debate over the role of employees within corporate governance never entirely went away. Transaction cost economics models the employment relationship as an incomplete contract which does not in itself guarantee the conditions for cooperation between workers and management.⁶ Thus even allowing for the predominant role given to shareholders in the governance structure of the business enterprise, laws mandating (p. 1038) job security and worker voice may increase the value of individual firms and enhance the societal surplus (or minimize the social costs) that they create.⁷ In line with this suggestion, a growing body of empirical work finds that worker-protective labor and employment laws are positively correlated with productivity and innovation at firm level.⁸

By contrast, the empirical literature on shareholder rights is much more equivocal: it seems that there is a tenuous relationship, at best, between corporate governance practices associated with the shareholder primacy norm, in particular independent boards, and enhanced firm performance.⁹ Laws mandating or encouraging higher levels of shareholder protection, by tilting the balance of corporate power away from workers and toward investors, may limit the ability of managers to make credible commitments of job security and worker voice. Empowerment of shareholders may also impact negatively on the innovative capacity of firms.¹⁰

To assess the relationship between corporate governance and employment relations requires a dual approach: investigating, on the one hand, the impact of the worldwide move to enhanced legal protection of shareholder rights beyond those provided by the basic framework of corporate law, and, on the other, the implications for the firm and for the wider economy of laws and regulations affecting the employment relationship. This chapter will provide an overview of relevant theoretical perspectives (section 2), a consideration of research methods (section 3) and an analysis of recent empirical findings, starting with evidence on long-run trends in laws relating to shareholder and employee protection (section 4), and then going on to review studies on the relationship between corporate governance, employment protection and innovation across a range of different country contexts (section 5). This empirical overview will cover recent research using “leximetric” data sets in the course of a wider review of the research field. Section 6 concludes.

(p. 1039) 2 Employment Relations and Corporate Governance: Theoretical Perspectives

Among the first tasks of corporate governance theory is to explain the incentive structures which arise from different configurations of ownership within the firm.¹¹

“Governance” in a narrow sense is concerned with how residual income and control rights are partitioned between the different corporate constituencies. Once shareholders are identified as the firm’s residual owners, an arrangement which corporate governance theory tends to regard as efficient,¹² the claims of other groups fall to be determined by contract, supplemented by regulation. Thus how employees are positioned in relation to

Corporate Governance and Employment Relations

the firm could be seen as falling outside the scope of “corporate governance,” understood both as an organizational and institutional practice, and as a field of study.

The boundary between “governance,” on the one hand, and “contract,” on the other, may not be so clearly fixed. On one view, it is because the contract between investors and the firm is too difficult to write that it is necessary to allocate residual income and control rights to shareholders rather than to workers or customers.¹³ If that is so, it is the comparative costs of contracting under different ownership regimes which determine the governance structure of the firm in the first place. Putting the point slightly differently, and without ascribing causal priority to one over the other, we might say that “ownership” and “contract” are interrelated mechanisms for the governance of the business firm.

When corporate governance scholarship has addressed the role of employees within the firm it has done so largely in order to explain why it is that they are so rarely constituted as its residual owners.¹⁴ Given the rarity in industrialized market economies of “employee-owned” firms such as producer cooperatives, this is certainly a legitimate question, but it is not the only one of interest. Another approach is to take the near-ubiquity of the “shareholder-owned” firm (referring to the standard legal model of the company limited by share capital) as a given, and to explore its consequences for employment relations and, more generally, for firm performance.

A starting point in this analysis is to consider the distinct features of the employment contract when viewed from a transaction cost perspective. The sum total of the norms governing employment—legal, contractual, and customary—can be thought of as providing a framework for repeated exchange in a setting characterized by uncertainty. Ex ante, the worker sells to the employer his or her labor power or capacity to work in return for an agreed wage. Ex post, residual income and control rights are vested in the employer. What juridical language refers to as the worker’s “subordination” can be described in economic terminology as contractual incompleteness.¹⁵ Because the precise terms of the bargain between employer and worker cannot be specified in advance, their formal agreement is supplemented by other norms, many of which have a fairness dimension in the sense of specifying distributions which the parties regard as legitimate. Behavioral studies show that fairness norms help (p. 1040) build trust between the parties to the employment contract, thereby reconciling equity and efficiency.¹⁶

That it may be in the enlightened self-interest of employers to offer job security and worker voice in order to improve contractual outcomes is not surprising; this observation is recognized in some well-established economic concepts such as those associated with efficiency wage theory, for example.¹⁷ It is less obvious that labor law should mandate particular forms of worker protection. It could be argued that if employers would adopt these norms anyway, the law should not impose them; and if they would not, the law would be interfering with autonomous contractual choices. However, this view neglects the presence, in practice, of constraints on the spontaneous emergence of worker-protective rules. Adverse selection effects may deter employers from offering job security to prospective employees,¹⁸ while the threat of free-riding by other employers may lead to

under-provision of training by firms.¹⁹ Labor laws setting standards for termination in employment and requiring employers to train are essentially means of overcoming collective action problems associated with the inability of employers to coordinate on efficient rules. Laws of this kind have often had the support of employer groups and have been legislated for by political parties with a broadly pro-employer leaning.²⁰

The economic case for employment regulation applies particularly to innovative firms. Innovation entails the transformation of productive inputs into saleable outputs in the form of goods and services which are more desirable and/or affordable to consumers than those previously available. The innovative enterprise must assess the quantity and quality of the productive resources that it has to invest to develop such goods and services, in the light of what it knows of its competitors' strategies.²¹ In this context, value creation is a developmental process, which turns on the capacity of the firm to utilize the human knowledge at its disposal.²² Innovative firms are characterized by decentralized decision making, alignment of risks and rewards over the medium to longer term, and toleration of failure.²³ The firm's dependence on specific knowledge may mean that internal, peer-based monitoring is more (p. 1041) efficient than external monitoring through outside investors.²⁴ However, decentralization of decision making and reliance on specific knowledge may make shareholders vulnerable to opportunism on the part of workers and managers. The innovative firm therefore faces a series of trade-offs.²⁵

These trade-offs could be resolved contractually, but only up to a point. In highly liquid capital markets, the threat of shareholder exit through a takeover bid or related restructuring may make employees reluctant to commit to innovative projects in which returns will be realized over the longer term. Firms may therefore offer managers and senior employees incentives to innovate through long-term compensation plans, stock options, golden parachutes, and job security guarantees.²⁶ These strategies may, however, give rise to new opportunities for managerial rent extraction, particularly where performance-related pay can be manipulated by insiders.²⁷

An alternative to contractual solutions of this kind is to alter the governance structure of the firm, so that residual control and income rights are shared between employees and investors. In principle these "hybrid" systems are unstable because of the high transaction costs associated with decision making within and across heterogeneous stakeholder groups.²⁸ However, they may be a feasible alternative to suboptimal contractual arrangements governing executive pay and performance. Although, as already noted, employee-owned firms in the form of cooperatives or worker-managed enterprises are rare, it is not uncommon to see workers being given voice rights within the firm via contract and regulation, in ways which may significantly qualify shareholders' control and income rights. Nor are shareholders' rights simply a function of ownership: the degree of control they exercise over management may also be affected by laws and regulations.

The literature on comparative capitalisms argues that corporate governance arrangements will be framed by nationally specific institutional factors, which may derive in varying degrees from legal origins,²⁹ political ideologies,³⁰ or technological complementari-

ties.³¹ In so-called “liberal market” systems, firms tend to be characterized by dispersed ownership and a high degree of director independence. These features may nevertheless be qualified in the context of the innovative firm by measures designed to lock shareholders in, including (p. 1042) poison pills, weighted voting, and insider-dominated boards.³² In “coordinated market” systems, the legal system itself may supply alternative governance mechanisms to the conventional model of shareholder-based control, in the form of dual-board structures and related mechanisms for employee participation in managerial decision making (“codetermination”³³). In both cases, firms’ governance choices are liable to be influenced by the state of the laws governing shareholder and worker protection.

3 Empirical Methods: Leximetrics and Time-Series Econometrics

How far the legal system actually drives corporate governance outcomes depends on a range of factors including the scope for firms to opt into or out of particular governance models and the leeway they have for customizing them. The tightness of the “fit” between legal norms and particular technological and organizational configurations may differ from one national and/or sectoral context to another. In this regard, it is helpful that the empirical turn in law and economics has seen the development of new data sources for analyzing cross-national differences in the legal framework for corporate governance and their economic effects. Attempts to measure legal institutions in a systematic way go back to the OECD’s *Employment Protection Index* (EPI), first published in the mid-1990s,³⁴ and the World Bank *Doing Business Reports* (DBR) from the early 2000s,³⁵ which built on the methods used in the legal origins literature.³⁶ Although these indices are very widely used by social scientists, they suffer from numerous flaws including home-country bias, inconsistent coding, and a lack of transparency in the reporting of sources.³⁷

A particular weakness of the OECD and World Bank data sets is that they each provide limited time-series. The OECD’s EPI has recently been revised to incorporate a more consistent time series but there are still gaps in the coverage.³⁸ The legal origins studies on which (p. 1043) the DBR indicators are based were mostly cross sectional. The later DBR studies have a limited time series, going back only to the early 2000s. By contrast, the data sets constructed at the Centre for Business Research in Cambridge provide several decades of continuous time series data.³⁹

An empirically informed assessment of the effects of corporate and labor laws should take into account a number of features of legal rules. A first of these is their partial endogeneity: legal rules reflect economic conditions as well as shaping behavior. Legal systems co-evolve alongside developments in the economy and the political system.⁴⁰ Thus quantitative economic analysis should be able to take on board the possibility of reverse causation or of multi-directional causal flows between legal and economic variables. It further follows that econometric analysis of law should be longitudinal. Cross-sectional analyses can indicate correlation but not, normally, causation.

A second relevant feature of legal rules is their mutability. Legal rules rarely have a completely fixed meaning or unique interpretation. Thus the application of a legal rule is rarely a matter of “either/or.” Binary variables, which purport to measure the presence or absence of a legal rule using a simple (0, 1) coding scheme, may well not be an appropriate way of conceptualizing the operation of regulatory norms.⁴¹

A third feature to consider is the gap between law in action and law in the books. The formal enactment of a legal rule may tell us something about its practical effects, but legal rules are not self-enforcing. If a given legal rule reflects an existing social consensus, it may well take effect without the need for regular enforcement. In other contexts, general respect for the law, the efficiency of the court system and the amount of resources devoted to enforcement may be critical variables to add into the analysis.⁴²

“Leximetric” coding techniques attempt to address these issues.⁴³ Leximetric method involves breaking down the process of index construction into a series of stages, beginning with the identification of a *phenomenon* of interest (“corporate law,” “employment law”) that may be expressed as a conceptual *construct* (“regulation,” from the viewpoint of the firm or employer, or “protection,” from that of the shareholder or worker). Then one or more *indicators* or *variables* are identified which, singly or together, express the construct (p. 1044) in numerical terms. A *coding algorithm* is devised, setting out a series of steps to be taken in assigning numerical values to the primary source material. The algorithm incorporates a *measurement scale* of some kind. Finally, a decision must be taken on whether and/or how to apply *weights* to the individual variables or indicators. The result is an *index* which provides a measure of the phenomenon of interest, which can be used in statistical analysis.

The CBR data set, which has been constructed according to these principles, can be put to use in time-series econometric analysis, to study the effects of legal change, and to identify the direction of causality in the law-economy relation. If the law-economy relation is essentially one of co-evolution,⁴⁴ a statistical method capable of identifying two-way causal flows, and of indicating when a change in the law induces a long-run shift in the evolutionary path of the economy or just a temporary adjustment after which the economy resumes its previous path, is needed. Vector autoregression (VAR) and vector error correction (VEC) models, which can distinguish between the short-run and long-run effects of a change in legal rules,⁴⁵ are among the methods which can be used here.⁴⁶

Leximetric datasets are a comparatively recent development, and the methods they employ are still being tested. Even with such data, there are limits to how far econometric testing can elucidate causal relationships. While VAR models can be used to test for short-run and long-run relationships between variables subject to a co-evolutionary dynamic, data and modelling constraints place limits on their use. In our current state of knowledge, they cannot be used to study the operation of informal institutions which are beyond the reach of quantitative data collection processes. To access these requires direct contact with actors who are in a position to explain to researchers what their perceptions of a particular institutional practice are. Qualitative research of this kind requires “a

substantial period of fieldwork, keen observational skills, thorough record keeping, and a high degree of self-awareness and ethical management of social relations” on the part of researchers, who should have “appropriate language skills and sufficient understanding of the local context to gain access, recognize informal institutions, and accurately interpret culturally coded observations.”⁴⁷ Evidence from such studies may be essential in formulating questions for quantitative analysis and in filling in the gaps left by statistical studies.⁴⁸

(p. 1045) **4 Evidence on Long-Run Trends in Shareholder and Employee Protection**

The Shareholder Protection Index (SPI) and Labor Regulation Index (LRI) are two of a number of databases developed at the Centre for Business Research in Cambridge since the mid-2000s which provide longitudinal data on changes in labor and company law. They are based on a “fine-grained” approach to the coding of primary legal sources which makes it possible to indicate not just the presence or absence of a shareholder/worker-protective law in a given country, but to estimate magnitudes concerning the degree of protection conferred by a given legal rule. These are represented using graduated scores between 0 (indicating little or no protection) and 1 (indicating high protection). Coding algorithms or protocols are used in an attempt to ensure consistency in the scoring of legal rules, and primary sources are reported in full alongside the scores for particular variables (see <https://www.repository.cam.ac.uk/handle/1810/263766> (last accessed 4 April 2018)).

The SPI focuses on laws protecting shareholders against managerial control or power, using ten indicators which were intended to capture the core of what, despite its common-law origins, had become a “global consensus” on shareholder protection from the early 1990s onwards. The indicators were drawn from texts of global relevance for corporate governance standards at this time, in particular the OECD’s *Principles of Corporate Governance* (1999, amended in 2004).⁴⁹

The LRI contains 40 indicators in all, spread across five sub-indices, covering, respectively, the regulation of different forms of employment (self-employment, part-time work, fixed-term employment, and temporary agency work), working time (daily and weekly working time limits and rules governing overtime), dismissal (procedural and substantive rules on termination of employment), employee representation (rules on collective bargaining, the closed shop and codetermination), and the industrial action (the extent of legal support for the right to strike, including rules on secondary and political strikes). Not all labor law rules touch on corporate governance. For the purposes of this paper, a segment of the LRI is relevant, that is to say, the nine indicators in the dismissal law sub-index, and two additional indicators from the employee representation index, covering employee directors and codetermination respectively.⁵⁰

Corporate Governance and Employment Relations

Figure 39.1 to Figure 39.4 present data on trends in shareholder protection and employment protection in 30 countries since the early 1990s, using the CBR data sets. It can be seen that shareholder protection scores have risen steadily over this period, and that the increase has been particularly marked in civil law countries, which have now more or less converged with common law ones. When the sample of countries is broken down by level of development, developed countries are shown to have higher levels of shareholder protection over most of this period than either transition or developing countries, but here again there has been convergence, with transition systems in particular catching up with developed ones.

Figure 39.1 Shareholder protection in 30 countries, 1990–2014, comparing common law and civil law origin countries.

Note: The countries in the data set are Argentina, Austria, Belgium, Brazil, Canada, Chile, China, Czech Republic, Cyprus, Estonia, France, Germany, India, Italy, Japan, Latvia, Lithuania, Malaysia, Mexico, Netherlands, Pakistan, Poland, Russia, Slovenia, Sweden, South Africa, Spain, Switzerland, Turkey, UK, US.

The story for employment protection is somewhat different: civil law countries have consistently higher scores than common law ones. There is little difference between developed and developing systems, and they follow similar trends, but transition systems show higher scores than the other two groups. There is no evidence of a general trend toward deregulation of employment protection laws, although a fall in the scores in some

(p. 1047) transition systems and developed countries reflects the impact of the economic crisis in Europe after 2010.

With both data sets, it should be borne in mind that these scores record the formal content of the law and do not take account of weaknesses in implementation or enforcement. These qualifications are important and are reflected in the use of additional data sets measuring the quality of legal institutions, such as the World Bank Rule of Law index, in econometric studies.⁵¹

(p. 1048) 5 Evidence on the Economic Effects of Corporate Governance and Employment Laws

5.1 Shareholder Rights and Economic Performance

One of the key empirical questions arising from the trend toward greater shareholder protection is whether the strengthening of shareholders' legal rights has had tangible effects on firm performance and, more generally, on economic growth. In principle, it should have led to improved managerial effectiveness and, via that route, to greater organizational efficiency and higher growth. These effects should be measurable in a number of ways: by reference to the value placed by shareholders on firms (share price movements around the "event window" of corporate announcement, and longer term share values relative to assets, or "Tobin's q "); the efficiency with which firms use their capital (return on equity); their profitability (return on assets); and their productivity performance.

Early research in this field was shaped by Gompers, Ishii, and Metrick's study⁵² of the effects on firm values of the adoption by US listed companies of measures restricting shareholder decision making over changes of control, including takeovers and mergers, and entrenching boards against shareholder influence. Their so-called G-index of corporate governance provisions focused on poison pills, supermajority requirements, staggered board rules, golden parachutes, and similar measures adopted by US listed firms, mostly in the period during the 1980s when the effects of hostile takeover bids were highly contested. They found a consistently negative correlation between firm value (measured by Tobin's q) and a high score on the G-index (indicating weak shareholder rights). Subsequent studies have refined this analysis, and have suggested that the results derived from the G-index are mostly driven by the adoption by firms of poison pills and similar devices for restricting the role of shareholder decision making in change of control transactions.⁵³ The G-index and later variants based on it mostly focus on company bylaws and other internal

corporate arrangements rather than legal regulation of corporate governance, although some account is taken of state-level laws on takeover bids. Because of its focus on poison pills and other features of corporate practice which are mostly specific to the American experience, this series of studies, although highly influential for both research and policy in the US, has limited relevance for the experience of other countries.

Another highly significant paper in the development of the field was the study by La Porta et al.⁵⁴ of the impact of cross-national differences in shareholder rights on financial development and growth. Their “anti-director rights index” measured shareholder rights by coding for laws affecting shareholders’ voting, voice, and dividend rights. Higher scores on this (p. 1049) index, indicating a higher degree of shareholder protection, were found to be correlated with more dispersed share ownership, and also with common law legal origin. This original index was limited in scope (it did not code for director independence or takeover regulation) and time invariant; later studies (reviewed below) have added further variables and incorporated a time-varying element to the process of legal index construction.

The first studies of the likely effects of legal encouragement for independent boards and related aspects of corporate governance were carried out in the context of US listed firms in the 1990s, when director independence was not a legal requirement, making it possible to compare the situation of companies with different board arrangements. In the most comprehensive such study, Bhagat and Black⁵⁵ found that there was no clear correlation between independent boards and corporate performance. While underperforming companies increased the proportion of non-independents on their boards, apparently in an attempt to improve performance, this strategy was largely unsuccessful.

Bhagat and Black’s causal variable, board structure, was constructed from data on the proportion of “inside,” “affiliated” (that is, non-executive but linked to the company) and “independent” directors, in a sample of around 1,000 large US public companies across a range of industries (including manufacturing sectors). Their outcome variables were Tobin’s q, return on assets, sales over assets, and adjusted stock price returns. They controlled for firm-specific characteristics including pre-existing board structure, firm size, industry, and the presence of larger, “blockholder” shareholders (>5%). They found that there was a negative correlation between director independence and one or more of the performance variables in the period prior to the adoption of majority independent boards, suggesting that weaker firms were more likely to increase the proportion of independent directors on their boards. They also found that firms adopting independent boards did not subsequently outperform the market, and, for one of the variables (Tobin’s q), did worse than comparable firms. They then looked at the impact on growth, using the percentage growth in assets, sales, and operating income over a period of years as the outcomes variables. Again, they found no positive impact of director independence on performance.

Bhagat and Black concluded from their study that the performance advantages of independent boards were most likely being overstated: insider directors were “conflicted” (that is, inclined to support management) but well informed, whereas inde-

pendent directors, while likely to be more attuned to shareholder concerns, were also less knowledgeable on the underlying business of the firm. On this basis, they argued for corporate governance standards based on a model of a “mixed” board of insiders and outsiders, rather than the majority-independent boards that were then being widely advocated in both the US and the UK.

Notwithstanding these findings, which were replicated by a number of other studies at the time and since,⁵⁶ US corporate governance standards in the early 2000s moved in the direction of mandatory independent boards: the Sarbanes-Oxley Act of 2003 required a majority of independent directors on audit and remuneration committees, and listing rules on the NYSE and NASDAQ exchanges were tightened up to require main boards of quoted companies to have majority independent membership. Studies of the impact of the SOX provisions including those on board structure have generally found negative effects of its (p. 1050) introduction, in particular for already well-governed firms, indicating high costs of compliance associated with this form of legislative intervention, and few if any performance-related benefits.⁵⁷

In the UK, company law largely leaves companies free to structure boards as they wish. The issues of board composition and structure are governed by the flexible regulatory approach of corporate governance codes applying to listed companies (currently, the UK Corporate Governance Code). Under the principle of “comply or explain,” listed companies have the option of either complying with the relevant corporate governance standard (such as rules on board structure), or of explaining why they do not comply. The thinking behind this approach is that companies are heterogeneous and should be allowed to match their corporate governance arrangements to their own needs. Thus the test of whether a given firm has adopted effective governance procedures is, in the final analysis, for the market to make; weak (or ill-matched) governance structures will be reflected in lower share prices.

The flexibility inherent in the UK approach makes it possible to test for the consequences for firm performance of companies’ decisions on board structure and other corporate governance arrangements. The empirical literature for the UK broadly follows that for the US, in failing to find a clear correlation between the adoption of independent boards and separate CEO/Chair roles, on the one hand, and firm performance on the other. One of the few studies to examine in detail the effects on performance of companies’ different approaches to disclosure (or “explanation” as an alternative to “compliance”) is by Arcot and Bruno.⁵⁸ Using a sample of 245 non-financial listed UK firms, they studied the impact of corporate governance compliance and reporting on firms’ return on assets, over a five-year period (1999–2004). They found some evidence of a positive correlation between compliance and performance, but also evidence that firms which did not comply with the standards set out in the Cadbury Code but offered effective explanations for non-compliance performed best of all. The worst performers were those which did not comply with corporate governance standards prior to the implementation of the Code, but did so after it was introduced.

The implication of the Arcot–Bruno study is that corporate governance standards may perform a useful function in enabling already well-run firms to signal this fact, in particular through their use of the “explanation” option. However, this potentially positive effect of corporate governance codes must be qualified by another of Arcot and Bruno’s findings, namely that shareholders did not value this subset of firms as highly as they should have done given their higher profitability; rather, there was a bias, in the valuations placed on companies by the stock market, in favor of firms which formally complied with the provisions of the Cadbury Code. This result implies a degree of shareholder myopia which puts into question the assumption, implicit in the “comply or explain” approach, that the market can efficiently gauge the quality of explanatory disclosures.

There is evidence to suggest that the impact of the laws and corporate governance codes strengthening shareholder rights differs according to the national context that is being considered. A number of studies have found that changes to legislation and/or to listing (p. 1051) rules, encouraging greater independence of boards and related corporate governance changes, have been reflected in improved firm performance in developing countries, as measured by Tobin’s q ⁵⁹ and abnormal share price returns around the “event window” of the announcement of legal changes.⁶⁰

There are few studies directly comparing the experience of developed and developing countries. Deakin, Sarkar, and Singh⁶¹ report findings from a study of the impact of legal reforms in a panel of 25 developed and developing countries over the period 1995–2005. Their causal variable consisted of the measure of legal adoption of pro-shareholder reforms in the CBR SPI. As we have seen, this index is focused on issues of board structure, shareholder voice and voting rights, and protection of minority shareholder interests in the context of takeover bids. The outcome variables in this study consisted of country-level measures of financial development, drawn from the IMF’s Financial Structure Dataset. They used a VEC analysis and the GMM (generalized method of moments) technique to estimate the long-run impact of legal changes, and Granger causality techniques to test for the direction of causation. They found a positive impact of legal change on stock market values (stock market capitalization over GDP) for developing countries, as well as evidence, in the developing world, of reverse causation, suggesting that investor demand was, in part, driving legal change. For developed countries, they found a positive impact of reforms on stock market capitalization for common law countries only; there was no effect in civil law systems. This finding suggests that standards of the kind contained in corporate governance codes have had most impact in common law systems, such as the US and UK, which have dispersed share ownership, but a limited impact in civil law systems, which tend to have concentrated or blockholder ownership. In addition, the results from this study for developed common law countries indicated a possible “bubble” effect, with legal change associated with an increase in equity values but not in the underlying volume of shares traded (this was not the case with the developing country sample).

This study implies that corporate governance reforms encouraging or mandating protections for shareholders are most likely to have positive impacts in systems where equity markets are still in the process of emerging and where firm-level governance is weak. In

developed country contexts, on the other hand, they can have negative implications, imposing regulatory costs on already well-governed firms, and contributing to overvaluation of shares during stock market bubbles. This effect is most marked in common law systems such as the UK and US.⁶² In civil law countries, where ownership still tends to be concentrated in large blocks, reforms premised on the assumption of the US or UK-style separation of ownership and control run the risk of failing to bed down in practice.

One of a very small number of cross-country studies to address the interaction of corporate governance standards and employment laws is by Conway et al.⁶³ They used (p. 1052) establishment-level data on workplace practices (the UK Workplace Employment Relations Survey and its French equivalent, REPONSE) to test for the significance of a stock-market listing on firm-level human resource management practices. They found that UK-listed companies were less likely to engage in high-commitment HRM practices than “stakeholder” firms (mutual, cooperatives, and public interest companies). In France, there was a somewhat different result: French listed companies were more likely to engage in formal HRM practices than non-listed firms, but reported lower levels of worker engagement than stakeholder firms. One interpretation of the different results for France and Britain is that French labor law, which is more worker-protective than that in the UK, mediated the impact of shareholder pressure on management, resulting in a more sustainable form of rent-sharing between investors and workers.

5.2 Board Structure and Managerial Strategy

One of the consequences of the move toward independent boards in both the UK and the US has been greater scrutiny of the hiring of senior executives, including CEOs, by board members, and the increased use of incentive payments and bonuses for CEOs based on share price performance and other performance criteria. The delegation of nomination and remuneration decisions to board subcommittees with a majority of independent members is mandatory for US listed companies under the Sarbanes-Oxley Act and recommended practice under the UK Corporate Governance Code. Although in principle these changes should bring about a closer alignment of managerial and shareholder interests, and hence increase firm value, there is evidence that firm value may be negatively affected by short-termism associated with the financial incentivization of CEOs. Antia, Pantzalis, and Chul⁶⁴ find that longer time horizons for CEOs of US listed companies, which they calculate in terms of current tenure plus age, are associated with higher firm value as measured by Tobin’s q , while Brochet, Loumiot, and Serafeim,⁶⁵ who measure the short-term orientation of CEOs on the basis of transcripts of conference calls with investors, find that US firms with a short-term strategy attract short-term investors and have higher stock price volatility.

The nature of relationships in the investment chain between pension fund trustees (who have a fiduciary duty to maximize returns for the scheme members) and asset managers, and the resulting implications for the strategies pursued by investee companies, is the subject of a small but growing empirical literature. Del Guercio and Tkac⁶⁶ find, in the context of a US study, that pension funds are more likely than mutual funds to replace

fund managers after poor performance over the short term (up to one year), and Heisler et al.⁶⁷ similarly find that US pension fund trustees' fiduciary duties and duty to monitor managers together make (p. 1053) them prone to use short-term performance measures and to replace managers who fail to meet them.

In the case of the US and the UK, there is evidence of potentially negative effects of shareholder-orientated corporate governance rules on investment decisions. Graham, Harvey, and Rajgopal⁶⁸ report that US listed companies are becoming less willing to invest in R&D when they come under pressure to prioritize shareholder returns through share buy-backs and higher dividends. Asker, Farre-Mensa, and Ljungqvist⁶⁹ find that US listed firms invest less than comparable private firms and are less responsive to changes in investment opportunities, particularly in industries characterized by high sensitivity of stock prices to current earnings. Comparative studies also provide evidence of trade-offs between shareholder protection and stock market values, on the one hand, and innovation, on the other. Belloc reports the findings of a 48-country study which analyses the relationship between shareholder protection, as measured by the World Bank and CBR indices, and innovation, as measured by investments in R&D and patenting activity. Employing a panel data methodology, he finds that a high level of legal shareholder protection is correlated with a higher level of stock market capitalization, but a lower level of innovation activity.⁷⁰

Lazonick and Prencipe's⁷¹ case study of Rolls Royce points to tensions between corporate governance practices in the UK and the development of technological capabilities by manufacturing firms. The paper describes how Rolls Royce consolidated and then improved its position in the global market for aircraft engine production in the course of the 1990s through a strategy of building internal capabilities that was led by a largely engineering-focused team of managers. In this period, the development of the company's three-shaft turbofan engine enabled it to overtake its US rival Pratt and Whitney to become the second-ranked commercial aviation engine producer after GE. In the early 1990s the company cut dividend payments, and its share price subsequently under-performed in the FTSE 100 index. Despite this, the company was able to raise capital through a rights issue in 1993, and it took on debt to fund a number of acquisitions. By the end of the decade it had largely paid off its debt through the revenues generated by increasing sales; its share of the global turbofan market increased from 8% in 1987 to 30% in 2002. Throughout this process, the company's management was effectively protected from negative investor opinion by the "golden share" retained by the UK government. The senior management team had virtually no ownership stake in the company, and the board members between them held less than 0.5% of the issued share capital. The authors of this study make the point that the success of Rolls Royce needs to be seen against the background of "the relative lack of success, more generally, of British companies in high-technology manufacturing industries over the past half century or so."⁷²

(p. 1054) 5.3 Shareholder Rights, Product Market Competition, and Innovation

There is a growing literature examining the interaction between corporate governance standards and product market competition, which has implications for the relationship between governance and innovation. Giroud and Mueller⁷³ analyze the impact of firm-level governance practices on a number of performance measures (share price performance, Tobin's q , return on equity, return on assets, net profits) for a sample of over 3,000 US listed companies across a range of industries (including but not confined to manufacturing sectors). They then control for the competitive structure of industries, as measured by the Hirschman–Herfindahl index of concentration. They find that governance has only a small effect on firm performance in competitive industries and a more sizable positive impact on performance in non-competitive ones. They conclude that product market competition and corporate governance operate as substitutes: governance has little role to play in enhancing firm performance if product markets are already competitive.

Knyazeva and Knyazeva⁷⁴ reach an opposite result, although differences in their focus, which is on legal rules rather than firm-level practices, and in the scope of their study, which does not include the US or Canada, may partly explain the divergence. Rather than focusing on differences in firm-level governance practices in a single jurisdiction as Giroud and Mueller⁷⁵ did, they look at differences in country-level laws on shareholder protection, using, for this purpose, the time-invariant index developed by La Porta et al.⁷⁶ They use a very large sample of mostly manufacturing firms (regulated industries and financial firms are excluded) in 45 developed and developing countries, excluding US or Canadian incorporated firms. They find that shareholder rights have a positive impact on firm performance (both financial performance and profitability) in industries which are more competitive (using the HHI as the measure of competitive structure). They explain this result on the basis that shareholders are likely to monitor managers more effectively in competitive industries where it is easier to identify and remedy managerial under-performance.

Chai et al.⁷⁷ introduce innovation into the picture by using as a measure of product market competition the abnormal persistence of firm-level profits. If markets were perfectly competitive, abnormally high profits should be competed away over time. Persistence of profits can therefore be interpreted as indicating incomplete or imperfect competition in product markets. However, abnormal persistence can also be interpreted as evidence for the presence of innovative firms which are successful over time in capturing rents from product or process innovation. Using a very large sample of manufacturing firms in 18 developed and developing countries, Chai et al.⁷⁸ estimate the impact of laws governing shareholder rights on the persistence of firm-level profits. They use the CBR SPI as the measure of legal shareholder protection; as this (p. 1055) varies over time it provides an alternative (and potentially more revealing) measure to the time-invariant index of La Porta et al.⁷⁹ They find that higher shareholder protection reduces the persistence of profits in common law countries and increases it in civil law countries. This is consistent with the view that increases in legally mandated or encouraged shareholder protection

during the 1990s and 2000s had a negative impact on firm-level innovation (proxied here by the abnormal persistence of profits) in common law systems. In civil law systems, which had a lower level of shareholder protection to begin with, the effect was positive, implying that there is a curvilinear (inverted U) relationship between shareholder rights and firm-level profitability based on innovation.

5.4 Employment Protection and Innovation

A body of work is beginning to look at the relationship between employment protection laws (EPL) and innovation. There are two possible routes by which they might be related. One possibility is that EPL, by raising dismissal costs, provides incentives for firms to move to, or remain on, a “high road” to competitive success, based on continuous product and process innovation, as the condition of being able to maintain a credible commitment to job security. This also implies a greater commitment by firms to training and upgrading of the labor force. A second possible route depends on the effect of EPL in reducing the downside costs to employees of risk taking of the kind associated with high-innovation practices. If employees are confident that their knowledge and know-how will not be appropriated ex post by the employer, through dismissal, they are more likely to contribute their skills and knowledge to the development of innovative products and processes.

There is some evidence to support both these sets of claims. With respect to the first, Koeniger⁸⁰ finds that a high level of EPL at country-level is associated with more innovation-related firm-level training. With respect to the second, Acharya, Baghai-Wadji, and Subramanian⁸¹ use the dismissal protection variables in the CBR-LRI to examine the effects of changes in EPL over time on patenting activity and citations to patents in four industrialized countries (France, Germany, the UK, and the US). Using a difference-in-differences approach, they find a positive correlation which can be interpreted as a causal relationship, with greater employment protection laws stimulating higher innovation based on employee input into new products and processes.

These findings on the positive link between innovation and employment protection are being replicated in other studies. A cross-national study by Belloc reports evidence that a combination of low EPL and high shareholder protection is correlated with reduced innovation, measured in terms of patenting and patent citation rates.⁸² Griffith and McCartney⁸³ report a correlation between high EPL and investments by multinational firms engaging in incremental innovation (involving the adaptation of existing technologies), although they (p. 1056) also find that low EPL attracts cross-border investments by firms pursuing radical innovation (developing new technologies). Zhou, Decker, and Kleinknecht⁸⁴ find, in an econometric study of Dutch firms in a range of sectors including manufacturing, that firms adopting “Rhineland”-style job security practices had stronger innovation performance (measured in terms of sales of new or improved products) than those with “Anglo-Saxon” hire-and-fire-type practices. Temporary contracts were positively correlated with “imitative” (follower) strategies on the part of innovating firms, but negatively correlated with strategies of market-leading firms. They interpret their findings as support for a theoretical model within which innovating firms offer “functional

flexibility,” combining job security with a high degree of firm-specific training and intra-organizational mobility on the part of workers, rather than “numerical flexibility,” which relies on temporary contracts and redundancies to meet fluctuations in labor demand. On this basis they caution against policies of labor market deregulation, arguing that they will reduce pressures on weaker firms to upgrade their performance.

A particular subset of this literature has looked at the legal regime governing early-stage finance and startups, which is a composite of the standard-form contracts which have evolved over time to meet the needs of firms and investors, and elements of the legislative framework drawn from each of the areas considered in this review (company law, insolvency law, and employment law), as well as tax law. It has been argued that shareholder pressure operates as a device for releasing capital from under-performing firms and ensuring its reallocation to more profitable and, in principle, innovative ones elsewhere in the economy, including startups. Specifically, it is suggested that the availability of venture capital for startups is linked to the ability of shareholders to extract value from companies in mature sectors through takeover bids and direct engagement with companies to increase dividends and engage in share buy-backs (“shareholder activism”). Once the capital is released in this way, the capital market functions to redirect it to growing firms in developing sectors of the economy.⁸⁵ More generally, it is argued that a liquid stock market is important for providing venture capital firms with an exit strategy, via an IPO, which will enable them to cash out their investments.⁸⁶

In the same vein, a flexible labor market can be understood as complementing the corporate governance mechanisms which underpin early-stage finance. The ability of established firms to downsize at minimal cost is part of the process by which hostile takeovers and shareholder activism work to free up capital for wider circulation in the economy. While downsizing in response to shareholder pressure can be analyzed as a breach of implicit contracts between the firm and its core workforce,⁸⁷ agency-theoretical approaches see advantages in labor law regimes which give employers the freedom to restructure the enterprise where to do so will enhance shareholder value.⁸⁸ This implies a regime of minimal employment protection regulation and limited provision for collective employee voice in the (p. 1057) event of redundancies. For startups, a low degree of employment protection could therefore be seen as providing an important source of flexibility in hiring and firing.

Acharya, Baghai-Wadji, and Subramanian⁸⁹ examine the effects of the erosion of the employment-at-will rule in California and a number of other US states from the 1970s onwards. Contrary to the predicted effects upon innovation of a strengthening of employment protection, they find that stricter controls over dismissal are found to be correlated with higher innovation, with the direction of causation running from the former to the latter. This study finds that the states with the greatest concentration of high-tech firms, namely California and Massachusetts, are among those with the most significant exceptions to the employment at will rule (the “implied good faith exception”), and that following the tightening of wrongful discharge laws in these states there was an increase not only in patenting activity but in the number of entrepreneurial startups and in the num-

bers employed in innovative firms. The study also reports positive effects on patenting activity in California following the adoption of the federal WARN law of 1988 on notice and severance pay. The authors ascribe these effects to the reduced risk of “hold-up” of innovative employees by firms following the adoption of stricter employment protection laws. The ability of employees to move between firms free of the constraints imposed by non-competition clauses or “restrictive covenants” may be a more important dimension than weak levels of employment protection in explaining the emergence of “high velocity” labor markets.⁹⁰

5.5 Takeover Bids and Hedge Fund Activism

The way in which the potentially divergent interests of shareholders and workers are addressed in the context of takeover bids is an important indicator of cross-national differences in approaches to corporate governance. In principle, hostile takeover bids enable shareholders in systems with liquid capital markets to hold managers to account in circumstances where, thanks to diffused share ownership, they may not be in a position to exercise direct control over the board.⁹¹ Hedge fund activism, in which takeover bids may be used as one of a number of tactics to put pressure on boards to enhance short-term financial returns to shareholders,⁹² is a related phenomenon which may similarly tip the balance of power within the firm in favor of shareholders.⁹³ The potential downside in both cases is decreased investment by employees in firm-specific human capital, which is vulnerable to expropriation through a “breach of trust” if the firm is taken over or its strategic direction altered through a hedge fund intervention.⁹⁴

(p. 1058) Evidence on the incidence of takeover bids and on success rates suggests that they are associated with diffused ownership, as theory would suggest. Jackson and Miyajima⁹⁵ report nearly 200 hostile bids in the UK between the early 1990s and the mid-2000s and over 300 in the US, during which there were only 18 hostile bids in France and six each in Germany and Japan, while there were 176 in the UK and 332 in the US. The success rate for bids, indicating whether the target company was taken over, was 42% in the UK and 22% in the US. In France 12 out of 18 bids succeeded but in both Germany and Japan there was only one instance of a successful bid during this period.⁹⁶ Hedge fund activism, while growing after 2000 in Europe⁹⁷ and Japan,⁹⁸ is still largely a US phenomenon.⁹⁹

There is also evidence to connect the scale of hostile takeover and hedge fund activity to differences in regulatory regimes. The UK’s Takeover Code has since its inception been highly protective of the rights of minority shareholders during takeover bids, to the extent of effectively prohibiting poison pills and similar defences of the kind which are common among US-listed companies.¹⁰⁰ Cross-national analysis suggests that the incidence of adversarial hedge fund activism is correlated with higher scores for shareholder rights on the CBR’s SPI.¹⁰¹

The efficiency and wealth effects of takeovers and activist interventions have been among the most intensively studied in the empirical corporate governance literature, and the

field continues to evolve with a growing emphasis on comparative analysis. Recent cross-national studies suggest that hostile bids do not, on average, lead to improved firm performance, but also that a large proportion of bids do produce enhanced value for shareholders, and that there is considerable variance in the range of outcomes.¹⁰² These findings do not rule out the possibility that pro-shareholder takeover regimes induce efficiency gains in firms which are never targeted for takeover, a result predicted by agency theory.¹⁰³ In the US context, firms (p. 1059) without anti-takeover defences are more highly valued by shareholders,¹⁰⁴ which may be evidence for the negative effects of poison pills on managerial performance.¹⁰⁵

There is evidence that corporate restructurings triggered by a change of control or by a hedge fund intervention may have negative effects for labor while producing value for shareholders. For the UK, studies suggest that takeovers which result in redundancies and downsizing also lead to improvements in firm value.¹⁰⁶ In the US, adversarial hedge fund activism tends to produce positive returns for shareholders of target firms around the period of the intervention, and while evidence of long-term improvements in firm performance is mixed, the consensus is that activism of this kind operates to reduce agency costs by aligning managerial strategy with shareholder interests.¹⁰⁷ Since there is also evidence that adversarial interventions involve losses for bondholders¹⁰⁸ and workers,¹⁰⁹ it is plausible to see hedge fund activism, whatever its wider implications for firm performance, as involving a trade-off between shareholder and worker interests.

5.6 Hybrid Forms of Governance: The Effects of Sharing Residual Income and Control Rights between Shareholders and Employees

There is a large literature on the effects of employee financial participation, but relatively little on the distinctive features of enterprises in which employees have residual income and/or control rights. The literature on employee share ownership suggest that while financial participation can induce heightened commitment and morale, it rarely has this effect on its own, but does so in conjunction with HRM practices which encourage employee engagement and the exercise of voice.¹¹⁰ The practice of employee share ownership through ESOPs (in the US) and similar financial structures in other countries (in the UK, ETs and QUESTs) indicates that while they may provide employees with individualized residual income rights, they are rarely associated with worker control rights, in part because they cannot easily be used as a means of exercising collective worker voice.¹¹¹

The codetermination model found in certain mainland European countries provides employees with a form of residual control rights, although these are best understood as structures within which shareholders and employees share supervisory responsibilities (p. 1060) in a way which is intended to encourage consensus between them over issues of corporate strategy. There is limited empirical evidence on the impact of two-tier boards on company performance. The German literature is mainly focused on the performance implications of works councils, which studies find to be positively correlated with innovation and productivity indicators.¹¹² The works council provides a basis for codetermination over matters of workplace organization, not corporate strategy. It is possible that the

supervisory board and the works council complement each other in providing a framework for labor-management cooperation, but this has not been shown empirically. The informational benefits which a two-tier board structure is meant to confer on worker representatives are commonly offset in practice by the informality of supervisory board processes.¹¹³ The Biedenkopf Commission which reviewed dual-board structures in Germany the early 1970s came to the view that worker directors had little impact on strategic or financial decision making, but did raise the profile of social aspects of firm performance.¹¹⁴

In Germany, the two-tier board structure is mandatory for larger companies, making direct comparisons with other structures problematic. In France, by contrast, the two-tier structure is optional. Rouyer¹¹⁵ studies the impact of supervisory boards using a sample of the 250 largest non-financial French firms, around a third of which had moved to the two-tier structure. She finds that companies with a supervisory board have superior long-run financial performance, as measured by Tobin's q , and lower cash holdings, a result she attributes to the superior monitoring achieved by the two-tier model.

The Japanese firm offers another national variant, which in practice treats workers as if they had a share of the residual control rights, alongside shareholders, although in formal legal terms this is far from the case. Japanese company law is strongly pro-shareholder. The CBR-SPI index ranks Japan in the top quintile of countries for this type of shareholder protection, alongside countries such as Canada, the UK, and US.¹¹⁶ Shareholders with a 1% holding can submit proposals to the annual general meeting and those with 3% can call for an extraordinary meeting. In most cases, a simple majority of participating shareholders is entitled to appoint the board and to dictate the level of dividend payouts, while a majority of two-thirds can vote to alter the company's capital structure. In the early 2000s Japanese company law was amended to permit firms to opt into a US-inspired "company with committees" model, with a more prominent role for external directors and a clearer demarcation between the managerial and monitoring functions of the board.¹¹⁷

However, very few firms took up this option, and those which did so used it to streamline executive decision-making structures, not to move to a different model of board-level (p. 1061) governance. External directors continue to have limited influence in Japanese firms and generally have an advisory rather than a monitoring role. The boards of large Japanese companies continue to be dominated by executive directors, and corporate governance practices more generally are "internally focused," with an emphasis on peer-based monitoring by informed insiders which is consistent with a broadly pro-stakeholder or "communitarian" conception of the firm. The strong and mostly effective resistance of listed Japanese companies to hedge fund activist campaigns in the mid-2000s testifies to the limited influence of minority shareholders in the Japanese system.¹¹⁸

In addition to their implications for firm-level performance, hybrid regulatory regimes have an impact on the relative wealth of shareholders and workers. Deakin, Malmberg, and Sarkar¹¹⁹ use the CBR LRI to analyze the effects of worker-protective labor laws on the labor share, which measures the relative proportion of national output taken by

wages and profits in six OECD countries. After controlling for differences in GDP, they find a correlation between legal support for employee representation through codetermination and collective bargaining, and an increased labor share. Conversely, there is evidence that a higher degree of protection for shareholders affects distribution. Sjöberg¹²⁰ finds that protection for minority shareholders, in conjunction with the incidence of takeover bids, is correlated with a higher degree of earnings inequality in OECD countries.

6 Assessment

The consensus position in corporate governance theory is that it is efficient to allocate residual income and monitoring rights to shareholders, leaving other stakeholders, including employees, to resolve their claims against the firm through contract. Because, however, the employment contract is inherently incomplete, some element of rent sharing between workers and investors is a necessity for the firm. Governance mechanisms which reflect this reality are commonly found in legal systems around the world: they include two-tier boards and codetermination systems of the kind that occur in parts of mainland Europe. While codetermination is relatively rare, laws making it costly for firms to dismiss workers and granting them voice rights in the firm are not, and may have similar effects in terms of enhancing employees' investments in firm-specific human capital, in particular in the context of innovative firms.

Systems in which employees play no role in governance and where regulation of the employment contract is minimal do not thereby escape the dilemmas posed by the need for rent sharing. In place of codetermination and job security clauses, firms compensate employees for the risk of dismissal by increasing their remuneration and linking it to stock price increases and other indicators of corporate performance. These solutions, supposedly (p. 1062) designed to align employee and shareholder interests, often do not work, since they invite new forms of opportunism and rent extraction on the part of strategically placed employees and managers, mostly to the detriment of shareholders. Meanwhile, laws adding to the rights shareholders already have to hold managers to account may tilt the balance of corporate power too far in favor of investor power, shortening managerial time horizons and leading to under-investment in firm-specific capabilities.

While the efficiency implications of a regime of high shareholder protection and low employee protection are equivocal, the distributional effects of such a regime are clear: they are regressive. Strong shareholder rights regimes are correlated with high earnings inequality, and worker-protective labor laws with an increased share of national production being taken in the form of wages rather than profits. At a time of growing concern over inequality, this may become an issue for corporate governance research and practice.

Corporate Governance, Capital Markets, and Securities Law

A. C. Pritchard

The Oxford Handbook of Corporate Law and Governance

Edited by Jeffrey N. Gordon and Wolf-Georg Ringe

Print Publication Date: May 2018 Subject: Law, Company and Commercial Law

Online Publication Date: Jul 2015 DOI: 10.1093/oxfordhb/9780198743682.013.45

Abstract and Keywords

This chapter explores the interrelationships among corporate governance, capital markets, and securities law. More specifically, it considers the role that securities law should play in encouraging corporate governance standards that hold managers and directors accountable to shareholders. It also examines whether disclosure, bolstered by market forces, is sufficient to promote efficient corporate governance provisions. After charting the origins of the dividing line between securities law and corporate governance in the United States, the article looks at the efforts of the Securities and Exchange Commission to push against that boundary. It then analyses the institutional connections between capital markets and corporate governance, especially whether there are practical limits to the link between securities law and corporate governance. Finally, it discusses future prospects concerning the boundary between corporate governance and securities law.

Keywords: corporate governance, capital markets, securities law, shareholders, disclosure, United States, Securities and Exchange Commission

1 Introduction

At first blush, the connection between corporate governance and capital markets might seem tenuous. Under the Efficient Capital Market Hypothesis (ECMH),¹ investors will incorporate their assessment of a firm's corporate governance into their valuation of the firm's future cash flows and the risk associated with those cash flows. Consequently, a company's stock price will reflect the quality of its corporate governance in limiting agency costs associated with the company's managers and/or controlling shareholders.² On this view, securities regulators' only concern is ensuring that corporate governance terms are accurately disclosed. If disclosure is effective, even unsophisticated investors will be protected. Poor corporate governance—if it is adequately disclosed—will not affect investors' expected returns because the price they pay for a security will be “fair,” i.e., discounted to reflect any reduced returns that may result from poor corporate gover-

nance. Thus, one can think of securities markets as a grading mechanism for the efficacy of corporate governance.

From its beginnings, however, securities law has sought to do more than neutrally grade corporate governance. Securities law obviously needs to discourage fraud, with its obvious implications for the value of disclosure. (Fraud also has the potential to undermine the market's ability to grade firms' corporate governance provisions.) But securities law has also worried about other forms of overreaching by corporate insiders. Justice Louis Brandeis' oft-quoted phrase that "s[un]light . . . is the best disinfectant; electric light the best (p. 1064) policeman" captures the attitude succinctly.³ Disclosure has been justified, not simply as a means of promoting accurate pricing, but also as a means of exposing—and disinfecting—problematic behavior. Exposure would deter wrongdoing by managers and promoters.⁴ Managers bent on self-dealing may restrain themselves if related-party transactions must be disclosed, at least if disclosure is backed by a plausible threat of enforcement. If investors (and perhaps, regulators) can see such activities clearly, then market participants (assuming either a modicum of shame or oversight) are less likely to engage in opportunistic behavior in the first place.⁵

What role should securities law play in encouraging corporate governance standards that hold managers and directors accountable to shareholders? Is disclosure, bolstered by market forces, sufficient to induce efficient corporate governance provisions, as the ECMH suggests? Or should securities law affirmatively seek to put a thumb on the scale of corporate governance outcomes, pushing companies toward "good" corporate governance? From the perspective of those who believe that governance has significant potential to limit agency costs, a disclosure regime—coupled with robust enforcement—that promoted good corporate governance might provide a signal that a company was well run, with structural provisions in place (e.g., independent directors) to keep agency costs in check. If investors value that signal, we have the groundwork for a virtuous circle, with an efficient and effective disclosure regime fueling a potential race to the top in corporate governance.

This argument blurs the line between corporate governance and the disclosure focus of securities law. But another question lurks: Does corporate governance influence the efficiency of securities markets? History suggests it might. Exchanges have long imposed corporate governance mandates on companies listing their shares for trading. Securities regulators, as they have gained greater authority over exchanges, have used listing standards as a tool for promoting more stringent corporate governance standards in the name of promoting "investor confidence," and at least implicitly, liquidity.

There may be limits, however, to the connection between liquidity and corporate governance. In the US, listing standards for public companies have become a favored tool by which the federal government imposes governance standards. Those standards, however, do not always have a clear connection to the efficiency of securities markets. Consequently, it is unclear whether the US model of securities law provides a useful lesson, or a cautionary tale, for other jurisdictions contemplating corporate governance reform.

This chapter explores the dividing line between corporate governance and securities law from both historical and institutional perspectives. Section 2 examines the origins of the dividing line between securities law and corporate governance in the United States, as well as the efforts of the SEC to push against that boundary. That history sets the stage for section 3, which broadens the inquiry by examining the institutional connections between capital markets and corporate governance. Are there practical limits to the connection between (p. 1065) securities law and corporate governance? The US again illustrates the point, as Congress has increasingly crossed the traditional boundary between securities law and corporate governance. I conclude by speculating on the future of the dividing line between corporate governance and securities law.

2 A Brief History of the Dividing Line between Corporate Governance and the Securities Law in the United States

2.1 Corporate Law and Corporate Governance in the United States

The US treats corporate governance and securities law as separate spheres. Why not just “company law”? The answer is historical, not functional. Before there were federal securities laws in the US, there were state corporate laws. State corporate law not only gave corporations their legal existence, but also imposed corporate governance mandates for the protection of shareholders and creditors. State corporate law determines most questions of internal corporate governance—the role of boards of directors, the allocation of authority between directors, managers, and shareholders, etc.⁶ The force of those mandates is constrained by the fact that, under US law, companies have unfettered discretion in choosing their state of incorporation. Moreover, the “internal affairs” doctrine requires courts to apply the law of the state of incorporation to corporate law disputes.⁷

The result of this combination has been an “issuer choice” regime in state corporate law in that US Corporations are free to choose the law of the state that best suits the needs of their directors, managers, and shareholders, without regard to where the corporation principally does business. States can compete to attract firms by offering the most attractive menu of corporate law rules and the best judges for resolving any disputes that may arise. Directors make that choice, subject to the risk that the market will sanction them if they pick a jurisdiction with overly lax standards. Thus, the stage was set early on for an “enabling” or “permissive” model of state corporate law, which progressively diluted a number of the regulatory mandates that were common in early state corporation statutes. First New Jersey, then Delaware, took the lead in attracting corporations headquartered in other jurisdictions, with the principal selling point being the elimination of restrictions on corporate directors and managers that earlier featured prominently in the corporate law of many states.⁸ Defenders (p. 1066) of this trend contend that competition in the cap-

ital markets compels managers to offer shareholders corporate law rules that effectively constrain the agency costs inherent in the separation of ownership and control.⁹

Even before the adoption of the federal securities laws, there were counterweights to the influence of the states over corporate governance, primarily driven by capital markets. That market-driven response suggests there may be an inherent connection between corporate governance and capital markets. The New York Stock Exchange (NYSE)—the first truly national exchange in the US—provided a contractual version of a national securities law, at least for the US’s largest public companies. Through its listing agreement, the NYSE played an important role in promoting both disclosure and improved corporate governance by allowing companies to pre-commit to best practices. Most conspicuously, the NYSE waged a long campaign against the traditional secrecy of corporate managers.¹⁰ Despite a number of practical obstacles,¹¹ the NYSE eventually was able to require listed corporations to provide regular balance sheets and other financial data to stockholders.¹² The NYSE’s requirement that those financial statements be audited also provided a substantial impediment to fraud.¹³

The NYSE’s practice of imposing corporate governance and disclosure requirements through listing standards, although purely voluntary (no one could force a company to list its shares), did create a contractual certification mechanism that companies could use to signal their quality. The value of the NYSE’s listing requirements is testified by the fact that Congress closely tracked the NYSE disclosure requirements when it drafted the Securities Exchange Act of 1934 (Exchange Act).¹⁴ The difference, of course, is that the disclosure requirements for public companies became a legal mandate, backed up by SEC enforcement, rather than a contractual undertaking, backed up by the threat of delisting from the exchange. With the advent of that mandate, the stage was set for the dividing line between corporate governance and securities law to have significant consequences because securities law, unlike state corporate law or listing standards, could not be easily evaded.

(p. 1067) 2.2 The Introduction of the Federal Securities Laws

The gradual relaxation of corporate governance mandates in state corporate law was not without its detractors, then or now. Critics of issuer choice argue that states were competing for charter fees—soliciting “tramp” corporations—by pandering to corporate managers. The incentive for the states to compete for charters is clear. Delaware, as the long-term winner of that competition for corporate charters,¹⁵ currently funds roughly a quarter of its state budget from corporate charter fees.¹⁶ Critics of issuer choice charge that states prevail in this competition by leaving shareholders vulnerable to overreaching by corporate managers. Exchange listing requirements are an insufficient counterweight, on this view, because exchanges are similarly beholden to corporate managers. The result, critics alleged, has been a “race to the bottom.”¹⁷

The obvious answer to concerns raised by a potential “race to the bottom” was federal minimum standards, but at one time, the federal structure of the US government was

thought to limit the federal government's power over corporate governance. As the US confronted the economic devastation wrought by the stock market crash of October 1929 and the ensuing Great Depression, corporate governance was seen as the province of the states, whose corporate laws gave corporations their very existence. Thus, the scope of the federal intervention was necessarily constrained, the policy levers available were limited.

There was some support among more radical New Deal reformers for a "federal corporate law." The interventions that Franklin Delano Roosevelt would ultimately pursue were more targeted, however, as his administration was reluctant to push constitutional limits. As we shall see, those limits were soon abandoned. By the end of the Second World War, the constitution was no longer a meaningful constraint on the power of the federal government to dictate corporate governance standards. The dividing line fostered by those now-discarded constitutional doubts, however, persists in the US as a matter of tradition and interpretive presumption. Even today, state corporate law determines most internal governance questions while federal securities law is generally limited to governing questions of disclosure to shareholders—annual reports, proxy statements, and periodic filings.

The push to enact federal securities law was one of the great political battlegrounds of the New Deal; 1933 to 1935 saw annual fights to enact the three laws that established the foundation of federal securities legislation. The first, the Securities Act of 1933 (Securities Act), brought the federal government into the regulation of the public offering of securities, curbing the investment bankers' prior domination of that process. The law required corporate issuers to make full disclosure when selling securities. The second, the Exchange Act, required disclosure of operations and results by companies listing on exchanges, as noted above. Although the Exchange Act targeted the NYSE, particularly in regulating broker-dealers, the NYSE did get one benefit from the law: The Exchange Act's mandate (p. 1068) for disclosure by listed companies eliminated the ability of rival exchanges to undercut the NYSE's disclosure requirements. The NYSE's gold-plated standards would be mandated for all listed companies, although companies that traded in the over-the-counter market remained exempt for another 30 years. These two laws cemented disclosure as the foundational basis of the securities law.

The third foundational securities law, the Public Utility Holding Company Act of 1935 (PUHCA), departed from the disclosure model underpinning the Securities Act and the Exchange Act, making it the most controversial of the three securities laws from FDR's first term.¹⁸ PUHCA targeted the holding companies that owned most of the public utilities in the US at the time. The public utility structure had long been a *bête noire* of reformers; the collapse of the Insull public utility holding company was the Enron of its day.¹⁹ The demise of the Insull empire cemented the public utility holding company structure's reputation for abuse.

Given that the holding companies sprawled across multiple jurisdictions, no state could effectively control their corporate governance. Disclosure was not enough to correct the

abuses. If regulatory oversight of these monopolies was to be effective, stronger medicine was required: The federal government needed to control corporate governance. The economic crisis provided Roosevelt with the opportunity to eliminate the holding companies. On January 4, 1935, Roosevelt called for the “abolition of the evil of holding companies” in his State of the Union address to Congress.²⁰ The public utilities industry was considerably less enthusiastic about being the subject of the federal government’s experiments in corporate governance, predicting economic disaster if the bill were enacted.²¹

PUHCA went well beyond the disclosure mandates of the two earlier securities statutes. PUHCA’s “death sentence” provision effectively limited utility holding companies to one geographic area; those that did not comply were to be broken up under the direction of the SEC.²² The death sentence provision was a major departure from the disclosure paradigm (p. 1069) of the earlier securities laws. The holding company legislation also required registration and disclosure, but it broke new ground in giving the SEC control over the utilities’ capital structures and corporate governance as part of their reorganization. Thus, the legislation set a new high water mark for federal interference with business: “Except in wartime, the federal government never before had assumed such total control over any industry.”²³ PUHCA’s sweeping reforms would trigger a decade-long war in the courts, as the giant utilities resisted the efforts of the SEC to dismantle them. But it also set the stage for the SEC to play a key role in corporate governance, albeit for only a portion of American business.

For opponents of federal economic regulation, PUHCA looked like the constitutional test case for the federal control of corporate governance that liberals had long sought. The Roosevelt administration ultimately prevailed despite the industry’s resistance, but only after an epic legal struggle, requiring three visits to the Supreme Court before it was finally resolved in the government’s favor.²⁴ Only a decade after PUHCA’s enactment did the Court resolve the constitutionality of the controversial death sentence provision.²⁵ When the *North American v. SEC* decision came down, it was an enthusiastic validation of the SEC’s power to break up utility holding companies. The Court’s opinion painted with a broad, moralistic brush: “The fact that an evil may involve a corporation’s financial practices, its business structure or its security portfolio does not detract from the power of Congress under the commerce clause to promulgate rules in order to destroy that evil.”²⁶ Under its new understanding of the Commerce Clause, the Court had validated the federal government’s authority over corporate governance. Would Congress and the SEC exercise that authority?

The answer was no—at least in the short term. Having gained the power, the federal government lost the will. PUHCA, which in the 1940s allowed the SEC to dictate corporate governance standards to an industry vital to the economy, faded in significance after the nation’s public utility holding companies were broken up by the 1950s. It did not prove to be the trial run for “federal corporation law” as liberals had hoped. A generation later, narrow interpretations and regulatory exemptions undid much of the work accomplished by the SEC in breaking up the holding companies. New utility conglomerates emerged, such as Enron, with diverse business interests and sprawling operations. PUHCA’s pur-

pose was largely repudiated, and the Act itself was repealed in 2005.²⁷ After PUHCA's repeal, the SEC was deprived of the role that gave the agency an important say in corporate governance, limiting the agency to overseeing the disclosure-focused regulation of the Securities Act and Exchange Act.

PUHCA's withering foreshadowed a broader retreat by Congress and the SEC in the realm of corporate governance, and indeed, securities law generally. Congress passed no significant securities legislation between 1940 and 1964. The SEC went from being an activist force in the 1930s, to being a backwater after its wartime move to Philadelphia. (It was not returned (p. 1070) from exile until 1948.) Simply put, almost as soon as the constitutionality of PUHCA was established in *North American*, affirming the power of Congress over corporate governance, securities law stopped pushing those boundaries. Not until the 1960s would that push be revived, but that extension would come from the SEC and the courts, not Congress.

2.3 The 1960s Expansion

The 1960s witnessed a rapid expansion of the influence of the federal securities laws, in the form of broad interpretations of Rule 10b-5 of the Exchange Act.²⁸ Rule 10b-5, which the Commission had adopted two decades earlier under its § 10(b) authority as a general anti-fraud prohibition, threatened to become an overarching “federal corporation law.”²⁹

The development began with a topic squarely at the intersection of disclosure and corporate governance: insider trading. Informational advantages discourage stock market liquidity, so exchanges and securities regulators have an incentive to check information asymmetry if it is feasible to do so. For that reason, the NYSE and other exchanges have long had (spottily enforced) requirements that listed companies disclose information that was likely to move the market. The intersection with corporate governance arises because use of inside information can be thought of as a misappropriation by the insider of a corporate asset: material, confidential business information. That misappropriation has come to be seen as a breach of fiduciary duty under state corporate law.³⁰ The influence of inside information on the securities markets has also attracted the interest of the SEC, however, and that agency has played the starring role in developing the law of insider trading.

The SEC's first salvo came in 1961, when it pioneered prohibitions against insider trading with its *Cady, Roberts* decision.³¹ The source of the prohibition was somewhat surprising. In *Cady, Roberts*, the Commission interpreted Rule 10b-5 to prohibit insider trading, despite the fact that neither Rule 10b-5 nor § 10(b) makes any mention of insider trading. Notwithstanding this omission, the SEC found in *Cady, Roberts* that a director of a public company violated Rule 10b-5 by tipping non-public information. The director had learned that the company was planning to cut the size of its dividend. The director, who happened to be the partner of a brokerage firm, provided the information to one of his partners at the brokerage house, who traded on it. In concluding that the director had violated Rule 10b-5, the SEC set out a broad fiduciary standard for the insider trading prohibition:

The obligation rests on two principal elements; first, the existence of a relationship giving access, directly or indirectly, to information intended to be available only for a corporate purpose and not for the personal benefit of anyone, and second, the inherent unfairness involved where a party takes advantage of such information knowing it is unavailable to those with whom he is dealing.³²

(p. 1071) This standard was not constrained by state law notions of fiduciary duty. Indeed, *Cady, Roberts* noted in passing that “the securities acts may be said to have generated a wholly new and far-reaching body of Federal corporation law.”³³

The SEC’s interpretation is breathtaking in its assertiveness. The fiduciary obligation outlined by the agency finds no support in the text of either Rule 10b-5 or § 10(b). With the *Cady, Roberts* decision, the SEC gave notice that in interpreting “[the] elements [of § 10(b)] under the broad language of the anti-fraud provisions we are not to be circumscribed by fine distinctions and rigid classifications.”³⁴ Thus, the SEC announced its intent to root out information asymmetries in the secondary markets to protect “the buying public” “from the misuse of special information.”³⁵ The securities laws would be interpreted as needed to achieve that goal; the SEC developing its own body of fiduciary principles, unmoored from statutory text and untethered by state corporate law, to achieve that end.³⁶

Three years later in *Securities and Exchange Commission v. Capital Gains Research Bureau, Inc.*,³⁷ the Supreme Court gave a green light to the SEC to extend the boundaries of its powers in fleshing out a new—federal—understanding of fiduciary obligation. The *Capital Gains* decision, although turning on an interpretation of the Investment Advisers Act of 1940,³⁸ suggested that the SEC could expand its power through agency and judicial interpretation of existing statutes and regulation. The agency would not need to resort to the cumbersome rulemaking process under the Administrative Procedure Act, or, still more daunting, seek legislation. According to the Court, “Congress intended the Investment Advisers Act of 1940 to be construed like other securities legislation enacted for the purpose of avoiding frauds, not technically and restrictively, but flexibly to effectuate its remedial purposes.”³⁹ After its victory in *Capital Gains*, the SEC would push an aggressive interpretation of § 10(b) of the Exchange Act in the lower courts, particularly the Second Circuit, as its principal weapon in its bold new campaign against insider trading. Four years later, in *SEC v. Texas Gulf Sulphur*, the Second Circuit would validate the SEC’s expansive reading of § 10(b) of the Exchange Act.⁴⁰ *Capital Gains* would be cited by the *Texas Gulf Sulphur* majority for the proposition that even negligent insider trading would be unlawful.⁴¹ Post *Capital Gains*, the SEC and the lower courts could feel confident that their expansive interpretations would be upheld.

By the end of the 1960s the federal securities laws seemed poised to take over the law governing corporations entirely. In the words of Louis Loss, “the great Rule 10b-5 . . . seems to be taking over the universe gradually.”⁴² This usurpation of corporate governance standards was being accomplished by the SEC and the courts without any intervention from Congress.

(p. 1072) 2.4 The 1970s and 1980s: Retrenchment

The era of 10b-5 expansionism came to an abrupt halt in the 1970s. The first salvo came in a pair of class actions from the mid-1970s—*Blue Chip Stamps*⁴³ and *Ernst & Ernst*⁴⁴—in which the Supreme Court made plain its intention to rein in Rule 10b-5. *Blue Chip Stamps* holds that a private plaintiff must be a purchaser or seller of securities to state a claim under Rule 10b-5,⁴⁵ but the opinion is notable for its skepticism regarding securities fraud class actions, which were the lawsuits affording the Second Circuit the opportunity to push the boundaries of Rule 10b-5.⁴⁶ *Ernst & Ernst* signals a reading of Rule 10b-5 narrowly tethered to the text of § 10(b). In rejecting the argument that an allegation of negligence would establish a fraud claim under Rule 10b-5, the Court emphasized that the scope of Rule 10b-5 “cannot exceed the power granted the [SEC] by Congress under § 10(b).”⁴⁷ *Blue Chip* and *Ernst & Ernst* signaled that the Supreme Court had abandoned “flexible” construction of the sort seen in *Cady, Roberts* and *Capital Gains* to achieve “remedial purposes.”

The nail in the coffin for the effort to push Rule 10b-5 into the realm of corporate governance arrived soon thereafter. *Santa Fe Industries v. Green*⁴⁸ is the Court’s most sweeping defense of state corporate law. The Second Circuit held that a short form merger authorized by Delaware law,⁴⁹ which “froze out” the company’s minority shareholders, violated Rule 10b-5.⁵⁰ That court held that “no allegation or proof of misrepresentation or nondisclosure [was] necessary” to state a violation of Rule 10b-5; a breach of fiduciary duty was sufficient.⁵¹ Rule 10b-5 was completely divorced from disclosure. Moreover, that breach of fiduciary duty arose out of federal, rather than state, common law.⁵²

In reversing the Second Circuit, Justice Byron White held for the Court that fraud requires a misrepresentation or nondisclosure.⁵³ That was sufficient to answer the question presented, but White went out of his way to defend the role of state corporate law:

The reasoning behind a holding that the complaint in this case alleged fraud under Rule 10b-5 could not be easily contained . . . The result would be to bring within the Rule a wide variety of corporate conduct traditionally left to state regulation . . . this extension of the federal securities laws would overlap and quite possibly interfere with state corporate law. Federal courts applying a “federal fiduciary principle” under Rule 10b-5 could be expected to depart from state fiduciary standards at least to the extent necessary to ensure uniformity within the federal system. Absent a clear indication of congressional intent, we are reluctant to federalize the substantial portion of the law of corporations that deals with transactions in securities, particularly where established state policies of corporate regulation would be overridden.⁵⁴

(p. 1073) Thus, the Supreme Court was emphatic in drawing a line in the sand to preserve state corporate law from lower federal courts developing their own “federal corporate law.”

A decade later, the Court did not hesitate to reaffirm the line between state corporate law and federal securities law when a wave of hostile takeovers reached its zenith in the 1980s.⁵⁵ The states were taking the lead in discouraging takeovers. The SEC was in the opposing corner, attempting to use federal law to head off state efforts to restrict the market for corporate control.⁵⁶ Once again, the Supreme Court came down firmly on the side of states' control over corporate governance.

In *CTS Corp. v. Dynamics Corp. of America*,⁵⁷ the Indiana anti-takeover statute at issue required a potential acquirer (defined as anyone acquiring certain threshold percentages of the company's shares) to obtain the approval of a company's "disinterested" shares (defined as shares not owned by the acquirer or management) before it would be allowed to vote its own shares.⁵⁸ Thus, a hostile tender offeror could not use its voting power to remove incumbent management without the approval of the company's independent shareholders. The Indiana statute was limited to corporations organized under the law of Indiana, with their principal place of business and a substantial shareholder presence in that state.⁵⁹

In upholding the statute against twin challenges based on the Dormant Commerce Clause and preemption under the federal securities law, the Court emphasized that state authority over voting rights was supported by tradition: "No principle of corporation law and practice is more firmly established than a State's authority to regulate domestic corps, including the voting rights of shareholders."⁶⁰ By implication, the SEC's authority in this area was doubtful absent explicit legislative authorization.⁶¹ As far as the Supreme Court was concerned, corporate governance was a topic for the states, not the SEC.

In some tension with these decisions rebuffing "federal corporate law" is the Supreme Court's insider trading decision in *Chiarella v. United States*.⁶² Justice Lewis Powell, writing for the Court, construed *Cady, Roberts* and *Texas Gulf Sulphur* and its progeny in the Second Circuit narrowly, fitting those decisions into a common law framework, but that (p. 1074) framework rested on a *federal* common law.⁶³ Powell rejected a duty to the sellers because *Chiarella* owed them no fiduciary duty.⁶⁴ The common law of fraud required a duty to the person on the other side of the transaction.⁶⁵ Despite his reliance on common law principles, Powell was creating a federal fiduciary principle, not incorporating state law into federal law. Consequently, *Chiarella's* approach is hard to square with Justice White's rejection of a federal fiduciary standard in *Santa Fe*. Powell's justification for relying on fiduciary duty? "Section 10(b) is aptly described as a catchall provision, but what it catches must be fraud."⁶⁶ Powell recognized that insider trading law would have implications for corporate governance, but he wanted to keep that body of law firmly rooted in disclosure, the province of federal law. Fiduciary duty provided him the doctrinal tool to confine insider trading to (somewhat) traditional notions of fraud.

3 Capital Markets and Corporate Governance

3.1 An International Market for Corporate Governance?

We have seen the US market for corporate charters protected by the Supreme Court from incursions by the SEC. That market now has an international analogue. Capital markets are no longer parochial; technological changes have made the market for listings much deeper. Improvements in communication and related technologies have created an *international* market for stock exchange listings that resembles, in many respects, the long-standing *federal* market for corporate charters in the US.

Historically, issuers listed their stock for trading on one of the exchanges in the country where they principally did business. In an era when businesses are consolidating across national boundaries to create international conglomerates, the notion of a corporation having a “home” country seems increasingly archaic. Corporations, at least those of a certain size, are now citizens of the world, although they may identify for a time with the jurisdiction where their headquarters are located. Today, corporations around the world realistically can choose the location, or locations, where they want to raise capital. They can also choose where they want their common shares to trade. Corporations are not limited to their “home” country for financing and trading, and the capital-raising decision need not be linked to the listing decision.

Why not, then, list on an exchange that allowed a company to signal the quality of its corporate governance? There are obvious efficiency advantages. Disclosure of corporate governance terms will not only facilitate more accurate securities prices, but also allow investors to make better choices in allocating their investment dollars, funneling capital to better managed companies. If firms do not give credible assurances that they will not abuse their investors’ trust, investors will not entrust them with their investment dollars. Companies (p. 1075) looking to maximize their returns when selling securities to the public will accordingly have a strong incentive to include corporate governance mechanisms valued by shareholders.

Exchanges have market incentives to promote the signal: “Self-interested stock exchange members will produce rules that investors want for the same reasons that self-interested bakers produce the kind of bread that consumers want.”⁶⁷ Securities markets live or die with trading volume. Broker-dealers make a substantial portion of their revenues from trading commissions; another chunk comes from trading for their own accounts. More trading by customers obviously means more commissions, but more liquid markets also enhance the profitability of broker-dealers’ own trading. Exchanges attract trading volume by encouraging companies to list their shares and by encouraging investors to trade in those listed shares. These two goals are largely consistent, as companies will want to list their shares on exchanges that provide the greatest liquidity because liquidity minimizes their cost of capital. The exchanges also have a quasi-property interest in the stock prices quoted in their market. This interest effectively makes the exchanges residual claimants in the integrity of those stock prices. Thus, exchanges might compete to attract

trading volume by providing a “bonding” signal to companies seeking to attract investors, if investors are more willing to trade in the stock of companies with good corporate governance.

That story provides an optimistic scenario of corporate government and securities law complementing each other. What is the practical limit of legislators and securities regulators to impose corporate governance mandates through securities laws? If capital markets provide the critical connection between the two, the answer to that question may lie with liquidity. Greater disclosure of information is associated with higher levels of liquidity.⁶⁸ And there is evidence that fraud may have market-wide effects on liquidity.⁶⁹ So exchanges, and perhaps, securities regulators, will have incentives to regulate in areas where the connection to liquidity is clear.

Consider insider trading, one area where the SEC has had considerable success in imposing fiduciary standards on corporate insiders, with the blessing of both the Supreme Court and Congress. Economic theory and empirical evidence suggest that insider trading harms liquidity.⁷⁰ Insider traders hold information advantages over outsiders. Those information asymmetries lead to trading profits—insiders buy low and sell high. To avoid the corresponding trading losses, outsiders would prefer to trade only with other outsiders. Securities markets are anonymous, however, so outsiders have no way of knowing when they are trading with an insider, but they do know that they will systematically lose when they do so. Market makers who supply liquidity to the markets on an uninformed basis will increase their spreads to reflect the possibility of dealing with an insider, converting insider trading into a transaction cost of all trading. Uninformed shareholders will discount the amount that they are willing to pay for shares by their expected losses from trading with insiders; (p. 1076) they may attempt to avoid losses from trading with insiders by trading less frequently. Less trading means less liquidity, and less liquid securities markets raise the cost of trading. In this scenario, the SEC’s effort to harness fiduciary principles in the service of promoting liquidity deftly walks the line where corporate governance and securities law intersect.

Policy makers recognize that encouraging liquid securities markets will facilitate capital formation, and thus, economic growth. Unfortunately, politicians are unlikely to worry about the details of promoting economic growth during a bull market. The capital markets are not crying out for government intervention when investors’ primary focus is counting their gains. Bear markets, however, inevitably follow bull markets. Corporate mismanagement and corruption can be obscured by rising stock prices, but the dirty laundry has a way of surfacing in bear markets. The bad news produces dissatisfied investors who clamor for government intervention, and politicians shake off their apathy and suddenly become profoundly interested in securities law. This dynamic means that demands for regulation will arise in times of crisis, particularly if that crisis spills over into the real economy. Politicians will want to “do something,” even if the proposed something has scant connection to the promotion of liquid securities markets. Corporate gov-

ernance may fit the bill, providing a salient response to the scandals arising during the crisis.

3.2 The US Competes

The recent history of securities regulation in the US illustrates the phenomenon. For a time, proponents of the US securities law regime argued that its rigor gave US exchanges a competitive edge by allowing them to provide a bonding signal. Foreign companies could signal their integrity by exposing themselves to the demands of the US disclosure and enforcement regime, which proponents claimed was the best in the world.⁷¹ That regime permitted foreign companies to credibly pre-commit to limit self-dealing transactions, a concern that might be particularly salient in jurisdictions where controlling shareholders are common, i.e., most jurisdictions other than the US and the UK. Companies headquartered in jurisdictions not known for the quality of their legal systems might be particularly interested in the possibility of buying a credible “bonding” signal; it might be difficult or impossible for such companies to duplicate such a signal on their own.⁷² The power of contract goes only so far if enforcement mechanisms are dubious.

Critically, the mechanism for the precommitment signal was not a corporate governance-style ban on such transactions, which might have been unworkable for companies in countries where cross shareholdings are common. Instead, the tool of choice was disclosure requirements under exacting US standards, backed by the threat of SEC scrutiny. The US exchanges’ computerized surveillance systems also promised real teeth for enforcing insider trading rules and other prohibitions against market manipulation. Other countries have followed the US lead in prohibiting insider trading, but enforcement of those (p. 1077) prohibitions pales in comparison to the SEC’s vendetta against the abuse. Of equal significance for companies listing in the United States, misstatements about a company’s fortunes would be subject to the sting of SEC enforcement, generally regarded as a step above other jurisdictions, both in the probability and size of sanctions.⁷³

In response to lobbying by the exchanges, the SEC encouraged foreign companies to list in the US by relaxing a number of potentially expensive requirements for listing.⁷⁴ The SEC did not, however, go so far as to allow foreign companies to merely comply with the disclosure requirements of their home jurisdictions (a “mutual recognition” regime). From the SEC’s perspective, US disclosure standards were superior; they could be tinkered with around the edges, but wholesale waiver was not an option. Although the SEC was anxious to bring foreign companies to US exchanges, it recognized that it bore a “significant political risk” from financial scandals involving foreign firms if American retail investors incurred substantial losses.⁷⁵ Moreover, the SEC did not exempt foreign companies from the anti-fraud rules, with their potential for both SEC enforcement, but also, the risk of private litigation, unheard of in other jurisdictions until very recently. Companies willing to face this risk by listing in the United States sent a strong signal of honesty and integrity.

The twin burdens of SEC disclosure requirements and exposure to securities class actions made listing in the United States a costly proposition for foreign companies, notwithstanding the SEC's efforts at accommodation. The fact that a significant number of companies were willing to pay this price allowed the SEC to tell a happy story of a race to the top in the competition for international listings. The best companies—world-class companies—sought to list in the United States because it had the best regulation, the story went. Evidence of a listing premium for companies selling shares in the United States strongly supported the SEC's account.⁷⁶

3.3 The US Loses its Lead

The cheery equilibrium between corporate governance and listing in the US has since proved to be fragile. The flow of foreign companies coming to the US stopped, and more worryingly, (p. 1078) reversed. After the SEC relaxed standards for foreign companies wanting to delist,⁷⁷ a flood of companies headed for the doors.⁷⁸

What derailed the US-led race to the top? The answer is politics, and more particularly, Congress. The dividing line between securities law and corporate governance drawn by the Supreme Court limits the SEC and the lower courts, but it does not constrain Congress. Nonetheless, for nearly fifty years after PUHCA had begun to dwindle, Congress generally respected that line. The securities laws were about disclosure.

The major exception to the disclosure focus of the securities laws was the enactment of the Foreign Corrupt Practices Act (FCPA) in 1977. The FCPA is a response to Watergate-era scandals involving the bribery of foreign officials by US companies, which came under the SEC's purview because companies were not recording the bribes and slush funds in their accounts (Surprise!). The FCPA includes a variety of books and records provisions intended to improve the accuracy of corporate disclosures, so some of its provisions are squarely within the bailiwick of the SEC. The FCPA, however, also includes a substantive provision outlawing payments by US companies to foreign officials, which can be enforced civilly by the SEC and criminally by the Justice Department. The provision sits oddly amidst the disclosure-oriented provisions of the securities laws, but its practical import has been limited until recent efforts to increase enforcement. Moreover, although it does contain a substantive provision that limits the conduct of corporations, it is not limited to *public* corporations, the traditional concern of the securities laws, but rather, US corporations generally. More importantly, the prohibition is outward directed. The law prohibits bribing foreign government officials. It says nothing about bribing company officers, which would be a classic corporate governance problem. Thus, the FCPA departs from the disclosure focus of the securities laws, but not in a direction that one could fairly criticize as an incursion into the state's domain of corporate governance.

More recently, however, Congress has made substantial inroads into corporate governance through amendments to the securities laws, blurring the line separating the two. Those forays by Congress into corporate governance correspond with the demise of the US as a listing destination. The first salvo of incursions into the field of corporate gover-

nance came with the Sarbanes-Oxley Act fueled by accounting scandals at Enron and WorldCom.⁷⁹ Collecting a hodge-podge of reforms, Congress (1) took over the regulation of accounting firms from the private sector;⁸⁰ (2) imposed expensive internal controls and certification requirements;⁸¹ and (3) adopted an array of new sanctions.⁸² The most expensive of these requirements were standards relating to internal accounting controls, requiring both review and certifications of those controls by the chief executive officer and chief financial officer.⁸³ (p. 1079) Foreign company executives proved less than enthusiastic about the spotlight afforded by those certifications, perhaps helping to speed the exodus that followed.

Not surprisingly, Congress also sought to improve corporate governance relating to the auditing function. Sarbanes-Oxley mandates that the retention, compensation, and oversight of the company's external auditor must be entrusted to an audit committee of the board of directors. The auditors must report to the audit committee "critical accounting policies and practices." The audit committee is also charged with establishing procedures for dealing with complaints relating to auditing and internal controls. These provisions are intended to set up audit committees as an independent power center within the governance structure of public corporations.

That independence is bolstered by additional mandates relating to the audit committee's composition. Audit committees must be made up exclusively of independent directors, meaning that the only compensation the director can receive from the company is the director's fee—no consulting or other employment arrangements are permitted.⁸⁴ The SEC has bolstered this independence requirement by requiring companies to disclose whether any member of the audit committee qualifies as a "financial expert," which requires either experience as an accountant or an accounting officer, or experience supervising an accounting officer or overseeing public accountants.⁸⁵ Listing requirements for the NYSE and Nasdaq now require financial literacy for all audit committee members.

These minor incursions into corporate governance in the Sarbanes-Oxley Act coincided with the exodus of foreign companies from US exchanges described above. Far from being chastened by that trend, Congress demonstrated even less restraint when it came to "do something" in response to the next financial crisis. This time, with the Dodd-Frank Act, the corporate governance mandates have no connection whatsoever to liquidity.⁸⁶ For example, the Dodd-Frank requires that companies disclose whether the same person holds both the CEO and Chairman of the Board positions, and explain why the position is combined or not.⁸⁷ This is a pure corporate governance provision, styled as a disclosure mandate, but with no possible connection to liquidity. It simply uses disclosure to put a thumb on the scale toward Congress's view of best corporate governance practices.

Other mandates are more explicitly driven by a political agenda. Most blatant is Dodd-Frank's mandate relating to conflict minerals. Concerned about violence in the Democratic Republic of Congo relating to a variety of resource extraction industries, Congress decided to use its leverage over corporate disclosure policies to deal with the problem.⁸⁸ The SEC adopted a new disclosure form, Form SD, requiring companies to disclose pay-

ments in excess of \$100,000 made to governments for the purpose of commercial development of natural resources.⁸⁹ The target was armed groups that were profiting from extortion of mining operations. The teeth of the rule were provided by the requirement that firms investigate and disclose if their products used any “conflict minerals.” The expense of the investigation was calculated to be enormous: the SEC estimated that the total costs of the final rule would be (p. 1080) \$3 billion to \$4 billion initially, and \$207 million to \$609 million annually thereafter.⁹⁰ The benefits of the rule? Hard to calculate, according to the SEC, because it was hard to quantify peace and stability in the Congo.⁹¹ It is not hard to guess, however, the benefit to investors from these disclosures, which are presumably zero.

Somewhat more closely tied to corporate governance are Dodd-Frank’s mandates relating to executive pay, an issue with apparently evergreen populist appeal. The political agenda is quite clear in Dodd-Frank’s requirement that companies disclose the ratio of their CEO’s pay to that of their median employee.⁹² On the governance side, the Dodd-Frank Act requires the SEC to direct, by rule, the securities exchanges to prohibit the listing of any equity securities of public companies unless the compensation committees of the public companies’ boards are made up exclusively of independent directors.⁹³ The independence requirement for the board compensation committee parallels the independence requirement for the board audit committee. Moreover, Dodd-Frank imposes a variety of responsibilities on compensation committees, such as the hiring and supervision of compensation consultants.

The Dodd-Frank Act also enhances shareholder power over executive compensation. Public companies are now required to conduct an advisory vote of shareholders on the pay packages of top executives at least once every three years.⁹⁴ “Golden parachute” payments made to executives displaced in connection with mergers and acquisitions also require an advisory vote of shareholders. In connection with these advisory votes, the SEC has enhanced the disclosure requirements for these executives in the Compensation Discussion and Analysis section of the proxy statement. That disclosure now must also address whether (and if so, how) the company has considered the results of the most recent say-on-pay vote in determining compensation policies and decisions. Shareholders are not allowed to dictate the pay packages of senior executives, but the new regime attempts to maximize the leverage implicit in embarrassment.⁹⁵

The Dodd-Frank Act also attempted to shift power to shareholders by ensuring access to the company’s proxy. Historically, outside insurgents could launch a full-blown contest with their own proxy statement to elect a competing slate to a company’s board of directors, but such contests are costly and correspondingly rare. The Dodd-Frank Act authorized the SEC to allow shareholders to nominate candidates for director directly on the company’s proxy without going to the trouble and expense of a proxy contest using a separate proxy statement.⁹⁶ The SEC attempted to implement proxy access through Rule 14a-11. Rule 14a-11 (p. 1081) allowed shareholders (and shareholder groups) who have held at least 3% of the company’s stock for three years the right to nominate directors and have those nominees included in the company’s proxy statement and ballot. The rule

did not provide an alternative to a full-fledged proxy contest, however, as shareholders were limited to nominating candidates for only 25% of the board. The SEC adopted Rule 14a-11 over the heated objections of corporate management. Groups representing management then challenged the rule in court, and in mid-2011, the D.C. Circuit vacated Rule 14a-11.⁹⁷ The SEC has not been stripped of its rulemaking authority, however, so it is a matter of time before it returns to the topic.

The net effect of the Sarbanes–Oxley and Dodd–Frank Acts has been to erode the traditional line between securities law and corporate governance in the US. The key word is “traditional”; there has not been any legal barrier to Congress taking over the governance of public corporations since the 1940s. Perhaps what is surprising is that the incursion took as long as it did. Perhaps less surprising is that Congress now appears completely indifferent to the status of the US as a listing destination. Competitiveness in financial services, once a hot topic, was swept aside as a concern in the rush to respond to accounting scandals and a financial crisis. Also swept aside has been the notion that there “should” be a dividing line between corporate governance and securities law.

4 Conclusion

The US maintained the dividing line between corporate law and securities law for nearly 70 years after the adoption of the federal securities law. Much of the work done protecting that line was done by the Supreme Court, which affirmed the role of the states in corporate law as a matter of tradition, rather than enforcing strict constitutional limits. The last 15 years, however, have seen that line beginning to erode as Congress has amended the federal securities laws to include corporate governance mandates with little or no connection to liquidity, the traditional focus of securities regulation. Those intrusions were responses to accounting scandals and financial crisis. Congress’s interventions in corporate governance have coincided with a decline in the competitiveness of the US in the market for listings, but Congress has not responded to that decline, which is not salient enough to rise to “crisis” level.

To be sure, the US’s decline as a listing destination cannot wholly be ascribed to Congress. Another factor fueling the trend has been the continuing development of trading technology and market liquidity that once promised to fuel the US’s race to the top. The comparative advantage of US exchanges has now been substantially eroded. Stock exchanges around the world now offer similar speed in executing orders. Increasingly, securities trading has been reduced to the status of commodity. The best trading systems are no longer the monopoly of the exchanges, which are hemorrhaging market share to proprietary trading systems and dark pools.⁹⁸ Commodification of trading technology—along with greater access (p. 1082) to information about companies in other jurisdictions—has greatly reduced the liquidity advantages historically enjoyed by the NYSE, which has cut fees in response.⁹⁹

Of equal importance to the question of liquidity is the fact that companies no longer need to bring their shares in physical proximity to investors. Institutional investors can access virtually any market in the world.¹⁰⁰ As a result, ADRs have fallen out of favor, as investors invest directly abroad.¹⁰¹ Moreover, Rule 144A allows issuers to access capital in the United States without a US listing.¹⁰² Why should a company pay for an expensive listing in New York if a listing in their home country allows them easy access to capital from around the world? For regulators, this means that listing requirements are likely to offer little leverage as a regulatory tool. Draconian mandates, unrelated to liquidity, will be met by an exodus to jurisdictions with more lenient standards.

Another threat to the use of listing standards as a means of promoting corporate governance reform is private equity. The rise of private equity has demonstrated that firms in many industries with diverse business models can thrive without access to public capital markets. For these firms, corporate governance is purely a matter of contract. Firms that value liquidity are likely to tolerate disclosure mandates relating to liquidity, but if securities law and disclosure mandates drift toward corporate governance imperatives unrelated to liquidity, firms are likely to exit the public markets. If Congress continues to intervene in corporate governance, the number of US public companies could dwindle.

The US experience thus presents a cautionary tale for reformers contemplating the use of securities law to upgrade corporate governance standards. Countries may vary, however, in the relationship that corporate governance has to liquidity. Lessons from the US experience may have limited relevance for other parts of the world: US corporate governance is pretty good, so marginal improvements in any particular aspect may have limited real-world effects.¹⁰³

The situation may be quite different in developing economies, where the baseline may not be as high. For example, there is evidence that degree of board independence and splitting the roles of Chair and CEO may correlate with greater liquidity post-IPO for Chinese firms.¹⁰⁴ These correlations may be explained by the prevalence of controlling shareholders in Chinese firms, and perhaps, relatively weak legal enforcement. The Chinese experience may be singular in another way—many governance reforms in that country are initiated by the country's securities regulator, which may be forced to act due to the absence of any (p. 1083) alternative actor.¹⁰⁵ In countries such as China, where the rule of law is not as well established, the move toward mandating better corporate governance standards may substantially improve the operation of the capital markets, even absent an obvious connection between corporate governance and liquidity.

Another consideration for corporate governance reformers is that familiarity may breed liquidity. Standardization may be an important feature in corporate governance if information is incomplete and market participants are boundedly rational. If investors understand a common governance structure, making it mandatory may allow for easier comparability, which may be particularly important to firms seeking overseas investment. From the US perspective, the prevalence of Delaware as the choice of incorporation for most public companies in the US is sometimes attributed to investors' preference for Delaware

incorporation—which may be based on Delaware’s prevalence. Institutional investors are familiar with Delaware corporate law; they know what they are getting. Sometimes having a consistent standard is more important than having the best standard, or the standard best tailored for a particular firm.

On the other hand, a standardization strategy may have long-term consequences. Once standards become prevalent, if not universal, in the marketplace, politicians may be tempted to mandate the prevalent standard as “best practice.” Once mandated, however, there may be costs imposed on firms that deviated from the norm for idiosyncratic, but perhaps legitimate reasons. In addition, the mandate may stifle experimentation and adaption to new conditions. Assessing the benefits and costs flowing from standardization is a daunting empirical task, particularly because the incidence of those benefits and costs is unlikely to be evenly distributed.

This chapter has focused on the connections between corporate governance, capital markets, and securities law. Looking at how the relation among these has developed over time in the US, it has identified liquidity as the key variable connecting the three. Corporate governance mandates with a clear connection to liquidity are more likely to be accepted and to last. When policy makers move beyond the promotion of liquidity, firms may choose to exit to avoid costly mandates.

(¹⁰) George L. Leffler, *The Stock Market* 428-29 (1951).

(¹¹) The movement toward requiring greater disclosure by listing companies was prolonged by the fact that changes in listing agreements do not work retroactively. Leffler, *supra* note 10, at 433 (“Companies could be held only to agreements which they had signed; some of these were entered into a great many years ago. If new and additional agreements were formulated by the Exchange, old listed companies could not be compelled to comply except by Exchange persuasion, or if they applied for further listing of stock”); Michael E. Parrish, *Securities Regulation and the New Deal* 40 (1970) (“Recommendations by the listing committee were never retroactive”). Until 1939, companies paid a one-time listing fee which gave them the right to a listing in perpetuity. Leffler, *supra* note 10, at 427. Finally, other exchanges imposed substantially lower listing standards than did the NYSE, and the over-the-counter market imposed none at all. Leffler, *supra* note 10, at 433. The combination of these factors undoubtedly reduced the NYSE’s bargaining leverage with companies in pushing for greater disclosure. More fundamentally, it also suggests that the demand for disclosure among investors was limited.

Vertical and Horizontal Problems in Financial Regulation and Corporate Governance

Jonathan R. Macey and Maureen O'Hara

The Oxford Handbook of Corporate Law and Governance

Edited by Jeffrey N. Gordon and Wolf-Georg Ringe

Print Publication Date: May 2018 Subject: Law, Company and Commercial Law

Online Publication Date: Mar 2018 DOI: 10.1093/oxfordhb/9780198743682.013.46

Abstract and Keywords

This chapter discusses vertical and horizontal problems in financial regulation and corporate governance. More specifically, it examines three contexts in which efforts to mitigate systemic risk and moral hazard in capital markets and financial institutions clash with long-standing principles of corporate governance. The first issue relates to the so-called “vertical” challenge between financial institutions and the separately incorporated holding companies that own and control them. The second issue relates to the “horizontal” challenge, in which regulatory arbitrage occurs between the banking subsidiaries of complex holding companies and their less-regulated nonbank and shadow bank siblings. The third and final issue deals with the conflict between the conception of fiduciary duty in the federal law of insider trading and the concept of fiduciary duty in state law.

Keywords: financial regulation, corporate governance, moral hazard, financial institutions, “vertical” challenge, holding companies, “horizontal” challenge, fiduciary duty, insider trading

1 Introduction

RECENT efforts to mitigate systemic risk and moral hazard in capital markets and financial institutions have run headlong into long-standing principles of corporate governance. This chapter discusses three contexts in which that is the case. The first issue relates to what we will describe as the “vertical” challenge between financial institutions and the separately incorporated holding companies that own and control them. The second issue relates to what we call the “horizontal” challenge, which concerns the regulatory arbitrage that occurs between the banking subsidiaries of complex holding companies and their less-regulated nonbank and shadow bank siblings. The final issue is the conflict between the conception of fiduciary duty in the federal law of insider trading and the different concept of fiduciary duty in state law.

2 Financial Institutions and the Companies that Own them

That corporate governance problems are particularly acute in banks is well understood.¹ What may not be appreciated, however, is the degree to which certain unique features of (p. 1085) banking complicate both the role of financial institutions' boards of directors and the effectiveness of their governance.

In an earlier paper, we reviewed the different models of corporate governance, with a particular focus on the duties board members owe to different constituencies.² We argued that these unique features of banks dictated a heightened duty of care for bank directors. We discussed the various legal cases defining the duty of care for directors, and how the courts have vacillated in their application of these duties owed by directors. Since then a lot has changed with respect to banking structure and practice, but little has changed with respect to the duties and obligations of bank directors. This inertia with respect to bank directors is all the more puzzling given that the Dodd-Frank Wall Street Reform and Consumer Protection Act³ (Dodd-Frank Act) explicitly addressed the externalities imposed by individual banks on the financial system—yet imposed no additional corporate governance requirements on bank directors to make them responsible for limiting such risks. Thus, while Dodd-Frank unleashed a plethora of changes for markets, with restrictions on what banks can do, who can regulate them, how they should be liquidated, mortgage and insurance reform, and consumer protection, the duties required of bank directors per se were not a focus of specific attention in the statute.

2.1 An Introduction to the Corporate Governance of Banks

Generally speaking, the problem of corporate governance stems from agency problems that emerge when the residual claims on a firm's income take the form of shares of stock that are mostly owned by people who are not involved in the management or operations of the company.⁴ In order to ameliorate agency costs, over time corporate law has generated the general rule that fiduciary duties should be owed exclusively to shareholders.⁵ The justifications for making shareholders the exclusive beneficiaries of the fiduciary duties owed by managers and directors are based on the fact that creditors, as fixed claimants, can safeguard their investments through a combination of pricing and the imposition of contractual protections such as conversion rights or put options.⁶

In our earlier paper on corporate governance problems in banks, we argued that banks are different from other firms and that the economic policies that justify making shareholders the (p. 1086) exclusive beneficiaries of fiduciary duties do not apply with the same force to banks as they do to other types of corporations, such as manufacturing companies or technology companies. We believe these difficulties have only increased in the past decade, with the result that banks in the post-crisis era face even greater corporate governance difficulties. Specifically, we believe there are a variety of unique features of

Vertical and Horizontal Problems in Financial Regulation and Corporate Governance

banks relative to other firms that make them unusually risky, more fragile, and more difficult to monitor and control.⁷

First, banks' unusual capital structures give them a unique role in generating liquidity for the economy. It is well known that banks' balance sheets are highly leveraged,⁸ with fixed-claim creditors supplying 90% or more of the funding banks require to operate. Moreover, these fixed-claim liabilities generally are available to creditors/depositors on demand, while on the asset side of the balance sheet, the bank's loans and other assets have longer maturities.

The development of increasingly robust secondary markets and banks' ability to securitize assets has enabled banks to move assets off their balance sheet, but this process has not led to a reduction in the size of banks' balance sheets: Banks tend to grow rather than shrink even as they securitize more of their assets. Because more transparent and liquid assets are the ones that tend to be sold either outright or as part of a pool of securitized financial assets, what is left on the bank's balance sheet tends to be the more opaque and idiosyncratic assets. Arguably, these evolutionary developments in capital markets have led to a secular deterioration, rather than to an improvement in the transparency and liquidity of bank assets.

The phenomenon of holding simultaneously transparent, liquid liabilities on the one hand, and illiquid, opaque assets on the other, enables banks to serve the vital economic role of creating liquidity.⁹ However, to create liquidity, banks must lend the funds that they receive from deposits and other short-term liabilities, and consequently banks keep only a small fraction of funds as reserves to satisfy depositors' demands for liquidity. This asset transformation process results in a situation in which no bank has sufficient funds on hand to satisfy the demands of depositors if a significant number demand payment simultaneously.

The mismatch in the liquidity characteristics and term-structure of banks' assets leads to bank runs and other systemic problems in the financial system. With greater than a third of US bank liabilities uninsured, rational uninsured depositors (and claimants) will try to be among the first to withdraw before other, more nimble creditors deplete the banks' assets. Thus, bank depositors, unlike creditors in other companies, are in a situation closely akin to the classic prisoner's dilemma. This prisoner's dilemma can lead to failures in solvent banks because the need for liquidity in the event of a run or panic can lead to fire-sale liquidations of assets, thereby spreading problems to heretofore solvent banks. For bank directors, the need to manage such liquidity risks is fundamental to a bank's survival.

Second, the existence of federally sponsored deposit insurance means that banks can continue to attract liquidity to fund their operations even after they are insolvent. Thus, unlike other sorts of companies, it is virtually impossible for federally insured banks to (p. 1087) become insolvent in the "equitable" sense of being unable to pay their debts as they come due in the ordinary course of business.¹⁰ Federal insurance eliminates the market forces that starve nonfinancial firms with poor prospects of cash. The federal govern-

Vertical and Horizontal Problems in Financial Regulation and Corporate Governance

ment has attempted to replace these market forces with regulatory requirements such as capital requirements and requirements for the “prompt resolution” of financially distressed banks. Nevertheless, it seems clear that the well-established tenet of corporate finance that there is a conflict between fixed claimants and shareholders is, as we previously observed “raised to a new dimension in the banking context.”¹¹ In banking, neither creditors nor capital markets have incentives either to negotiate for protections against risky, “bet-the-bank” investment strategies, or to demand compensation for such risk in the form of higher interest payments.

Bebchuk and Spamann argue that these agency conflicts manifest particularly in problems with bank executive compensation.¹² They make the intriguing point that governance reforms aimed at aligning compensation with shareholder interests—such as say-on-pay votes, use of restricted stock, and increased director independence—fail in banks because shareholders also benefit from bank management taking on excessive risk. This raises the disturbing specter that bank directors are in fact doing their job—but that their job does not include adequately recognizing the systemic risks that banks pose for the financial system.

Third, moral hazard caused by deposit insurance coupled with imperfections in the regulatory system also leads not only to suboptimally easy access to liquidity, but also to an industry-wide reduction in levels of monitoring within the firm, resulting in a higher incidence of large losses and bank failures due to fraud.¹³ The high incidence of fraud is attributable both to the lack of monitoring by creditors and to the highly liquid form of banks’ assets, which makes it easy to divert bank assets to private use relative to less liquid assets such as factories and equipment.

Shareholders’ incentives to monitor to prevent fraud and self-dealing exist in banks as they do in other sorts of companies. As in these other sorts of companies, however, “such monitoring is notoriously ineffective in many cases because individual shareholders rarely have sufficient incentives to engage in monitoring because of collective-action problems.”¹⁴

Perhaps no event illustrates the endemic monitoring and other corporate governance problems in the context of the banking industry more clearly than the London whale trading loss debacle, in which Mary Jo White, the new chair of the US Securities and Exchange Commission (SEC) deployed her marquee policy to require admissions (p. 1088) of wrongdoing in certain “egregious” cases.¹⁵ The SEC charged JPMorgan Chase with misstating financial results and lacking effective internal controls to detect and prevent its traders from fraudulently overvaluing investments to conceal hundreds of millions of dollars in trading losses.¹⁶

The SEC’s lawsuit against JPMorgan charged the company with violating provisions of the Sarbanes-Oxley Act of 2002 (SOX) relating to corporate governance and disclosure. In particular, SOX requires public companies to maintain disclosure controls and procedures that ensure that important information flows to the appropriate persons so that timely decisions can be made regarding disclosure in public filings.¹⁷ Also at issue were

Vertical and Horizontal Problems in Financial Regulation and Corporate Governance

JPMorgan's alleged violations of SEC regulations requiring corporate managers to evaluate on a quarterly basis the effectiveness of the company's disclosure controls and procedures and to disclose management's conclusion regarding their effectiveness in its quarterly filings.¹⁸ The SEC also alleged that even after having announced a trading loss of approximately \$2 billion on May 10, 2012, the full extent of the trading losses that occurred during the first quarter of 2012 was not detected and reported. This failure was due, in part, to ineffectiveness of internal control functions within the bank's Chief Investment Office, which was known as the Valuation Control Group ("CIO-VCG").¹⁹

Within banks, valuation control units are a critical part of a company's internal controls because they monitor and control for accuracy of the valuations of the financial assets acquired and held by traders and other market professionals within the firm. From a corporate governance perspective it is obvious that a valuation control group must be independent of the trading desks it monitors in order to be effective. The consequences of a corporate governance failure in this respect are severe because such failures risk both the inaccurate valuation of the bank's assets as well as the material misstatement of the bank's financial condition in its public filings. In the case of JPMorgan, the SEC found that JPMorgan's CIO-VCG was "unequipped to cope with the size and complexity of the credit derivatives" that were the principal assets in the bank's Synthetic Credit Portfolio ("SCP").²⁰ As of March 31, (p. 1089) 2012, the SCP contained 132 trading positions with a net notional amount of approximately \$157 billion.²¹

The SEC also found that the CIO-VCG "did not function as an effective internal control" during the relevant time period because the CIO-VCG was "understaffed, insufficiently supervised, and did not adequately document its actual price-testing policies."²² Perhaps more disturbingly, it appeared to the SEC that the price-testing methodology used by CIO-VCG "was subjective and insufficiently independent from the SCP traders, which enabled the traders to improperly influence the VCG process."²³ In addition, during the first quarter of 2012, CIO-VCG failed to escalate to CIO and JPMorgan management significant information that management required in order to make informed decisions about disclosure of the firm's financial results for the first quarter of 2012. As a result, JPMorgan did not timely detect or effectively challenge questionable valuations by the SCP traders as the portfolio's losses accumulated in the first quarter of 2012, leading the bank to publicly misstate its financial results for that period.²⁴

The internal problems were egregious. For example, when losses were incurred on the traditionally profitable SCP portfolio in the first quarter of 2012, the senior SCP trader instructed SCP traders to stop reporting losses to CIO management unless there was a market-moving event that could easily explain the losses. At least one SCP trader changed his daily marking methodology for the SCP and began assigning values at the point in the bid-offer spread that resulted in highest valuations of the SCP positions, a valuation technique inconsistent with Generally Accepted Accounting Principles (GAAP).²⁵ Things got much worse when this trader even began valuing assets at prices that were

Vertical and Horizontal Problems in Financial Regulation and Corporate Governance

completely “outside every dealer’s bid and offer received that day” and thereby “intentionally understated mark-to-market losses in the SCP.”²⁶

In JPMorgan’s \$200 million settlement of the SEC’s enforcement action against it, the bank acknowledged significant corporate governance failures. For example, the bank admitted (p. 1090) that significant facts learned in the course of the various internal reviews were not shared in meetings and calls among the participants in such reviews. As a result, these facts were not escalated to JPMorgan senior management or communicated to the Audit Committee of the board in a timely fashion.²⁷ However, it is not clear that the Bank’s Audit Committee would have been able to handle the monitoring and internal control problems in the bank even if they had been better informed. Also apparently missing in action was the bank’s risk committee which also was not kept informed of what was clearly a gaping hole in the bank’s risk management process.

The Board of Governors of the Federal Reserve (Fed) joined the SEC in suing and settling with JPMorgan Chase & Co. (JPMC), the registered bank holding company that owns and controls the bank.²⁸ The Fed’s Order did raise these deficiencies in risk management and oversight, as well as raising concerns with the governance, finance, and internal audit functions of the company.²⁹

In earlier decades, the mismatch between the maturity and liquidity characteristics of banks’ assets and liabilities, their unusually high leverage, and the moral hazard caused by such institutional features as the Fed discount window, deposit insurance, and the expectation of bailouts, largely defined the unique corporate governance problems experienced by banks.³⁰ These characteristics remain, but the JPMorgan whale debacle underscores some important new dimensions of bank corporate governance problems: the opacity of bank activities, combined with the complexity of risk-management activities involving the valuation and control of complex asset positions, create significant monitoring difficulties for directors.³¹

Thus, a large part of the problem with JPMorgan Chase appears to be that the firm’s directors lacked the special expertise necessary to evaluate the nature and the quality of the information they were getting (or not getting) from managers.³² JPMorgan Chase was not by any means the only financial institution whose board lacked sufficient industry and financial markets expertise. When Citibank teetered on the brink of insolvency, requiring a massive federal bailout, its board was:

filled with luminaries from all walks of life.—It boasted directors from a chemical company, a telecom giant, and a liberal arts university, for example. Yet in early 2008 only one of the (p. 1091) independent directors had ever worked at a financial services firm—and that person was concurrently the CEO of a large entertainment firm.³³

2.2 Vertical Corporate Governance: The Problem of Dual Boards

A significant corporate governance challenge for banks arises from their unique organizational structure in which banks, which are corporations with their own boards of directors, tend to be entirely owned and controlled by holding companies, which are also corporations but are generally publicly held. In the case of major commercial banks such as JPMorgan Chase and Citibank, the holding companies are incorporated in Delaware, while the banks are federally chartered and under the jurisdiction of the Comptroller of the Currency. Delaware has strong, shareholder-centric corporate governance norms and rules oriented toward profit maximization. In stark contrast, the Comptroller of the Currency has only a remote interest in profit maximization. Its concern is on the safety and soundness of banks and the financial system.

Since Goldman Sachs³⁴ and Morgan Stanley³⁵ became bank holding companies and financial holding companies during the financial crisis, every major bank in the US is now organized as some form of bank holding company ("BHC"). A BHC is defined as

[a] company that owns and/or controls one or more U.S. banks or one that owns, or has controlling interest in, one or more banks. A bank holding company may also own another bank holding company, which in turn owns or controls a bank; the company at the top of the ownership chain is called the top holder.³⁶

Bank holding companies are, by definition, involved in the business of banking. In fact, bank holding companies are limited by law to activities that are "so closely related to banking (p. 1092) as to be a proper incident thereto."³⁷ Because the BHC controls the bank, the monitoring and control of risk must take place at multiple levels. From a regulatory perspective, the Federal Reserve "is responsible for regulating and supervising bank holding companies, even if the bank owned by the holding company is under the primary supervision of a different federal agency (OCC or FDIC)."³⁸ When assessing a BHC, however, the Fed will "work cooperatively" with the functional regulator of the subsidiary bank "to address information gaps or indications of weakness or risk identified in a supervised BHC subsidiary that are material to the Federal Reserve's understanding or assessment" of the BHC.³⁹ This structure of supervision acknowledges that bank holding companies wield control over the banks they hold.

From a governance perspective, the holding company's board inevitably exerts control over the banks within the holding company structure, particularly where, as is often the case, the directors of the bank holding company also sit as officers and directors of the bank. As such, it is each holding company director's duty to control risk down to the level of the banks the BHC holds.⁴⁰ This means the directors of holding companies, like the directors of the banks themselves, must be involved in the governance, risk-management, and monitoring and oversight of the banks and bank affiliates within the holding company structure. The formal corporate separateness of BHCs and the banks they control does not absolve holding company directors from involvement with the activities of their sub-

Vertical and Horizontal Problems in Financial Regulation and Corporate Governance

subsidiary banks even if there are directors who are on the board of a BHC but not on the board of the bank.⁴¹

Howell Jackson has observed that holding companies and the banks they own and control are not truly separate as a practical matter:

Within bank holding companies, there is a natural tendency of management to centralize decision making power and resources in the parent bank or BHC. It is doubtful that management would leave the bank and nonbank subsidiaries free to make the important business decisions as to activities, reinvestment of profits and new markets. It is more likely that there would be significant centralization of decision making at the parent company level, with management deciding what products and markets will be focused upon and how profits will be reallocated.⁴²

Jackson also argues that this interrelatedness of banks and BHCs has increased over time:

Until twenty years ago [i.e. until 20 years prior to the publication of this article by Professor Jackson in 1994], financial holding companies [. . .] had relatively few affirmative obligations with respect to their regulated subsidiaries [. . .]. Over the past two decades however, financial (p. 1093) holding companies have become increasingly embroiled in the regulatory supervision of subsidiary financial institutions.⁴³

Jackson posits that this increased interrelatedness reflects a regulatory push to “transfer front-line supervisory responsibility from governmental agencies to financial holding companies.” This is because:

[n]ot only are financial holding companies apt to be more proficient than government officials in evaluating institutional behavior, but holding companies also can monitor risks at a lower cost than government agencies, because holding companies already have substantial information about their regulated subsidiaries as a result of ordinary managerial activities.⁴⁴

The Fed evaluates bank holding companies’ directors and senior executives based upon their ability to identify, measure, and control risk, which includes those posed by the underlying banks. Thus, the Fed essentially treats BHCs and their bank affiliates as so inextricably linked that, when evaluating BHCs, it analyzes the *consolidated* organization’s financial strength and risks. Additionally, the Fed can examine a BHC’s subsidiaries directly to “inform itself of the systems for monitoring and controlling risks to such depository institutions.”⁴⁵

Since both the holding company and the bank have boards of directors, a natural question is what role should each board play? Thomas C. Baxter, Jr., General Counsel and Executive Vice-President of the Federal Reserve Bank of New York addresses this point:

Vertical and Horizontal Problems in Financial Regulation and Corporate Governance

We want the governing body of the holding company to perform two critical functions. First, we want it to understand the risks to the “enterprise,” meaning the risks in all of the company’s constituent parts. Second, we want the holding company to *take reasonable steps to manage* those risks and keep them within acceptable limits.⁴⁶

...

As I see it, the public interest in the bank subsidiary is protected by a panoply of prudential laws and regulations. The ownership interest of the holding company in the bank is protected by the holding company’s ability to control the bank’s board of directors.⁴⁷

From both a regulatory perspective and a corporate governance perspective, bank safety and soundness is paramount. The well-known “source of strength” doctrine requires that bank holding companies provide financial assistance to support its banking subsidiaries. In particular, § 225.142 of the Bank Holding Company Act provides that “[i]n supervising the activities of bank holding companies, the Board has adopted and continues to follow the principle that bank holding companies should serve as a source of strength for their subsidiary banks.” This notion pervades the BHC’s corporate governance and directly impacts the relationship between the BHC and its subsidiaries.

(p. 1094) It is our contention that the Fed’s BHC regulations, the principles of corporate governance developed here, as well as basic concerns about systemic risk and bank safety all indicate that BHC officers and directors have fiduciary obligations that guide—and when necessary, trump—corporate form. Fiduciary duties flow not only to shareholders of the holding company but also to the corporate organization itself. Thus the responsibility for bank safety and soundness must be shouldered by both holding company directors and officers and the directors and officers of their subsidiaries, particularly their bank subsidiaries.

Less clear, however, is how the shared responsibility between the holding company board and the bank board should work in practice in the post-crisis environment. On the one hand, it clearly makes no sense to say that BHC officers and directors can ignore issues of safety and soundness that affect their subsidiary banks on the grounds that they are fiduciaries of a different corporate entity, namely the holding company. On the other hand, the notion that the duties and obligations of holding company officers and directors and bank officers and directors are identical and wholly duplicative also appears problematic. To see why, consider the perspective of the OCC (the Office of the Comptroller of the Currency), the main regulator of nationally chartered banks, on its expectation for the subsidiary bank’s directors. The OCC argues “For its part, the primary duty of the subsidiary bank’s directors is to protect the bank.”⁴⁸ This may be the view of the OCC, but it is inconsistent with the duties of the directors of BHCs, which require that directors of holding companies—like directors of other firms—maximize value for shareholders.

Vertical and Horizontal Problems in Financial Regulation and Corporate Governance

Thus, there is a significant obstacle to making safety and soundness the primary duty of BHCs or BHC directors. And these holding companies determine who sits on the board of directors of the banks they own or control. BHCs are, from a state-law point of view, garden-variety corporations, with garden-variety fiduciary duties that are owed exclusively to shareholders. Unlike banks themselves, holding companies are not only subject to the same corporate governance rules as other companies, but, also unlike banks, which receive charters either from the Comptroller of the Currency (national banks) or state bank regulators (state banks), holding companies are chartered by the same state chartering authorities as any other nonbanks. For example, Citigroup, which owns a national bank, is charged in the state of Delaware,⁴⁹ as are Morgan Stanley⁵⁰ and Goldman Sachs.⁵¹

The problem is simple to describe. Because they are considered simply to be directors of garden-variety corporations, holding company directors (and bank directors too, for that matter), ostensibly have no obligation to mitigate risk, but rather are tasked with *maximizing* the value of the company on whose board they sit. This rule makes perfect sense in the context of non-financial corporations, whose failure poses no systemic risk and whose shareholders can eliminate the firm-specific risk of the company's business antics easily and cheaply through diversification.

(p. 1095) On the other hand, of course, the federal government, if not the state governments, wants banks and BHCs to refrain from engaging in excessive risk taking. Thus, BHC directors are pulled in two opposite directions by the legal rules that govern their behavior. On the one hand, as established in this section, it is the clear policy of federal banking regulators, particularly the Fed, that holding companies—and particularly large holding companies whose operations pose systemic risks—should focus primarily on issues of safety and soundness. On the other hand, the state laws that impose fiduciary duties on the directors of all corporations, both banks and nonbanks, require all such directors to maximize the value of the firm, even if doing so causes the company to assume considerable risk. And because of the low cost of leverage for federally insured banks and for companies designated as “systemically important financial institutions” (SIFIs),⁵² these fiduciary duties will channel directors towards tolerating, if not actively encouraging, risky capital structures and risky investment practices. One way to reconcile the apparent deep inconsistency between bank and BHC directors' fiduciary obligation to maximize returns and their statutory and regulatory obligations to promote safety is to prioritize these conflicting dictates. The regulatory and (p. 1096) statutory obligations come first. Managers and directors can only maximize profits to the extent that doing so does not conflict with relevant legal rules and regulations. As the influential American Law Institute Principles of Corporate Governance make clear, a corporation “[i]s obliged, to the same extent as a natural person, to act within the boundaries set by law.”⁵³ Or as Milton Friedman admonished, corporations are obligated “to make as much money as possible while conforming to the basic rules of the society, both those embodied in law and those embodied in ethical custom.”⁵⁴

Vertical and Horizontal Problems in Financial Regulation and Corporate Governance

In our view, the fact that banks and, their officers and directors, can only maximize profit within the limits of applicable law and regulations is an extremely important feature of the corporate governance landscape. Establishing and maintaining this hierarchy, however, does not resolve entirely the tension between profit maximization and the regulatory and social goals of achieving safer and sounder financial institutions. This is because, as we have seen over the past several decades, there is plenty of room for financial institutions to engage in excessive risk taking even after they have complied with the law.

For example, banks must, of course, comply with the relevant rules regarding the maintenance of certain capital levels. But even after complying with such rules, there is ample room to maneuver. Banks, for example, can, and do invest in the riskiest assets within a particular risk-weighting class. They also look for loopholes in regulations such as the Volcker rule in order to squeeze the highest returns they can for their shareholders: and, of course, this quest for the highest returns involves risk, which, in turn, is not something that regulators are interested in maximizing.

But the fiduciary duty to maximize profits is not the only obstacle to reaching the goal of incentivizing managers and directors of financial institutions to focus on keeping banks safe with the same intensity as directors of other companies focus on maximizing share prices. In addition to fiduciary duties, it also is the case that holding company directors, like the directors of all other corporations, are elected by the shareholders. Fixed and contingent claimants, such as depositors, non-depositor-creditors, and the US government lack voting power. In an election between a risk taker and a non-risk taker, the shareholders will vote for the risk taker. Thus, to the extent that directors survive in their jobs in the Darwinian environment that characterizes the democratic process, among the strongest characteristics for survival in the job of bank or BHC directors is a strong proclivity for risk taking.⁵⁵

Outside of the US, bank directors have faced strictly higher burdens, with some jurisdictions viewing bank failures as a criminal offense on the part of directors. Brazil, for example, holds banks' executives and directors personally liable for the debts of failed institutions even when no fault is proven.⁵⁶ The UK government, following on the recommendation of the Parliamentary Commission on Banking Standards, has recently introduced a new criminal offense for reckless misconduct in the management of a bank. This criminal liability would apply to both executive and non-executive directors of a bank.⁵⁷ The maximum sentence for the offense is seven years in prison and/or an unlimited fine.

(p. 1097) The notion that "reckless management" is a crime is rather alien to the US perspective that business failure is not a criminal offense, but rather a natural, albeit unfortunate, outcome of business judgment in an uncertain world. In our view, criminalizing bank failure is not a viable approach to resolving the difficulties of bank corporate governance. It does, however, change the calculus for bank directors with respect to the acceptable level of risk for a financial institution.

Vertical and Horizontal Problems in Financial Regulation and Corporate Governance

A similar change in calculus can arise from the concept found in Germany, Switzerland, and Austria called *Untreue*. This “breach of trust” is defined as “a derogation of duty that causes real harm to the institution,”⁵⁸ and it has been the basis for charges against bankers at West LB, Bayern LB, HSH Nordbank, and Sal. Oppenheim.⁵⁹ Indeed, the CEO of West LB paid a fine of EUR 150,000 to settle charges relating to breach of trust, and the former CEO of Bayern LB was convicted to a suspended prison sentence of 18 months in 2014 for bribery, although the court dismissed separate allegations of breach of trust against him.⁶⁰ More intriguing are the cases involving board members of these failed financial institutions. The entire management board of the German bank HSH Nordbank stood on trial for breach of trust due to risk management failures relating to a CDO and other off-balance-sheet activities that resulted in the bank having to be bailed out to the tune of EUR 30 billion, although the board was eventually acquitted.⁶¹ Similarly, seven former directors of LBBW, Germany’s largest public sector lender, were charged with breach of trust (and eventually settled) in connection with moving risky assets to special-purpose vehicles allegedly to hide the riskiness of the bank.⁶²

In the US, bank directors and managers can be criminally prosecuted for fraud and for violating the federal securities laws or provisions of the securities laws, and this was the fate that befell more than 800 bankers jailed in the aftermath of the S&L crisis. But pursuing such cases, particularly against bank directors, is notoriously difficult due to the challenge of linking wrongdoing to those actually running the bank.⁶³ The rarity of this outcome means that bank director behavior is unlikely to be affected.

What is clear from this review is that corporate governance problems are remarkably resilient. While some approaches have been more successful than others, in general even the most extreme outside constraints have failed to resolve bank governance problems. In our view, this suggests using a new approach, one that explicitly recognizes the inherent difficulty of managing and controlling risk in the post-crisis era.

(p. 1098) 2.3 Bank Governance in the Post-Crisis World: A Proposal

Several factors suggest that it may be time to impose a more rigorous standard on the directors of certain financial institutions, particularly those deemed to be systemically important by regulatory authorities. The fact that an institution is systemically important seems to us reason enough to expect directors of such institutions to be able to perform their functions at the level of other directors at comparable financial institutions. The vast complexity not only of the businesses of banking and finance but also of the laws and regulations that govern financial institutions, particularly in the wake of Dodd-Frank, provide additional support for the argument that bank directors should be held to higher standards than the amateur standard that governs directors generally. Our proposal here is particularly relevant for directors of BHCs, who currently face no special requirements as to qualifications.⁶⁴

While our proposal that bank directors have special expertise is new, the idea that corporate directors in general should have special expertise is not new, though the idea has not

Vertical and Horizontal Problems in Financial Regulation and Corporate Governance

been well developed in the literature. Some scholars define the term “professional directors” simply as directors who serve on multiple boards, and adduce evidence that board membership of such professional directors correlates with improved performance for the companies on whose boards those directors serve.⁶⁵ Others use the term “professional” to refer to the particular, industry-specific expertise that certain directors have.⁶⁶ We use the term in the latter sense.

Among the earliest and most persuasive appeals to require that corporate directors have substantial industry-specific expertise was made by Yale law professor, later Supreme Court Justice William O. Douglas. Douglas argued that experts on the board “would be invaluable [. . .] in determining the course of conduct for the managers,” and would be “better qualified to determine financial and commercial policy.” For these reasons Douglas argued that outside experts on boards of directors “should have a position of dominance and power on the board” so that they can “make their directive influence effective” by means of their “real power over executive management.”⁶⁷ In arguing for directors with sufficient industry expertise, Robert Pozen has observed,

Lack of expertise among directors is a perennial problem. Most directors of large companies struggle to properly understand the business. Today’s companies are engaged in wide-ranging operations, do business in far-flung locations with global partners, and operate within complex political and economic environments. Some businesses, retailing, for one, are relatively (p. 1099) easy to fathom, but others—aircraft manufacture, drug discovery, financial services, and telecommunications, for instance—are technically very challenging. I remember catching up with a friend who had served for many years as an independent director of a technology company. The CEO had suddenly resigned, and my friend was asked to step in. “I thought I knew a lot about the company, but boy, was I wrong,” he told me. “The knowledge gaps between the directors and the executives are huge.”⁶⁸

Just as the idea that some directors should be held to higher standards is not alien to the academic literature, neither is it new to policy makers. As noted above, Dodd-Frank requires at least one of the members of the risk committees of BHCs and SIFIs to have risk-management experience commensurate with the firm’s capital structure, risk profile, complexity, size, and activities. The Sarbanes-Oxley Act explicitly set higher requirements for qualified audit committees by requiring all members to be independent and at least one member to be a “financial expert” as defined by SEC rules.⁶⁹ Indeed, one of the motivations behind Sarbanes-Oxley was to strengthen audit committees to “avoid future auditing breakdowns” which were contributing to a loss of confidence in the integrity of US companies and markets.⁷⁰ Our argument here is that the failure of risk management at financial institutions, particularly systemically important ones, can lead to outcomes of even greater consequence, and that current steps are insufficient to address the magnitude of the problem of excessive risk taking by financial institutions.

How might such a system work? We suggest a two-part structure involving differential standards for both bank risk committee members and bank directors. With respect to risk

Vertical and Horizontal Problems in Financial Regulation and Corporate Governance

committee members, we note that risk management of a complex financial institution is not something easily grasped by a typical corporate director but instead requires specialized expertise. Indeed, the shareholder advisory services ISS and Glass Lewis both recommended voting against the members of JPMorgan Chase's Risk Committee, citing their lack of risk-management experience. We believe that risk-management committees should be composed only of individuals who can demonstrate expertise in evaluating and monitoring the risk control systems of a bank. Allowing "amateur hour" in this oversight function at large complex financial institutions is simply irresponsible in post-crisis financial markets.

Such individuals, whom we will call "banking experts," would have acquired, either through experience or education, the skills needed to monitor the risk-management (p. 1100) functions of the bank. For smaller financial institutions, this expertise may be more limited, reflecting that risk management at such institutions generally involves less complex methodologies (such as gap analysis, liquidity monitoring, and the like). For large, complex financial institutions, the needed skill set will be larger, requiring familiarity with risk modeling, valuation of complex derivatives, synthetic asset replication, hedging strategies, etc. The specific qualifications for being a banking expert could be defined in much the way that audit committee financial experts are determined.

Second, we also propose higher professional standards for bank directors. As we have argued in this chapter, bank corporate governance issues pose an ongoing threat to the financial system. While heightened oversight of banks is surely called for, such oversight will be successful only to the extent that the directors of financial institutions have both the incentives, and the experience and skill required to be successful in carrying out their oversight responsibilities. At a minimum, we believe bank directors should be "banking literate," where such literacy is defined by an understanding of the basic functions of banking, the nature of risk in complex financial organizations, and the complex regulatory structure defining banking. Such literacy, which would be a prerequisite for becoming a director, could have been acquired through experience or through education.

We suspect that some may object to these proposals on the grounds that if having more qualified directors were valuable, then bank shareholders would demand this on their own. Alternatively, others may argue that if higher requirements are desirable for banks, then perhaps they should be required of firms more generally. We think the response to both objections is actually the same: banks are different from other firms. As we have argued, bank shareholders do not have properly aligned incentives to limit bank risk, so externally imposed requirements may be necessary. Other firms can adequately address corporate governance deficiencies internally, so requiring higher standards for all corporate directors is unnecessary.

Another objection to our proposal involves a more subtle point about bank risk taking. There is empirical research that indicates that banks with more knowledgeable directors are more likely to take on greater risk than other banks. One could argue that our proposal could actually exacerbate the risk taking problem at banks rather than ameliorate it

because our proposal would place more knowledgeable directors on boards. We have two responses to this. First, ignorance is not a good strategy for risk control—relying on directors' lack of knowledge to restrain risk is surely not a formula for a safe and sound banking system. We completely agree, however, that knowledge alone is not sufficient to achieve the goal of safety and soundness in banking. In addition to knowledge and competence, there must also be a culture within banks that considers prudent banking to be a way of life rather than an oxymoron. Culture starts at the top, so efforts by regulators to highlight the importance of cultural issues within banks should be viewed as working hand in hand with our proposals to improve corporate governance in banking.

Finally, a legitimate concern is that our proposal would cause the demand for qualified bank directors to exceed the supply. We acknowledge that it will take time and effort to groom enough competent directors for all of the important financial firms in the economy. But if better directors result in creating better banks, then the returns to searching for, educating, and empowering those directors will pay off for all concerned.

(p. 1101) **3 Horizontal Governance Issues: Nonbank Subsidiaries versus Bank Subsidiaries**

Another context in which financial regulation and corporate governance clash are the interactions among the bank and the nonbank subsidiaries of BHCs. The banks' subsidiaries operate as banks, while the nonbank subsidiaries often operate in the shadow banking sector as so-called "shadow banks." Shadow banking refers to traditional banking activities, particularly lending, that occur outside the regulated banking system and are effectuated by nonbank financial intermediaries as well. Claessens and Ratnovski define shadow banking as a nonbanking institution that engages in what, from an economic and functional point of view, is the business of banking.⁷¹ In contrast, other researchers, including Paul McCulley and Mehrling et al., focus on the nature of the financial assets involved in the transactions.⁷²

Shadow banking includes such important financial sectors as the repo market and the commercial paper market. Among the more important sorts of firms that operate as shadow banks are money market mutual funds, hedge funds, commercial and personal/finance companies, and broker-dealers firms. Because unregulated nonbanks are active in the shadow banking system, such institutions were able to engage in transactions featuring significantly higher credit risk, market risk, and liquidity risk, while holding much smaller capital cushions than their regulated bank competitors.

According to the IMF, in the US shadow-banking assets exceed those of the conventional banking system and have for some time.⁷³ Shadow banking amounts to between 15 and 25 trillion dollars in the United States, between 13.5 and 22.5 trillion in the euro area, and between 2.5 and 6 trillion in Japan—depending on the measure—and around 7 trillion in emerging markets. In emerging markets, its growth is outpacing that of the traditional

Vertical and Horizontal Problems in Financial Regulation and Corporate Governance

banking system.⁷⁴ In the US, the UK, and the euro area, the value of assets in the shadow banking system is greater than the GDPs of each of the individual countries.

Subsequent to the subprime meltdown in 2008, the activities of the shadow banking system came under increasing scrutiny and regulation in Europe, Japan, and the United States. In particular, new rules cover money market funds (MMFs), securitization, and financial companies such as American International Group, General Electric Capital Corporation, MetLife, Inc., and Prudential Financial that have been designated as “systemically important financial institutions” (SIFIs) by the Financial Stability Oversight Council (FSOC). This is an entity created by Dodd-Frank that is empowered to determine that a (p. 1102) financial institution poses a threat to US financial stability and thereby is to be subjected to prudential regulation by the Board of Governors of the Federal Reserve System.⁷⁵ A threat exists if the material financial distress of an institution or the particular characteristics of the institution could cause systemic effects throughout the US economy.

Also pursuant to Dodd-Frank, in July 2014, the SEC issued final rules for the reform of MMFs. Certain MMFs known as “prime institutional” MMFs will be required to transact at a floating NAV and to maintain daily share prices that change according to changes in the value of the individual assets that constitute the portfolio.⁷⁶ MMFs whose customers are natural persons and government MMFs, which are MMFs that invest in government debt, may impose the practice of using constant NAV pricing. However, in times of stress, all MMFs may impose liquidity fees and redemption gates.⁷⁷

Another point of entry for US regulators seeking to regulate the shadow banking systems is through the imposition of credit risk retention requirements in securitizations. Such requirements, known colloquially as “skin-in-the-game” provisions, are, strangely enough, coupled with prohibitions against hedging the retained credit risk portion of the securitization. These anti-hedging provisions are strange, of course, because they increase rather than decrease the risks of the firms that are subject to the credit risk retention rules. Anti-hedging provisions are necessary, because without them hedging would permit financial firms involved in securitizations to avoid having “skin in the game” by implementing hedging strategies that nullified the risks associated with the securitized financial assets retained by these financial firms.

From a corporate governance perspective, one particular facet of the shadow banking system is of particular concern. Bank and financial holding companies can conduct banking activities not only through the downstream banks that they own and control, but also through virtually unregulated nonbank subsidiaries such as mortgage companies:

Mortgage companies were largely ignored (by both functional and institutional regulators), despite the fact that they had held a dominant market share (of mortgage originations) since the early 1990s. Mortgage companies were not funded by deposits, so no institutional regulator oversaw them, and their activities did not fall under the domain of any functional regulator. The Federal Trade Commission and the State Attorneys General did have the ability to bring punitive actions against mortgage companies, but only if they observed unfair and deceptive prac-

Vertical and Horizontal Problems in Financial Regulation and Corporate Governance

tices evidenced by a pattern of customer complaints. Before the 2007 crisis, this “repeat-complaint-oriented supervision” had little power to systematically affect mortgage company behavior, leaving them essentially free of regulatory oversight.⁷⁸

In a recent article, Yuliya Demyanyk and Elena Loutskina observe that, while defaulted mortgages originated by bank subsidiaries weakened the balance sheets and income (p. 1103) statements of their holding company parents by increasing their reported loan losses and reducing their profits (net income), the defaults on mortgages originated by their nonbank mortgage-company subsidiaries did not.⁷⁹ Thus, rather stunningly, loan losses from mortgage defaults from subprime mortgages “have an adverse effect on a BHC’s reported loan losses and net income only if they were originated by a bank subsidiary, not a mortgage-company subsidiary.”⁸⁰

Unsurprisingly, the different consequences for a BHC of making loans through a mortgage company subsidiary rather than through a subsidiary bank had consequences. Demyanyk and Loutskina document the fact that “mortgage-company subsidiaries of BHCs originated more loans to borrowers with lower credit scores, higher loan-to-income ratios, and lower relative incomes than did their bank subsidiaries. Mortgage companies were also more likely to originate loans of riskier types, such as adjustable-rate and interest-only mortgages.”⁸¹

The incentives for holding companies to shift their riskiest subprime lending activities out of banks and into nonbank mortgage companies were further heightened by the Gramm-Leach-Bliley Act of 1999, which, in an effort to control risk, isolated the activities of bank and nonbank subsidiaries by erecting “formal financial barriers between the BHCs’ bank and their non-depository subsidiaries.”⁸² In particular, BHCs were required to erect “firewalls” between their bank subsidiaries and their nonbank subsidiaries. Gramm-Leach-Bliley explicitly prohibited BHCs from bailing out troubled nonbank subsidiaries, which meant that as a practical matter “BHCs’ exposure to the limited liability mortgage-company subsidiaries was indeed limited to their equity investment.”⁸³

Gramm-Leach-Bliley had the stated policy objective of protecting FDIC-insured banks, the federal deposit insurance fund and taxpayers—from the costs associated with the failure of their nonbank/uninsured affiliate. The unintended consequence of Gramm-Leach-Bliley was that it increased systemic risk because risky activities were simply shunted from insured banks to their uninsured, unregulated nonbank affiliates within the same holding company. This shift not only led to weaker lending standards, but also led to the financial crisis.⁸⁴

4 Regulatory Externalities

In previous joint work, we have observed another tension between the interests of the financial markets and the interests of individual market participants. In particular, we have shown that the SEC’s order-handling rules for securities trading, the so-called “trade-

Vertical and Horizontal Problems in Financial Regulation and Corporate Governance

through rules,” tend to benefit the securities markets in general but tend to harm certain individual traders who bring liquidity to the markets by preventing them from attaining the most efficient execution of their orders.⁸⁵

The trade-through rule requires that purchasers (sellers) buy (sell) securities at the best displayed offer (bid) price even if the offer (bid) is for fewer shares than the bidder (offeror) would like to buy (sell). The problem arises because traders with a large block to buy or sell (p. 1104) may achieve better overall execution terms for their entire order by executing the entire order at an inferior price rather than splitting their entire order up into smaller blocks and taking offers or hitting bids seriatim at different, and usually constantly worsening, prices. As we have explained in earlier work:

For example, if the best bid anywhere for a stock is \$100, a large block seller (with 10,000 shares to sell) must, under the current incarnation of the trade-through rule, execute the trade at that price, even if the bid were for only 1,000 shares and the seller would prefer to sell the entire 100,000-share block at an inferior bid of \$99.75. Of course, if the block trader were permitted to “trade-through” the superior bid as the SEC proposed in 2004 and consummate the transaction at \$99.75, the retail trader who entered the \$100 bid might not obtain best execution if the market moves higher before the trade can be executed.⁸⁶

Here in contrast to having rules, the so-called firewall rules of Gramm-Leach-Bliley that cabin off the unregulated nonbank affiliates from their affiliate regulated banks, which make individual banks safer but may increase systemic risk by shifting risky activities from regulated banks to unregulated and relatively monitored subsidiaries.

Several provisions in 2010 Dodd-Frank Act provide regulators with the tools to deal with the problem just identified. But it is important that regulators understand this problem so that they can address it properly.

Dodd-Frank is an enormously complex and multifaceted statute. Here we focus as precisely as we can on the provisions that can be most useful as a tool for dealing with the negative externality problem just identified. These provisions call for establishing the Financial Stability Oversight Council (FSOC) to address systemic risks. The FSOC was established primarily to (1) identify risks to the financial stability of the United States that could arise from the material financial distress or failure, or ongoing activities, of large, interconnected bank holding companies or nonbank financial companies, or that could arise outside the financial services marketplace; (2) promote market discipline, by eliminating expectations on the part of shareholders, creditors, and counterparties of such companies that the US government will shield them from losses in the event of failure; and (3) to respond to emerging threats to the stability of the US financial system.⁸⁷

In addition, Dodd-Frank requires the Federal Reserve to adopt enhanced prudential regulatory standards for the largest BHCs and designated nonbank financial companies. The

Vertical and Horizontal Problems in Financial Regulation and Corporate Governance

stringency of these requirements increases with the size and complexity of the holding company subject to the rules.

Further, Dodd-Frank restricts banks, bank affiliates, and BHCs from proprietary trading or investing in a hedge fund or private equity fund, requires the Federal Reserve to impose a debt-to-equity limit on companies the Council has determined pose a grave threat to financial stability, and to establish enhanced prudential standards for large BHCs and foreign banking organizations (known as FBOs).

These rules have the potential to mitigate the risk-shifting problem that arises when insured and regulated depository institutions shift their riskiest activities to uninsured (p. 1105) unregulated subsidiaries, at least for depository institutions that are designated as SIFIs. It appears to us, however, that the rules do not go far enough. They do not affect holding companies such as General Electric, which has many subsidiaries but only one (General Electric Credit Corporation) that is designated as a SIFI. The rules also do not affect non-SIFIs. SIFIs consist of BHCs with total consolidated assets of \$50 billion or more as well as nonbank financial companies⁸⁸ designated as systemically important by the FSOC. The nonbank holding companies designated as SIFIs are American International Group (AIG), General Electric Capital Corporation (GECC), MetLife, Inc., and Prudential Financial Inc.⁸⁹

Title I of Dodd-Frank gives the FSOC the authority to determine whether a nonbank financial company will be subject to the Fed's supervision and prudential standards. Specifically, the Fed's powers kick in if the company's size, complexity, interconnectedness, and mix of activities pose a threat to the US financial system, and also when a nonbank financial company is in "material financial distress," defined as being in imminent danger of default or insolvency, that poses a threat to the financial system of the US.

Under Dodd-Frank, the FSOC must apply 10 statutory considerations when it makes its determination.⁹⁰ In so doing, the FSOC will employ a three-stage process. In the first stage, it will analyze nonbank financial companies based on six quantitative measures (see Table 41.1). The companies that exceed the asset size threshold plus one or more of the remaining five quantitative measures "could move onto the second stage, during which the (p. 1106) FSOC will evaluate their risk profiles using a wider variety of quantitative information that is available from public and regulatory resources." In the third stage, the FSOC will use quantitative and qualitative information it receives from the companies to determine whether they are potential threats to the financial stability of the US.⁹¹

Vertical and Horizontal Problems in Financial Regulation and Corporate Governance

Vertical and Horizontal Problems in Financial Regulation and Corporate Governance

As reflected in Table 41.1, several nonbank financial companies are not designated as SIFIs despite meeting the \$50 billion asset threshold. For other such companies see Table 41.1.

(p. 1107)

5 Conclusion

There is a fundamental and perhaps irreconcilable difference between the corporate governance goals of systemically important financial institutions and federally insured financial institutions on the one hand, and non-federally insured, non-systemically important companies on the other. Because all systemically important financial institutions and virtually all insured banks are controlled by holding company parents, this means that different subsidiaries of the same holding companies will be subjected to different corporate governance norms. This structure creates a conflict between the goal in financial regulation of reducing the incidence of failure of systemically important financial institutions and the goal in corporate law of maximizing the value of the corporation for shareholders.

The conflict between BHCs and their subsidiaries, discussed earlier in this chapter is a “vertical” corporate governance problem. The horizontal conflict is exacerbated by the size and complexity of large financial institutions. It can be mitigated by imposing higher professional standards on bank directors and on members of board risk committees.

The conflict between the bank and nonbank subsidiaries of BHCs discussed in the second part of this chapter is a “horizontal” corporate governance problem. The horizontal conflict exists among bank and nonbank subsidiaries, and is, if anything, even more difficult to resolve than the vertical governance problem. The extent of this challenge is reflected in the immense complexity of Dodd-Frank, and particularly in the designation and regulation of entities designated as systemically important. In light of the small number of institutions designated as SIFIs, however, it appears that more work is required to mitigate the horizontal challenge, particularly as the shadow banking system remains extremely robust.

(²²) SEC, *supra* note 16, at 2.

(²³) Id.

(²⁴) Another significant corporate governance failure was inadequate communication between JPMorgan's Senior Management and the Audit Committee of JPMorgan's Board of Directors (the "Audit Committee"). JPMorgan senior management initiated reviews of the CIO-VCG's work after learning of significant disputes between the bank and its counterparties about the value of the assets held in the SCP. From these reviews, the bank's management learned that there were problems with the CIO-VCG's price testing and "an undue amount of subjectivity" in its control function. Contrary to the requirements of SOX, however, JPMorgan's management did not inform the Audit Committee of the bank's board of directors that it was aware of significant deficiencies or material weaknesses in

Vertical and Horizontal Problems in Financial Regulation and Corporate Governance

the firm's internal control over financial reporting. As the SEC observed in its Order, this information must be passed along to the board by management so that the Audit Committee can fulfill its oversight role and help to assure the integrity and accuracy of information.

⁽²⁵⁾ Under applicable accounting rules, the positions in the SCP had to be marked "within the bid-ask spread" at the point that is "most representative of fair value in the circumstances," with a particular emphasis on the price where the traders could reasonably expect to transact. GAAP also allows for the use of mid-market pricing "as a practical expedient for fair value measurements within a bid-ask spread."

⁽⁵²⁾ SIFIs are firms whose failure the Board of Governors of the U.S. Federal Reserve System has determined would pose a serious risk to the economy. In theory (though not in practice) supervision and regulation by the Fed. and other regulators will prevent a financial company designated as a SIFI from becoming “too big to fail.” In fact, designating a financial institution as a SIFI means that it is too big to fail, and SIFIs commonly are referred to as “too big to fail.” See, e.g. Mary Williams Walsh, *MetLife Sues Over Being Named Too Big To Fail*, N.Y. Times, January 13, 2015, http://dealbook.nytimes.com/2015/01/13/metlife-to-fight-too-big-to-fail-status-in-court/?_r=0. Somewhat more rigorously, the credit rating agencies rate SIFIs more highly because they assume that they will receive government support. See Mark Labonte, *Systemically Important or ‘Too Big to Fail’ Financial Institutions*, Congressional Research Service, September 19, 2014.

The most reliable evidence of whether SIFIs are or are not too big to fail is funding (capital) costs. Firms that are too big to fail should have lower capital costs. A study for Bloomberg by Robert Litan and Christopher Payne found that “the funding advantage received by the eight designated U.S. global systemically important financial institutions (G-SIFIs) by virtue of being perceived as ‘too-big-to-fail’ may be as large as \$34.4 billion in 2012.” At least eight separate studies support this view. Vertical and Horizontal Problems in Financial Regulation and Corporate Governance

⁽⁸⁷⁾ See Financial Stability Oversight Council, 2014 Annual Report, at iii, available at <https://www.treasury.gov/initiatives/fsoc/Documents/FSOC%202014%20Annual%20Report.pdf>.

⁽⁸⁸⁾ A Nonbank Financial Company is defined in Title I of Dodd-Frank as a company that is predominantly engaged in financial activities. Predominantly means that 85% of its consolidated gross revenues are derived from what are defined as financial activities by the Bank Holding Company Act of 1956.

⁽⁸⁹⁾ The Dodd-Frank Act also authorizes the FSOC to designate a Financial Market Utility (FMU) as “systemically important” if it determines that the failure of or a disruption to the functioning of the FMU could create or increase the risk of significant liquidity or credit problems spreading among financial institutions or markets and thereby threaten the stability of the U.S. financial system. Designated FMUs are subject to the heightened prudential and supervisory provisions of Title VIII of Dodd-Frank, which relate to risk management and safety and soundness issues such as requiring that FMUs conduct their operations in compliance with applicable risk-management standards; providing advance notice and review of changes to their rules, procedures, and operations that could materially affect the nature or level of their risks; and being subject to relevant examination and enforcement provisions.

At its July 18, 2012 meeting, the FSOC voted to designate eight FMUs as systemically important under Title VIII of the Dodd-Frank Act: (1) The Clearing House Payments Company L.L.C. (on the basis of its role as operator of the Clearing House Interbank Payments System); (2) CLS Bank International; (3) Chicago Mercantile Exchange, Inc.; (4) The Depository Trust Company; (5) Fixed Income Clearing Corporation; (6) ICE Clear Credit LLC; (7) National Securities Clearing Corporation; and (8) The Options Clearing Corporation. See Financial Stability Oversight Council, Designations, <http://www.treasury.gov/initiatives/fsoc/designations/Pages/default.aspx>.

⁽⁹⁰⁾ The statutory considerations are: (1) the extent of (financial) leverage; (2) the extent and nature of off-balance-sheet exposures; (3) the extent and nature of the company’s transactions with other significant nonbank financial companies and bank holding companies; (4) the importance of the company as a source of credit for households, businesses, and municipalities, and as a source of liquidity for the U.S. financial system; (5) the importance of the company as a source of credit for low-income, minority, and underserved communities; (6) the extent to which assets are managed rather than owned by the company and the extent that ownership of AUM is diffused; (7) the nature, scope, size, scale, interconnectedness, and mix of the company’s activities; (8) the degree to which the company is already regulated by one or more primary regulatory authorities; (9) the amount and nature of the financial assets; and (10) the amount and types of liabilities, including the reliance on short-term funding PLUS any other risk-related factors that the FSOC deems appropriate.

Abstract and Keywords

According to a common narrative, the failure of banks in the financial crisis reflected poor corporate governance practices, as well as inadequate prudential regulatory safeguards. Yet it turns out that the “best” governance practices according to ordinary standards were the ones that did worst during the financial crisis. In the period leading up to the financial crisis, it was believed that regulation would cause banks to internalize the costs of their activities, meaning that what maximized bank shareholders’ returns would also be in the interests of society. Consequently, large banks used the same governance tools as non-financial companies to minimize shareholder-management agency costs, namely independent boards, shareholder rights, the shareholder primacy norm, the threat of takeovers, and equity-based executive compensation. Unfortunately, such tools had the adverse effect of encouraging bank managers to take excessive risks. Consequently, a significant rethink about the way in which banks are governed is required.

Keywords: financial crisis, regulation, banks, governance, executive compensation, independent boards

1 Introduction

ACCORDING to a common narrative, the failure of banks during the financial crisis in part reflected poor corporate governance on their part, as well as failures in the prudential regulatory regime to which they were subject.¹ According to this view, bank failures reflected internal deficiencies stemming from the relation between those who financed the banks, as shareholders or creditors, and those who ran these firms, as managers. Yet empirical studies report that the banks with the “best” corporate governance practices, as measured by ordinary standards, were the ones that did worst during the financial crisis.

Reconciling these views requires a theory of what “good” corporate governance for banks should look like. Banks are materially different in their financing, business model and balance sheets from most non-financial firms. First, banks are extremely highly leveraged institutions. The core of a bank’s business model is to transform short-term deposits into

Bank Governance

long-term loans, implying that most of its capital is raised through debt. With any leveraged firm, shareholders may gain at creditors' expense from an increase in risk and associated returns. If things go well, shareholders keep the higher returns; if things go badly, the creditors suffer. The potential for such risk-shifting rises with the level of leverage. It is consequently greater for banks than for most nonfinancial firms. At the same time, the financial assets held by a bank are distinguished from the assets of a non-financial firm by their opacity—that is, the difficulty outsiders have in determining their quality. This makes it more difficult for outsiders to monitor asset quality in a bank than in a non-financial firm.

So banks have greater potential for risk shifting, in ways that may be harder to detect, than non-financial firms. What is worse, their failure can impose enormous costs on society at large—negative externalities. The interconnection of the banking system means that the failure of a large bank can trigger contagion to other institutions, and the collapse of banks imposes costs on the real economy, not least through a reduced supply of capital for investment. To avoid this outcome, prudential regulation imposes capital and liquidity (p. 1109) requirements on banks so as to reduce their probability of failure. Deposit insurance mitigates the incentives of depositors to engage in a run. Moreover, as a last-ditch measure, bank bailouts prevent a failing bank from creating systemic costs.

Unfortunately, these policy measures have the effect of muting bank creditors' incentives to engage in monitoring of bank risk taking. If banks were companies like any other, depositors and other creditors would take notice of the risk of shareholder opportunism and either charge a higher interest rate (making financing through debt more expensive and therefore less predominant) or insist on having stronger governance and control rights.² Yet various factors stand in the way of creditors themselves playing an important part in disciplining bank shareholder opportunism. Depositors have no oversight rights, are dispersed, and are protected by deposit insurance. Banking regulation and supervision are there exactly to prevent shareholder opportunism of this kind, so that (at least unsophisticated) market participants may over-rely on their effectiveness. And perhaps most importantly, creditors of larger banks could (and perhaps still can) reasonably expect a state bailout that will avoid losses for them should the bank become insolvent.

In the period leading up to the financial crisis, the peculiarities of banks' balance sheets, their regulation, and the externalities they can create were thought not to necessitate any difference in the structure of bank governance from that of non-financial firms. It was believed that prudential regulation caused banks to internalize the full social costs of their activities, meaning that what maximized bank shareholders' returns would also be in the interests of society. On this view, which we might call the "assimilation" theory of bank governance, it was appropriate for banks to use the same governance tools as non-financial companies to minimize shareholder-management agency costs, namely independent boards, shareholder rights, the threat of takeovers, and equity-based executive compensation.

Unfortunately, tightening the linkage between shareholders and managers in banks had the adverse effect of encouraging bank managers to test the limits of regulatory controls. Given the opacity of bank assets, it is hard for regulators to ensure that bank risk taking is appropriately controlled. In the presence of less than complete regulatory controls, those running banks have incentives to take excessive risks. As described throughout this chapter, the banks that had the most “pro-shareholder” boards and the closest alignment between executive returns and the stock price were those that took the most risks prior to, and suffered the greatest losses during, the crisis.

As a result, a significant rethink about the way in which banks are governed is required. The revised perspective might be termed the “bank exceptionalism” theory of governance.³ On this view, the structure and function of bank boards, the compensation of bank employees, and the function of risk management within organizations need careful differentiation from ordinary corporate governance if reforms are to address, and not exacerbate, bank failures.

(p. 1110) The rest of this chapter is structured as follows. Section 2 reviews the conventional goals and mechanisms of corporate governance, and explains their limitations when applied to banks. Sections 3–6 then consider, respectively, the operation of boards of directors, executive pay, shareholder rights and directors’ duties in relation to banks, reviewing empirical evidence, and describing regulatory initiatives. Section 7 offers a brief conclusion.

2 Corporate Governance: How Are Banks Different?

2.1 The Conventional Approach to Corporate Governance

The standard approach to corporate governance exhorts managers to run their firm in the interests of shareholders. This is because shareholders are “residual claimants”: that is, they receive what is left after all fixed claimants have been paid. Focusing on maximizing the residual surplus gives incentives to maximize the overall value of the firm: that is, to run it as efficiently as possible. Moreover, amongst those who contract with the firm—investors, creditors, employees, customers, and suppliers—the shareholders have the most homogeneous interests in the financial performance of the firm.⁴ Their interests relate simply to the maximization of the value of their claims, which, in the context of a publicly traded firm, is reflected in the firm’s stock price. Consequently, maximizing the stock price should be management’s objective.

To implement this, shareholders are given the right to appoint directors, who in turn select the managers.⁵ The significance of the directors derives from the fact that ownership of shares in large public corporations is typically widely dispersed. As a consequence,

shareholders face high coordination costs in exercising their rights. A number of mechanisms are relied upon to overcome this problem.

First, the board of directors has increasingly come to be viewed as performing the function of monitoring managerial performance on behalf of the shareholders. If the shareholders are too dispersed to be able to engage in effective monitoring themselves, then the elected board of directors can do so in their stead. The problem here is that the shareholders' very lack of coordination may undermine the process of election of effective monitors. The managers may influence the list of candidates and ensure that only their friends and associates are represented on the board. In response to this concern, directors are increasingly expected to be "independent" of the firm: that is, they should have no family, financial, or employment ties to the firm or its managers. Independent directors, it is thought, will make better delegated monitors on behalf of shareholders. The problem remains that in the absence of effective shareholder input, the "independence" of directors means simply the absence of a conflict of interest; it does nothing to ensure the presence of the necessary qualities to be an effective monitor.

(p. 1111) Executive pay comprises a second mechanism, which has in recent years become the most important focus of governance activity in the US. Tying managerial compensation to the stock performance gives very direct incentives. A drawback with conditioning pay on financial performance is that it requires managers to bear the risk of the firm's underperformance, even for reasons beyond their control. This may result in managers adopting an unduly risk-averse approach to decision making, passing up valuable but risky opportunities in favor of safer, more conservative, strategies. One way to encourage managerial risk taking and stock price maximization at the same time is to pay managers by way of options. These have the potential to offer managers rewards for increasing the stock price, but with no associated loss if the share price falls. However, the incentives associated with options are highly sensitive to the way in which the strike price is set. These contracts are normally negotiated by the compensation committee of the board of directors. Their success, therefore, is a function of the quality of the board. Because of this, some influential scholars argue that the rise in option-based compensation is not so much a function of improved corporate governance, but of a combination of changes to the US tax code that made it cheaper for firms to grant options than cash compensation, and of thinly veiled managerial self-interest.⁶

Third, shareholder rights provide channels through which shareholders may exercise control, for example by voting on major business decisions or more generally by removing directors. The exercise of shareholder rights requires some concentration of ownership, so as to overcome coordination problems. It is sometimes suggested that takeovers are a mechanism by which external discipline is brought to bear on management even in the presence of dispersed shareholdings. Poorly performing management faces the threat of acquisition by another company, and the mere threat of this occurring may be sufficient to encourage management to pursue the interests of their shareholders vigorously.

The last few years have witnessed the emergence of a second mechanism by which external discipline is brought to bear on management in the presence of dispersed shareholders. Activist shareholders, and in particular hedge funds, have acquired significant but not necessarily controlling shareholdings in firms to effect changes in corporate policy and management. They frequently act in conjunction with other institutional investors in promoting change. The rise of institutional activists has had a profound impact on the conduct of management in dispersed ownership systems in the UK and US particularly.

Fourth, directors and officers are subject to legal duties to avoid conflicts of interest and to take appropriate care in the running of their company. These may be enforced by shareholders through derivative or class actions, which enable a single shareholder or group of shareholders to represent the rest in claims against errant directors. However, it is unlikely that the shareholders who initiate such an action, or the judges called upon to adjudicate them, will know as much about the business as the incumbent managers. This makes litigation a blunt instrument. To avoid over-zealous enforcement, there are typically checks on shareholder litigation in relation to good faith business decisions that grant considerable discretion to management in the running of their businesses, leaving shareholder plaintiffs to focus on more egregious cases of conflicts of interest.

(p. 1112) **2.2 How Are Banks Different?**

As anticipated in the introduction, governance problems and mechanisms often play out differently in banks than in ordinary firms, reflecting how banks are special from this perspective in three important respects. The first difference is that banks are highly leveraged. The core of a bank's business model is to transform short-term deposits into long-term loans, implying that most of its capital is raised through debt. In addition to deposits, banks raise money via short-term and long-term debt, which, together with deposits, typically make up most of the liability side of their balance sheets. As a result, shareholders may stand to benefit at creditors' expense from changes in the bank's investment projects that increase risk and associated returns. If things go well, the shareholders keep the increased returns, whereas if things go badly, the creditors suffer losses. Perversely, mechanisms that succeed in tying executives to the interests of shareholders may actually exacerbate these financial agency costs. Creditors should therefore satisfy themselves that there are strong checks in place to ensure that the riskiness of the bank's activities is kept within acceptable limits. However, depositors are usually widely dispersed with only small amounts at stake, and do not wish to, or feel able to, monitor bank lending effectively.

The second difference is that bank failure imposes greater costs on society. A bank failure can trigger contagion in other parts of the financial system and, by impeding the operation of the financial system can harm the ability of businesses to obtain finance. Since losses are purely economic, they are not generally susceptible to compensation through the tort system.⁷ Moreover, as the source of contagion is usually the failure of a financial firm, governments have incentives to throw money at troubled firms to avert such failure.⁸ The more systemically important the bank, the more likely it will be able to rely

Bank Governance

on government support should it get into difficulties. This gives banks a perverse incentive to structure their operations such that they are systemically important and, in the eyes of policy makers, “too big to fail.”⁹ The implicit government guarantee means that such firms enjoy a lower cost of credit, and that creditors’ incentives to monitor the firms’ performance is weakened. What this does is to morph the creditors’ problem described in the previous paragraph into a problem for society more generally, through the implicit subsidy that creditors receive.

Of course, bank shareholders will lose money if their bank fails, but, because of limited liability, the shareholders’ maximum loss is set by the initial value of their shares. Consequently, other than the extent to which it affects creditors’ willingness to lend, shareholders have no (p. 1113) incentive to take precautions that might reduce the total losses consequent upon failure: as far as the shareholders are concerned, they have lost everything anyway by that point. There is even a Wall Street acronym used by market participants to reassure themselves they need not worry about marginal losses consequent upon failure: “IBG-YBG”—“I’ll be gone, you’ll be gone.”¹⁰

The third difference is that certain types of financial assets are hard to observe and measure. The rationale for bank lending is that banks may be able to collect information on borrowers that is not available to others. Hence, the value of their loan portfolio may not readily be subject to external scrutiny by shareholders as well as potential hostile bidders and creditors themselves.¹¹

As a result of the first and second of these differences, regulators—in lieu of creditors—are tasked with monitoring and controlling bank risk taking. However, the very difficulty of monitoring financial assets—the third of the differences described above—makes it particularly challenging for regulators, as well as investors, to perform this task effectively. And the efficacy of regulatory control is further compromised by very intense managerial incentives to maximize the share price. Managers may, therefore, seek to avoid regulation and to minimize the costs of regulation by influencing regulators, rather than taking desired actions and precautions to minimize risks of failure.

2.3 Bank Governance before the Crisis

For much of the postwar period, banks were treated as utilities subject to a form of rate regulation: both entry to the sector, and profits, were restricted. This gave shareholders a steady stream of returns, and no great incentive to push managers. Managers in turn had no great incentive to push to increase the firm’s performance. From the 1980s onward, there was significant deregulation in banking in the US, the UK, and many other countries. This introduced greater competition to the sector and volatility to shareholder returns. Bank governance, therefore, became more intensely focused on share price maximization. To the extent that banks were different, it was thought that financial regulation could be relied upon to correct any problems. Consequently, policy makers and industry participants sought to apply ordinary “best practice” in corporate governance to banking firms. For example, guidance by the Basel Committee on Banking Supervision concerning

corporate governance in banks emphasized the monitoring role of the board of directors.¹²

Of the governance mechanisms described in section 1, incentive pay was perhaps the most heavily relied upon to control bank executives. This tracked the rise of executive compensation as a governance mechanism generally. Moreover, variable pay has long been a feature (p. 1114) of employment in the investment banking sector. When the major investment banks converted from partnerships to corporations in the 1990s, profit-sharing that had previously been effected through partnership status came to be managed through variable pay for risk takers instead. As investment banks merged with commercial banks, these pay practices were rationalized as promoting shareholder value and extended to the commercial banking divisions of the resulting financial conglomerates.

However, reliance on incentive compensation has a serious drawback in the context of financial institutions. Correctly calibrating incentive pay depends on assessments of the state of financial assets, which by definition are hard to observe. For example, consider a loan officer, who agrees loans on the bank's behalf. The number of loans she writes, and the interest charged, are easy to observe. But the quality of the borrowers she lends to is not. If the bank were to offer her "incentive" compensation, this should condition amongst other things on the quality of borrowers, but because borrower quality is hard to observe, the bank may only be able to make the contract conditional on loan size and interest rates, which will lead to predictably problematic results.

The failure to appreciate that the differences between banks and non-financial firms had implications for governance, and that these could not readily be solved by regulators, had unfortunate consequences. An emerging body of literature reports that the bank executives who had the strongest incentives to maximize the value of their shares—as reflected in stock-based compensation, oversight by independent directors, and shareholder power—worked at banks that took the greatest risks and suffered the greatest losses.¹³ In other words, financial firms that had the "best" governance mechanisms, as conventionally understood before the crisis, actually did *worst* during the crisis.

We now review the application to financial institutions of each of the corporate governance mechanisms described in section 1. We begin with boards of directors, then consider compensation practices, then shareholder rights, and conclude with a discussion of legal duties. In each case, we consider first what we have learned from pre-crisis practices, and then review critically recent regulatory initiatives.

3 Bank Boards of Directors

3.1 Before the Crisis

Historically, bank boards in the UK and US were typically larger, and had more independent directors, than non-financial firms.¹⁴ However, the size of bank boards around the world had been shrinking during the decade prior to the financial crisis, making these

boards (p. 1115) look more like those in non-financial firms.¹⁵ Yet banks' compliance with general norms of "good" corporate governance was associated with their failure during the financial crisis.¹⁶ Two studies of banks around the world report that those with more "shareholder-oriented" boards had greater levels of risk prior to the crisis and experienced greater losses subsequently.¹⁷ There are at least two, likely complementary, explanations for these results. The first is that independent directors in banks may have assumed that regulators were exercising appropriate risk controls and consequently become less intensive in their own scrutiny. The second is that, because of the externalities associated with bank risk taking, shareholders would have wanted banks to take greater risks. In other words, since financial gains benefit shareholders and losses that are so large as to put to banks into bankruptcy are borne by others, shareholders benefit from the firm's pursuit of more risky investments.

3.2 Bank Internal Controls

An important role of the board of directors is to oversee internal controls within a firm. In most firms, these are primarily concerned with ensuring operational decisions are actually made in accordance with the firm's strategy. However, the business of financial institutions is principally concerned with the allocation of risk. As a result, these firms need to engage in risk management—that is, ensuring that the financial risks assumed by the organization are consistent with its objectives.¹⁸ At the core of this is the need to assess whether (1) the risks are justified by the returns associated (for particular contracts), and whether (2) the portfolio of risks taken on by the firm as a whole is appropriately constructed.

Banks' risk management systems can be subdivided into four components:¹⁹ (1) the assimilation and communication of information about exposures, in the form of standards and reports; (2) the application of rules governing limits on positions that employees with a given level of authority may enter into on the firm's behalf; (3) the development of strategies and guidelines governing investment; and (4) the design of employee compensation so as to generate appropriate incentives. Each component needs to be monitored and reviewed on a continuing basis, as does its relationship with the others.

(p. 1116) A number of aspects of bank risk management are particularly problematic. First, the gross level of complexity. In addition to the inherent difficulty of observing financial assets, noted in section 2, bank risk management systems have evolved gradually over time, following different trajectories in relation to different categories of risk. Credit risk management differs from interest rate risk or liquidity risk, for example. The level of complexity involved in the management of each of these has evolved in accordance with the limit of the competence of the most highly skilled teams of experts. This makes it extremely difficult for senior management to synthesize and assess overall risks to the firm.²⁰

Second, there is a particular conflict between risk management and high-powered financial incentives for employees. Employees with strongly incentive-based compensation will

seek to maximize whatever performance benchmark has been set for them. The more intense the incentive to maximize a particular benchmark, the more single-minded the focus on that measure will be, which may be to the detriment of other business objectives. Worse still, intense incentives can lead employees to seek to “game” the performance benchmark through steps that are positively harmful to the business as a whole, or even fraudulent. Given the great difficulties in monitoring financial assets, the appropriate calibration of employee compensation schemes and the policing of the way in which employees meet their performance targets are extremely important for the successful operation of the business. They therefore demand significant levels of internal oversight. This needs to be effected not just at the level of individual compensation targets and behavior, but also at group- and firm-wide levels, ensuring that individual (group) targets are set in a way that are mutually consistent at the level of the firm as a whole.

Consistent with intuition, there is evidence that the level of resources devoted to risk management has a meaningful impact on bank overall returns. Ellul and Yerramilli constructed an index of risk management intended to capture the strength and independence of risk management functions at US bank holding companies. They report that bank holding companies with higher scores in this index were less risky prior to the crisis and enjoyed better returns during the crisis.²¹

3.3 EU Regulation of Bank Board Structure and Risk Management

The EU has, under the aegis of the Capital Requirements Directive IV (“CRD IV”) and the accompanying Capital Requirements Regulation (“CRR”),²² introduced a wide-ranging and prescriptive set of guidelines for bank governance, dealing inter alia with board structure (p. 1117) and risk management. In contrast, the US has steered clear of imposing prescriptive rules on bank boards, save as respects compensation committees (discussed in section 4) and for risk management, for which a board committee with oversight over risk management policies is required under Dodd-Frank and the implementing regulations, with heightened requirements for the largest firms.²³

CRD IV, which applies to credit institutions and investment firms, emphasizes the obligations of the board to monitor the performance, risk controls, compensation strategy, and the integrity of disclosures of the firm.²⁴ It imposes regulatory duties of care and loyalty on board members.²⁵ It does not impose any minimum requirements for the proportion of independent directors, or the extent of their independence, save for separation of Chair and Chief Executive and the composition of the nomination, remuneration, and risk committees.²⁶ However, it does require that board members “commit sufficient time to perform their functions in the institution,” and to encourage this, mandates that not more than two non-executive roles at other organizations may be combined with one executive role, and not more than four non-executive roles in total may be held by any individual director.²⁷ It also requires firms to promote diversity in the boardroom, on the theory that this will assist in “recruiting a broad set of qualities and competences.”²⁸ To this end,

nomination committees must specifically introduce targets for representation of women on the boards, although not as regards ethnicity.²⁹

CRD IV also imposes both procedural and substantive requirements regarding risk management. Procedurally, it emphasizes the importance of overall risk management functions that are proportionate to the nature, scale, and complexity of the risks inherent in the firm's business model.³⁰ It also requires boards to "devote sufficient time to consideration of risks," and for large firms to establish a risk committee of the board comprised of non-executive directors.³¹ Firms are also required to ensure that they have a "risk management function," which is independent of the operational decision makers, reports to the board, has sufficient stature and resources to ensure that "all material risks are identified, measured, and properly reported", and is capable of delivering a "complete view of the whole range of risks of the institution."³² Turning to substantive requirements, the Directive requires regulators to specify guidelines regarding the management of various types of risk run by financial institutions.³³ Ironically, however, to the extent that these detailed guidelines adopt different measurement technologies for different types of risk, they may actually make it harder for boards and risk committees to comply with their procedural obligations.³⁴

Institutions must also disclose their recruitment and diversity policies for the board and its members' relevant knowledge and expertise, whether or not the firm has a risk committee, and if so, how frequently it meets, and a description of the information flow on risk to the management body.³⁵

(p. 1118) 4 Executive Pay in Banks

4.1 History and Problems

Prior to the crisis, the financial sector made enthusiastic use of performance-related pay.³⁶ In keeping with the pattern for non-financial firms, CEOs of US banks typically received far more variable pay than base salary.³⁷ For example, Fahlenbrach and Stulz ("F&S"), studying compensation of US bank CEOs in 2006, report a mean base salary of \$760,000, which is less than a sixth of the mean variable pay (comprising cash bonus and equity compensation) of \$5.3 million.³⁸ This heavy weighting towards variable pay—characterized as "performance-related"—was relatively recent. Historically, US bank executives received a greater fraction of fixed pay than was the norm in non-financial firms.³⁹ Following the deregulation of banking in the 1990s, the use of equity-based pay rose sharply in the sector, such that by the turn of the century, bank executive pay looked very similar to other sectors.⁴⁰

Just as before the crisis no one questioned the application to banks of ordinary governance standards, it has now become an article of faith that high levels of variable pay for bank executives tend to encourage "excessive" risk taking. Yet such a generalization

might be just as misleading as the pre-crisis complacency. We need to look carefully at the details in order to understand the mechanisms in play.

Did having “skin in the game” restrain risk taking? First, we should note that bank executives typically held significant holdings of stock in their firms. In F&S’s sample, the mean value of the stock CEOs held in their own firm was \$87.5 million, approximately 0.4% of the outstanding stock.⁴¹ In part this would have been because stock awards were often “restricted” for five years, meaning that the CEO could not sell until five years after grant. However, these very large holdings also reflected a significant degree of voluntary exposure by executives—that is, not selling their stock holdings even when they were no longer restricted. As a result, bank CEOs suffered huge losses—averaging \$31.5 million—over the (p. 1119) period 2006–2008.⁴² Should we conclude that because managers had such a substantial amount of “skin in the game,” they did not have incentives to indulge in “excessive” risk taking?

Apparently not. While managers clearly had significant downside exposure, looking solely at their holdings of stock does not take account of cash already received from bonuses and stock sales. Bebchuk, Cohen, and Spamann report that the top five executives in Bear Stearns and Lehman Brothers received aggregate cash flows of \$2.4 billion over the period 2000–2008.⁴³ Although these executives suffered losses of approximately \$1.4 billion through their holdings of stock in their firms, taking cash flows into account showed they were still ahead by approximately \$1 billion over these eight years.⁴⁴ In other words, even for the financial firms that failed outright, managers’ payouts from good years had greatly exceeded their eventual losses when the firms failed. This asymmetry—upside returns exceeding downside—seems to generalize. Thus F&S report that, taking into account options and cash bonuses, the mean CEO in their sample would receive 2.4% of the value of any increase in the stock price.⁴⁵ However, their downside losses would only be 0.4% of any decrease, tracking their holdings of the firm’s stock. In short, incentives on the upside were five times as strong as on the downside.

Moreover, this asymmetry of incentives appears linked to underperformance during the financial crisis. F&S report that the greater the managers’ incentives to increase the stock price—as measured by the proportion of the increase in value they captured—the worse were bank shareholders’ returns during the financial crisis.⁴⁶ This suggests that powerfully asymmetric financial incentives encouraged managers to pursue strategies that, at least ex post, turned out to be harmful to shareholders. We need to understand why this may have been the case.

One answer may be that stock options gave incentives to take risks in excess of what was optimal even from the shareholders’ perspective. The basic rationale for using options is that—assuming they are correctly priced (that is, “out of the money”)—they provide a powerful upside incentive to take actions that will increase the stock price. But might managers be pushed too far? Could options encourage them to pursue risky projects simply for the sake of it? An increase in the volatility of firm’s stock price will increase the value of an out-of-the-money option on that stock⁴⁷ and if the incentive is sufficiently pow-

erful then managers may be induced to select projects with lower net present values simply because they are more risky. F&S did not find any evidence of a link between the risk-sensitivity of (p. 1120) managers' portfolios and shareholder returns.⁴⁸ In other words, they found no evidence that option compensation led managers to select projects with lower expected values—thus harming even shareholders—simply because they are more risky. However, this does not imply that option contracts do not encourage a degree of risk taking that is detrimental to creditors or society more generally.

Were the risks excessive from a societal perspective? The costs of financial firm failure are not borne entirely by shareholders. Implicit or explicit government guarantees of creditors mean that these costs are only partially priced into credit agreements. As a result, shareholders as a group may stand to benefit from strategies that increase default risk but generate more positive cashflows in other states of the world. Consistently with this, Balachandran et al. report a positive relationship between managerial equity compensation and default risk.⁴⁹ That is, firms whose managers had the strongest incentives to maximize share price were also those most likely to fail. However, this cynical perspective fails to explain why managers did not reduce their holdings of shares in anticipation of the financial crisis. Had managers simply been ramping up risk in order to transfer losses to the state, it would make no sense for them to remain holding shares at the time the losses crystallized. Moreover, this perspective also overlooks the fact that—in the US and UK at least—most bank shareholders are diversified, meaning that they incur significant losses through their other portfolio firms should systemic harms materialize.⁵⁰ Such shareholders would not want bank managers to take socially excessive risks.

What about more junior employees? We have so far focused on the compensation of senior managers, primarily because these are the only group for whom detailed compensation information must be disclosed. Consequently, far less is known about the compensation of less senior employees. However, such literature as exists suggests that incentive problems stemming from miscalibrated “performance” pay may have been most egregious at the level of trading and sales staff, rather than senior executives. Shortly after the onset of the financial crisis, the (then) Financial Services Authority (FSA) carried out a study of bank employee compensation practices in the UK.⁵¹ They found that cash bonuses accounted for a large proportion of employees' pay. However, these bonuses were typically not linked to the stock price, but to *net revenues* in that financial year. This seems an astonishingly poor way to motivate employees. Where a financial firm takes on a risk under a contract, it is functionally—albeit not legally—providing insurance to the counterparty in respect of that risk. We would expect the premium for providing this insurance to be reflected in the price of the contract. It is clearly a mistake to reward people for writing insurance based only on the size of the premium they earn, without taking into account the risks insured. This simply gives them incentives to commit their firm to the biggest risks they can find, because these will attract the highest premiums. But this is precisely the effect of rewarding employees in a financial firm on the basis of revenues, without any adjustment for risk.

(p. 1121) This disturbing picture is reinforced by Acharya et al.'s innovative study of the impact of employee incentive compensation.⁵² These authors identify the aggregate compensation for sub-board-level employees by subtracting the (disclosed) compensation for “top five” executives from the (disclosed) aggregate total compensation paid by financial firms, and then determine how sensitive this total compensation is to the firm's revenues (not stock price). This gives a measure of the extent to which employees are incentivized to maximize revenues in a given year. The authors go on to report that greater revenue-sensitivity of aggregate employee cash pay was associated with greater default risk for the firm. This implies that incentive contracts of the type the FSA reported—linking pay to revenues—were associated with greater default risk.

In light of our discussion in section 4 about the deficiencies of internal monitoring, we can offer a conjecture about the ways in which senior management may have made mistakes about risk taking. Management with strong incentives to increase the stock price may have been more inclined to focus simply on revenues generated by employees and (mistakenly) reflected in the stock price, paying insufficient attention to appropriate risk adjustment of returns. That is, there was likely a negative synergy between the extent to which managers were encouraged to “manage the stock price” and the extent to which the stock price failed—owing to opacity—to take into account the true downside costs of firms' strategies.

4.2 The New Regulation of Executive Compensation in Banks

Bank executive compensation became an early target for regulatory reform. At the G20 summit in Pittsburgh in September 2009, member countries circulated a *Statement of Principles* regarding executive pay in the financial services sector.⁵³ This encompassed a programme of reform with the following three pillars: First, internal governance mechanisms were to be strengthened as regards the process of setting compensation. Second, the substance of compensation packages should be more closely aligned with “prudent risk taking.” Third, there should be more disclosure, and effective supervisory oversight, of both the process and substance of compensation arrangements.

These principles were first implemented in Europe through CRD III,⁵⁴ and subsequently tightened considerably in CRD IV,⁵⁵ which goes significantly beyond what is envisaged by the Financial Stability Board's (FSB) *Statement of Principles*. In the US, the Dodd-Frank Act requires the appropriate Federal regulators to introduce rules in relation to internal governance,⁵⁶ disclosure of executive pay, and substantive regulation of compensation contracts.⁵⁷ (p. 1122) Rules regarding internal governance, in particular the role of compensation committees, have been implemented by the SEC, and in 2016 there was a revised interagency rule proposal regarding enhanced disclosure of compensation in financial firms and substantive standards on compensation contracts.⁵⁸ However, it currently appears unlikely that this proposal will be implemented under the Trump administration. Table 42.1 sets out the firms and executives to which the regulations apply in the EU and US, respectively. We now turn to consider specific details of the rules that have emerged.

4.2.1 The Process of Setting Compensation

The FSB's first pillar proposed more active internal oversight of the setting of compensation.⁵⁹ At the center is the idea of a remuneration committee of the board with sufficient independence and expertise to exercise appropriate judgment on remuneration policies. The remuneration committee should work with the firm's risk committee to evaluate the incentives created by the firm's compensation arrangements so as to ensure that these are consistent with the risk committee's assessment of the firm's financial condition and prospects, and with regulatory guidelines. It should also oversee an annual review of compensation practices which should be produced for regulators. Employees working in the firm's risk and compliance function should have their remuneration set independently of the firm's performance, at a level sufficient to attract qualified and experienced staff, and their performance should be assessed on the basis of the achievement of the objectives of their functions (that is, risk management).

This was the least controversial aspect of the FSB's proposals, and—with the addition of a nod to greater involvement by risk management officials in the process—largely reflected existing best practice.⁶⁰

4.2.2 Substantive Regulation of Executive Compensation Arrangements

Much more significant are the substantive guidelines regarding the content of executive compensation, which are to be overseen by regulators. At their heart is a commitment to continued use of performance-related pay, but in a manner better aligned with the long-term and risk-adjusted performance of the firm. There are two principal routes by which the guidelines seek to do this. First, variable compensation awards must be adjusted ex ante in accordance with the riskiness of the activities undertaken by the employee and/or the firm.⁶¹ While this idea is easy to state in principle, it is harder to implement in practice, because it requires a benchmark of risk. Any such benchmark in turn creates incentives to game the system.

The second limb operates in part as a check against such gaming. It requires that performance-related pay should vary with ex post realizations of risk outcomes, over a (p. 1123) sufficiently long period of time. The FSB consequently prescribes that for senior executives and other employees whose actions have a material impact on the firm's risk exposure ("material risk takers"), a "substantial proportion" of pay should be performance-related over time.⁶² A large part of this variable pay (no less than 40%, rising to at least 60% for the most senior executives) should be deferred for a period of at least three years, but possibly longer depending on the risks associated with the business.⁶³ This is most easily done for equity-related pay (stock and options), by restricting the manager's ability to sell stock or exercise the options for a longer period. The FSB also suggests that at least half of variable pay should be awarded in equity. Some part of cash bonuses can also be deferred, with the possibility (p. 1124) that it will not vest if negative performance is realized. This deferred compensation must then be subject to clawback—a so called "malus" award—if poor performance outcomes are realized within the vesting period.⁶⁴

Bank Governance

Table 42.1 To which financial firms does the regulation of executive compensation apply?

	EU	US
<i>Which firms?</i>	CRD IV Art 3, CRR Art 4(1). “ <i>Credit institutions</i> ” (firms taking both deposits and granting credit); “ <i>Investment firms</i> ” (firms providing investment services or engaging in investment activities, including brokers, dealers, investment managers, underwriters and market operators).	Dodd-Frank Act of 2010, § 956 “ <i>Covered financial institutions</i> ” (firms taking deposits or their holding companies, registered broker-dealers, credit unions, investment advisors, Fannie Mae and Freddie Mac, and any other financial institution that Federal regulators jointly determine should be treated as such) with assets > \$1 billion.
<i>Which employees?</i>	CRD IV Art 92(2) and Delegated Regulation (EU) No 604/2014. “ <i>Material risk-takers</i> ” (categories of employee whose professional activities have a material impact on [the firm’s] risk profile). Identification based on both internal criteria developed by the firm and qualitative (functions performed) and quantitative (compensation value) criteria applied by supervisors. <i>Qualitative criteria:</i> Board and senior management; staff with the authority to commit significant credit risk exposures. <i>Quantitative criteria:</i> <ol style="list-style-type: none"> (1) Total gross remuneration > €500 000; or (2) among firm’s 0.3% most highly paid staff; or (3) remuneration equal to senior managers; or (4) variable pay could exceed €75 000 and 75% of fixed pay. 	Dodd-Frank Act of 2010, § 956 and Proposed Rule “ <i>Senior executive officers and significant risk-takers</i> ”: senior executive officers, and any other executive officer or employee who received total compensation in top 5% (for firms with assets >\$250bn) or top 2% (for firms with assets >\$50bn but <\$250bn) of firm’s payroll, or who can expose 0.5% or more of the firm’s net worth.

Although the EU first implemented these guidelines under CRD III, it then went significantly beyond them with CRD IV.⁶⁵ CRD IV imposes an outright cap on the amount of variable compensation that may be paid.⁶⁶ It may not exceed the amount of fixed pay for any individual, although with the approval of a supermajority of the shareholders, it may be up to twice the size of fixed pay. What is more, the rules regarding the identification of material risk takers (to whom the restrictions apply) are extensive in their coverage.⁶⁷ They apply to all employees of EU-based organizations, including, for example, those working in New York or Singapore.⁶⁸ Up to 25% of variable compensation may be discounted (for the purposes of the cap) at a supervisor-determined rate, provided that it is deferred for at least five years.⁶⁹ Moreover, up to 100% of variable compensation (not just that part which has been deferred) is subject to “malus” or clawback provisions.⁷⁰

In the US, implementation of the FSB *Principles* has been proposed through an interagency rule made under the mandate conferred by section 956 of the Dodd–Frank Act. The current draft outlines standards as regards incentive-based compensation, such that it must not “encourage inappropriate risks” either by providing “excessive compensation, fees, or benefits,” or “that could lead to a material financial loss.”⁷¹ Moreover, for institutions with assets in excess of \$50 billion, there are detailed rules requiring deferral of 40–60% (depending on employee seniority and the size of the firm) of variable compensation for at least three years (or four years for firms with assets of more than \$250 billion), and its adjustment downward to reflect losses realized during this period. However, it appears unlikely that these proposed rules will be implemented under the Trump administration.

The EU’s step of capping the ratio of variable pay to fixed pay is likely to lead to an increase in base rates of pay, given an internationally competitive market for executive talent. It may also have a counter-intuitive impact on risk taking. This is because, according to some commentators, the base pay in a traditional investment banking compensation scheme was set below the competitive rate, such that the bonus already incorporated a significant amount of downside performance sensitivity. Increasing the proportion of fixed pay will reduce this. Decreasing the proportion of variable pay will also reduce the upside payoffs. As a result, executives will have less incentives to take risks with upside components, and more incentive to take risks with downside components.⁷² Moreover, incentives to increase performance (p. 1125) will entirely dry up once the bonus has been “maxed out.” Coupled with deferrals and realized performance contingencies, it will create incentives to “manage” performance into subsequent periods as well. There are also likely to be employment selection effects. Making pay less performance-sensitive will select away from highly talented individuals and in favor of less talented types.

4.2.3 Disclosure and Supervision of Compensation Practices

The FSB’s third pillar exhorts that information about both the process of setting compensation and the quantum of pay for top executives should be disclosed publicly, at least annually.⁷³ Process information should include information about the composition and mandate of the remuneration committee; the most important criteria used in setting compensation (performance measurement, risk adjustment, pay-performance linkage, deferral policy and vesting criteria, and the parameters used for choosing between cash and other

forms of compensation). As regards substantive pay, there should be aggregate disclosure of the total (and the breakdown into various components) paid to all senior executives and material risk takers. This level of disclosure was already largely in place in the US under existing rules for disclosure by public corporations of executive compensation arrangements. In the EU, the relevant disclosure obligations are found in the Capital Requirements Regulation accompanying CRD IV.⁷⁴

The FSB also called for “rigorous and sustained” domestic supervisory engagement with the implementation of the FSB Principles.⁷⁵ In particular, compensation practices should be taken into account as part of supervisory risk review of financial service firms. Failure by firms to implement appropriate compensation policies should result in “prompt remedial action” to offset any associated risks. This would be implemented in the US through proposed rules made under section 956 of Dodd–Frank, which would require covered financial institutions to keep records for at least seven years of incentive-based compensation plans. In the EU, this will be implemented by Article 75 of CRD IV.

5 Shareholder Rights

Early responses to the financial crisis suggested that lack of shareholder oversight was part of the problem in the governance of financial institutions. For example, the Walker Review, commissioned by the UK government in 2009, concluded that greater engagement by institutional shareholders with boards of financial institutions was desirable.⁷⁶ Similarly, the Dodd–Frank Act in the US introduced powers for the SEC to strengthen shareholders’ rights, in particular their ability to put forward candidates for the board not supported by incumbent management and a right to vote to approve the compensation of senior executives.⁷⁷

(p. 1126) It is far from clear that such proposals are appropriate. As shareholders enjoy limited liability, then in the presence of imperfectly priced deposit insurance, or the expectation of a bail-out for “too big to fail” firms, we might think they would have incentives to encourage firms to take more risk than is socially desirable.⁷⁸ Consistently with this, Ferreira et al. report that US banks in which shareholders enjoy objectively greater power—in terms of shareholder rights and ability to control management—were more likely to be bailed out during the financial crisis.⁷⁹

We might expect this concern to be ameliorated where investors hold shares in banks as part of a diversified portfolio. Such investors will internalize a large part of the costs to society of bank failure through losses to their other portfolio firms.⁸⁰ On the other hand, the problems will be exacerbated by the presence of controlling shareholders, who will be in a position to make more of a difference to the control of the firm than dispersed shareholders, and who will be less diversified and so care less about impacts on other firms. In a study of large banks from across 48 countries, Laeven and Levine report that the proportion of the cash flow rights enjoyed by large shareholders is positively correlated with bank risk taking.⁸¹ To this end, many regimes require regulatory approval of the identity of major shareholders as a condition of bank licensing.⁸² Similar restrictions apply to

changes of control, with regulators reserving the right to refuse to approve such deals.⁸³ A key factor as regards such approval is the reputation of the controlling shareholder.⁸⁴

6 Liability Rules

Is it enough simply to moderate the “upside” returns that those running a bank receive, by altering the terms of executive compensation? Or should we also push for the imposition of more “downside” liability? The classic objections to liability for those controlling a business firm—at least for business decisions (as opposed to conflicts of interest)—are that judges lack the capacity to review such decisions effectively, and that fear of liability will induce undiversified managers to take less risk than diversified shareholders might want. In the case of firms whose activities have the propensity to create systemic risk, this logic might actually be reversed. Diversified shareholders may actually stand to lose proportionally more, in the case of default, than executives who have a stake in the firm through equity-based compensation. This is because systemic harms can impact negatively on their entire portfolios, not just on their holding in the bank. Consequently, for banks with diversified share ownership and managers with equity-based pay, fear of liability would not lead to undesirable risk-aversion on the part of managers. Rather, it might simply rein in undesirably risky activities such managers might otherwise take.⁸⁵

(p. 1127) Such liability is in principle available in the US in the case of banks entering FDIC receivership proceedings.⁸⁶ However, for other banks, directors and officers are shielded from liability for errors and omissions in relation to business judgment and oversight, unless they are so egregious as to evince a lack of good faith.⁸⁷ In the UK and many other European countries, directors and officers do in principle owe a duty of care in relation to business decisions, but this is almost never enforced. Civil procedure rules make it costly for shareholder litigation to be commenced. Enforcement by public agencies seems a more worthwhile strategy in this case. Here, the problem has been that agencies lack standing to pursue private law obligations, but rather enforce a parallel regulatory regime. Within this, there has been a lack of clarity as to individual versus organizational responsibility.⁸⁸ Upon the input of the UK’s Parliamentary Commission on Banking Standards, UK supervisory authorities have approved a new ‘Senior Managers Regime’ aimed at focusing regulatory responsibility onto specific individuals, who should then become natural targets for regulatory enforcement.⁸⁹ Moreover, a new criminal offense for bank senior managers whose reckless misconduct causes their firm to fail has been introduced.⁹⁰

7 Conclusion

In this chapter, we have explored why the corporate governance framework that is applied for most businesses, in which managers are encouraged to focus on maximizing the stock price, is less well suited to the case of banks. Financial assets are particularly hard to monitor, and so managerial agency costs are unusually high. Banks’ business model

makes them unusually fragile, and their failure imposes costs on society beyond those borne by their investors. As a consequence, ordinary mechanisms of corporate governance, which rely on stock market prices to incentivize managers, are liable to yield perverse results. Managers may exploit the opacity of financial assets to game the measures, and regulators will face an uphill struggle to uncover this. Maximizing the stock price may not be the right approach in any event, as shareholders' interests may diverge from those of society. Reforms since the financial crisis have gone some way to address these problems. Two particularly beneficial steps have been the push toward greater resources being deployed in risk management and internal monitoring functions, and an attempt to better calibrate incentives in relation to executive pay. The latter task will be extremely challenging for regulators to get right, but the former seems more promising.

Notes:

(⁷) This is ordinarily justified on the basis that economic harms to one party often represent opportunities to someone else: a power outage closing firm A's factory for a week (and resulting in lost profits) represents an opportunity for A's competitors to earn extra profits by selling more products instead. However, if contagion is systemic in the sense that it affects the entire financial sector, competitors will not profit from a bank's difficulties, nor will competitors of manufacturing firms who are unable to raise finance be readily able to profit from their circumstances. And even if the economic losses caused by contagion were in principle recoverable, the way in which they are triggered ensures they will not be visited on shareholders. Banks trigger contagion through their financial distress and there would consequently be no assets to pay tort liabilities.

⁽⁸⁾ This is distinct from other cases of catastrophic industrial accidents, where governments intervene to ameliorate the consequences but nevertheless are content to bankrupt the firm in the process.

⁽⁴⁴⁾ Similarly, Bhagat and Bolton look at CEO payoffs in the largest 14 crisis institutions, and find that they took \$1.77 bn in net stock sales plus \$0.89 bn in cash compensation during the period 2000–2008, a total cashflow of \$2.66 bn. In 2008, their equity holdings suffered an aggregate loss of \$2.01 bn. Nevertheless, they were better off, on net, over the period by \$0.65 bn. Sanjai Bhagat & Brian Bolton, “Financial Crisis and Bank Executive Incentive Compensation”, 25 J. Corp. Fin. 313, 319–23 (2014).

⁽⁴⁵⁾ Fahlenbrach & Stulz, *supra* note 38, at 17.

⁽⁴⁶⁾ F&S gauge the incentive effect for managers by measuring the dollar value CEOs earn from a 1% increase in stock price. *Id.* This measure—the change in managerial pay associated with a change in the stock price—is known as the “delta” of the compensation package.

⁽⁴⁷⁾ This is because the increase in volatility implies an increase in the states of the world in which the option will be in the money. The extent to which an increase in the volatility

of the share price results in an increase in the value of managerial compensation is known as the “vega” of the latter.

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

David M. Schizer

The Oxford Handbook of Corporate Law and Governance

Edited by Jeffrey N. Gordon and Wolf-Georg Ringe

Print Publication Date: May 2018 Subject: Law, Company and Commercial Law

Online Publication Date: Jul 2015 DOI: 10.1093/oxfordhb/9780198743682.013.47

Abstract and Keywords

This chapter examines the influence of tax on managerial agency costs, with particular emphasis on public companies in the United States. Focusing on “C-corporations,” this chapter first considers why tax is an imperfect vehicle for mitigating managerial agency costs. It then discusses how tax influences the compensation of managers, both in ways policy makers intended, and in ways they did not. The chapter also considers how tax affects management decisions about capital structure, hedging, and acquisitions. In addition, this chapter explores the tax system’s influence on the ability and incentives of shareholders to monitor management. This chapter then concludes with an analysis of how the tax system itself monitors managers.

Keywords: tax, agency costs, public companies, C-corporations, compensation, managers, shareholders, management, hedging, acquisitions

1 Introduction

¹MOTIVATING managers to be faithful agents of shareholders is a foundational challenge of corporate governance. The tax system is regularly conscripted in this effort.² In addition, tax also can affect managerial agency costs in ways policy makers do not intend or even recognize. Yet although the tax system influences managerial agency costs in a number of ways, many of these effects have attracted only limited scholarly attention; tax experts rarely focus on agency costs, while corporate experts seldom have detailed knowledge of tax. To fill this gap, this chapter of the *Oxford Handbook on Corporate Law and Governance* canvasses a broad range of ways that tax influences managerial agency costs, focusing especially on the United States.

In doing so, this chapter has two goals. The first is to help corporate law experts target managerial agency costs more effectively. The analysis here flags when tax is likely to exacerbate agency costs, and when it is likely to mitigate them. Armed with this information, corporate law experts have a better sense of how vigorous a contractual or corpo-

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

rate law response they need. In some cases, a change in the tax law may also be justified. This chapter's second goal, then, is to enhance our understanding of tax rules, shedding light on a set of (p. 1129) welfare effects that are important but understudied. After all, tax policy is more likely to enhance welfare if policy makers weigh *all* possible welfare effects, including managerial agency costs.

Overall, the US tax system's record in influencing agency costs is not encouraging. After all, the system's priority is not to reduce agency costs, but to raise revenue efficiently and fairly. Government tax experts do not usually have the expertise or motivation to tackle corporate governance problems. Tax also is a poor fit because it typically applies mandatorily and uniformly, while responses to agency cost should be molded to the context. For example, promoting stock options or leverage will be valuable in some settings, but disastrous in others. There also are political hurdles to be overcome. Accordingly, when tax rules target agency costs, the results are often poorly tailored or even counterproductive. This is all the more true when tax influences agency costs by accident, instead of by design.

Fortunately, the effects are not all bad. On the positive side of the ledger, US tax rules encourage performance-based pay both intentionally and inadvertently, albeit in blunt ways.³ In addition, by taxing intercompany dividends, the US keeps block-holders in one firm from indirectly controlling other firms. In so doing, tax discourages "pyramidal" ownership, which is a common source of agency costs in other jurisdictions.⁴ US tax rules also encourage leverage, which usually (but not always) mitigates managerial agency costs.⁵ Likewise, some tax rules favor long-term ownership,⁶ which can motivate shareholders to monitor management more carefully. The need to disclose financial information on a corporate tax return can also discipline management.⁷ Discouraging the use of off-shore accounts and off-balance sheet entities, moreover, can keep managers from cheating shareholders, as well as the fisc.⁸

On the other side of the ledger, US tax rules can be a reason (or excuse) for flawed pay.⁹ Managers also can use tax as a pretext to retain earnings, and also to oppose takeovers that put their jobs at risk. Tax also can be invoked to justify "empire building" acquisitions as well as hedging, each of which appeals more to undiversified managers than to diversified shareholders.¹⁰ US tax rules also encourage firms to incorporate offshore or to use (p. 1130) pass-through entities, even though these steps can weaken shareholders' corporate law rights.¹¹

This chapter concentrates on public companies, where the separation of ownership and control is especially pronounced. The focus is on "C-corporations," since pass-through entities (such as S-corporations, LLCs, and partnerships) are generally ineligible for public trading.

While the topic here is how tax can affect agency costs, causation also can run the other way: that is, agency costs can affect tax. For instance, a manager whose bonus is based on accounting earnings might reject a tax planning strategy that reduces book earnings. If so, agency costs (and accounting rules) are serving as non-tax constraints on tax plan-

ning (or “frictions”). Frictions are not the focus of this chapter, but a few are mentioned along the way.

After section 2 assesses why tax is an imperfect vehicle for mitigating managerial agency costs, section 3 assesses how tax influences the compensation of managers. Section 4 analyzes how tax affects management decisions about distributing and investing firm resources. Section 5 considers how the tax system influences the ability and incentives of shareholders to monitor management, as well as how the tax system *itself* monitors managers. Section 6 is the conclusion.

2 An Imperfect Vehicle for Mitigating Managerial Agency Costs

Although there is a plausible theoretical case for using tax to influence managerial agency costs, tax is likely to be an imperfect vehicle for a number of reasons.

2.1 Agency Costs, Free Riding, and Externalities

In theory, a tax rule that successfully enhances corporate governance is appealing, since poor governance leads to suboptimal allocations of capital, less innovation, inflated costs, and slower economic growth. Of course, a government role is unnecessary if shareholders are effective in monitoring management. Yet although monitoring is in their collective interest, individual shareholders would prefer to free ride on others. As a result, monitoring usually is undersupplied. By compensating for this free riding, the government can enhance welfare.

2.2 An Existing and Potentially Persuasive Mechanism to Influence Managers

Even though there is a plausible case for government intervention, is tax the right instrument? One advantage is that managers pay attention to tax. They want to reduce their own (p. 1131) tax liabilities as well as the firm’s tax bill (as long as doing so isn’t costly to them). Using this existing mechanism for communicating government policy to management avoids the costs of building another from scratch.

Of course, tax considerations are not always persuasive to managers. While executives want to reduce the firm’s tax bill (and, of course, their own), they have other priorities as well, such as maximizing the firm’s accounting earnings. Indeed, managers sometimes favor book over tax when these goals are in conflict.¹²

2.3 Mismatch in Institutional Focus and Expertise

Another limitation of using tax to constrain agency costs is the mismatch in institutional focus and expertise. Many government tax experts do not have deep experience with key corporate governance problems or potential solutions. Most do not view these issues as

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

central to their mission. This lack of focus and expertise helps explain why some tax rules targeting agency costs pursue misguided goals, while others pursue sensible goals in poorly tailored ways.

2.4 Political Constraints and Symbolic Legislation

These deficiencies sometimes derive also from political dynamics. In enacting these rules, Congress often responds to critical media reports about a particular practice. At the same time, organized interest groups exert offsetting pressure to keep this response limited. A politically expedient reaction, then, is to target the abuse, while allowing an obscure way for it to continue. Since these rules and the targeted practices are usually complex, unsophisticated constituents are unlikely to know how narrow the response actually is. As a result, government officials can claim credit with these constituents without alienating affected interest groups.

2.5 Poorly Tailored Scope: The Drawbacks of Uniform and Mandatory Rules

These political constraints, combined with the mismatch in expertise and institutional focus, tend to breed poorly tailored rules. Some are easy to avoid. A modest tweak allows a (p. 1132) firm or manager to dodge a well-deserved penalty or claim an unwarranted benefit. Other measures are too broad. A practice that compounds agency costs in one setting may mitigate them in another. The answer can vary by industry, firm size, dispersion of share ownership, overall market conditions, and so forth. The tax authorities may not be sensitive to these differences. In addition, unlike corporate law, whose default rules can be tailored to a firm's circumstances, tax rules usually are mandatory and uniform. In principle, tax rules could vary with the context or be waivable (e.g., by a board or shareholder vote), but this sort of tax rule is rare.

In navigating these tax rules, firms typically rely on the ingenuity of law firms, compensation consultants, and other professional advisors. Their services do not come cheap, and shareholders usually are footing the bill. These planning costs are regrettable even when the goal is to reduce agency costs—and all the more so when the opposite goal is pursued.

2.6 The Magnitude of the Penalty or Subsidy

In targeting agency costs, tax subsidies or penalties must have not only the right scope but also the right magnitude. In other words, the *amount* has to be calibrated to the relevant externality. Unfortunately, though, government tax experts are unlikely to have the expertise to pick the right level, especially if the externality varies with the context.

An additional problem is that the level varies with the taxpayer's marginal rate when a deduction or exclusion is used.¹³ Yet marginal rates obviously are not set with managerial agency costs in mind. For example, a firm with substantial net operating losses, which would not pay taxes anyway, could be immune from the penalty. If anything, this seems

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

backwards. Firms may be unprofitable *because of* agency costs, and these firms should not be left out. Moreover, to the extent that marginal rates otherwise vary with income—as is more true of LLCs (subject to individual rates) than corporations (subject to largely flat corporate rates) in the US—the penalty or subsidy is lower for less profitable firms. Credits and some excise taxes can avoid these problems, as can rules that affect the tax bill of the manager instead of the firm.

2.7 Imposition on the Wrong Party

There is another reason to target the manager instead of the firm: the manager is more likely to pay attention. After all, a manager who wastes the firm's money on lavish offices or travel accounts presumably will not mind inflating the firm's tax bill. Since tax is complex and esoteric, shareholders may not notice. In contrast, managers usually will know (and care) about their *own* tax liabilities. Admittedly, the latter incentive is neutralized if the firm grosses the manager up. But, at least in some cases, a gross-up could discourage the relevant practice by calling more attention to it.

(p. 1133) 2.8 Accidental Effects

These issues arise not only when the government uses the tax law deliberately (so-called “Pigouvian” measures), but also when effects are unintended. For example, a goal pursued by the tax system, such as reducing compliance costs or blocking a form of tax planning, could end up affecting agency costs as well. In some cases, government tax experts may not even be *aware* of these accidental effects. When they are, they often won't consider them *their* problems to solve.

This mismatch in expertise and mission is a problem, then, not only because tax experts are unlikely to craft a successful Pigouvian measure, but also because they are unlikely to consider managerial agency costs when making run-of-the-mill tax policy decisions. Tax experts may overvalue a tax rule that fares well on traditional tax policy criteria, but has adverse corporate governance effects. Likewise, they may undervalue a rule that is weak on traditional criteria, but diminishes managerial agency costs. Of course, agency costs are not a trump that always should override these traditional tax policy considerations, but they should not be neglected either.

For parallel reasons, an interdisciplinary perspective is also valuable for corporate governance experts. For example, if a change in tax law exacerbates agency costs, corporate experts should consider an offsetting change in contracts, corporate law, or securities law. Admittedly, though, this sort of coordination is a delicate matter, which requires enough tax expertise to know of the change and its likely effect on agency costs.

There are good reasons, then, for the government to develop more interdisciplinary expertise, although it may be optimistic to expect them to do so. Practitioners and academic commentators can play a valuable role in identifying unintended effects and suggesting reforms to respond to them.

2.9 Randomness and Instability

Just as tax effects can be *enacted* unintentionally, they also can be *repealed* unintentionally. The tax rule can change for policy or political reasons having nothing to do with corporate governance. When this happens, the good news is that executives are unlikely to capture the process. The bad news is that changes are essentially random. They are as likely to exacerbate agency costs as to mitigate them.

3 Compensation

To see how these dynamics play out, we turn to a key setting in which tax influences agency costs: executive compensation. In the US, a number of Pigouvian tax provisions regulate executive pay. Some pursue worthy goals in imperfect ways, while others are misguided. There also are unintended effects. In some cases, the tax system has its own reasons to target activity that could compound agency costs. In other cases, the effects are essentially an accident. Ironically, the unintended effects have a somewhat better track record, a reality that does not inspire confidence.

(p. 1134) 3.1 Pigouvian Provisions Encouraging Performance-Based Pay

3.1.1 Performance-Based Pay: A Standard Response to Agency Costs

In general, managers should earn more for doing good work, but this is easier said than done. If cash bonuses reward executives for meeting specified goals, the right goals must be set and progress must be measured in ways that are hard to manipulate. Alternatively, equity compensation can motivate executives to raise the stock price, but it has three familiar problems. First, equity compensation can tempt managers to use accounting gimmicks (or fraud) to raise the stock price. Second, this pay often rewards executives for general market increases. Third, stock and options create different incentives. Unlike stockholders, option-holders generally do not benefit from dividends, so option grants can exacerbate agency costs by discouraging dividends.¹⁴ Option grants also encourage more risk taking than stock grants.¹⁵ This incentive often is valuable, since managers tend to be more risk averse than shareholders. Yet options sometimes induce *too much* risk.

The right mix of stock, options, and bonuses, then, depends on a broad range of context-specific factors, including the business's maturity, its debt-equity ratio, general market conditions, the executive's overall portfolio and risk preferences, the extent of shareholder monitoring, and the type of industry (since risk taking at banks, for instance, creates unique concerns). One-size-fits-all answers will not be optimal, and sometimes are quite flawed.

3.1.2 Tax Deferral for Equity Compensation

Compared to cash compensation, US tax on equity compensation generally is deferred.¹⁶ During this deferral period, the employer can invest the cash it otherwise would have used to pay cash compensation. When the firm pays tax on these investments, it in effect

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

serves as a surrogate taxpayer for the employee.¹⁷ This arrangement is tax-advantaged, as Daniel Halperin and Alvin Warren have shown, “if the employer earns an after-tax return on the deferred compensation that is higher than that available to the employee.”¹⁸ This can happen, for instance, if the firm uses this cash to buy back its stock (e.g., to hedge its obligation on the executive compensation), since (unlike executives) firms are not taxed on gains in their own stock.¹⁹ In other cases, though, the firm cannot earn a higher after-tax return than the executive. For example, if the firm invests in stock of a third party, its tax rate could be *higher* (p. 1135) than the executive’s tax rate on the same investment.²⁰ In this case, the arrangement is not tax advantaged, once all the parties’ tax burdens are considered.²¹

3.1.3 Favoring Bonuses and Stock Options: A Worthy Goal Sometimes, but Not Always

Section 162(m) accords a clearer tax advantage to equity compensation (and other performance-based pay), but in a blunt way. It denies a deduction for pay above \$1 million to certain senior executives.²² The goal was to use tax to police abuses in managerial pay, a model that in principle can be used more generally.²³

Yet Section 162(m) is not an encouraging precedent. When enacted in 1993, it was explained as a limit on the *amount* of pay. Nevertheless, its main effect has been on the *type* of pay, since it offers a widely used exception for “performance-based compensation.”²⁴ To qualify, pay must be “solely on account of the attainment of . . . pre-established, objective performance goals,” and attaining these must be “substantially uncertain.”²⁵ In response, firms shifted from cash compensation to stock options and stock appreciation rights (SARs) in the 1990s,²⁶ something they were doing for other reasons anyway. Options and SARs qualify as long as they are not in-the-money when issued, as do earnings-based bonuses if the target is challenging enough.²⁷

Section 162(m) has introduced potentially useful process requirements. A committee of independent directors must set performance-based targets and confirm that they have been met.²⁸ In addition, shareholders must vote to approve material terms.²⁹ These requirements could mitigate agency costs in some cases.

Yet Section 162(m) has also distorted compensation practices in unfortunate ways. For example, the formula for computing performance-based pay can provide discretion to *reduce* pay, but not to *increase* it.³⁰ This asymmetry can justify (or rationalize) a more generous (p. 1136) formula, since the resulting number can be cut but not raised. If compensation committees then reduce the number, they can claim to be holding the line on pay—by offering less than was authorized—even as they award a substantial increase over the prior year.

Section 162(m) also creates a preference for options and SARs over stock, which is not always advisable. Restricted stock grants do not qualify as performance-based—and thus are not deductible—unless employees earn the stock grant only by satisfying a performance-based standard (e.g., an earnings-based bonus paid in stock). In deciding whether

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

to compensate executives with stock or options, a key question is how much risk we want executives to take. Unfortunately Section 162(m) does not account for the context-specific factors bearing on this judgment. In addition, as noted above, option grants may discourage firms from paying dividends.³¹

Unfortunately, section 162(m) may even have motivated some firms to commit fraud. By favoring options that were at-the-money when granted, the rule creates a tax incentive to lie about the grant date. Many firms have “backdated” options to conceal that the options were in-the-money when granted.³²

3.1.4 Conventional Options Instead of Indexed Options: Worthy Goal but Imperfect Means

Another problem with Section 162(m) is that it treats options as performance-based even when they are not—or, at least, when a significant source of their value is not. Assume XYZ stock is trading at \$100, and executives are given options to buy shares at \$100. Let’s say that the market as a whole increases by 30%, while XYZ shares rise by only 10%. Even though XYZ has significantly underperformed the market, executives still earn \$10 per share. In contrast, if the overall market declines by 30%, but XYZ declines by only 1%, XYZ has significantly outperformed the market. Nevertheless, executives earn nothing on these conventional options.

To avoid this problem, the exercise price should not be a fixed number. Instead, it should float with the overall market or with the performance of industry competitors.³³ For example, the exercise price on an “indexed” option can be 1/20th of the S&P 500 (e.g., if the S&P 500 is 2000 when the option is granted). Yet even though an indexed option is more performance-based, Section 162(m) does not distinguish between it and a conventional option.

On the contrary, Section 162(m) actually *favors* conventional options over indexed options in a range of ways. First, the process requirements for conventional options are more relaxed than for indexed options.³⁴ Second, conventional options offer pay that is not really (p. 1137) performance-based but is still deductible. These options offer two sources of value: a firm-specific bet, which is performance-based, and a general market bet, which is not. As a result, compensating executives with conventional options is like giving them indexed options along with extra cash that is invested in a diversified portfolio.³⁵

Finally, there is even an argument that indexed options cannot qualify as “performance-based pay,” although the better view is that they can. The concern derives from Section 162’s legislative history, which suggests that stock options are performance-based only if they reward *increases* in the stock price.³⁶ If this is the rule, indexed options may not pass muster; they reward executives whose stock price *declines*, as long as it declines *less than the index*. Yet unlike the legislative history, the statute itself says nothing about this issue. Instead, it merely requires compensation to be “payable solely on account of the attainment of one or more performance goals.”³⁷ Indexed options should satisfy this requirement. Their performance goal is that the stock price has to outperform the index.³⁸

3.1.5 Incentive Stock Options: Worthy Goal but Imperfect Means

Another US tax rule favoring performance-based pay is Section 422, which offers capital gains tax treatment for so-called incentive stock options (ISOs). Under current rates, executives are taxed at 23.8% on ISOs (20% on capital gains and, in some cases, an additional 3.8% net investment tax), instead of the top bracket of 39.6%, as long as holding period and other requirements are satisfied.³⁹ Yet this tax advantage is offset—often, more than offset—by a tax disadvantage to the firm: ISOs are not deductible.⁴⁰ For each dollar, the firm gives (p. 1138) up 35 cents to save employees 15.8 cents. ISOs are not truly tax advantaged, then, unless the employer cannot use the deduction, as is the case with a tech startup that is not yet profitable.

Even so, ISOs are used beyond this narrow setting presumably because managers care more about *their* taxes than the *firm's* taxes. In theory, a firm could instead persuade shareholders to forgo capital gains treatment by “grossing them up” with a larger (but deductible) grant that is taxed as ordinary income.⁴¹ But managers may be reluctant to accept this trade because the gross-up would be more visible to shareholders than the lost deduction. As a result, even though the tax law limits the size of ISO grants, executives often receive the largest allowable grant. Ironically, a form of pay that is supposed to target agency costs is probably overused for agency cost reasons.

3.1.6 Deferred Compensation: Worthy Goal but Imperfect Means

Managers are supposed to be faithful agents not only to shareholders but also to creditors. A familiar concern is that when insolvency is likely, executives take unwise risks hoping to save the company (and their jobs). If the bet doesn't pay off, creditors will be hurt, but the executive has little to lose.⁴² In response, the interests of managers and creditors can be aligned by giving managers deferred compensation so they become unsecured credits.⁴³ A tax preference can promote deferred compensation by offering higher after-tax returns if pay is deferred.⁴⁴

Even so, deferred compensation reduces agency costs only if structured properly. To expose this pay to the risks of bankruptcy, it should not be paid too soon after the executive retires.⁴⁵ Yet US executives can accelerate this pay by incurring a 20% penalty.⁴⁶ They will be willing to incur this cost if bankruptcy is imminent, which means acceleration is most likely when it is most problematic.⁴⁷ Deferred compensation also should be disclosed (p. 1139) clearly. It should not be performance-based, and it should not encourage executives to take risks.⁴⁸ However, according to Robert Jackson and Colleen Honigsberg, these conditions are often violated.⁴⁹

3.1.7 Golden Parachutes: Misguided Goal

The US also imposes a Pigouvian tax on golden parachutes, or payments to managers when their employer is sold. Presumably, the concern is that parachutes make managers too willing to accept acquisitions.⁵⁰ Yet this provision neglects the strong management interest in resisting acquisitions, which can eliminate their jobs. In tempering this self-in-

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

interested impulse, parachutes *align* shareholder and management interests in many cases, and should not be discouraged.⁵¹

Unfortunately, Section 4999 imposes a 20% excise tax on “excess parachute payments,” which generally are the excess over three years’ salary. This penalty applies not only to cash payments, but also to the accelerated vesting of stock and options. These grants appreciate if there is an acquisition premium, so this appreciation—a significant percentage of most parachutes⁵²—increases the excise tax bill. Yet it makes no sense to penalize managers for a deal premium that benefits shareholders.⁵³

The tax penalty on parachutes is misguided also in imposing costs on the firm, instead of on management. Experts must be retained to value this accelerated vesting, and this difficult and costly process is funded by shareholders. In addition, Section 280G disallows the firm’s deduction for excess parachute payments (as well as payments “grossing up” managers for the excise tax). But if managers really put their own interests ahead of the firm, as this regime assumes, why would a tax penalty on *the firm* deter them?

(p. 1140) 3.2 Shared Interests: Hedging Stock Options and Suspicion of Hedged Positions

Although the focus so far has been on tax effects that are intentional, unintended effects can also be important. In fact, one of US tax law’s main contributions to corporate governance—discouraging executives from hedging their stock options—arose essentially by accident. Options are supposed to reduce agency costs by rewarding executives when the firm’s stock price rises, but in theory executives could thwart this goal by neutralizing this exposure with derivatives.⁵⁴ Although firms should have contractual bans on hedging, only some do. US securities laws can require reporting, but this reporting can be obscure and is required only in some cases.

Instead, US tax law plays an important but largely unintended role.⁵⁵ Executives are reluctant to hedge stock options because they can incur tax even when they have no economic gain. Although the relevant rules are technical, the executive’s problem is that stock option gains are taxed as ordinary income, while (offsetting) hedging losses generally are treated as capital losses, which cannot shelter ordinary income.⁵⁶ For example, assume an executive’s options appreciate by \$1 million after she hedges them. She has an extra \$1 million of ordinary income, which is matched by a \$1 million capital loss on the hedge that cannot be deducted from ordinary income. As a result, she owes an extra \$396,000 in tax, but without a corresponding economic gain. Of course, she still has \$1 million of capital losses, but she cannot use them unless she has \$1 million of capital gains elsewhere in her portfolio.⁵⁷ Unlike the Pigouvian measures discussed above, the relevant tax rules here are not meant to target managerial agency costs. Rather, tax systems have their own reasons to penalize offsetting positions. In a realization-based system, gains and losses can be timed in ways that reduce tax; in response, capital loss and other limitations are supposed to impede this tax planning. These rules were added by

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

the tax system for its own reasons, but they end up playing a valuable corporate governance role.

Even so, these rules are incomplete and potentially unstable. They apply only if equity compensation is taxed as ordinary income, which is true of non-qualified options but not (always) of stock. Although stock grants usually are taxed as ordinary income when they vest, executives can elect to pay tax earlier, so that subsequent appreciation is capital gain. (p. 1141) After this “83(b) election,” executives can hedge stock without any tax mismatch.⁵⁸ Unlike option grants, then, stock grants sometimes can be hedged. This difference is all the more significant because stock grants have increasingly been replacing option grants in recent years.⁵⁹ Not only is this tax effect becoming less important, but it also is at risk of being repealed. A range of tweaks in US tax law could solve the executive’s tax mismatch.⁶⁰ Since the tax authorities never intended to block hedging, they are unlikely to notice (or care) if they inadvertently stop doing so.

3.3 Accidental Byproducts

Accidental effects can arise not only because tax and corporate governance have partially overlapping goals, but also because of wholly unrelated choices made by the tax system. This Section offers two examples, which derive from the tax system’s reluctance to require difficult valuations.

3.3.1 Venture Capital (VC) and Valuation

The first involves venture-capital-financed startups. Although this chapter focuses on public companies, privately owned high-tech startups also struggle with agency costs. When these firms fail, investors cannot always tell whether the idea was unworkable or managers were not working.

Equity compensation is a standard response, which the tax system enhances (inadvertently) by applying capital gains rates. Although the US tax system intentionally offers a preference for startups,⁶¹ the focus here is on an unintended preference that helps executives who receive stock in early VC funding rounds. This stock is effectively salary—issued for “sweat equity,” not capital—which otherwise would be taxed at ordinary rates. Assume, for instance, that VCs pay \$100 per share for their stock, and the executive receives identical shares at the same time. Under the usual rules, the executive has \$100 of ordinary income upon receiving the stock and is eligible for capital gains rates only on subsequent appreciation.⁶² Nevertheless, executives prefer capital gains to ordinary income, and Silicon Valley (p. 1142) has a strategy to provide it. The key is for VCs to receive convertible preferred stock⁶³ so their shares are no longer the same as the executive’s common shares. If the startup is liquidated, the VC is paid first. Although the value of this preference is unclear—since early stage startups typically have few assets⁶⁴—the standard practice is to treat the VCs preferred as much more valuable than the executive’s common. When executives pay tax on the common, then, they assign a low valuation for it

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

(e.g., one dollar, instead of the \$100 paid by the VC). When they sell later, proceeds above one dollar are reported as capital gain.⁶⁵

The lynchpin of this strategy—aggressive valuation—has not been explicitly blessed by the US government. Even so, valuation is difficult to challenge, especially when the relevant assets are ideas (which might not work), and not hard assets. Once again, the tax system makes a choice for its own reasons—in this case, administrability—that inadvertently reduces agency costs. The resulting subsidy piggybacks on the judgments of VCs. Since the strategy works only when outside investors provide funding, it is limited to startups that attract outside investors.⁶⁶

3.3.2 Untaxed Perquisites and Valuation

Administrability also explains why the tax system does not tax some perquisites and thus inadvertently encourages them. It is hard to tax the utility that managers derive from light hours, long lunches, lavish offices, and nepotistic hiring practices. Unfortunately, though, a manager may favor these benefits for a parallel reason: they are hard for shareholders to see. While tax is unlikely to motivate these practices, then, it may reinforce them. Unlike most issues in this chapter, this issue arises in all tax systems since the administrative cost challenge is universal.

Even so, different jurisdictions target work-related consumption in particular contexts. For example, US firms can deduct only half of work-related entertainment expenses.⁶⁷ Again, though, taxing the firm instead of the executive is a poor strategy. Managers who put their own interests ahead of the firm's worry less about a tax on the firm than one on them. Even a tax on managers will not have much effect, moreover, if it is too low. In the US, for example, executives are taxed on personal travel on corporate jets, but the tax is based on the taxpayer-friendly "standard industry fare level." The actual cost to the firm, then, significantly exceeds what the executive includes in income.⁶⁸

(p. 1143) Another tax strategy to constrain agency costs is to offer tax-free treatment only if a perquisite is available to all employees. Under these "nondiscrimination rules," executives can either offer the benefit broadly, which raises costs and can attract more attention, or pay tax on it. By raising a perquisite's visibility or imposing a tax on the executive, these rules discourage the proliferation of benefits, at least at the margin.

4 Management Decisions about Capital Structure, Hedging, and Acquisitions

Tax influences not only the pay executives receive, but also the choices they make. In a number of jurisdictions, for example, Pigouvian tax provisions discourage bribes and participation in international boycotts, while encouraging research and development, corporate charity, and various types of investments.⁶⁹ In addition to these deliberate uses of tax, unintended effects also can be quite important. In the US, for instance, tax influences

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

management decisions about capital structure, hedging, and acquisitions. This section focuses on these (largely) unintended effects.⁷⁰

4.1 Capital Structure

The US tax system has two (largely) positive effects on capital structure, and one that is less clear. First, US tax rules encourage leverage, which usually (but not always) reduces agency costs. Second, it discourages pyramidal ownership by taxing intercompany dividends. Third, the US tax system can distort payout policies, although the magnitude and direction of this effect varies with the context and over time.

4.1.1 Accidental Byproduct: Tax Advantages of Leverage

The US tax system favors leverage, and debt can reduce agency costs in three ways. First, debt ensures that some earnings are distributed as interest, leaving less for perquisites. Second, the need to pay interest pressures managers to generate earnings. Third, bankruptcy can be even more costly for managers than shareholders. Senior executives are likely to lose their jobs and could have trouble finding another. This means debt—and thus (p. 1144) the prospect of bankruptcy—can motivate managers to perform better. These factors could help explain why share prices usually rise when firms issue debt to buy back equity.⁷¹

Context is also important since debt sometimes can *add* to agency costs. Managers and shareholders often have different risk appetites, and debt can increase these differences in two (competing) ways. On one hand, managers of levered firms might shy away from especially risky investments, since bankruptcy is costlier for them than for shareholders. On the other hand, once managers believe bankruptcy is likely, they have the incentive to take extra risk, even if it has negative expected value.⁷² Managers “swing for the fences” if anything short of a home run would not prevent bankruptcy and save their jobs. In contrast, creditors and shareholders would prefer more modest returns with higher expected value, which would increase their recoveries in bankruptcy.

Given these competing effects, the net impact of debt on agency costs varies with general market conditions, the maturity of the business, the sector, the assets backing the loan,⁷³ and the negative externalities from insolvency. Bank failures, for example, are likely to pose greater systemic effects.

Just as debt usually (but not always) reduces agency costs, it also usually (but not always) has tax advantages. Unlike a dividend, interest is deductible in the US.⁷⁴ This means profits paid to creditors are taxed only once (at the creditor level), while profits paid to shareholders are taxed twice. Although this difference persuaded Franco Modigliani and Merton Miller that firms should be capitalized with 100% debt, it is not quite so simple.⁷⁵ The incentive to add debt is stronger when corporate tax rates are high.⁷⁶ At the same time, this incentive is weaker when the firm already has enough debt to shelter its profits⁷⁷—or, for that matter, when it has other deductions to do so, such as depreciation, foreign tax credits, or stock option expenses.⁷⁸ There also is a competing effect for multinationals.

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

Though the relevant (p. 1145) rules are technical, the upshot is that borrowing more can sometimes reduce a firm's foreign tax credits.⁷⁹

Moreover, if we look only at the tax treatment of the firm, but not the investor, we are missing half the picture. In the US, (taxable) investors are taxed *less* favorably on debt than on equity: interest is ordinary income, while dividends and capital gains are eligible for reduced rates. The importance of this offsetting disadvantage depends on who the creditor is, and also on the rate structure.⁸⁰ If the creditor is tax exempt or foreign (and thus does not pay US tax), this disadvantage is irrelevant. As a result, these clienteles are especially likely to hold debt.⁸¹ When they do, corporate cash flow funded by debt is, in effect, never taxed by the US.⁸² However, if the creditor is taxable, the tax advantage of debt over equity depends on how the (p. 1146) corporate tax rate (which firms avoid by using debt) compares with the extra tax investors must pay. This additional tax is the spread between the tax on interest (at ordinary rates) and dividends (at capital gains rates). Under current rates, debt has a significant advantage.

Yet the magnitude of this advantage can change over time, since ordinary and capital gains rates for individuals fluctuate. When Congress changes these rates, it usually is not focused on managerial agency costs. The same is true when government tax experts modify the interest deduction. So although the tax treatment of debt has an important influence on agency costs, it is a blunt instrument.

4.1.2 Pigouvian Effort to Discourage Pyramidal Ownership: Intercompany Dividends

US tax rules also reduce agency costs by discouraging "pyramidal ownership." As an example of a pyramid, assume A owns 10% of B (effectively controlling it), and B owns 10% of C (effectively controlling it). This means A effectively controls C, even though it (indirectly) owns only 1%. This sort of control, "assembled mainly with other people's money," can breed agency costs.⁸³

Yet although pyramids are the norm in many developed economies,⁸⁴ they are much less common in the US. One reason is that the US taxes intercompany dividends (i.e., a 7% tax on dividends received by firms owning between 20% and 80% of the dividend-paying firm), while many other jurisdictions do not (e.g., the EU, Japan, Australia, Switzerland, Singapore, and Canada).⁸⁵ Commentators suggest that President Franklin Roosevelt proposed this tax in 1935 to address corporate governance problems with pyramids,⁸⁶ although others claim that pyramids were already becoming uncommon in the US for other reasons.⁸⁷

4.1.3 An Earnings Trap?

Tax also can affect agency costs by influencing firm payout policies. In general, dividends mitigate agency costs by reducing the resources under management's control. When a project is funded with retained earnings instead of new debt or equity, managers are under less pressure to demonstrate the project's value, and thus are more likely to fund perquisites and pet projects.⁸⁸ Paying dividends also is a signal of a firm's good health.⁸⁹

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

(p. 1147) As a result, if tax discourages dividends, it could exacerbate agency costs. But does the US tax system actually discourage dividends? The answer is somewhat complex and context-specific. By retaining earnings, a firm defers the shareholder's dividend tax, but this deferral does not necessarily reduce the shareholders' tax burden. Obviously, this deferral is irrelevant to tax exempt shareholders.⁹⁰ For less intuitive reasons, it may also not matter to taxable shareholders: if the firm reinvests these earnings at a profit, tax ultimately is levied on a larger base (the compounded earnings).⁹¹ Therefore, a taxable shareholder has the same after-tax return—whether the dividend is paid now or later—as long as two conditions are satisfied: first, the dividend tax has to be paid eventually (at the same tax rate); second, earnings must grow at the same (after-tax) rate either inside or outside the firm.⁹² When these conditions hold, there is no tax reason to retain earnings.

Yet the plausibility of these conditions can fluctuate over time, causing the US tax system to discourage dividends in some circumstances while favoring them in others. For instance, the first condition—that the dividend tax is inevitable and constant—does not hold if earnings can be bailed out another way that avoids this tax. Share repurchases are a familiar example.⁹³ For many years, they were taxed more favorably than (p. 1148) dividends,⁹⁴ and often replaced them in the 1990s.⁹⁵ Like dividends, share repurchases can mitigate agency costs by reducing a firm's free cash flow. Yet if repurchases are more sporadic, so that scaling them back attracts less market attention, they impose somewhat less discipline on managers. In any event, the tax difference between repurchases and dividends was largely (but not entirely) eliminated in 2003.⁹⁶ This sort of tax change, moreover, is another reason why dividend timing can matter. If dividend tax rates are expected to decline, there is a tax advantage in retaining earnings, so they can be distributed after the rate cut. Conversely, an expected rate increase is a reason to *accelerate* dividends.

The second condition—that earnings grow at the same after-tax rate whether they are reinvested or distributed—also does not always hold. If shareholders can earn a better return elsewhere, they will want a dividend. In making this judgment, shareholders should account for tax treatment, as well as pre-tax returns. For instance, a dividend can fund an investment in an LLC (which avoids corporate tax) or a foreign corporation (which is taxed at a lower corporate rate). In contrast, a shareholder may want to *delay* a dividend if reinvested earnings would compound at a favorable tax rate. For example, US multinationals often do not want dividends from foreign subsidiaries, so these earnings can continue to earn tax-advantaged returns in low-tax jurisdictions.⁹⁷ Obviously, these choices about retaining or distributing earnings can affect agency costs. For example, if foreign firms are harder for shareholders to monitor, a tax incentive to keep (or shift) capital there can compound agency costs.⁹⁸

(p. 1149) This analysis is sufficiently complex that unsophisticated shareholders may not fully understand it. If so, managers could invoke tax as a pretext not to pay dividends, even if it is not (and could not be) the real reason. Yet whether the facts actually support this claim—that is, whether tax actually discourages dividends—can vary across firms and

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

over time.⁹⁹ Indeed, during the Great Depression, an undistributed earnings tax was enacted to encourage dividends, but was soon repealed.¹⁰⁰ Instead of this stick, the US used a carrot in 2003, slashing the shareholder tax from 35% to 15%. Dividends increased in response,¹⁰¹ especially where executives (or large taxable block-holders) owned relatively more stock.¹⁰² Correspondingly, just before this tax cut was supposed to expire, firms accelerated dividends—paying one-time “special” dividends and shifting January dividends into December—so the lower rate would still apply.¹⁰³

4.2 Hedging

In addition to influencing payout policy in some cases, tax also can affect the decision of firms to hedge. Corporations often use derivatives to hedge currency, interest rates, commodity prices, and other sources of revenue or costs. The pervasiveness of hedging is something of a puzzle since diversified shareholders are already insulated from these fluctuations. For instance, while a spike in fuel prices is bad for airlines, it is good for oil companies. Because diversified shareholders hold both, firm-level hedging seems wasteful to them.

(p. 1150) Yet managers may take a different view because they are less diversified. Hedging protects their human capital by keeping the firm out of bankruptcy. It also can smooth earnings, increasing earnings-based bonuses. While agency costs may explain some hedging, there are other explanations as well. For example, hedging can protect retained earnings so the firm does not depend as heavily on the capital markets, with their associated information and transaction costs.

In addition, tax supplies two additional reasons (or excuses) to hedge. First, hedging can increase a firm’s debt capacity by reducing the likelihood of financial distress.¹⁰⁴ This enables firms to take on more debt so they can shelter more profits with interest deductions. Second, hedging can smooth earnings, reducing the likelihood of net losses that firms cannot deduct.¹⁰⁵ While the first reason arises only when debt-financed profits are tax-favored, as in the US, the second reason applies in any tax system that limits net losses.

4.3 Acquisitions

Tax also can motivate and shape acquisitions. In some cases, tax is a key reason for the deal. For instance, a US firm may want to combine with a foreign firm in order to become a foreign firm for tax purposes, thereby reducing its tax bill.¹⁰⁶ Even if tax is not the deciding factor, it is still likely to shape the deal’s structure.

4.3.1 Agency Cost Implications of Acquisitions: Entrenchment, Empire-Building, and Camouflage

Affecting the probability or structure of an acquisition is important, since wise acquisitions can advance shareholder interests for familiar reasons. They transfer a business to new owners who value it more, for instance, because of synergies in production, better

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

management, and the like. In addition, the possibility of being replaced in an acquisition can discipline management.

For parallel reasons, managers may resist being acquired. They want to preserve their jobs, as well as private benefits from controlling the target business, such as higher pay for managing a larger firm. Managers may also worry about becoming less diversified, as discussed above. Just as *selling* is unappealing to management, *buying* can be correspondingly (p. 1151) appealing, since “empire building” offers diversification and private benefits of control. In addition, the complexity of acquisitions can enable managers to negotiate self-interested terms that are obscure enough to escape shareholder notice.

4.3.2 Pigouvian Measures and Management Entrenchment: Parachutes and Greenmail

Since managers have self-interested reasons to resist being acquired, offering them special compensation in this scenario can reduce agency costs. As a result, Pigouvian taxes targeting golden parachutes are potentially counterproductive, as discussed above.¹⁰⁷

Instead, it would be wiser to discourage the techniques managers use to *resist* acquisitions. In this spirit, the US has a Pigouvian tax on “greenmail,” or payments to potential acquirers for ceasing efforts to acquire a firm. The concern about greenmail is that managers are using the firm’s money to save their jobs¹⁰⁸ (although some defend the practice as a way of motivating outsiders to monitor management).¹⁰⁹ To discourage greenmail, Section 5881 imposes a 50% tax on greenmail gains. But it is a very blunt instrument. In addition to taxing a premium received only by greenmailers, it also taxes general market appreciation.¹¹⁰

4.3.3 Accidental Byproducts: Net Operating Losses and Lock-in as Reasons (or Excuses) for Management Entrenchment

A change in control sometimes triggers tax costs that managers can invoke as a reason (or excuse) not to sell. For instance, when a firm has accumulated tax losses that it cannot use currently (“net operating losses” or “NOLs”), tax is a powerful reason not to be acquired. NOLs are a silver lining of losing money, since a firm can use them to avoid tax in later years. Indeed, profitable acquirers used to buy unprofitable targets in order to access their NOLs. However, to prevent this “loss trafficking,” the US enacted Section 382, which severely limits an acquirer’s ability to use a target’s tax losses. As a result, Section 382 offers firms with NOLs a compelling tax reason to avoid being acquired. Indeed, even an increase in a large shareholder’s ownership stake can trigger draconian limits. In effect, NOLs become a poison pill of sorts, and also can prompt firms to adopt *actual* poison pills.¹¹¹ The (p. 1152) implications for agency costs are unfortunate. After all, a management team that has generated sizable NOLs usually should be replaced, not protected. Yet in seeking to defend the tax base, Section 382 inadvertently handed self-interested managers an argument for keeping their jobs, while also complicating the task of reviving struggling companies.¹¹² In approving NOL pills, moreover, Delaware courts have emboldened managers to implement other aggressive takeover defenses; NOL pills have es-

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

pecially low triggers—taking effect when a would-be-acquirer has acquired only 4.99% of the target—and are invoked to justify other low-trigger pills.¹¹³

In resisting a change of control, self-interested managers also can emphasize the tax bill that would come due. Unsophisticated observers might not realize that this tax problem could be solvable, for instance, with a “tax-free” reorganization (which defers the seller’s tax) or a larger deal premium to offset the seller’s tax. Again, the tax system’s goal here is not to protect management. The relevant tax rule—the so-called “realization rule,” which defers gain or loss until the asset is sold—is supposed to make the tax system more administrable, not to influence agency costs. At the same time, rules that allow “tax-free” acquisitions have governance advantages in facilitating a more vibrant market for corporate control.¹¹⁴

4.3.4 Accidental Byproducts: Depreciation, Tax Holidays, and Avoiding Net Losses as Reasons (or Excuses) for Empire Building

Managers can invoke tax not only as an obstacle to selling, but also as a justification for buying. Like many tax effects in this chapter, the tax advantages of acquisitions come and go. Before the 1986 tax reform, newly purchased assets offered very generous depreciation in the US, so the tax advantage to purchasers could outweigh the tax cost to sellers.¹¹⁵ Yet (p. 1153) this tax advantage was eliminated when the 1986 act raised corporate capital gains rates (increasing the tax cost to sellers) and lowered corporate ordinary rates (reducing the tax benefit to buyers).¹¹⁶ Even so, the pendulum swung back (to an extent) after 1993 when the US enacted more generous depreciation for goodwill and other intangibles purchased in acquisitions.¹¹⁷

Likewise, the US offered a temporary tax cut in 2004 when US multinationals received dividends from foreign subsidiaries. To claim this “tax holiday,” US firms had to invest the money instead of paying dividends or buying back their shares. As a result, many used this cash for acquisitions.¹¹⁸

There also is a more enduring tax justification for empire building. A firm with diversified businesses is less likely to have net losses, which cannot be deducted (currently).¹¹⁹ This advantage flows from a pervasive feature of tax systems that is unlikely to change: tax-payers usually need income to use tax losses. This tax advantage of diversification can reinforce (or rationalize) a manager’s personal desire for diversification (discussed above).

4.3.5 Accidental Side-Effects: Complexity as Camouflage

Agency costs arise not only in deciding *whether* to make an acquisition, but also *how* to make it. Various acquisition structures offer different tax consequences,¹²⁰ and faithful agents choose the structure that best serves shareholder interests. For example, US buyers are likely to prefer a taxable deal, which gives them a higher tax basis and thus more depreciation. In contrast, US sellers usually favor “tax-free” deals that defer their tax. To resolve this conflict, the parties should choose the structure that minimizes their combined tax liabilities (and advances their business objectives).¹²¹ They can then share the

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

resulting tax savings by (p. 1154) adjusting the purchase price.¹²² In this way, managers can maximize the after-tax returns of shareholders.¹²³

As in other responsibilities, however, managers are not always faithful agents in tax planning. Self-interested tax structuring is especially hard for shareholders to monitor, since tax rules are so esoteric. For example, assume managers have self-interested reasons to buy another company. To clinch the deal, they might accommodate the seller's desire for a tax-free structure, even if a taxable deal is more tax-efficient. This is a form of overpaying, but one that is well hidden from shareholders, who are unlikely to notice the firm's lost depreciation deductions. Alternatively, instead of neglecting the *firm's* tax position, managers can overemphasize their *own* taxes. For instance, in selling the company, managers may seek to minimize their own tax bills as selling shareholders.¹²⁴ They might accept a reduced sale price in return for a "tax-free" structure, even though tax exempt and foreign shareholders (who do not owe US tax anyway) would prefer a higher price. Managers who prioritize their own tax bills in this way are effectively taking money from these shareholders, but in a way that is hard to see.

Discerning the true motivation of managers is all the more difficult because deal structuring—such as the use of cash or stock as the acquisition currency—can be explained in other ways. For example, cash deals usually close more quickly and involve fewer hurdles than stock deals.¹²⁵ In addition, when an acquirer offers its own stock instead of cash, it may be signaling that its stock is overvalued.¹²⁶ Because there are competing considerations, it can be all the more difficult for shareholders to know if managers are making a value-maximizing structuring choice or a self-interested one.¹²⁷ To my knowledge, this influence of tax on corporate governance—tax structuring that camouflages self-interested deal terms—is new to the academic literature.

(p. 1155) 5 Tax and Monitoring: Who is Watching Management?

Although shareholders can reduce agency costs by monitoring management, individual shareholders may not have enough at stake to do so. Their legal ability and economic incentive to monitor can be influenced by the tax system, at least to a degree. While some of these effects are intended, most are not. The tax system not only can encourage (or discourage) shareholder monitoring, but also can substitute for it (at least to a degree). After all, the government has its own revenue-related reasons to monitor management. Even so, this is a mixed blessing for shareholders.

5.1 Shareholder Monitoring

5.1.1 Accidental Byproduct: Inversions and Jurisdiction

Tax has perhaps the greatest impact on shareholder monitoring in influencing where a firm incorporates and, thus, what corporate law protections shareholders have. Under US tax rules, incorporating outside the US offers a notable advantage: avoiding US tax on

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

overseas earnings. Although a Delaware firm owes US tax on profits earned abroad, a Cayman Islands firm does not. Yet this tax savings can come at a cost. Other jurisdictions may not offer comparable shareholder protections, especially tax havens like the Cayman Islands or Bermuda.¹²⁸ This means US tax rules offer a reason (or excuse) to incorporate in jurisdictions with weaker legal constraints on managerial agency costs.

A straightforward response to this tax incentive is to incorporate overseas when starting a business. Still, this practice is relatively rare.¹²⁹ It is cheaper and easier to organize in the US. Founders also are sometimes unsophisticated about tax planning or are unsure how much non-US profit they will earn. In addition, key investors may want US corporate law protections.

Even so, a US firm can become a non-US firm later. In a so-called “inversion,” the US entity that has been the multinational’s parent becomes a subsidiary of a new non-US parent.¹³⁰ (p. 1156) Yet after a number of high-profile inversions in the late 1990s and early 2000s,¹³¹ Congress responded with Section 7874, which taxes the new non-US parent as a US firm when the relevant conditions are satisfied. Although Section 7874 shut down this “first wave” of inversions,¹³² it does not reach a firm that has substantial business operations in its new sites of incorporation.¹³³ In addition, the rule does not apply when a US firm combines with a sufficiently large non-US firm. For this combined entity to avoid being taxed as a US firm, the former shareholders of the US firm must own less than 80% of it. Using this rule, a wave of US pharmaceutical companies have bought smaller foreign firms to become Irish, British, Dutch, or Swiss companies.¹³⁴ In these deals, shareholder protections can change, depending upon where the new firm is incorporated and what its new charter provides.¹³⁵

While the goal of these tax rules is to have a broader tax base—not to influence corporate governance—the tax system can respond to inversions in various ways, each of which has agency cost implications. One possibility is to make the tax benefits from inversions harder to claim. If this goal is pursued successfully, the incentives to reincorporate overseas (and the associated governance risks) are diminished. Another approach is to stop using the site of incorporation to define tax residence. In the UK and Canada, for instance, tax residence does not turn on where the firm is incorporated, but on where it is *managed*. Under this approach, if senior management stays in the US, there is no US tax advantage to incorporating in the Cayman Islands. Finally, instead of trying *harder* to tax worldwide earnings, the US can stop trying. Most developed economies have territorial systems that tax firms only on domestic earnings, not on foreign earnings. If the US adopts a territorial system, Delaware firms—like Cayman Islands or Irish firms—would not owe US tax on overseas profits. There would no longer be a tax reason to leave Delaware.

5.1.2 Accidental Byproduct: Choice of Entity

In the US, tax and governance are in tension in deciding not only where to incorporate, but also what entity to use. A partnership or LLC has a familiar tax advantage over a (p. 1157) corporation: shareholders are taxed, but the entity is not.¹³⁶ Under current law, the maximum US rate for a pass-through entity is 43.4%, compared with a combined

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

51.5% rate for a corporation.¹³⁷ Yet this tax advantage has a governance price, although probably a lower one than inversions: pass-through entities can have weaker investor protections because corporate default rules do not automatically apply. This difference should not be overstated, since these protections can be added to the charter.¹³⁸ In addition, investors in a pass-through may not need as much legal protection. Because pass-through treatment is not available for public corporations,¹³⁹ there are fewer shareholders, so monitoring is more feasible.

5.1.3 Pigouvian and Unintended Incentives for Long-Term Ownership: Reduced Capital Gains Rates and Lock-in

Tax can affect monitoring also by encouraging long-term investment. To claim the US capital gains preference, for example, investors must hold for at least a year. Yet this preference is an imperfect vehicle for enhancing monitoring. After all, monitoring is effective only if shareholders can influence management, something that is more plausible for large shareholders than small ones.

The analysis is similar for other ways the tax system (inadvertently) encourages long-term holding. The realization rule, in deferring tax until stock is sold, can reduce the present value of tax for those who keep it longer.¹⁴⁰ In the US, the step up in basis at death also discourages sales, since those who die with stock avoid income tax on appreciation.¹⁴¹ Once again, however, the incentive to hold longer may not translate into better monitoring. In addition, there is no longer an incentive to hold when a tax-free exit is available, for instance, through (p. 1158) hedging or a tax-free reorganization.¹⁴² The same is true if stock prices decline; the incentive then is to sell in order to trigger tax losses.¹⁴³

All these effects depend on tax details that vary over time and across jurisdictions. For example, tax effects reduced the concentration of share ownership in both the UK and Germany, but for different reasons. In the UK, estate taxes forced families to sell.¹⁴⁴ Germany, by contrast, was deliberately pursuing a corporate governance agenda, introducing an exemption from the corporate capital gains tax so banks and insurance companies would sell their cross-holdings.¹⁴⁵

5.1.4 Accidental Byproduct: Tax Exempts, Institutional Investors, and Boards as Monitors

These lock-in effects obviously do not affect tax-exempt shareholders who have no tax liability to defer. In theory, this freedom from tax affords them extra resources for monitoring, as Randall Mork and Bernard Yeung have argued. Yet tax exempts still have the same reason as taxable shareholders not to monitor: they bear the full cost while reaping only part of the benefit.

US tax rules can also influence monitoring by institutional investors. On the one hand, individual investors secure favorable tax treatment by investing in tax deferred accounts; these often (though not always) are invested with an institution, which has more resources for monitoring than an individual investor.¹⁴⁶ On the other hand, US tax rules keep mutual funds from concentrating on a small number of companies, even though this

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

strategy would be more conducive to monitoring.¹⁴⁷ Analogous diversification requirements apply to real estate holding companies (so-called REITS),¹⁴⁸ annuities, and segregated accounts.¹⁴⁹ The significance of these rules should not be overstated, however; institutional investors vary in their willingness to monitor, while the value of their monitoring is debated.

Tax rules can also weaken monitoring by the board. In Germany, director compensation is only partially deductible (as a way to keep it from serving as disguised, and thus untaxed, dividends). According to Wolfgang Schön, this rule discourages firms “from hiring and (p. 1159) paying high-class people” for the board,¹⁵⁰ although some firms avoid the constraint by also hiring directors as consultants.¹⁵¹

5.2 Shared Interests: Government Monitoring

In addition, the tax system has its own revenue-related reasons to verify a firm’s profits, which sometimes have spillover benefits for shareholders.¹⁵² After all, managers who cheat the government might be willing to steal from (or mislead) shareholders as well.¹⁵³ Both types of strategies use similar techniques, such as offshore accounts and off-balance sheet entities. As a result, rules protecting the fisc can (inadvertently) protect shareholders as well, as Mihir Desai and Dhammika Dharmapala have emphasized.¹⁵⁴ For example, when the Russian government began cracking down on offshore entities, the Russian stock market reacted favorably.¹⁵⁵ The (bizarre) implication is that managers were stealing more than the Russian government was seeking in taxes.

These spillover benefits are more obvious when book and tax accounting are conformed.¹⁵⁶ In these circumstances, when the tax system demands greater transparency, shareholders receive more informative financial statements. Yet the opposite can be true as well. If book-tax conformity induces firms to report *less* accurately (e.g., understating profits to minimize taxes), shareholders end up with less reliable information.¹⁵⁷

Even without book-tax conformity, tax enforcement can generate useful information for shareholders in two ways. First, if returns are publicly available—as was briefly true when the US corporate tax was first enacted—they are an independent source of information; indeed, transparency was an early justification for the US corporate tax.¹⁵⁸ Second, even if returns are confidential, managers who have to track information for tax reasons (e.g., on corporate campaign contributions) cannot invoke administrative costs as a reason to withhold it from shareholders.

(p. 1160) Needless to say, though, government and shareholder interests are only partially aligned. To shareholders, lowering the tax bill is likely to enhance returns¹⁵⁹ and raise stock prices.¹⁶⁰ As a result, rules requiring the disclosure of tax risks, such as FAS 48, may not advance shareholder interests; while tax risk may become easier to evaluate, it is magnified if the disclosure attracts government scrutiny.¹⁶¹ In general, shareholders have reason to value tax planning even more than managers, since shareholders do not bear the same downside risks. If the firm is caught being too aggressive, shareholders are un-

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

likely to bear reputational costs, while managers could lose their jobs and even go to jail.¹⁶² This is an agency cost, but a socially useful one.

Just as shareholders may not think they share interests with the tax authorities, the reverse can also be true. The priority of tax authorities is to collect tax, not to protect shareholders. As long as a firm is paying its taxes, tax collectors may not care about earnings manipulation or diversion.¹⁶³ Indeed, in a high-profile German case, tax authorities did not intervene even though they knew managers were defrauding shareholders.¹⁶⁴

6 Conclusion

The bottom line, then, is that tax affects managerial agency costs in a broad range of ways. In the US, tax influences how managers are paid, how they allocate the firm's resources, and (p. 1161) how effectively they are monitored by shareholders, as well as by the tax authorities themselves. The overall record is unimpressive, but not uniformly so.

Indeed, four effects are particularly useful in mitigating agency costs. First, tax rules discourage executives from hedging stock option grants, thereby backstopping the incentives these grants are supposed to create. Second, tax rules promote the use of equity compensation in venture-capital-backed startups. Third, the tax advantages of leverage pressure managers to issue debt, and thus to generate sufficient earnings to pay interest. Fourth, the tax on intercompany dividends discourages pyramidal ownership. Notably, only the last of these was (arguably) intended by Congress as a response to agency costs.

At the same time, three tax effects are especially pernicious. First, to the extent that tax offers a reason (or an excuse) not to pay dividends, managers have more control over retained earnings, which they can use in self-interested ways. Second, it is unfortunate that managers can invoke tax losses as an argument against being acquired, since these losses are often evidence of poor management. Third, governance can suffer when tax supplies a reason (or excuse) to reincorporate in jurisdictions with weaker corporate law protections.

The reality, though, is that tax authorities are unlikely to focus on these effects. Their institutional mission is to collect taxes, not to target managerial agency costs. It is not surprising, then, that virtually all the Pigouvian measures discussed here are imperfectly tailored or even misguided. Accidental effects do not give any more cause for optimism. Some will escape the notice of government tax experts, while others will not be considered a priority. Given this track record, Congress should use tax only sparingly, if at all, to target agency costs.

Even so, there is value in charting these effects. In some (rare) cases, the tax authorities may be willing and able to adjust tax rules in ways that reduce agency costs. A more promising avenue, though, is to educate corporate governance experts about these tax effects, so they can account for them when tailoring corporate and securities law responses to agency costs. (p. 1162)

Government Regulation and the Structure of Compensation Contracts”, 62 J. Fin. Econ. 453 (2001) (enactment of 162(m) contributed to growth in equity compensation); Brian Hall & Jeffrey B. Liebman, The Taxation of Executive Compensation, in Tax Policy and the Economy 14 (James Poterba ed., 2000); M. Johnson, S. Nabar, & S. Porter, “Determinants of Corporate Response to Section 162(m)”, U. of Mich. Working Paper (1999) (of 297 publicly held US firms that paid more than \$1 million of compensation in 1992, 54% preserved deductibility; of these 78% did so through plan qualification).

(²⁷) A further advantage of at- or out-of-the-money options and SARs is that they are generally exempt from the onerous requirements of Section 409A for deferred compensation.

(²⁸) Treas. Reg. 1.162-27(e)(3) & (e)(5).

(²⁹) Treas. Reg. 1.162-27(e)(4).

(³⁰) Treas. Reg. 1.162-27(e)(2)(iii)(A).

(³¹) See *supra* section 3.1.1.

(³²) See Jesse M. Fried, “Option Backdating and its Implications”, 65 Wash. & Lee L. Rev. 853, 854 (2008) (“Evidence has emerged that several thousand publicly traded firms used hindsight to secretly backdate stock option grants”). Before 2005, firms also had an accounting reason to avoid in-the-money grants. These had to be expensed, while at-the-money options did not. Since 2005, all option grants must be expensed. *Id.* at 859.

(³³) Schizer, Indexed Options, *supra* note 9, at 1941.

(³⁴) Conventional options comply with the so-called “performance goal requirement” if they are issued at-the-money or out-of-the-money, so that “the amount of compensation the employee could receive is based solely on an increase in the value of the stock after the date of the grant or award” 1.162-27(e)(2)(vi). In contrast, this language—and the process shortcut it provides—does not apply to indexed options; rather, indexed options offer a return if the stock prices increases more (or decreases less) than the index, and not “solely” if the stock price increases. As a result, indexed options are subject to the more rigorous process requirements governing earnings based bonuses.

(³⁵) Assuming this market exposure represents half of a conventional option’s value, a package of \$1 million in conventional options and \$1 million in cash is roughly comparable to one of \$500,000 in indexed options and \$1.5 million of cash, of which \$500,000 is invested in the stock market. A difference is that the executive loses the \$50,000 stock market portfolio if the firm-specific bet is sufficiently unsuccessful. In other words, if the firm declines in value in a rising stock market, the executive gets no return. This is differ-

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

ent from a package composed of an indexed option and a separate investment in the S&P, since the executive would still have the latter even if the former expires worthless.

⁽³⁶⁾ See H.R. Conf. Rep. No. 103-213, at 587 (1993) (treating stock options as performance-based if the return is “based solely on an increase in the corporation’s stock price,” but not performance-based “if the executive is otherwise protected from decreases in the value of the stock (such as through automatic repricing)”).

⁽³⁷⁾ Section 162(m)(4)(C).

⁽³⁸⁾ If this interpretation is not fully reassuring, the option’s terms can be adjusted to avoid rewarding executives whose stock price declines. A (partially) indexed option can reward executives if the firm outperforms the index, but only if the stock price also appreciates. For example, if the stock price is \$100 and the S&P 500 is 2000 on the grant date, the exercise price can be the greater of: (a) 1/20th of the S&P 500; and (b) \$100.

⁽³⁹⁾ For example, the taxpayer must satisfy a 12-month holding period for the option and another 12-month holding period for the stock, and the options must not be issued in-the-money.

⁽⁴⁰⁾ In contrast, non-qualified options (NQOs) allow the firm to deduct the same amount that employees include as ordinary income, which generally is the difference between the stock price and the exercise price when the option is exercised.

⁽⁴¹⁾ On an ISO grant of 100 shares, each dollar of share appreciation gives the executive \$80, but it costs the firm a full \$100 (because this cost is not deductible). If instead the executive receives a non-qualified grant of 140 shares, both the executive and the firm are better off: the executive has \$84.56 (\$140 minus \$55.44 in tax), while the firm spends only \$91 (since it can deduct \$49).

⁽⁴²⁾ See also Chenyang Wei & David Yermack, “Investor Reactions to CEOs’ Inside Debt Incentives”, 24 Rev. Fin. Stud. 3813–40 (2011); Frederick Tung & Xue Wang, “Bank CEOs, Inside Debt Compensation, and the Global Financial Crisis” (Boston Univ. School of Law Working Paper No. 11-49) (December 11, 2012).

⁽⁴³⁾ Michael C. Jensen & William H. Meckling, “Theory of the Firm: Managerial Behavior, Agency Costs and Ownership Structure”, 3 J. Fin. Econ. 305 (1976) (if a firm is capitalized with equity and debt, an optimal pay package provides both).

⁽⁴⁴⁾ In the US, for instance, non-qualified plans are taxed favorably if the employer’s tax rate on investment earnings is lower than the employee’s rate. Halperin & Warren, *supra* note 17, at 12–13 (“any benefit from nonqualified deferred compensation is due entirely to the difference between the employer’s and the employee’s after-tax rate of return on income earned by investing the deferred amount”).

⁽⁴⁵⁾ Robert J. Jackson, Jr. & Colleen Honigsberg, “The Hidden Nature of Executive Retirement Pay”, 100 Va. L. Rev. 479, 486 (2014) (“for retirement arrangements to serve as in-

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

side debt the executive must, in the event of bankruptcy, recover amounts comparable to those recovered by the company's other unsecured creditors").

(⁴⁶) Section 409A(a)(1)(B).

(⁴⁷) Jackson & Honigsberg, *supra* note 45, at 503 ("But the provision instead merely limits accelerations to cases in which executives are most certain that bankruptcy is coming").

(⁴⁸) *Id.* at 486 ("Unlike bonuses or stock-based pay, which reward managers for taking risk, fixed payments encourage executives to avoid risks that might render the firm insolvent").

(⁴⁹) *Id.* at 506 (estimating that \$32,500 of annual compensation is hidden through deferred compensation for the average executive in their sample).

(⁵⁰) David W. Leebron, "Games Corporations Play: A Theory of Tender Offers", 61 N.Y.U. L. Rev. 153, 183 n.105 (1986) (managers may not drive a hard enough bargain); Ronald J. Gilson, "Value Creation by Business Lawyers: Legal Skills and Asset Pricing", 94 Yale L. J. 239, 285 n.114 (1984) (noting perverse incentives in parachutes).

(⁵¹) Daniel R. Fischel, "Organized Exchanges and the Regulation of Dual Class Common Stock", 54 U. Chi. L. Rev. 119, 137 (1987) (parachutes are a way to protect managers for developing firm-specific skills; John C. Coffee, Jr., "Shareholders Versus Managers: The Strain in the Corporate Web", 85 Mich. L. Rev. 75-76 (1986) (parachutes can be a way to recruit quality management in active takeover environment).

(⁵²) Jay C. Hartzell, Eli Ofek, & David Yermack, "What's In It For Me? CEOs Whose Firms Are Acquired", 17 Rev. Fin. Stud. 37, 45 (2004) (noting that "mean CEO's gains from stock and option appreciation are just under \$5 million," median gains "are a little over \$1.5 million," and "[t]hese sources of wealth represent the largest component of the overall gains obtained by sample CEOs").

(⁵³) *Id.* ("CEOs obtain [equity appreciation] only because shareholders as a group receive a premium price from the buyer. Therefore, to the extent that a conflict of interest exists between CEOs and shareholders in connection with merger negotiations, the conflict must arise from" other components of parachutes).

(⁵⁴) For instance, an executive who receives a compensatory option to buy 10,000 shares at \$100 might sell a similar over-the-counter call option to a derivatives dealer so the two positions essentially cancel each other out.

(⁵⁵) Schizer, Executives and Hedging, *supra* note 3, at 440.

(⁵⁶) Only a modest amount of capital loss can be used to offset ordinary income each year. Some hedges generate ordinary losses, but involve comparable problems. See generally Schizer, Executives and Hedging, *supra* note 3.

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

⁽⁵⁷⁾ If the capital loss can be used currently, but offsets long-term capital gain, it reduces tax only by \$238,000. (The tax rate is assumed here to be 23.8%, which includes the 20% capital gains rate and the 3.8% net investment tax of Section 1411.) As a result, the executive's tax bill still increases by \$158,000. In theory, the executive could respond by adjusting the size of the hedge so the two positions are offsetting on an after-tax, instead of a pre-tax, basis. But another anti-abuse rule, the straddle rules of Section 1092, prevents this by subjecting hedging gains and losses to different rates. See Schizer, *Executives and Hedging*, *supra* note 3, at 481.

⁽⁵⁸⁾ Likewise, executives who received stock as investors (e.g., as founder of the company) also do not face this mismatch since their return also is taxed as capital gain. Also, once executives exercise their options, they can hedge the stock they receive. Yet they are also permitted to sell it, so hedging does not have the same agency costs implications, as long as it is disclosed.

⁽⁵⁹⁾ Emily Chasan, "Last Gasp for Stock Options", WSJ.Com, Aug. 26, 2013, <http://blogs.wsj.com/cfo/2013/08/26/last-gasp-for-stock-options/> ("At their peak in 1999, stock options accounted for about 78% of the average executive's long-term incentive packages. Last year, they represented just 31%, and are expected to shrink to 25% in the next two years, based on grant values so far this year"); James F. Reda, David M. Schmidt & Kimberly A. Glass, "The Move Away from Stock Options Continues: Preview of 2012 Data", J. Comp. & Ben. 12, 14 (May/June 2013), <http://www.jfreda.com/public/pdf/The%20Move%20Away%20from%20Stock%20Options.pdf> (estimating that in 2015 stock options will represent just 25% of the typical award).

⁽⁶⁰⁾ For a discussion, see Schizer, *Executives and Hedging*, *supra* note 3.

⁽⁶¹⁾ See Section 1202 (qualified small business stock).

⁽⁶²⁾ This assumes they make a Section 83(b) election. They also have the option of deferring the tax until the shares vest, but then all gain up to that point is taxed at ordinary rates. See Ronald J. Gilson & David M. Schizer, "Understanding Venture Capital Structure: A Tax Explanation for Convertible Preferred Securities", 116 Harv. L. Rev. 874 (2003).

⁽⁶³⁾ Id.

⁽⁶⁴⁾ Indeed, there is an extensive literature debating why VCs in the US always take convertible preferred, instead of common stock. Although signaling and other governance reasons are often invoked, tax is a central reason. Id.

⁽⁶⁵⁾ A cost of this favorable tax treatment is that the startup itself can deduct only one dollar per share instead of one hundred dollars. But early stage high tech startups often are not yet profitable, so they don't (yet) need the deduction. Id.

⁽⁶⁶⁾ Gilson & Schizer, *supra* note 62.

(⁶⁷) Section 274(n).

(⁶⁸) The firm's deduction is limited to this amount so that, again, much of the tax cost is imposed on the firm, instead of the executive. See, e.g., Cleary Gottlieb Alert Memo, New Personal Use of Corporate Aircraft Tax Rules: Notes for Tax and Executive Compensation Practitioners (Aug. 22, 2012), <http://www.cgsh.com/files/News/90795eb3-eb05-43a8-9a3e-69ae66fcb5b6/Presentation/NewsAttachment/48406b2f-00b4-4baa-a071-6c9f97bdcd30/CGSH%20Alert%20-%20New%20Personal%20Use%20of%20Corporate%20Aircraft%20Tax%20Rules.pdf>.

(⁶⁹) See, e.g., Section 162(c); IRC Section 908; see also, e.g., Jeffrey P. Owens, Good Corporate Governance: The Tax Dimension, in *Tax and Corporate Governance* 11 (Wolfgang Schön ed., 2008) (all OECD members disallow deduction for bribery, and Germany, the UK, and the US all allow deductions for corporate charity).

(⁷⁰) In a frictionless world, capital structure does not affect firm value, as Modigliani and Miller famously showed, but the analysis obviously changes once we account for tax, information and transaction costs, and other frictions. See Franco Modigliani & Merton H. Miller, "The Cost of Capital, Corporation Finance and the Theory of Investment", 48 *Am. Econ. Rev.* (1958).

(⁷¹) See, e.g., Kshitij Shah, "The Nature of Information Conveyed by Pure Capital Structure Changes", 36 *J. Fin. Econ.* 89 (1994) (correlating exchange offers with information about reduced future cash flows for leverage-decreasing offers, and decreased risk for leverage increasing offers).

(⁷²) Jensen & Meckling, *supra* note 43 (managers take excessive risk since they benefit from gains but do not share in losses).

(⁷³) Stewart C. Myers & Nicholas S. Majluf, "Corporate Financing and Investment Decisions when Firms Have Information that Investors Do Not Have", 13 *J. Fin. Econ.* 187 (1984) (firms with more tangible assets borrow more, since it is easier to grant security interest); James H. Scott, Jr. "Bankruptcy, Secured Debt, and Optimal Capital Structure", 32 *J. Fin.* 1 (1977) (same).

(⁷⁴) Section 163(a). Cf. Arne Friesse, Simon Link, & Stefan Mayer, *Taxation and Corporate Governance—The State of the Art*, in *Tax and Corporate Governance* 392 (Wolfgang Schön ed., 2008) (noting that interest is 50% deductible in Germany).

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

tacharya & George M. Constantinides eds., 1989) (if firm is already using enough debt to shield likely profits, there is no tax advantage in using more debt).

(⁷⁸) Harry DeAngelo & Ronald W. Masulis, “Optimal Capital Structure Under Corporate and Personal Taxation”, 8 J. Fin. Econ. 3 (1980) (noting that other sources of deductions can reduce tax advantage of debt); Dan Dhaliwal, Robert Trezevant, & Shiing-Wu Wang, “Taxes, Investment-Related Tax Shields and Capital Structure”, 14 J. Am. Tax’n. Ass’n. 1 (1992) (showing that firms with nondebt tax shield are less likely to use debt); John R. Graham, Mark H. Lang, & Douglas A. Shackelford, “Employee Stock Options, Corporate Taxes, and Debt Policy”, 59 J. Fin. 1585 (2004) (option deductions are large enough to reduce the median marginal tax rate for sample of large firms from 34% to 26%); Robert Trezevant, “Debt Financing and Tax Status: Tests of the Substitution Effect and the Tax Exhaustion Hypothesis Using Firms’ Responses to the Economic Recovery Tax Act of 1981”, 47 J. Fin. 1557 (1992) (finding support for debt substitution and tax exhaustion hypotheses by examining 1981 legislation); Kathleen M. Kahle & Kuldeep Shastri, “Firm Performance, Capital Structure, and the Tax Benefits of Employee Stock Options”, 40 J. Fin. Quant. Anal. 135 (2005) (“long- and short-term debt ratios are negatively related to the size of tax benefits from option exercise”).

(⁷⁹) In general, firms need foreign income in order to use foreign tax credits. Thus, if US interest expense shelters foreign income, it can reduce the credits a firm can claim. There is a formula for deciding whether US interest expense reduces overseas income, which is based on the percentage of assets abroad. The more assets held overseas, then, the more foreign tax credits a firm loses by taking on more US debt. Empirical evidence shows that firms respond to this incentive. Julie H. Collins & Douglas A. Shackelford, “Foreign Tax Credit Limitations and Preferred Stock Issuances”, 30 J. Acct. Research (Supp.), 103 (1992) (multinationals respond to 1986 change by using preferred stock instead of commercial paper); Kenneth A. Froot & James R. Hines, Jr., Interest Allocation Rules, Financing Patterns, and the Operations of US Multinationals, in *The Effects of Taxation on Multinationals* (Martin Feldstein, James R. Hines, Jr., & R. Glenn Hubbard, eds., 1995) (excess credit firms reduce their use of debt, with greater reductions in firms with more foreign assets); Rosanne Altshuler & Jack M. Mintz, “US Interest-Allocation Rules: Effects and Policy”, 2 Int’l. Tax and Pub. Fin. 7 (1995) (multinationals with more assets abroad have more foreign debt, presumably because domestic interest would be allocated abroad).

(⁸⁰) This disadvantage obviously grows as the gap widens between ordinary and capital gains rates. Graham, *supra* note 5, at 1082 (“If the investor-level tax on interest income (τ_P) is large relative to tax rates on corporate and equity income (τ_C and τ_E), the net tax advantage of debt can be zero or even negative.”); Jeffrey K. MacKie-Mason, “Do Taxes Affect Corporate Financing Decisions?”, 45 J. Fin. 1471 (1990) (finding that firms slightly increased use of debt after 1986 tax reform, which reduced tax rates on interest income).

(⁸¹) It is not easy, though, to document this clientele effect empirically. See Graham, *supra* note 5, at 1096 (“The truth is that we know very little about the identity or tax status of the marginal investors”).

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

(⁸²) Not surprisingly, then, there is empirical evidence that share prices rise when firms announce they are replacing equity with debt. See, e.g., Ronald W. Masulis, “Stock Repurchase by Tender Offer: An Analysis of the Causes of Common Stock Price Changes”, 35 J. Fin. 305 (1980) (leverage-increasing exchange offers increase equity value by 7.6%, and leverage-decreasing transactions decrease value by 5.4%). Moreover, the exchange offers with the largest increases in tax deductions (debt-for-common and debt-for-preferred) have the largest positive stock price reactions. Ellen Engel, Merle Erickson, & Edward Maydew, “Debt-Equity Hybrid Securities”, 37 J. Acct. Research 249 (1999) (comparing MIPS yields to preferred yields and concluding that the tax benefit of MIPS are approximately .28 per dollar of face value, net of the aforementioned costs.); see also John R. Graham, Taxes and Corporate Finance in 2 Handbook Of Corporate Finance: Empirical Corporate Finance 73 (B. Espen Eckbo ed., 2008). (“If all firms lever up to operate at the kink in their benefit functions, they could add 10.5% to firm value over the 1995–1999 period”).)

(⁸³) See Randall Morck & Bernard Yeung, “Dividend Taxation and Corporate Governance”, 19 J. Econ. Persp. 163, 177 (2005).

(⁸⁴) See Rafael La Porta, Florencio Lopez-de-Silanes, & Andrei Shleifer, “Corporate Ownership Around the World”, 54 J. Fin. 471 (1999).

(⁸⁶) *Id.*

(⁸⁷) Steven A. Bank & Brian R. Cheffins, The Corporate Pyramid Fable, University of Cambridge Faculty of Law Legal Studies Research Paper Series 11/04 (January 2011) (“The introduction of the intercorporate dividend tax did not foster a rapid dismantling of corporate pyramids. Instead, pyramidal arrangements were already rare in the US”).

(⁸⁸) Michael C. Jensen, “Agency Costs of Free Cash Flow, Corporate Finance, and Takeovers”, 76 Am. Econ. Rev. 323 (1986); Andrei Shleifer & Robert W. Vishny, “Management Entrenchment: The Case of Manager-Specific Investments”, 25 J. Fin. Econ. 123, 123–24, 137 (1989) (retained earnings can fund irreversible investments that make firm less valuable but enhance management’s value to firm); Nancy L. Rose & Andrea Shepard, “Firm Diversification and CEO Compensation: Managerial Ability or Executive Entrenchment”, 28 Rand J. Econ. 489 (1997) (diversified firms are harder to manage and make skills more valuable).

(⁸⁹) Sudipto Bhattacharya, “Imperfect Information, Dividend Policy, and ‘The Bird in the Hand’ Fallacy”, 10 Bell J. Econ. 259 (1979). As a result, empirical evidence suggests a connection between dividends and good governance. Larry H.P. Lang & Robert H. Litzenberger, “Dividend Announcements: Cash Flow Signaling vs. Free Cash Flow Hypothesis?”, 24 J. Fin. Econ. 181 (1989) (dividend increases raise share prices the most for firms with ample cash flows and few investment opportunities); Rafael La Porta, Florencio Lopez-de-Silanes, Andrei Shleifer, & Robert W. Vishny, “Agency Problems and Dividend

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

Policies Around the World”, 55 J. Fin. 1 (2000) (concluding that good governance causes higher dividends and that public investors demand dividends where free cash-flow problems are worst).

⁽⁹⁰⁾ It is hard to know how common tax-exempt shareholders are, but there is empirical evidence suggesting that taxable shareholders are the marginal holders. See, e.g., Edwin J. Elton, Martin J. Gruber, & Christopher R. Blake, “Marginal Stockholder Tax Effects and Ex-Dividend-Day Price Behavior: Evidence from Taxable Versus Nontaxable Closed-End Funds”, 87 Rev. Econ. Stat. 579 (2005) (share values fall by after-tax value of dividend, not its full nominal value, on ex-dividend date); Trevor S. Harris, R. Glenn Hubbard, & Deen Kemsley, “The Share Price Effects of Dividend Taxes and Tax Imputation Credits”, 79 J. Pub. Econ. 569 (2001) (taxable individuals are marginal equity investors, so dividend taxes are impounded in price).

⁽⁹¹⁾ Daniel Halperin, “Will Integration Increase Efficiency? The Old and New View of Dividend Policy”, 47 Tax L. Rev. 645, 648 (1992) (“The advantage of deferral would be offset by the fact that the tax base would be growing as the corporation continued to accumulate earnings”).

⁽⁹²⁾ Id. at 648 (“if all distributions were taxed at the same rate, the corporate and individual rates were the same and the rate of return inside the corporate sector is no different than the rate of return outside the corporate sector, the tax burden on corporate distributions could not be reduced by deferral of distributions”); see also, e.g., Alan J. Auerbach, “Share Valuation and Corporate Equity Policy”, 11 J. Pub. Econ. 291 (1979). For example, assume a firm has \$100 of earnings, which it either can distribute immediately or reinvest for three years. Assume also that this money can be invested—either inside or outside corporate solution—to earn the same 6.5% after-tax return. Assume also that it is subject to a shareholder level tax of 23.8% when it is distributed (the 20% capital gains rate plus the 3.8% net investment tax). If the money is distributed now, the shareholder has \$76.20. After three years, this amount grows to \$92.05. Alternatively, if the firm invests the \$100, it grows to \$120.80 over three years and is distributed. After a 23.8% tax, the shareholder has the same \$92.05.

⁽⁹³⁾ Fisher Black, “Dividend Puzzle”, 2 J. Portf. Man. 215 (1976); Morck & Yeung, *supra* note 83, at 163, 168 (“Another option is for firms to make cash payments to shareholders by repurchasing their own shares”).

⁽⁹⁴⁾ If structured properly, a share repurchase is taxed as capital gain. In contrast, dividends were taxed as ordinary income before 2003. See Graham, *supra* note 5, at 1105 (“All else being equal, tax effects imply that firm value is negatively related to 1) the portion of payout dedicated to dividends, and 2) dividend taxation relative to capital gains taxation”); see also Friese, Link, & Mayer, *supra* note 74, at 383 (noting an analogous effect in Germany and other imputation systems if the shareholder tax is higher than the corporate tax).

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

⁽⁹⁵⁾ Eugene F. Fama & Kenneth R. French, “Disappearing Dividends: Changing Firm Characteristics or Lower Propensity to Pay?”, 60 J. Fin. Econ. 3 (2001) (declining dividend yields in recent years); Morck & Yeung, *supra* note 83, at 171 (ordinary dividends remain roughly proportional to permanent component of corporate income, and extraordinary dividends or share repurchases are used to disburse free cash flow); *id* at 168 (“Since firms can make cash payments to their investors without dividends, and do so in ways that avoid dividend taxes, cutting dividend taxes may have less effect now than several decades ago.”); Erik Lie & Heidi J. Lie, “The Role of Personal Taxes in Corporate Decisions: An Empirical Analysis of Share Repurchases and Dividends”, J. Fin. Quant. Anal. 34, 533–52 (1999) (firms with low-dividend payout (and presumably high-tax-rate investors) use self-tender-offer share repurchases more often than they use special dividends, and these firms also use open-market repurchases more often than they increase regular dividends).

⁽⁹⁶⁾ Since 2003, dividends (like share repurchases) have been taxed at capital gains rates. But a difference still remains: shareholders can use tax basis to reduce their tax on share repurchases, but not on dividends. For the firm itself, though, the tax burden is the same: deductions are not available for either dividends or share repurchases. See Section 162(k) (disallowing deduction for expenses associated with share repurchases).

⁽⁹⁷⁾ Alvin C. Warren, Jr., “Deferral and Exemption of the Income of Foreign Subsidiaries: A Review of the Basic Analytics”, Harv. Pub. Law Working Paper 14–18, at 9 (Jan. 2014), http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2390021 (“if the repatriation tax rate . . . does not go down, the advantage of delaying repatriation of foreign earnings under current law comes not from delaying the repatriation tax, but from the application of a foreign tax rate . . . on investment earnings during the period of deferral that is lower than the US tax rate . . . on such earnings”).

⁽⁹⁸⁾ Cf. Mihir A. Desai, C. Fritz Foley, & James R. Hines, Jr., “Dividend Policy Inside the Multinational Firm”, 36 Fin. Mgmt 5 (2007) (dividends of nonlisted foreign subs to US parents typically are steady or rising, so that “dividend policies are largely driven by the need to control managers of foreign affiliates. Parent firms are more willing to incur tax penalties . . . when their foreign affiliates are partially owned, located far from the United States, or in jurisdictions in which property rights are weak.”); C. Fritz Foley, Jay C. Hartzell, Sheridan Titman, & Garry Twite, “Why Do Firms Hold So Much Cash? A Tax-Based Explanation”, 86 J. Fin. Econ. 579–607 (2007).

⁽⁹⁹⁾ Cf. Roger Gordon & Martin Dietz, Dividends and Taxes, in Institutional Foundations Of Public Finance: Economic And Legal Perspectives 220 (Alan J. Auerbach & Daniel N. Shaviro eds., 2008) (concluding that signaling offers only a partial explanation for why firms pay dividends).

⁽¹⁰⁰⁾ See Mark J. Roe, Strong Managers, Weak Owners: The Political Roots of American Corporate Finance 118 (1994) (“The tax on undistributed profits threatened managers; within a few years the tax was dead”); Bank, *supra* note 2, at 1204–06.

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

⁽¹⁰¹⁾ Raj Chetty & Emmanuel Saez, “Dividend Taxes and Corporate Behavior: Evidence From the 2003 Dividend Tax Cut”, 120 Q. J. Econ. 791, 828 (2005) (“The 2003 dividend tax cut induced a large set of firms to initiate regular dividend payments or raise the payments they were already making”); Brandon Julio & David L. Ikenberry, “Reappearing Dividends”, 89 J. App. Corp. Fin. (2004) (tax reduction is consistent with the reappearance of dividend-paying firms, although trend to initiate dividends was already in motion before tax cut was announced); Jennifer L. Blouin, Jana Smith Raedy & Douglas A. Shackelford, “The Initial Impact of the 2003 Reduction in the Dividend Tax Rate”, University of North Carolina, Working Paper (2004) (tax cuts also led to special dividends).

⁽¹⁰²⁾ Chetty & Saez, *supra* note 101, at 818–820, 823 (larger changes for firms with large taxable shareholder and bigger changes where senior executives have relatively more stock and fewer unexercised options; no change in dividends for firms where largest shareholder is not taxable).

⁽¹⁰³⁾ See Michelle Hanlon & Jeffrey L. Hoopes, “What Do Firms Do When Dividend Tax Rates Change?: An Examination of Alternative Payout Responses”, 114 J. Fin. Econ. (estimating a \$7 billion increase in special dividends paid in the end of 2010 and 2012, as well as significant shifting of January dividends into December).

⁽¹⁰⁴⁾ Graham & Rogers, *supra* note 10, at 815 (finding that hedging leads to greater debt usage, increases the debt ratio for the average firm by 3%, and adds tax shields equal to 1.1% of firm value).

⁽¹⁰⁵⁾ John R. Graham & Clifford W. Smith, Jr., “Tax Incentives to Hedge”, 54 J. Fin. 2241 (1999) (“From our analysis of more than 80,000 COMPUSTAT firm-year observations, we find that in approximately 50% of the cases, corporations face convex effective tax functions and thus have tax-based incentives to hedge”); Georges Dionne & Martin Garand, “Risk Management Determinants Affecting Firms’ Values in the Gold Mining Industry: New Empirical Results”, 79 Economics Letters 43 (2003) (hedging among gold-mining firms is positively related to estimated convexity); Morton Pincus & Shivaram Rajgopal, “The Interaction between Accrual Management and Hedging: Evidence from Oil and Gas Firms”, 77 Acct. R. 127 (2002) (profitable oil and gas firms use derivatives to smooth income in response to tax incentives). But see Graham & Rogers, *supra* note 10, at 815 (finding no evidence that firms hedge in response to tax function convexity).

⁽¹⁰⁶⁾ See *infra* section 5.1.1.

⁽¹⁰⁷⁾ See *supra* section 3.1.7.

⁽¹⁰⁸⁾ See John C. Coffee, Jr., “Regulating the Market for Corporate Control: A Critical Assessment of the Tender Offer’s Role in Corporate Governance”, 84 Colum. L. Rev. 1145, 1293 (1984); Jeffrey N. Gordon & Lewis A. Kornhauser, “Takeover Defense Tactics: A Comment on Two Models”, 96 Yale L. J. 295, 297 (1986–1987) (“[T]arget stock buybacks are unlikely to increase shareholder wealth as a general matter and, on a shareholder wealth criterion, should not be permitted”).

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

(¹⁰⁹) Jonathan R. Macey & Fred S. McChesney, “A Theoretical Analysis of Corporate Greenmail”, 95 Yale L. J. 13, 15 (1985) (“greenmail payments can be an efficient means of compensating those who supply valuable information to the market (or the firm) about the value of a firm’s stock”).

(¹¹⁰) For a critique, see generally Edward A. Zelinsky, “Greenmail, Golden Parachutes and the Internal Revenue Code: A Tax Policy Critique of Sections 280G, 4999 and 5881”, 35 Vill. L. Rev. 131, 166–68 (1990) (fails to distinguish between good and bad greenmailing).

(¹¹¹) Mark C. Van Deusen, A Primer on Protecting Tax Losses from a Section 382 Ownership Change, William & Mary Annual Tax Conference, Paper 20, at 18 (2010), <http://scholarship.law.wm.edu/tax/20> (“Many public companies with significant NOLs and NCLs have recently adopted poison pill plans that are intended to discourage an ownership change. In 2009, over 40 public companies adopted section 382 poison pills, including Citigroup Inc. and Ford Motor Company”).

(¹¹²) Samuel J. Dimon, “Limit My Practice Instead! Thoughts on Reforming Section 382”, Taxes—The Tax Magazine 65 (March 2010) (“Code Sec. 382 influences corporate decision-making more than it should. Stressed companies too often are inhibited by fear that otherwise rational economic decisions will precipitate an ownership change (or set up conditions where an ownership change could easily occur). As a consequence, stock-for-debt exchanges outside of bankruptcy may be avoided, or pared back, and so may stock offerings to raise needed cash”).

(¹¹³) *Versant, Enters. v. Selectica, Inc.*, 5 A.3d 586 (Del Sup. Ct. 2010) (approving NOL pill with 4.99% trigger); Paul H. Edelman and Randall S. Thomas, “Selectica Resets the Trigger on the Poison Pill: Where Should the Delaware Courts Go Next?”, 87 Ind. L. Rev. 1087, 1090 n. 27 (2012) (“Law firms are already claiming that Selectica validates ‘acting in concert’ poison pills with 4.99% triggers, which are designed to stop shareholders from engaging in coordinated activities”).

(¹¹⁴) Frieese, Link & Mayer, *supra* note 74.

(¹¹⁵) See Ronald J. Gilson, Myron S. Scholes, & Mark A. Wolfson, Taxation and the Dynamics of Corporate Control: The Uncertain Case for Tax-Motivated Acquisitions, in *Knights, Raiders, And Targets: The Impact Of The Hostile Takeover* (John C. Coffee, Jr., Louis Lowenstein, & Susan Rose-Ackerman eds., 1988) (describing this pre-86 strategy); Carla Hayn, “Tax Attributes as Determinants of Shareholder Gains in Corporate Acquisitions”, 23 J. Fin. Econ. 121 (1989) (finding that target shareholder capital gains and tax benefit of stepped up basis affect returns of bidder and target after taxable acquisition is announced in pre-86 transactions).

(¹¹⁶) Before 1986, corporate capital gains were taxed at 28%, while the maximum rate for ordinary income was 46%. Since 1986, the top rate for both has been 35%. See also Myron S. Scholes & Mark A. Wolfson, “The Effects of Changes in Tax Laws on Corporate Reorganization Activity”, 63 J. Bus. S141 (1990).

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

(¹¹⁷) Section 197; see also Steven L. Henning & Wayne H. Shaw, “The Effect of the Tax Deductibility of Goodwill on Purchase Price Allocations”, 22 J. Amer. Tax’n Assn. 18 (2000) (finding that enactment of Section 197 increased purchase price, as buyers shared tax savings with sellers); Connie D. Weaver, “Divestiture Structure and Tax Attributes: Evidence from the Omnibus Budget Reconciliation Act of 1993”, 22 J. Amer. Tax’n Assn. (Supp.) 54 (2000) (enactment of Section 197, which introduced deduction for goodwill, increased the probability of the taxable transaction being structured to obtain a step-up in basis and thus a deduction for goodwill; step-up is more likely when acquiring firm has higher marginal tax rate); Benjamin C. Ayers, Craig E. Lefanowicz, & John R. Robinson, “The Effects of Goodwill Tax Deductions on the Market for Corporate Acquisitions”, 22 J. Amer. Tax’n Assn. 34 (Supp.) (2000) (enactment of 197 did not increase frequency of taxable transactions with basis step up, but did increase purchase price premium, so that target gets 75% of tax benefit).

(¹¹⁸) Thomas J. Brennan, Where the Money Really Went: A New Understanding of the AJ-CA Tax Holiday (March 6, 2014). Northwestern Law & Econ Research Paper No. 13-35.

(¹¹⁹) See, e.g., Randall Morck, Andrei Shleifer, & Robert W. Vishny, “Do Managerial Objectives Drive Bad Acquisitions?”, 45 J. Fin. 31, 31-32 (1990).

(¹²⁰) See generally Mergers, Acquisitions & Leveraged Buy-Outs (Martin Ginsburg & Jack S. Levin eds., 1989).

(¹²¹) Gilson, Scholes & Wolfson, *supra* note 115.

(¹²²) Merle Erickson & Shiing-wu Wang, “The Effect of Transaction Structure on Price: Evidence from Subsidiary Sales”, 30 J. Acct. & Econ. 59 (2000) (finding that when one firm buys another’s sub, price depends on the seller’s tax on gain); Benjamin C. Ayers, Craig E. Lefanowicz, & John R. Robinson, “Shareholder Taxes in Acquisition Premiums: The Effect of Capital Gains Taxation”, 58 J. Fin. 2783 (2003) (finding that premium paid in taxable acquisitions increases with the capital gains taxes of the target shareholders).

(¹²³) See, e.g., Edward L. Maydew, Katherine Schipper, & Linda Vincent, “The Impact of Taxes on the Choice of Divestiture Method”, 28 J. Acct. & Econ. 117 (1999) (finding that the size of the tax differential between divestiture methods affects the form of divestiture; firms with the largest potential tax benefits from using a spin-off opt for spin-offs); William M. Gentry & David M. Schizer, “Frictions and Tax-Motivated Hedging: An Empirical Exploration of Publicly-Traded Exchangeable Securities”, 56 Nat’l. Tax J. 167 (2003) (empirical study of use of contingent notes to simulate economics of sale without triggering tax).

(¹²⁴) The assumption here is they received shares as equity compensation and made an 83(b) election, so they are eligible for “tax-free” treatment in selling these shares.

(¹²⁵) See Isfandiyar Shaheen, Stock Market Reaction to Acquisition Announcements using an Event Study Approach, 2006, <https://dspace.fandm.edu/bitstream/handle/11016/4167/Shahen.pdf?sequence=1>.

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

(¹²⁶) Myers & Majluf, *supra* note 73, at 187.

(¹²⁷) The market may well react to structuring choices; indeed, there is a literature showing that cash deals generate a more favorable market reaction than stock deals. See, e.g., Nickolaos G. Travlos, “Corporate Takeover Bids, Means of Payment, and Bidding Firms’ Stock Returns”, 42 J. Fin. 943 (1987) (cash bids generate more favorable market reaction for bidder than stock bids); Shaheen, *supra* note 125 (cash bids generate more favorable market reaction for both target and bidder). But in explaining this difference, commentators focus on signaling and the likelihood that the deal closes, and not on the tax difference in these structures or the possibility that managers are allocating tax costs as a less visible means of under- or over-paying. If sophisticated commentators do not focus on these issues, unsophisticated shareholders also are unlikely to do so.

(¹²⁸) Victor Fleischer, *Despite Tax Rules, Companies Stick With US*, N.Y. Times, June 6, 2013 (“Minority investors might be nervous about enforcing their contractual and shareholder rights in a court in Bermuda, British Virgin Islands or Ireland”), http://dealbook.nytimes.com/2013/06/06/despite-tax-rules-companies-stick-with-u-s/?_php=true&_type=blogs&_r=0.

(¹²⁹) Susan C. Morse, “Startup Ltd: Tax Planning and Initial Incorporation Location”, 14 Fla. Tax. Rev. 319, 320 (2013) (arguing that “startup firms generally organize as US corporations” because of “limited tax benefits of non-US incorporation, legal benefits of US incorporation, startups’ liquidity and other resource constraints, and investor preferences”); Eric J. Allen & Susan C. Morse, “Tax Haven Incorporation for US-Headquartered Firms: No Exodus Yet”, 66 Nat. Tax. J. 395 (2013) (finding that US-headquartered MNCs rarely have incorporated parent corporations in tax-haven jurisdictions; only 27 firms, or about 3%, of the 918 US-headquartered MNCs identified in their sample of IPOs have incorporated in tax havens).

(¹³⁰) Desai & Hines, *supra* note 11, at 410 (“These national differences create opportunities for American companies with foreign income to reduce their tax obligations by expatriating, thereby shedding their American identities and becoming foreign corporations”).

(¹³¹) Donald J. Marples & Jane C. Gravelle, “Congressional Research Services Report 7-5700: Corporate Expatriations, Inversions, and Mergers: Tax Issues”, May 27, 2014, 4, <http://fas.org/sgp/crs/misc/R43568.pdf> (“Among the more high-profile inversions were Ingersoll-Rand, Tyco, the PXRE Group, Foster Wheeler, Nabors Industries, and Coopers Industries”).

(¹³²) See generally Jefferson P. Vanderwolk, “Inversions under Section 7874 of the Internal Revenue Code: Flawed Legislation, Flawed Guidance”, 30 Nw. J. Int’l. L. & Bus. 699, 700 (2010) (“Section 7874 is widely believed to have had a severe chilling effect on inversions of publicly held corporations”).

(¹³³) To make it more difficult to avoid the statute by doing business in the new site of incorporation, the US Treasury increased the safe harbor for substantial business activities

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

from 10% to 25%. This more demanding test makes it less likely this path will be used. Marples & Gravelle, *supra* note 131, at 6.

(¹³⁴) Doug Gelles & Chad Bray, Drug Firms Make Haste to Elude Tax, N.Y. Times, July 14, 2014, http://dealbook.nytimes.com/2014/07/14/shire-and-abbvie-in-talks-over-53-billion-pharmaceutical-merger/?_php=true&_type=blogs&_r=0. (“It appears that health care companies are playing an expensive game of keeping up with the Joneses”).

(¹³⁵) See Orsolya Kun, “Corporate Inversions: The Interplay of Tax, Corporate, and Economic Implications”, 29 Del. J. Corp. L. 313 (2004) (noting that fiduciary duties of managers can be different, and that courts are likely to have less corporate law experience and fewer reported precedents).

(¹³⁶) A further tax advantage of LLCs is that they allow losses to flow through to investors, so that net operating losses are not trapped inside a failed firm. Cf. Joseph Bankman, “The Structure of Silicon Valley Start-Ups”, 41 UCLA L. Rev. 1737, 1738 (1994) (noting that Silicon Valley startups are usually C-corporations instead of pass-through entities, and that this structure is potentially tax-inefficient).

(¹³⁷) A dollar of corporate profit is taxed at 35% at the corporate level and then at 23.8% at the shareholder level (a 20% capital gains tax plus the 3.8% net investment income tax). This leaves only 49.5 cents: $1(1-.35)(1-.238) = .495$. In contrast, a dollar taxed once at the maximum individual rate of 39.6 (plus the 3.8% net investment income tax, assuming it applies) leaves 56.6 cents.

(¹³⁸) For instance, although Delaware LLCs impose fiduciary duties, the case law is considerably less developed than Delaware corporations. Cf. Victor Fleischer, “The Rational Exuberance of Structuring Venture Capital Start-Ups”, 57 Tax L. Rev. 137 (2003–2004). (why nontax business considerations often lead firms to organize as corporations instead of as partnerships). A business that wants both Delaware corporate law and pass-through treatment can use an S-Corporation. Yet S-Corporations are subject to various limits that do not apply to LLCs.

(¹³⁹) Michael Doran, “Managers, Shareholders, and the Corporate Double Tax”, 95 Va. L. Rev. 519, 528 (2009) (“Whether it makes policy sense or not, the corporate double tax serves as a toll charge imposed by the government on accessing capital through the securities markets”).

(¹⁴⁰) Schizer, Realization as Subsidy, *supra* note 6, at 1551–52.

(¹⁴¹) As James Repetti has observed, though, this rule can have adverse corporate governance effects by favoring retained earnings over distributions. James R. Repetti, “The Misuse of Tax Incentives to Align Management-Shareholder Interests”, 19 Cardozo L. Rev. 697, 716–17 (1997).

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

(¹⁴²) David M. Schizer, “Frictions as a Constraint on Tax Planning”, 101 Colum. L. Rev. 1312 (2001). As noted above, “tax-free” reorganizations can reduce agency costs by enlivening the market for corporate control. See *supra* section 4.3.3.

(¹⁴³) The price pressure from selling may have positive corporate governance effects but not through monitoring.

(¹⁴⁴) Steven Bank & Brian R. Cheffins, Tax and the Separation of Ownership and Control, in Tax and Corporate Governance 111 (Wolfgang Schön ed., 2008).

(¹⁴⁵) Courtney H. Edwards, Mark H. Lang, Edward L. Maydew, & Douglas A. Shackelford, “Germany’s Repeal of the Corporate Capital Gains Tax: The Equity Market Response”, 26 JATA 73 (Supp. 2004); Friese, Link & Mayer, *supra* note 74, at 375 (describing exemption as an effort “to unravel the close net of cross-holdings” in Germany).

(¹⁴⁶) Andrei Shleifer & Robert W. Vishny, “Large Shareholders and Corporate Control”, 94 J. Pol. Econ. 461 (1986) (Tax on dividends gives investors an incentive to hold stock through tax exempt organizations).

(¹⁴⁷) To qualify for pass-through tax treatment, a mutual fund (or so-called “RIC”) cannot hold more than 25% of its portfolio in a single company. Section 851(b)(3).

(¹⁴⁸) Section 857.

(¹⁴⁹) Treas. Reg. 1. 817-5(b).

(¹⁵⁰) Wolfgang Schön, Tax and Corporate Governance: A Legal Approach, in Tax and Corporate Governance 60 (Wolfgang Schön ed., 2008).

(¹⁵¹) Friese, Link, & Mayer, *supra* note 74, at 392.

(¹⁵²) Mihir A. Desai, Alexander Dyck & Luigi Zingales, “Theft and Taxes”, 84 J. Fin. Econ. 591 (2007).

(¹⁵³) Michelle Hanlon & Joel Slemrod, “What Does Tax Aggressiveness Signal? Evidence from Stock Price Reactions to News About Tax Shelter Involvement”, 93 J. Pub. Econ. 126, 128 (2009) (aggressive tax planning “may signal that the dishonesty extends to the financial accounting statements”).

(¹⁵⁴) Desai & Dharmapala, *supra* note 8, at 17–18.

(¹⁵⁵) Desai, Dyck, & Zingales, *supra* note 152.

(¹⁵⁶) In Germany, tax and financial accounting generally are aligned, whereas in the US, tax and financial accounting can diverge in significant ways. See Friese, Link, & Mayer, *supra* note 74, at 376–78, 380–381 (discussing corporate governance advantages and disadvantages of book-tax conformity).

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs

⁽¹⁵⁷⁾ See Hanlon, Maydew, & Shevlin, *supra* note 12 (finding that quality of information to shareholders declined as a result of change in tax law requiring greater book-tax conformity, which induced firms to report more conservatively).

⁽¹⁵⁸⁾ Kornhauser, *supra* note 7, at 134–35 (“publicity” was important early rationale for corporate tax; as first enacted, corporate tax made publicly traded firms’ returns available to the general public); Dave Hartnett, The Link Between Taxation and Corporate Governance, in *Tax And Corporate Governance 4* (Wolfgang Schön ed., 2008) (“Some countries publish tax returns . . . to produce . . . transparency”).

⁽¹⁵⁹⁾ See Hanlon & Slemrod, *supra* note 153, at 126 (“in order to maximize the value of the firm, shareholders would like to minimize corporate tax payments net of the private costs of doing so”).

⁽¹⁶⁰⁾ See Hanlon & Slemrod, *supra* note 153, at 127 (noting that stock price declines associated with news that corporations are involved in tax shelters tend to be less severe for firms with high effective tax rates; suggesting the reason for this difference may be that shareholders value the fact that firms are “not as ‘tax passive’ as previously believed”); Katharine D. Drake, Stephen J. Lusch, & James M. Stekelberg, “Investor Valuation of Tax Avoidance and the Uncertainty of Tax Outcomes: Evidence from the pre- and post-FIN 48 periods”, Working Paper, University of Arizona, Eller College of Management (March 2014) (investors generally value tax avoidance, although they discount it for tax risk); Michelle Hutchens & Sonja Rego, “Tax Risk and the Cost of Equity Capital”, Working Paper, Indiana University (September 2013) (investors do take tax risk into account in valuing companies, especially now that there is an accounting requirement for increased disclosure of tax risk); Mihir A. Desai & Dhammika Dharmapala, “Corporate Tax Avoidance and Firm Value”, 91 *Rev. Econ. & Stat.* 537 (2009) (tax avoidance is positively related to firm value in well governed firms, but negatively related in poorly governed firms).

⁽¹⁶¹⁾ Schön, *supra* note 150, at 50.

⁽¹⁶²⁾ Incentives may vary among managers as well. Tax directors could have higher appetites for tax risk than other managers, for instance, since successful planning can enhance their reputations. See Schön, *supra* note 150, at 49. Yet the other side of the coin is that they have more to lose from unsuccessful planning.

⁽¹⁶³⁾ Merle Erickson, Michelle Hanlon, & Edward L. Maydew, “How Much Will Firms Pay for Earnings That Do Not Exist? Evidence of Taxes Paid on Allegedly Fraudulent Earnings”, 79 *Acc. Rev.* 387 (2004) (firms paid significant tax on fraudulent earnings, presumably because they worried more about IRS monitoring than shareholder monitoring).

⁽¹⁶⁴⁾ Schön, *supra* note 150, at 60 (discussing the Baden-Wurtemberg decision, in which the court found for the state in a suit where shareholders sued because the state’s tax authorities knew of fraud but did not intervene to stop it).

Tax and Corporate Governance: The Influence of Tax on Managerial Agency Costs
